The word *Walnut* from the diversity of the colour *Grauwaller*. It is called also *Funiculus*, as it were *Puniqus sinn*, or rather of *Balick*, because they were wont to be brought in bundles or to be sold figly together, and they were sold for twenty groats. *Volutania*, and *Hermolaus* are of this opinion, that the white one in this kind, be called of the *Italians*, *Armeline*, and the *Germans*, *Hermelin*, but we have promisèd already to prove that *Hermelin* is a kind of Weefil, which in the Winter time is white, by reason of extremity of cold, and in the Summer returneth into her colour again, like as do the Hares of the *Alpes*. This *Pontique Moufe* differeth from others only in colour, for the white is mingled with ash colour, or else it is sandy and black, and in *Polonka* at this day they are found red and ash coloured. Their two lowermost teeth before are very long, and when it goeth, it draweth the tail after it like Mice; when it eateth it useth the fore-feet in stead of hands, and feedeth upon *Walnuts*, *Chefsnut*, *Filbeards*, small *Nuts*, *Apples*, and such like fruits. In the Winter time they take lie in stead of meat: And it is to be remembered, that the *Polonians* have four kinds of precious skins of *Mice* which they use in their garments, distinguished by four several names. The first of grizel colour, called *Papetisz*. The second is called *Graunshai*, a very white *Beaut* all over, except the tip of the tail which is all black, and this is the *Hermelin*.

The third is called *Nepogrodela*, from the name of a *Town*, and this is white mingled with grizel, and this is also a kind of *Pontique Moufe*. The fourth *Uniework*, of a bright Chefsnut colour, and this is the *Squirrel*, for they call *Squirrels*, *Weefils*, and *Hermelins* all by the name of *Mice*. *Thefe Pontique Mice* have teeth on both sides, and chew the cud. In the Winter time as we have said they lie and sleep, especially the white ones, and their sense of taste doth excel all other, (as *Pinty* writeth) they build their nests and breed like common *Squirrels*.

Their skins are fold by ten together, the two belt are called *Lizafohna*; the third, a little worfe, are called *Crakina*, and the fourth next to them *Porofina*, and the last and vifest of all *Moleshohna*; with these skins they hem and edge garments; and in some places they make Canonical garments of them for *Priests*, unto which they liew their tails to hang down on the skirts of their garments; of which cullom *Hermolam* writeth very excellently in their words. *Institiuit, & ex maribus luxuriam quam vitam, alias magiam frigoribus, alias medio anni tempore, a septentriobus petebat, armatus corpora, & debellatus animos*. That is to say: The life of man hath learned to be prodigal, even out of the skins of *Mice*, for some they use against extremity of cold, and they fetch others out of the farthest Northern parts, for the middle part of the year: Thus do we arm and adorn our bodies, but put down and spole our mindes.

Befide, there is a flying *Pontique* or *Scbian* Moufe, which we may call the broad *Squirrel Moufe*, whose skin is here expressed as you may fee, and for the description thereof, I have thought good to add an Epistle of *Antonius SCHNEBERGUS* the *Litterianus of Vilna* unto *Gefar*, in these words following:

I fend unto thee a little skin, the upper place of the hairs thereof being of a white ash colour, but the root of the hair or inner part thereof is a black brown. They call it *Poyelceza Lataczza*, that is, a *Pontique* flying Moufe: It is always so moift, that it can never be dresse d by the Skinner, or Lether-dreffer.

The people use it to wipe fore running eyes, having a perfluation that there is in it a singular vertue for the easing and mitigating of those pains: but I think that the foffenes was the first cause which brought in the first use thereof, but if the hairs do not cleave hard to the skin, it cannot be done without danger. Also the hairs hanging as it were in a round circle against or above the two former feet, they call wings, wherewithal they
are thought to flee from tree to tree. Thus far *Antonius*. Gefier after the receipt of their skins, being willing to preserve them from moths, because they were raw, for experience gave them to a leather drier, who presently dressed them with Vinegar, and the Lees of Wine, so that it appeared the Skinners of *Lituania* had not the skill how to dress it.

After they were dressed they were so soft, that they stretched above measure, so that every one of them were square, that is to say, their length and breadth were equal, for they were two palms or eight fingers broad: and no more in length, the head and tail excepted: wherefore it may well be called a square Moufe, or *Sicuras quadrata*, because we are sure of the former, but not of the flying; the tail was as long as four or five fingers are broad, being rough like the tail of other Squirrels, but befted with black and white hairs, the whole colour both of the belly and upper part was white, as we have said, but black underneath, the hair is so soft as any filk, and therefore fit for the use of the eyes. The ears shorter and rounder then a Squirrel: the feet did not appear by the skin: the neither part was distinguished from the upper part, by a certain visible line, wherein did hang certain long hairs, which by their roughness and solidify under the thin and broad frame of their body, might much help them to flee, even as broad fitches swim by the breadth of their bodies, rather then by the help of their fins. The *Helvetians* wore these skins in their garments. It is reported by *Elianus*, that the Inhabitants of *Pontus*, by making supplication to their Gods, did avert and turn away the rage of Mice from their Corn-fields, as the *Egyptians* did, as we have said before in the story of the vulgar Moufe.

**Of the Moufe called the Shrew, or the Erd Shrew.**

The word *Honake* of the *Hebrews* remembered in the 11. chapter of Leviticus, is diversely inter- preted by the translatours; some call it a repitile beast which always cryeth: some a repitile flying beast; some a Horfe-leach; some a Hedgehog: and some a Beaver, as we have heued before in the Hedgehog. But the *Septuagint* translate it *Mgale*; and S. *Jerom*, *Mus araneus*, that is, a Shrew. *Disquisideris* calleth it *Migale*; the *Germans* and *Helvetians*, call it *Matzer*; in some parts of *Germany*, from the figure of the snout it is called *Spitzmuth*, by some *Ziffmuth*, from the fiction of his voice, and some *Grafs Ziffmuth*; the *Hollanders* call it *Mull Mauffe*, because it femebleth a Mole. *Mathesius* for the *Italians* call it *Toporagno*; that is, a Mole-Shrew. The *Helvetians* call it *Bifemnus*, that is, a Musk-moufe, because it being dried in a furnace fmeleth like Musk. The skin pul- led from the fleth, fmeleth belt by it felf, and yet the fleth fmeleth well alfo, and fo do the ex- crements. But to return to the *Greek* name, why it should be call'd *Mgale*, there is not one opinion amongst the learned: but I do moft willingly confede the opinion of *Antius*, who writeth that it is called *Migale*, because in quantity it exceedeth not a Moufe, and yet in colour it femeleth a Weefil, and therefore it is compounded of two words, *Myt*, a Moufe, and *Gales*, a Weefil.

*Antius* is of opinion, that it is so called, because it is begot betwixt a Moufe and a Weefil, but this is neither true nor probable. For it is likely that Weefils and Moufe will couple together in carnal copulation, whose natures are fo contrary, the one living upon the death of another, that is, the Weefil upon the Moufe? And befoide the difference of quantity betwixt them, maketh it im- possible to have fuch a generation. The other derivation of *Mgale*, which is made by *Rodolphus* writting upon Leviticus, fetching *Mgale* from *Mur galicus*, that is, a devouring Moufe, it is again the order of all good Linguifts, to derive *Greek* words from *Latin*, but rather confonant to learning, to fetch the *Latin* from the *Greek*.

There is no lefs inquiry about the *Latin* name, why it should be called *Mus araneus*, seeing *Aranea* signifieth a Spider. This Moufe faith *Albertus*, is a red kinde of Moufe having a small tall, a sharp voice, and is full of poyfon, or venom: For which caufe Cats do kill them, but do not eate them. *Siponius* writeth thus, of this Shrew; *Mus araneus*, *exiguum animal*, *et to levifimum effe*, quod aranea modo tenuifimum filum, et gladii aciem confederit. That is to say, this Shrew-moufe is a little and light creature, which like a Spider climeth up upon any small thread, or upon the edge of a fword: and therefore you fee, they derive the *Latin* name from his climbing like a Spider.

But in my opinion it is more reafonable, to derive it from the venom and poyfon which it contains in it like a Spider. For which caufe *Silvaticus* writeth thus; *Mgali id eff*, *dracon mar-
The History of Four-footed Beasts.

In, & animal venenum, posuitium muri simile: haum & araneum pipec, proper venenum pungentibus influm sinea, vetere opim, id efi, serpentum nominatur, & boice quam vulgo draconem vel drakenem. That is to say; There is a fish of the Sea, and a little Beast on the Earth like a Moufe, which by a general word are called Mojdes, and the Spider-fish called at this day a Dragon, or Dragonfish, was in ancient time called a Serpent, because by his prickly fins, he did poyfon those which were inrucken by him. And concerning the description of this Beast, it may be taken from the words of an ancient English Physician, called Doctor William Turner.

I have seen (faith he) in England, the Shrew-moufe of colour black, having a tail very short, and her fnow very long and sharp, and from the venemous biting of this Beast, we have an English Proverb or Imprecation, I behove thee, when we curfe or with harm unto any man, that is, that some fuch evil as the biting of this Moufe may come unto him. The Spaniards call this Beast Raton t equus ; the Hijiens, Vifudis kamy; and the Polonians, Kerti. They were wont to abound in Britany, as Hermidaw writeth.

They are also plentiful in Italy beyond the Mountains Apennnine, but not on this fide (as Pliny writeth) yet in the hither parts of Italy and Germany, there are many found, especially in the Country neer Trent, in the Valley Anona, where this is admirable, that by reason of the coldnes of that Country their bitings are not venemous. For the Scorpions there are not venemous, although in other places of Italy they poyfon deeply. This Beast is much lefs then a Weeffil, and of an ash colour, in molt places like a Moufe, although the colour be not alwaies the fame.

The eyes are fo small, and beneath the proportion of her body, that it hath not been unjustly doubted of the Ancients, whether they were blinde or no, but in their behalf their fight is very dull. And for this caufe the ancient Egyptians did worship it: for as they held opinion, that darknes was before light, so they deemed that the blinde creatures were better then the feeing. And they also believed, that in the wane of the Moon the liver of this Beast consumed. It hath a long and fharp fnow like a Mole, that it may be apt to dig. The teeth are very small, but fo as they fand double in their mouth, for they have four rows of teeth, two beneath, and two above, which are not only apparent by their defection or Anatomy, but also by their bitings, for their wounds are Quadruple, whereofever they faften their teeth. Their tail is flender and fhor. But the defcription of this Beast was better apprehended by Gofnor, at the fight of one of them, which he relateth on this manner:

The colour (faith he) was partly red, and partly yellow, mingled both together, but the belly white. The hinder-feet feemeth to cleave to the body or loins. It smelth well strongly, and the favour did bewray or dignifie some fecret poyfon. The tail about three fingers long, beft with very fhort hairs. The residue of the body was three fingers long. The eyes very small and black, not much greater then Moles, fo that next to the Mole they may juftly be called, the leaf fighted creature among all four-footed Beasts; fo that in old age they are utterly blinde by the Providence of God, abridging their malice, that when their teeth are grown to be molt fharp, and they fopk full of poyfon, then they fhould not fee whom nor where to vent it.

They differ as we have faid in place and number, from all four-footed Beasts, fo that they feem to be compounded and framed of the teeth of Serpents and Mice. The two fore-teeth are very long, and they do not grow fingle as in vulgar Mice, but have within them two other fmal and fharp teeth. And alfo tho fome long teeth grow not by themfels, as they do in other Mice, but are伴有 in the fide, in one continued rank. They are fharp like a faw, having fharp points like needles, fuch as could not be fen by man, except the tips of them were yellow. Of either fide they fhall have eight teeth, whereas the vulgar Mice have but four, befide the two long fore teeth, which alfo feem divided into two or three, which exceft one mark diligently, he would think them to be all one.

It is a ravening Beast, feigning it felf gentle and tame, but being touched, it biteeth deep, and poyfoneth deadly. It beareth a cruell minde, defiring to hurt any thing, neither is there any creature that it lovethe, or it lovethe him, because it is feared of all. The Cats, as we have faid, do hunt it and kill it, but they eat not them, for if they do, they consume away in time. They annoy Vines, and are feldom taken except in cold; they frequent Ox-dung, and in the Winter time repair to howes, gardens, and fables, where they are taken and killed.

If they fall into a Cart-road, they die and cannot get forth again, as Marcelus, Nicander, and Pliny affirm. And the reafon is given by Plises, for being in the fame, it is fo amazeth, and tremblieth, as if it were in bands. And for this caufe fome of the Ancients have prefcribed the earth of a Cart-road, to be laid to the biting of this Moufe for a remedy thereof. They go very flowly, they are fraudulent, and take their prey by deceit. Many times they gnaw the Oxes hooves in the flable. They love the rotten flefh of Ravens; and therefore in France, when they have killed a Raven, they keep it till it flinketh, and then call it in the places where the Shrew-moufe haunt, whereunto they gather in fo great number, that you may kill them with floues. The Egyptians upon the former opinion of holines, do bury them when they die. And thus much for the defcription of this Beast. The succeeding discoure toucheth the medicines arising out of this Beast; alfo the cure of her vnemous bitings.
The Shrew, which falling by chance into a Cart-rode or track, doth die upon the same, being burned, and afterwards beaten or dissolved into dust, and mingled with Goose greave, being rubbed or anointed upon those which are troubled with the swelling in the fundament coming by the cause of sofe inflammation, doth bring unto them a wonderful and most admirable cure and remedy. The Shrew being slain or killed, hanging so that neither then nor afterwards the may touch the ground, doth help those which are grieved and pained in their bodies, with fores called fellons, or biles, which doth pain them with a great inflammation, so that it be three times inuironed or compassed about the party so troubled. The Shrew which dyeth in the furrow of a Cart-wheel, being found and rowled in Potters clay or a linnen cloth, or in Crimson, or Scarlet woollen cloth, and three times marked about the Impollumes, which will suddenly swell in any mans body, will very speedily and effectually help and cure the same.

The tail of a Shrew being cut off and burned, and afterwards beaten into dust, and applied or anointed upon the fore of any man, which came by the biting of a greedy and ravenous Dog, will in very short space make them both whole and found, so that the tail be cut from the Shrew when she is alive, not when she is dead, for then it hath neither good operation, nor efficacy in it. The former hool of a Horse being scraped, and the fame fragments or scantlings thereof being beaten in the dust or earth, which hath been digged up by a Shrew, in four measures of water, poured down the mouth of a Horse which is troubled with any pain or wringing in his bowels, will soon give him both help and remedy. The Shrew being either applied in drink, or put in the manner and form of a platter, or hanged upon the fore which he hath bitten, is the most excellent, and most medicinal cure for the helping and healing thereof. A preparative against poyson, would be an excellent remedy, that neither man nor any other living creature, should be bitten if they should leave or would want that superstition called an enchantment against poyson, being hanged about the neck, whereof we will speak more in the curing of the bites of this Beast.

That the biting of a Shrew is venemous, and of the reason of healing in this kind.

In Italy the biting of a Shrew is accounted for a very strong poyson, and that except there be Piny, some medicine very speedily applied for the curing and healing thereof, the party so bitten will die. These Shrews are truly so venemous and full of poyson, that being slain or killed by Cats, whose nature is to kill whatsoever Mice they take, they will not offer to touch or eat the least part of them.

But the biting of a female Shrew is most obnoxious and hurtful when she is great with young, but most dangerous of all when the biteth any one which is great with young, either a woman or any other Bealt whatsoever, her self being also with young, for then it will hardly be cured.

If a Shrew shall bite any creature while she is great with young, the putres or biles will in time be broke which they make, and will come unto a very great and magnifiant wound and fore. If the Shrew do also bite any creature during the time she is with young, she will presently leap off, notwithstanding the bite more dangerous. There is nothing which do more apparently explain and shew the biting of a Shrew then a certain vehement pain and grief in the creature which is so bitten, as also a prickings over the whole body, with an inflammation or burning heat going round about the place, and a fiery redness therein, in which a black pufh or like dwelling with a watery matter, and filthy corruption doth arise, and all the parts of the body which do joyn unto it seem black and blew with the marvelles great pain, anguish, and grief, which ariseth and proceedeth from the same.

When the pufh or bile which cometh by the occasion of a Shrew cleaveth or is broken, there proceedeth and issueth forth a kinde of white fleth, having a certain rinde or skin upon it, and sometime there appeareth in the a certain burning, and sometimes the fame is eaten in and falleth out, but in the beginning there is a most filthy green corruption and matter which floweth in the same, afterward it is putrefied, and eaten in, and then the fleth falleth forth: the wrunnings alfo of the inward parts, the difficulty of voiding the urin, and a corrupted sweat doth follow and accompany the fame.

But Avicenna affirmeth, that in what place forever this Beael shall bite, the fores thereof with great anguish will pant or beat, and that in every hole wherein his venemous teeth have entred, there will a certain fiery redness appear, the skin whereof being broken, there will come a very white and mattery fore, which will breed much pain and trouble in all the parts of the body for the most part. The fores or wounds which are made alfo by this Beael are very manifestly known by the marks of the fore-teeth flanding all in a row together, as alfo by the blood which issueth from the wound, being at the first pure, clear, and exceeding red, but afterwards corrupt, blackish, and full of putrefaction.

There do also divers bitches arise in the fleth usually after the biting of this Beael, which if any man shall break, he shall see the fleth which lyeth under them corrupt, and divided with certain
The History of Four-footed Beasts.

Aetrica. certain clefts or riffs in the same. Moreover the nature of this Beast is fuch, that for the molt part he doth covet to bite those whom he can come unto by the ftones or genital, not only men, but also all other brute Beasts whatsoever: and thus much shall suffice concerning the biting of this Beaf.

Dissectores. Wormwood being beaten or bruifed small, strained in a fine linen cloth, and mingled in Wine, given to the party, either man or woman, in Wine to drink, who is bitten by a Shrew, will procure him present ease and remedy. The fame alfo is an excellent remedy for the bitings or flings of a Sea-dragon. Vinegar is very medicinable for the bitings of the Shrew, and of Dogs, as alfo for the fith called by the Latins, Scophendus, (which voideth all her bowels out until the hook come forth, wherewith the is taken, and then fucketh them up again) the Scorpion and all other venemous Serpents.

But the Grecian Physicians affirm, that the fame ought to be mingled with other medicines for the helping of the aforefaid diseases, as to take the ashes of the Shrew being burnt, the gun or liquor of the Herb called Pemal-giant, dryed Barly beaten into small powder, Mustard-seed pounded small with the Herb called Purple, or Mothmullein, and mingle them all together with Vinegar, and being so applied they will prefently cure the aforefaid flings or bitings.

Garlick being bruifed, and the juice thereof anointed upon the place which was bitten by a Shrew, will prefently expel the pain, and wholly cure the fore. For the expelling of the Superfluities or the parings of the dead flesh, growing round about the fore, being not caft away but remaining thereon. Take Cummin and cover the wound or biting therewith, then apply Garlick beaten into Oyl thereunto, and anoint the places about the fore, as alfo the fore it self very diligently, and in very fhort space it will caufe the fame to fall away of its own accord.

For the healing alfo of the bites of this Beaf: Take Garlick, the leaves of a Fig-tree, and Cummin, mingle them very well together, till they come to a mollifying or temperate fulblance; then take the fame, and fahion it in the form or manner of a plaifter, and it will very speedily and effectually cure the fore.

The feed or leaves of Coleworts, being beaten together with Vinegar, and the herb called Alfa feida, is very good and profitable to be applied either to the bites of this Beaf, or a raving Dog. The dung of a Dog being taken and anointed upon either Man or Horfe which hath been bitten by a Shrew, will be an excellent remedy both for the curing and healing them of the fame. The hoof of a Ram being dryed, beaten into powder & afterwards mixed with Honey, will be likewise very good for thofe which are bitten with the fame Beaf, fo that they be firft tempered and fashioned in the manner of a plaifter, and then applied thereunto. The little white flacks which proceed from a black Fig. being beaten with the leaves of the herb called Moth-mullein, Wax, and Vinegar, until they come unto a mollifying juice or falt, will be an excellent remedy against the biting of the Shrew, being anointed thereupon.

The young or tender flacks of a wilde Fig-tree, be they never fo few or small, being firft steeped in Wine, then lapp'd in a leaf of the fame Tree, and fo applied unto the flings and bites of Scorpions, and the Shrew, will in very fhort time cure and heal the fame. Provided always that the wound be well and diligently bathed or wafted, before any thing be put or applied thereunto.

Dissectores, Aetrica., and Alharus, do affirm, that the excellenteft, and medicinableft cure for the bites of a Shrew is thus: To take the Spleen of the fame Beaf, and beat it together with Vinegar, and the Gum called Galbanum, then to anoint it or rub it upon the fore, and it will prefently expel away all pain, and in some fhort space altogether heal it. If the red bunches or ulcers which do usually grow about the bites of a Shrew, do fortunate to break; take very sharp and throng brace or pикle, and rub it both about, and within the fore, and afterwards apply Barly being burned and beaten into small dult or powder thereunto, which medicine although it feem somewhat grievous and painful, yet it is very good and profitable for the expelling either of the flings of Scorpions, or the bites of the Shrew or ravenous Dog.

The genital of a Hare being beaten into powder mingled with Vinegar, and anointed upon the bites of a Shrew, doth speedily cure them. Wild Melows being mingled with thofe Melows that grow in the Garden, have in them a very effectual force and power to cure all flings or venemous bitings, especially of Scorpions, Shrews, Wafps, and fuch like flinging creatures.

The Shrew being cut and applied in the manner of a plaifter, doth effectually cure her own bites. The Shrew being killed and anointed all over with Oyl, and durt or mire, applied into the Ulcers or red swellings which come by her venemous teeth, will very speedily procure them to break. The Shrew being cut or beaten into small pieces, dryed into powder, mixed with Vinegar, and fashioned in the form of a plaifter, will very speedily and effectually cure the bites of a Shrew, whether the be great with young or not, fo that they be well applied thereunto.

But there are fome which do think it nothing convenient to mingle the Shrew with any other thing whatsoever; but that it is only after this manner to be applied by it fell, as to take it burned or dry'd, and then to pound it in powder, and fo to sprinkle it in the wound or fore, which in very fhort time will easily heal it. The Shrew falling into the furrow of a Cart wheel doth prefently die: the dult thereof in the paffage by which the went, being taken and sprinkled into the wounds which were made by her poysonome teeth, is a very excellent and prefent remedy for the
the curing of the same. 

Hart-wort, a'vd Trifoly, unto the worts which wounds an. If the pimples or bladders which arise in the bites of a Shrew shall be thought convenient to be broken, for the performing of the same, take the skin of a baked or roasted Pomgranate, and spread it upon the aforesaid red pimples, as hot as possible may be suffered for some small time, and it will cause the ulcers to break, and all the corruption to issue forth.

If it grow unto an Impudence, take the little berries or pellics which are within the Pomgranate, being very well baked and apply them unto the fore some short time, and they will very eafily cure the same. Mustard-feed being mingled with Vinegar, annointed upon the bites of a Shrew, doth very effectually heal them. A Moul being bruised into small pieces, and applied unto the bites of a Shrew of the form of a plaister, is a very excellent remedy for the curing of them. Ditch and Trifoly being mingled very well, upon the bites of a Shrew, is accounted an admirable cure; but it is requisite that the fomentation be given unto none but such as are of a fofire and powerful body, and are also able to endure pain. The liquor of the Herb called Southernwood being given in Wine to drink, doth very much profit those which are troubled, and pained in their limbs with the bites of Shrews. Wormwood being used in the like manner, will cure those which are bitten by a Shrew.

The genital of a Lamb or Kid being mingled with four drams of the Herb called Aristolochia, or Hart-wort, and six drams of the sweetest Myrrh, is very good and medicinable for curing of those which are bitten or lungen with Shrews, Scorpions, and such like venomous Beasts. The leaves of Coleworts being dried, mingled with flower, and tempered together, until they come into the form of a plaister, will very much help against the venomous bites of the Shrew. The seeds of Coleworts, and the leaves of the same herb being mingled with Vinegar, and the herb called Alfa sativa beat or pounded together, do very well and speedily cure the bites of the Shrews, as also of a ravenous Dog: if the same in due time be applied thereunto. The liquor also of the leaves of Coleworts being given in any kind of drink, is good and wholesome for the curing of the aforesaid bites or wounds. The Nuts of a young Cypress tree being mixed with a certain syrup or potion made of Hony, Water, and Vinegar, and afterwards drunk, doth very speedily procure ease and help for those which are bitten by a Shrew.

The root of a white or black Thistle, being beaten or bruised and given in drink, doth very effectually help or cure those which are bitten by a Shrew. The like vertue hath the herb called Rocket in it, and also the feed thereof being given in any kind of drink. The gum or liquor which proceedeth from a kinde of Ferula, being given in Wine to drink, doth very much help and cure those which are bitten by a Shrew. The same vertue also in it hath the root of the herb called Gentian or Bitterwort, being given in Wine to drink. One or two drams of the youngest or tenderest leaves of the Laurel tree, being beaten small and given in Wine to drink, doth speedily cure the fores or wounds which are bitten by a Shrew: the same being also used in the faid manner, and given in some certain portion unto Horses to drink, doth quickly help and heal them. But there are some which before all other medicines do commend this for the belt, and chiefly, that "to take the juuyce which proceedeth from the leaves of the Laurel tree, and the leaves themselves, being moist and new growing, and to boil them in Wine, and being once cooled, to give it to any which is bitten by a Shrew, and this will in very short space altogether help them. A young Weefit being given in Wine to drink, is accounted very medicinable for those which are bitten by a Shrew, or lungen by a Scorpion or any other venomous creature. The herb called Balk'mint or Calmary, the herb called Bartram, or mild Pello, the herb called Beany, the herb called Water-mint, or Watercrees, the sweet and delicious gum called Storax, as also the herb called Vervin, being each of them severally by themselves, either given in Wine to drink, or applied in the manner of a plaister, or annointed upon the bites or wounds which come by the venemous teeth of a Shrew, will very effectually cure the pain thereof: The biting of a field Mouse or Shrew, is very troublesome or grievous to all labouring Beasts; for instantly after her bittings there do little red Pimples arise, and there is most danger of death in those Beasts which the bithe when she is great with young; for the aforesaid pimples will then presently break, after which the Beatt so bitten will instantly die. The Shrew doth also kill some labouring Beasts with poifon, as chiefly Horses and Males, but especially and for the most part Mares, which are great with young. There are some which do affirm, that if Horses, or any other labouring creature do feed in that pasture or grafs in which a Shrew shall put forth her venom or poifon in, they will presently die. In what place soever a Shrew shall bite in any creature, it will be compatified with an exceeding hard swelling, the Beatt also being so bitten, doth express his grief or sorrow with much pain, and training his body doth likewise swell all over, his eyes do in a manner weep, the swelling in his body doth sinue out matter, or filthy purfiation, he voideth poifon out of his belly; and doth vomit all sustenance up affoon as ever he receiveth it. If an Alfa being great with young be bitten by this Beatt, it is a very great chance if she scape death.

But if the Shrew do bite any Beatt when she is great with young, it is known by these things, or marks, there will certain red pimples compasse the fore round about, and also spread themselves over all the body of the bitten Beatt, and will in short space destroy him, except there be procured some
some present remedy. The Normans in France, do supposle the Shrew to be a Beast so full of venom, and poyson, that if he shall but pass over either an Ox, or a Horse lying down along upon the ground, it will bring such a dangerous disease upon them, that the Beast over which the shall pass, shall be lame about the loins, or shall seem as if he were immovable, and that he can be cured by no other means but by the same Shrew, who either of his own accord, or by compulsion must pass over the contrary side of the Beast, and that then he will be cured; which thing I do hold to be very vain and not to be believed.

For the curing of Beasts which are bitten by a Shrew, thou shalt boil the feed of Partly together with Wine and Oyl, and thou shalt cut the place which swelleth by a Pen-knife, by which the poyson may issue forth, and the wound being pointedly pulled or torn may wax raw: if by these the inflammation do wax more fervent and hot, thou shalt eat the fore with Iron instruments burning with fire, taking away some part of that which is whole and sound: then shalt thou renew the wound with the Iron instruments being governed rightly, by which the corruption may issue forth: but if that part do chance to swell by the exculceration, thou shalt sprinkle Barly being burned and dried therein; but before you do this, it is meet to joyn the old fat.

There is also another excellent medicine for the curing of the Shrew, which Startonius himself doth much commend, which is this: To lance or foraine the wound assoon as it is bitten, but especially if it be compassed with an inflammation, afterwards to sprinkle Salt and Vinegar upon it, then to encourage or provoke the Beast the next day following by some sweet water or liquor to run or go some little journey, first having anointed the fore with Fullers-earth, being beaten small and mixed with Vinegar, and then daily to nourish or bathe it with water which cometh from baths where some have washed themselves, and this in very short time being fouled, will very well and altogether cure the Beast. Against the biting of a Shrew Garlick is accounted for an excellent remedy being mingled with Nitre; but if there shall be no Nitre to be had, mix it with Salt and Cumin, then to dry and beat them all together into powder, and with the same to rub the places which are infected with the biting; but if the venemous wounds do chance to break; then to take Barly being scorched or burned, and pound it into small powder, and steep it in Vinegar, and afterwards to sprinkle it into the wound: This medicine Pelagon afterthohn, will only heal the bites of a Shrew, and that the grief of the fore, by the use of any other medicines doth rather encrease, then decrease.

The flour which is made of red Wheat, the herb called Dill, the liquor or Rozen which runneth out of the great Cedar, and two pound of the beet Wine, being mingled all together, in a potion, and poured down the throat of any labouring Beast which is bitten by a Shrew, will presently ease and cure him of his pain.

There is also another potion for the curing of the bites of this Beast; which is this: To take cloves of Garlick being bruised small, Salt, Cumin, and Wine, of each the like quantity; these being given to any Beast to drink, doth presently cure him; as also any man being anointed upon the wound, but not given to drink. The herb called Nard or Pepper-wort, being beaten to the quantity of two ounces and a half, and mingled with some sweet smelling Wine, will presently help any Beast which is bitten by the Shrew, being poured through his Nose, and his fore being at that instant time anointed with Dogs dung: the same is very medicinable or wholesome for men which are troubled with the said biting.

The bites of a Shrew being pricked with an Aul, and anointed with dust which is found in the furrows of Carts under the marks or signes of the Wheel, being mingled with sharp Vinegar, doth presently all生效, and heal the fore. The earth of the track of a Cart also mingled with stable or urine, being applied unto the bites of a Shrew, will very speedily cure them either upon Men or Beasts. A Shrew being new killed and rubbed over with Salt, applied unto the wounds which the shall bite in any Beasts, will instantly cure them: This vertue also hath the gall of a Rere-mouse or Bat, being mixed with Vinegar.

There is a very good remedy against the bitings of Shrews, or to preserve Cattle from them, which is this; to compass the hole wherein the lyeth round about, and get her out alive, and keep her so till she dye, and wax fife, then hang her about the neck of the Beast which you would preserve, and there will not any Shrew come near them; and this is accounted to be most certain. And thus much shall suffice concerning the bitings of the Shrews, and of the cures thereof.

Of Wilde Field-Mice.

This wilde Moufe called by the Latines, Mus agrestis, Mus Sylvatica, Sylvaticus, Subterraneus, and some say Nidulula, (although I rather take that word to signifie a Glaze-worm.) It is called also Enystus Mus, and Rafficus. The Greeks call it Nysa Areages; the Germans, Field-mouse, and Erd-mouse, that is, a Moufe of the Earth, and Nuidus, Nuidus, Schortarius, Schwermerus, Stoffmus, and Luckynus, by reason of her digging in the earth like a Mole. The French call it Mault. There is of these Mice two kindes, a greater and a lesser. The picture of the greater we have described here, forbearing the lesser, because in all parts it resembles this, except in the quantity.

This
Of the Field-mice.

This greater kind is not much leffer than a Rat, having a long broad tail like it. The ears of it are round, the head round and great; and the snow or chaps do not stand out long. They are of two colours in both kindes, some red and some black. They have a beard between their mouth and their eyes; and the lesser Mice have a short tail. A Physitian taking occasion of the writings of Baffinian Lamius, to dissect one of these Mice, found it to bee true which he faith, that their jaw and guts lie all straight and upright. We have shewed already, that all kindes of Mice are generated out of the earth, although also they suffer copulation. And in Egypt it is very common about Tebe, and the places where Nile overfloath, that in the decrease and falling away of the Waters, the Sun engendereth many Mice upon the slime of the earth; so that it is ordinary to fee at one time their fore-parts to have life, flesh, and motion, and the hinder-parts deformed, and nothing but earth.

And about this matter there is some disputition among the Authors, for there be Philosophers which affirm, that every creature as well perfect as unperfect, may be made both by feed and of putrified matter; and from hence came the opinion in the Poets, of the sons and daughters of the earth, and fo they say, that things grow by generation in infinitum. Some faith, that perfect creatures cannot be generated in that manner, but the imperfect ones, such as Mice are, may be engendered by feed and putrified matter, and afterwards beget more of his one kind.

But Aristotle confeth the first generation, and denyth the second, and faith; although they do generate by copulation, yet it is not 

Idem sed animal speciei diversum, a quo nihil, amplius gibus potest?

And therefore Jeromimus Gabncium endeth this controversy, saying; Mures ex putrione natui, generant quidem & ipsi, sed quod ex eis generatur, nec Mures alter, nec samina, nec amplius generat: that is; Mice engendered of putrified matter do also engender, but that which is begotten of them is neither male nor female, neither can it engender any more, that it may not proceed in infinitum, like a Mouse engendered by copulation. But concerning the beginning of their wilde Field-mice, and ther encreafe, Aristotle speaketh in this manner: We have received (faith he) the wonderful generation of wilde Field-mice, abounding in every place, and especially in corn-fields, which by their multitude, do infantly eat up and devour a great deal of grain, inomuch as it hath been seen, that divers poor Husbandmen, which have determined to day, to reap their corn on the morrow, in the mean season it was so destroyed by Mice, that when the Reapers came in the morning, they have found no corn at all.

And as the encrease of these Mice was extraordinary, so also was the destruction, for men could not drive them away, as in former times, by smoking them, or else by turning in Swine to root out their nests from the earth, or by sending Foxes, or wilde Cats among them, but their multitude did always prevail; and yet after a few days, the flowers of the clouds destroyed them. And Pliny faith, that this ought to be no marvel, that there should be so great a harvest and store of these Mice, seeing that men yet never knew how to hinder their generation, or to kill them, being engendered, and yet for all that they are seldom found in the Winter time either alive or dead. And faith, that we have entered into the mention of the damage of these wilde Field mice, it is profitable to let down some storied out of Authors, recording the place and persons, whom they have very much annoyed.

Pliny writeth, as we have sheweth in our former discourse, that the Inhabitants of Troas, were driven from their habitation by these Field-mice; because they devoured all their fruits, and when they dyed, there was a worm engendered in their heads. Diodorus Siculus in his fourth Book of ancient Monuments recordeth, that there were certain people of Italy, which by incursion of Field-
Field-mice were driven to flight and to forsake their patrimony, for they destroyed the roots of the corn, like some horrible drought, or some unrefractive cold frost. Celsa a Town of Umbria, in the days of Pliny, which at this day is called Orbis teum, was destroyed by Field-mice, (as Volaterranus writeth.) Nepos also faith, that he saw in one night, all the Corn-fields at Caetulum destroyed by the Mice.

There are such a number of thefe Mice in Spain, that many times their destruction caused pestilential diseases, and this thing happened amongst the Romans when they were in Cametria, for they were constrained to hire men by stipends to kill the Mice; and those which did kill them, scarce escaped with life. The Inhabitants of Cyamus, an Island of the Cyclades, after they had long resisted the violence of these Mice, yet at length they were fain to yield unto them, and forsake their Territory; and the Mice after their departure, through hunger did gnaw the Iron. We have shewed already how the Phoibistae were punished with Mice, before they fent away the Ark of the Lord, and how the Aeolians and Trojan, were annoyed with them, until they had sacrificed to Apollo Sminthius, and how the Mice of Heraclia, at the time of Grape-gathering, do go out of the Country and return again in the Autumn. When Senecacharib, King of the Arabians and Egyptians, invaded Egypt, it is said by Herodotus, that Vulcan in the night time fent upon his Army such an innumerable swarm of wide Mice, that before morning they had eaten a fburd of their Quivers, Arrows, Bows, and all warlike instruments, and therefore the next day, for the want of weapons, and fear of their enemies, they were constrained to take their heels and run away. And to conclude, by the fame means the Chaldeiensians were driven out of Elymum, a City of the Mountain Atlas; and thus much shall suffice for the harm of these Mice. They make their dwellings and habitation in the earth, according to this saying of Virgil:

Sapere aude quicquid parvo,
Sub terra pisalis; domos, aegyptiorum, focras fercit.

Yet now and then they come out of the earth, although it be but seldom. They heave up hills like Mole's, and they eat and devour the roots of corn and herbs. They make not very deep holes, but dig under the turfs and upper face of the earth; so that when a man walketh upon it, he may perceive it by the sinking in of his foot. Repifi the hole be opened with a Spade, they close it again as a Mole doth, but not so speedily, for they defer it two or three days together; and therefore if it be watched, they may kill her at her return by treading upon her; concerning the manner of taking them, those obervations following may be put in practice.

Their kind of Mice are driven or chased away with the ashes of a Weefil, or of a Cat mingled with water, and by sprinkling or scattering seed or corn abroad, or by some things well fodd'en in water; but the poyoning of these Mice is in the scent or favour of bread: and therefore they think it more profitable to touch the seed or corn lightly with the gall of an Ox. Apuleius doth affirm, that to foake the grain or corn in the gall of an Ox before you sprinkle it abroad, is very good against these Field-mice: also (as it is read in Geopon Grec.) it doth very much commend the gall of Oxen, whereas with him, if the seed or corn be touched, they shall be freed from the molestation or trouble of these Field-mice.

Notwithstanding in the Dog-days Hemlock-feed with the herb Heliebore is better, or with wild Cowcumber, or with Hen-bane, or being beaten with bitter Almonds, and Bears-foot, and to mingle with them just as much meal or corn, and beat and fmod them in Oyl, and when you have so done, put it into the hollow places of these Field-mice: and they will die asfoon as ever they shall taft of it. Aselin doth affirm also, that Hen-bane-feed doth kill these kinds of Mice, without the mixture of any other thing. Very many do ftop the paffages of them with the leaves of Rhododaphne, who do perifh in the time they are labouring to make their paffage, by the gnawing of them.

Apuleius also faith, that the people of Bitinava have had much experience of these things, who ftopped the paffages of these Mice with these Rhododaphne leaves, that so they defire to come forth by touching the fame often with their teeth: which truly fo soon as they shall touch or come unto, they shall presently die. But they use a kind of incantation which is this that followeth: I do adjure all ye Mice, which do remain or abide here, that ye do not offer me wrong, or fuffer me to be wronged of any other. For I do affign and appoint you this field (then he nameth the field) in which I should purprize you hereafter, I call Luna to witnefs, I will tear every one of you into feven pieces: When as thou haft writ this charm, bind paper falt to the place wherein the Mice haunt, and that before the rising of the Sun: so that the characters or marks may appear upon the outfive eaving to a natural hone of that place. I have written this (faith the Author) left any thing shou'd seem to be overskipped: neither do I allow or prove fhuch things can be done, but I rather counsel all men that they do not let their minde to any of these, which are more worthy of derifion then imitation. If thou fhal'l fill the paffages of thefe rufcical and Field-mice with the allies of an Oak, he shall be poffefled with a fervent defire to it, often touching it, and fo shall die.

Thfe Country Mice, that is to fay, thofe Mice which are found in the fields, being bruised and burned to ashes, and mingled with fresh Hony, doth comfort or reftrine the fight of the eyes by diminishing the darkefs of the eyes thereof; in what field forever you shall finde any thing, dig them up by the roots with a little flake or poll.
Of the **Wood-mouse**.

P**liny** doth oftentimes make mention of this Wood-mouse, or rather a Mouse belonging to the Wood, but he doth it only in medicines; but that it doth differ from this Country or Field-mouse we have have shewn in the chapter going before, because it doth not inhabit or dwell in the Countries or tilled places, as the Country or Field-mice do, but doth inhabit in Woods and Forrests. The Wood-mouse is called in Greek as the Country-mouse: but I think it to be a kind of Dormouse, which proceedeth from the kind of Wood-mouse. **Pliny** truly doth make the same remedy or medicines of a Dormouse, as he doth of a Wood-mouse, as I will a little after rehearse or recite unto you. Also I should have thought that a Sorex had been the same; because it is a Wood-mouse, but that, that one place of **Pliny** did hinder me, where he commendeth the ashes of a Wood-mouse to be very good for the cleansin of the eyes, and by and by after he declareth that the ashes of the Sorex were good also in the same use, as I will recite or rehearse below in the medicines or remedies of the Wood-mouse. **Agricola**, a man of great learning, doth interpret or judge the Wood-mouse to be that Mouse, to which they do appoint the name derived from **Aquilia**: but he doth account that to be the Sorex, which I will shew or declare beneath to the Slew. I do understand that there are properly two kinds of the Wood-mouse spoken of before. The one of them that which **Albertus** doth write, saying that there is a certain kind of Mouse which doth build or make her habitation in trees, and of a brown or swart colour, and having also black spots in her face, which only is called by the universal name of a Wood-mouse. Of the same kind **Pliny** doth mean, (if I be not deceived) when he writeth, that the malt of a Beech-tree is very acceptable to Mice, and therefore they have good lucceis with their young ones. The other which is peculiarly named the Sorex, which (faith **Pliny**) doth sleep all the Winter time, and hath a tail full of hair: whole shape or form we propone and set evidently before you. But that I may more distinctly handle those things which **Pliny** hath shewn us concerning the Wood-mouse; I will write her down separately, or by it itself, and afterwards concerning the Moule which hath her name derived from Fil-birds, which the Germans have left in writing, and which I myself have confidered or observed; and I oft of all I will write concerning the Sorex peculiarly and severally from the Ancient Writers.

The ashes of a Wood-mouse being mingled with Hony, doth cure all fractures of bones, the brains also spread upon a little piece of cloth; and covered with wool is good also; but you must now and then spread it over the wound, and it doth almost make it whole and strong within the space of three or four days: neither must you mingle the ashes of the Wood-mouse with Hony too late: Hony also being mingled with the ashes of Earth-worms, doth draw forth broken bones. Also the fat of these Beasts, being put to Kibes is very good; but if the Ulcers are corrupt and rotten, by adding Wax to the former things doth bring them to cicatrizing. The Oyl of a burned Locust is also very good; and also the Oyl of a Wood-mouse with Hony, is as effectual as the other. They say also that the heads and tails of Mice mixed with the ashes of them, and anointed with Hony, doth restore the clearnes of the sight, but more effectually being mingled with the ashes of a Dormouse or a Wood-mouse.

The medicines of the Wood-mouse, **Pliny**.

Of the **Nun-mouse**, Hafel-mouse, or Filbird mouse.

This Beast is a kind of Sorex, and may be that which the Germans name Ein grofs Hafelmouse, a great Hafel-mouse, so called because they feed upon Hafel-nuts, and Filbirds. The Flemings call it Ein Slipfair, that is, a sleeping Rat; and therefore the French call it by the name Le fil, where by also we have shewed already; they understand a Dormouse.
The History of Four-footed Beasts.

For this sleepeoth like that, and yet the flesh thereof is not good to be eaten. The colour of this Moufe is red like the Hafel, and the quantity full as great as a Squirrel, or as a great Rat: upon the back and sides it is more like a Moufe, and upon the head more red. His ears very great, and pilled without hair. The belly white, if also are his legs. The neathermost of his tail towards the tip white. His nothris and feet reddith. The tail wholly rough, but must at the end with white hairs.

The eyes very great hanging out of his head, and all black, so that there is not in them any appearance of white. The beard partly white, and partly black, both above and beneath his ears, and about his eyes, and the upper part of his tail next his body all black. Upon his forefeet he hath four claws or dindell toes, for he wanteth a thumb. But upon his hinder-feet he hath five. I mean upon each severally. The outside of his hinder-feet, from the bending to the tip of his nails is altogether bald without hair. And the favour of all this kindes is the smell of the vulgar Mice. They live not only in the earth, but also in trees which they clime like Squirrels, and therefore make provision of nuts and meat against the Winter, which they lodge in the earth.

The Countreymen finding in the Summer their caves and dens, do wisely forbear to destroy them, knowing that they will bring into them the bell Nuts and Fil-birds can be gotten, and therefore at one side they flock up a certain long rod, by direction whereof in the Winter time they come and dig out the den, justly taking from them both their life and store, because they have unjujustly gathered it together: Some have eaten it, but they were deceived, taking it for the Dormoufe.

Of the LASCITT MOUSE.

This Moufe is called by the Germans, Lajfitt, and also Harnebul, because of the similitude it holdeth with the Ermetine Weefil. The skin of it is very precious, being shorter then the Ermetine two fingers breadth. And forasmuch as else, there is no difference between the Lajfitt Moufe, and the Lajfitt Weefil, except in the quantity: My opinion is, that they are all one, and differ only in age.

And I am rather led to affirm thus much, because there are skins annually brought to the Mart of Frankford, out of Polonia (call'd Lajfitt) which are no other then the Weefils of Novo grodela, whole white skins are intermixed with griffeld; And thus much shall suffice to have said of this Moufe.

Of the SOREX.

I am of opinion, that this kindes of Moufe belongeth to the Hafel Moufe before spoken of, because it is wilder, hath a hairy tail, and sleepeoth in the Winter, all which things are by Pliny ascribed to the Sores; only this hindereth, that he maketh the Sorex to have rough hairy ears, and the Sorex of Germany hath bald ears. For answer whereof this shall suffice, that the other three notes being so great and pregnant, there is no cause why the want of one, and that so little as the hairs on the ears, should deprive of it his natural due and kinde. The Italian and the French use this word Sorex, for a domestical vulgar Moufe, and so peradventure did the Antients before them; but it is greater then the domestical Moufe, although Plinys Sorex be neither greater nor leffer. The Spaniards call a Sorex, Sorace, or Ratn Pequeno. The Illyrians, Viennicae Myfis, by which word also they understand a Shrew-moufe. The fibres of the intrails of the Sorex do encrease and decrease with the Moon, so that the number of them, do always answer the number of the days of her age.

Her ears as we have said are full of hairs, but in the lowest part or tip thereof. The reason of her name is taken from the skreeching voice the maketh in gnawing. For it is a very harmful biting Beast, cutting afunder with her teeth like a saw. Some do derive the Greek word from Harus, which anciently did signifie a Moufe, and therefore they call this Syraex, and Savrext, but I lift not to stand any longer upon the name, seeing the Beaf it self affordeth little worthy matter to entreat of.

It is reported by Varro, that in Arcadia there was a Hog so fat, that a Sorex did eat into her flesh, and made her nelt and brought forth young ones therein, which may very well be; for such is the nature of a fat Swine, that he will hardly rife to eat his meat, or sale himself of his excrescens: And besides, fatnes foppeth sene, burying both the Nerves and Arteries very deep: so that in the body of a man, his fattest part is least sensible. Lyscin the Emperor going about to restraine the inoficiency of the Eunuches and Courtiers, called them Tainen, Sorksefs, Palatins, that is moths and Sorices of the Court.

There was an ancient garment (as Pliny writeth) called Vefis Sortulata, and this was very preci- ous in my opinion, because it was garded or fringed with the skins of the Sorex. If this Beaff fall into any Wine or Oyl, the corrupteth the fame; and it is to be recovered by the same means, as we have formerly described in the vulgar Moufe. It should seem there was great force of
Of the Indian Mouse.

of them in the days of Hetcagabalus, for he commanded (as Lampridius writeth) to be brought unto him, not only a thousand of these Beasts, but also a thousand Weebs, and ten thousand vulgar Mice, as we have shewed before in the story of the vulgar Mouse.

When the Sooth-layers were about their divinations, Pliny writeth, that if they heard the squeaking of the Sorex, they brake off, and gave over their labour, holding it unprofitable to go any further therein: and it is also reported, that the voice of this Mouse gave occasion to Fabius Maximus, to give over his Dictatorship, and unto Caius Flaminius, to give over the Mastership of the Horlemen, such fear of silly Beasts, was begotten in the minds of gallant and magnanimous spirits, by the unprofitable and foolish behaviour and doctrines of the Magicians.

It is said by Nigidius, that these Sorics do sleep all the Winter and hide themselves like the Dormice. They also when they eat any corn, do screech and make a greater noise then other Mice, whereby they bewray themselves in the dark unto their enemies, and are killed, which was the occasion of that proverbial speech of Parmera in Terence, Ego mel indico miser, quasi Sorex territ. Saint Aufrine, and Saint Origin, do also make use of this proverb, the one in his Book of Order, the other in a Homily upon Genesis, which caused Erasius to write in this manner, Sed video ipse mei indicius capuni, that is, I have overthrown my self with my own tale. These Sorics do make hollow the trees wherein Emets or Ants breed, and there is perpetual hatred betwixt the Bittors, and them, one lying in wait to destroy the others young.

The Medicines of the Sorex.

Serenus and Pliny say, that if a woman with child do eat the finews of a Sorex, if her eyes be black, so shall the Infant be likewise;

Si praegnan.tarum captivi Soricheredit,
Dicatur fatus nigrarum lumina fingi.

The fat of these Beasts or of Dormice, is very profitable against the Palsey. The powder of the heads and tails anointed with Hony upon the eyes, refeth the clearness of sight, and with Hony at the tick, the powder and fat of a Sorex burneth, helpeth running eyes; and the same powder mingled with Oyl, cures both bunches in the eye.

There is another Mouse called by Muscaebolu, Mus Napelli, that is, a Wolf-bane-mouse: so called, because it feeddeth upon the roots of that Herb; although there be some of opinion, that it is not a creature, but another little Herb growing near unto it for a counter-poyson.

And Marcellus also maketh mention of Nafellus, and Antinellus, whereunto I should easily condescend, but that the eyecatch of Muscaebolu leadeth me to the contrary. For he writeth that he took one of them in the top of a high Mountain in Italy. And Sylvianus calleth this mouse Mus Siring, or Sucefimus, and calleth it a Counter-poyson to Wolf-bane, and that God might shew thus much unto men, he calleth it to live upon the roots of this natural vertue destroying poyson and venemous herbs.

The Indian Mouse, and divers other kinds of Mice, according to their Countries.

I do finde that divers times Mice do take their names from Regions wherein they inhabite, which happeneth two manner of ways: one, because the form of their bodies will somewhat vary: the other, because not only in shape, but also in wit they have some things in them common to Mice, over and above the Mice of our Countries; therefore we will briefly comprehend all their furnames of whatsoever regions they are in one order or Alphabet. In the Oriental parts of the world, there are great Mice, (as Alexander writeth) of the quantity of Foxes who do harm both men and Beasts, and although they cannot by their biting kill any man, yet do they much grieve and molest them.

American Vespucius writeth that he found in an Island of the Sea being distant from Ulbanda a thousand leagues, very great Mice. The hair of the Egyptian Mice is very hard, and for the most part like a Hedge-hogs: and there are also some which walk bolt upright upon two feet, for they have the hinder-legs longer, and their fore-legs shorter, their procreation is also manifold; and they do likewise sit upon their buttocks, and they use their fore-feet as hands. But Herodotus affirmeth these Mice to be of Africa, and not of Egypt; amongst the African or Carthaginian patures (faith he) in Africa towards the Orient, there are three kinds of Mice, of which some are called Bipodal or two-footed, some in the Carthaginian language Zetes, which is as much in our language as hills, some Hedge-hogs.

There are more kinds of Mice in the Cyrenaic region: some which have broad fore-heads, some sharp, some which have prickings hair in the manner of Hedge-hogs. It is reported that in Cyrene there are divers kinds of Mice both in colour and shape, and that some of them have as broad a countenance as a Cat; some have sharp bristles, and bear the form and countenance of a Viper, which the Inhabitants call Escherete, but improperly, as it appeareth by the words of Aristote in his book of Wonders.

O o 3

Herodotus
There are also some Mice in Egypt, which do violently rush upon pastures and corn: of which things Elianus speaketh, saying in this manner; When it beginneth first to rain in Egypt, the Mice are wont to be born in very small bubbles, which wandering far and near through all the fields, do affect the corn with great calamity, by gnawing and cutting afunder with their teeth the blades thereof, and waiting the heaps of that which is made in bundles, do bring great pains and losses unto the Egyptians: by which it comes to pass, that they endure all manner of ways to make snares for them, by setting of Mice-traps, and to repel them from their inclosures, and by ditches, and burning fires to drive them quite away: but the Mice as they will not come unto the traps, for as much as they are apt to leap, they both go over the hedges, and leap over the ditches. But the Egyptians being frustrated of all hope by their labours, all subtil inventions and policies, being left as it were of no efficacy, they betake themselves humbly to pray to their Gods to remove that calamity from them. Whereat the Mice by some fear of a divine anger, even as it were in battle array of observing a squadron order, do depart into a certain Mountain: The leaf of all these in age do stand in the first order, but the greatest and eldest do lead the last troops, compelling those which are weary to follow them.

But if in their journey the least or youngest do chance through travaile to wax weary, all those which follow (as the manner is in Wars) do likewise stand still, and when the first begin to go forward, the rest do continually follow them. It is also reported, that the Mice which inhabit the Sea, do observe the same order and custom.

The African Mice do usually die as soon as ever they take any drink: but thistis commonly proper unto all Mice, (as Ephesius affirmeth) where it is written above concerning the poisoning of Mice. Mice, (but especially those of Africa) having their skins pulled off, boiled with Oil and Salt, and then taken in meat, doth very effectually cure those which are troubled with any pains or diseases in the lungs or lights. The same doth also easily help those which are molested with corrupt and bloody spettings with retchings.

The kindes of African Mice are divers; some are too footed; some have hair like unto Hedgehogs: some faces of the breadth of a Weesil: but some call these Mice Cirematian: some Egyptian, as I have before declared. In Arabia there are certain Mice much bigger then Dorsmice, whose former legs are of the quantity of a hand breadth, and the hinder of the quantity of the joynct to the end of the finger: I do understand them to be so short, that nothing thereof may seem to appear without the body, except the space of the joints of the finger, as it is in Martines.

The Armenian Mice.

It is said, that the garments of the Armenians are usally woven with Mice which are bred in the same Countrey, or diversely decked with the shape of the same creature. The Author writeth, that Pliny maketh mention of the Armenian Moule, but I have read no such thing: therefore he doth per chance take the Armenian Moule for the Shrew. In Cappadocia there is a kind of Moule which some call a Squirrel. Elianus writing of the Caspian Moule, Amyntas (faith he) in his Book entituled De Meteorologius, which he doth so inscribe, faith that in Caspia, there do come an infinite multitude of Mice, which without any fear do swim in the floods, which have great and violent currents, and holding one another by their tails in their mouths, (as it is likewise reported of Wolves) have a sure and stable passage over the water.
Of the Musk-cat.

This Beasts name is derived from the Hebrew word Bofem, which signifies fweet odour: for the Germans call the same Bijem, and the Beast it self Bifembier. And the Graecians derive their Muskis of Meo and ozo, to seek, and to smell, and of Meo Muslhabis, to proceed out of their middle: because the true fligtor cometh out of the navel, as we shall shew: but I rather think they derive it from the Arabian words Meib, and Meib, and Almeib. The Italians, French, and Spaniards use Mus and Mufchi, which is derived from the later Latins; and beside the Italians call it Caprido del Musco; and the French, Chevreul du musclfe: the Musk is felf is called in Italy, Mufchi, of the Latins, Mufhum, and Mufcutum: the Thibrians, Palm; and the Germans, Bijem. The Arabians were the first that wrote any discovery of this Beast, and therefore it ought not to feeme strange, that all the Graecians and Latins derive the name from them. And although there be an unconceivable difference among Writers: about this matter; yet it is certain, that they are nece- ssarily to the truth, that make it a kind of Roe: for the figure, colour, nature, and horns, feem to admit no other similitude, except the teeth which are like a Dogs, whereas two are like a Boars teeth, very white and straight: And there be some (as Simeon Sethi, and Actius), which say he hath also one horn, but herein is a manifest er- or, because no man that ever saw one of these Beasts doth so much as make mention thereof; and therefore the original of this error came from the words of Avien, who writeth that his teeth bend inward like two horns. Cardan writeth, that he saw one of these dead at Millian, which in greatnefs, fmell, and hair reembled a Roe, except that the hair was more thick, and the colour more gray. Now the variety of the hair may arise from the Region wherein it was bred. It hath two teeth above, and two beneath, not differing absolutely from a Roe in any thing, except in the favour. It is called Musellz, they are leffer, thinner, and more elegant creatures than the Roes are. Paulus Venetus writeth thus of this Beast. The creature out of whom the Musk is gathered, is about the bignes of a Cat, (he should fay a Roe) having gros thick hair like a Hart, and hoofs upon his feet.
The History of Four-footed Beasts.

is found in the province of Cathay, and the Kingdom of Gurgeth, which is subject to the great King of Tartars.

Likewise there was a most odorous Musk-cat at Venice, which a Merchant there had to be seen, brought as he paid out of Cathay, and for proof whereof he shewed the way that he went, namely through the Euxine Sea, Cilicia, Iberia, and Albaniua, even to the entrance of Sicilia. For the Country Cathay is a part of Sicilia, beyond Iamus, neither ought this to seem wonderful, for in that place there was a Region, called by Prolemus, Randa marafia, wherein he placeth the eleventh Table of Asia. This Region is watered by the River Savr, and therein aboundeth Spikenard, and the Inhabitants call the Country wherein the bell Musk-cats are bred, Ergynul, and the greatest City of that Country Singu. The same Author writeth also, that Musk-cats are brought out of Egypt, and out of many places of Africa. In Tiberius also there are many Cities, and Beasts about those Cities called Gadery, which do bring forth the Musk, and the Inhabitants hunt them with Dogs. The Province of Cenciolue, doth also yield many of these Beasts, and likewise Syria. S. Jeron also writeth thus: Muscus & Oemanta, & pergerius muris pellicula, by which skin of the strange Mouse, he meaneth the little bag, or skin wherein the Musk of the Musk-cat is included. The Princes of Europe do nourish these tame, being brought out of the New-found World, and many other rich men especially in Italy, be delighted with the odorous favour which cometh from it. Bravissimus faith, that he saw a Merchant offer one of these to be sold unto Alphonse Duke of Ferrara, which had the Navel full of Musk. And Catherinibus Lenzus, an ancient Nobleman of Venice, had a Roe of this kinde, which he left after his death unto his heirs; and by this it doth plainly appear, that the Musk-cat is neither like a Cat, nor a Mouse, and that all those which have affirmed so much thereof, have been deceived of their own conjectural derivation of Musk or Muscus, or by the error of some Writer of the ancient Books, which instead of Magnificus Caprios a Roe, have inserted Catti, a Cat. And thus much shall suffice for the description of this Beast, and for the Regions where it is bred, except I may add the Relation of Ludovicus Romanus, who affirmeth, that the Musk-cats of Gallocat are brought out of the Country Pegus. These Bees of the New-foundland are wonderful nimble and quick, and so swift, that they are seldom taken alive; but after they are taken, by pulling out their longer teeth they wax tame. When they are prosecuted with the Hunters, and with Dogs, they defend themselves with their teeth. In some places they take them in snares, and in ditches, also kill them with darts; and so having killed them, they cut off the little bag wherein the Musk groweth, for that Musk doth exceed in sweetnefs of odor all things that were ever made by the art of man, and therefore the use of it is more plentiful then of any other thing, for they carry it about in Garments.

The place where the Musk groweth.

The natural expression of Musk.

The place where the Musk groweth, and the use thereof.

Bals of it, and include it in Gold or Silver, carrying it about, either to be seen, or because they are delicate and wanton; or to shew their riches and abundance; or to preserve themselves from putrid and flaming airs; or else against cold and moist diseases of the brain. With this the luxurious women perfume themselves, to entrap the love of their Wouers: For as the thing itself is a vice or flickness of the Beasts; so also by men it is used to vice and wickednefs; and the Venetian Matrons will never use it, and he that beareth it about him shall never perceive it himself.

Thus we have shewed already, that it groweth in the navel, or in a little bag near unto it; and it is true by Gymnula and Variorum, that when the Beasts beginneth to be lively, and prone to the rage of enery and carnal copulation, then the blood floweth to the navel, and there putteth the Beasts to pain, because it fwelleth above measure. The Beast then abateth from all meat and drink, and rowleth himfelf upon the ground, and so by the weight of his body presseth forth the humor that troubled him, which after a certain time doth coagulate and congeal together, and then rendereth such an acceptable favour, as you fee it hath. The relation whereof you shall hear out of the words of Serapion. The wilde Bees (f王先生 he) which wander to and fro in the Mountains freely, without the government of man, have in a little bag, certain putrid matter or blood, which of it self groweth to beripe, whereunto when it is come, the Beast itcheth, and is pained as it were with launcing, therefore he rubbeth himself upon thone, rocks, and trees, a great while together, for it delighteth him, whereby the thones grow white through his rubbing, and therefore in time he weareth the bag afunder, making issue unto it for the corruptible matter to come forth, which presently runneth out upon the fores, no otherwife then if it had been lanced. Then the wound groweth to be whole again, and the Beast departeth, until the like exccssne of blood come into the same place again. For every year this happeneth them.

The inhabitants of the Country know all the Hunters of these wilde Beasts, and therefore note them where they empty their bellies. For the humor so presseth out as before is declared, through the heat of the Sun congealeth and dryeth upon the thone, growing more commendable and pleasant through the Sun heat; Then come the Inhabitants, and in little bottles made of the skins of these Beasts, which before they have killed, and fo put the musk into them.

This they fell for a great price, because it is thought, (and that worthy) to be a gift fit for a King. But if this Musk be taken out of the creature by violence, then will he bring forth no more; yet expres it by his own natural art he beareth again and again. The greatest cause of this humor is the sweetnefs of his food, and the air wherein they are bred; therefore if one of them be brought into this part of the world, with Musk in his cod, it will grow to ripeness in a temperate climate.
Of the Musk-cat.

The best musk declared by thefe several Countries.

The prettiness of this thing deverveth a further treatife, for thy better direction and instruction of the knowledge hereof, both for the chofe of that which is bell, and for the avoiding and putting away of that which is adulterate. At Venice at this day it is fold in the cods, and the Indian Musk is better then the African. The brown is always better then the black, except it be of Catha; for that of Catha is black, and bell of all. There is fome that is yellowish, or betwixt red and yellow, after the very fame colour of Spikenard; this alfo is of the bell fort, because the Beauf that render it do feed upon Spikenard.

Therefore this is good to be choene, because it cannot be adulterated, and besides the tall of it is bitter, and affiaion as ever it is taile, it prefently ascendeth to the brain, where it remaineth very fragrant without refiulfance, and is not eafily diflolved. It is not bright within, but muddy, having broad grains, and equal throughout, like the wood of Builm. But according to the Regions, they chufe Musk in this fort.

Of the Indian Musk that of the Region of Sceni (called Antemnon.) they fet in the firft place, and next unto it, the Beaufs of the Sea live; The Musk of Cubit is known by the thin bladder of the Beauf wherein it is contain; but that of Gergeri, is lefs Aromatical, and more thick. The Musk of Capr is in the middle place between both, wherewithal they mingle powder of Gold and Silver, to encreafe the weight. The Musk of Salmundry is word of all, because it is taken out of his bladder or cod, and put into a glass. There are fome which prefer the Tumbafine Musk, and they fay, that the odor thereof comes from the sweet herbs whereupon the Beauf feedeth, and the like is laid of the Region of Sceni; but the odor is not equal to the other. And the Tumbafines do not gather the Musk after the fashions of others: for they draw not forth this matter out of the cod, nor yet gather it in calm weather. The Chymists, they pref forth the matter out of the ventercle, and when they have it forth, mingle it with other things, and that in cloudy and tempeftuous weather; afterwards they put them up in glaifes, and stop the mouth clofe, and fo they fend it to be fold unto the Sarizones, and to Amamau, and to Taffis, and to Habaray, as if he were a Tumbafine. When this Beauf goeth forth from the Sea, and feedeth toward the Defert, upon Spikenard, then is his Musk sweeter, but when they feed neer the Sea, it is not fo fragrant, because they feed upon Myrrh. Achilles faith, there is fome kinds of Musk like a Citron, but fuch hath not been feen in this part of the world, for our Musk is most commonly like the colour of Iron, and the favour of it like a Cyprine Apple, but stronger; and confifteth of little pieces, but it is better that hangeth together, and hath a favour of the Wildernefs: but if it be adulterated with Snakes or Birds-dung, then will it be lefer pleafant in the favour, and alfo pinch and offend the nofe.

The Hunters of Telyem, and Seni, as we have fhewed already, do kill their sweet Roe, and afterfe takes out from them their bladder of Musk, which Musk being exceped before it be ripe, ftelth strongly and unpleafantly. And then they hang it up a little while in the open and free air, wherein it ripeneth as it were by conceotion in the Sun, and thereby receiveth an admirable sweetnefs. And the like do divers Gardners use towards Apples, and fruits of trees which are gathered before they ripen. For by laying them up in a dry place, they wear away their sharpnes and become pleafant. But it is to be remembered, that Musk is the bell which doth ripen in its own cod, before it be taken out of the Beauf, for before it is ripe, it ftelth displeafantly.

There is not much perfect Musk brought into this part of the World, but the frengthen of it cometh from the vertue of the cod wherein it is put, and fo it is brought to us; but the bell is brought out of the Erit, where growh Spikenard and sweet herbs. Rodericus Luffitani faith, that our Musk is compounded of divers things, the ground whereof is the blood of a little Beauf like a Cony, which is brought out of Pegna Province of India. But the means whereby to try it may be this, after it is waigned, they put it into fome moift or wet powder, and after a little while they weigh it the fefcond time, and if it exceed the former waight, then do they take it for found, perfecft, and good, but if it do not exceed, then do they judge it adulterate.

Some Merchants when they do buy Musk flippit to their nofes, and holding their breath run Simien Parli, half a ftraw: call, afterdafts they pull it from their nofes, and if they perceive the favour of the Musk, Sylvain then do they buy it, and take it for good, but if not, they refufe it for corrupted. In fome Churches they make perfumes with Musk, and by mingling Stixas, Aloes, Amber, and juice of Roles, they make a perfume called Regia, which is the Kings perfume; likewise unto fweet waters, drawn out of the furnaces of Chymists, whereunto they add fimple Rose Water, and for this reaion certain fort of people Musk and Camphory.

Andreas Furtinarius, in his Ebrech Book of adorniing mans nature, teacheth a compofition to be made of certain Oyls, Sone, and Musk; and alfo Ointments and musked Oyls. He alfo teache how to make little round Balls of Musk, and other confecions, and, afterwards to draw a thread through the middle of them, and fo wear them about ones neck.

Some put it into Silken wool, through which they firft draw a thread, and fo diflolve it in Rose-water, afterward make it up in medicines, and ufe it as aforefaide. It may be preferved in a veffel of Lead.
The History of Four-footed Beasts.

Lead, close it stopped a long time, for the lead which is cold and moist, agree well with the nature of the Musk, and therefore it a leaden vessel being wanting, so as ye be forced to use glasses and Silver, then must you put two or three pieces of lead into it, for the better preservation, and covering the passage all over with Wax, and above all things you must avoid all kinds of Spices, taking heed that no grain thereof come into it. If while it is in the vessel it lose the favour and be dead, then it is to be recovered by opening the mouth of the Vial, and hanging it over a privy; for when the flink and evil favour cometh unto it, Contra faturam eluderit, & quasi ludendo reviviscit, it reviveth against the filthy flink, and as it were revived in that conception, faith Fidusius, Albuerus, and Petruatus.

But concerning the adulterating of Musk, I will say more in this place. First of all, the Mountebanks do corrupt it by mingling with it the liver of a Calf. Also by a root called Makir, and an herb called Saltex. Many times the dung of Mice is sold for Musk, and so great is the deceit herein, that a man may not truss the outward shape of an entire cod, for there be Impostors which can counterfeit them, and make them in all parts for the outward appearance, and fill them with certain stuffe, interposing some little true Musk among it until it have a reasonable favour, and therewithal deceive simple people.

It is also adulterated by mingling with it a little Goats blood dried, or brown Bread dried, so that three or four parts of these, will receive feaonable taint from one part of the Musk. It is also adulterated in the skin by putting pieces of the skin into it, and it may be known from the true Musk, because it will weigh twice as heavy. The Sarazen uses this shift above all others, and there is one principal way of making counterfeit Musk, which is this; they take Nutmegs, Mace, Cinnamon, Cloves, Gilly-flowers, and Spikenard, of every one a handful, all these being beat diligently together, and dried and sifted, they are mingled with the warm blood of a Dove, and afterwards dried in the Sun, then are they seven times sprinkled over, or moistened with the water of Musk-roes, and by twixt every sprinkling they are dried; at length they mingle therewithall a third or fourth part of true Musk, and then sprinkle it over again with Musk-rofe water, so divide it into three or four lumps, and take the white hairs from under the tail of a Roe or Kid, and do put it in a vessel of glasses.

Benyvine, white Wax taken out of a new Hive of Bees, the rotten part of Eve-tree, and a little Musk, are mingled all together to make a counterfeit Amber, for it will smell like Civet, or Musk, or else Strax, and the powder of Lignum aloes, with Civet, and Rose-water; but the fraud in one and other is easily depredated, for both the odor and the colour are different from the true Amber, and also it will sooner waxed in water, then that which is natural.

Some do corrupt their Musk with the feed of Angelica, or rather with the root of it, because the root fenneth sweeter like Musk, but the coenzyme may be easily discovered, by putting it into water: for the Angelica will sink, and the Musk will swim. The true Musk is fold for forty millions an ounce at the leaf. It is also observed by Arnoldus Villanovanus, that in the presence of Alfa fistida or Caffireum, the bell Musk will have a horrible and intolerable favour, although they touch not one another, which cannot be ascribed to any known reason, but to some secret in nature. The sweetnefs of the Arabian Musk is described by Alesius in this verce;

Et celebris sauci est unguine Muscum Arabum.

There be divers herbs which smell sweeter like Musk: as Angelica, Dorris, Musk-gilliflowers, Musk-grapes, the leaves of a Winter Cherry, and an herb growing near Basul without a name, like wilde Parley, the Damasfine-roe, and many other. Wilde Cats and Martins do also render an exceent much like Musk; and there are Hares called Mofchite, which leave fuch an intolerable smell in the impreffion of their foot-steps, that the Dogs by touching them grow mad, as we have flewed in the story of the Hare: And thus much for the description of this Beast; now followeth the medicines.

The Medicines of the Musk-cat.

A very little part or quantity of a Musk-cat is of great vertue and efficacity; wherefore it is very sparsely used in medicines or potions, neither is there any part thereof beaten or bruised, as it is of all other Beasts; but it is melted and dissolved in water which proceedeth from the sweeted Rofes. It is also a Beast which is very hot and dry, but rather more dry then hot, yet not withstanding the fame his heat is affwaged and allayed by no other thing but only the Gum called Campfire; and his drinfe is only moistened or mollified with Oyls, and very sweet, as Oyl of Viblet; and Oyl of Rofes. Amongst sweet finnes and favours, the principall and chiefest laud and commendation is attributed unto the smell which proceedeth from the Musk-cat: For he doth not only with his odorous and delightful favour pleaseth and contenteth the fcent of men, but also doth strengthen the spirits, and all the parts of mans body, yea and that in a moment, for the flendernefs of his parts, which although it doth forthwith penetrate or enter into the fcent of man, yet doth it endure longer, and is not so speedily or quickly dissolved as the feare or favour of any other sweet smell whatsoever.
A Musk-cat and the herb called Mercury's-fingers or Dog's bane, being given in purging medicines to drink, do greatly renew and refresh the decayed strength or force of those which have been before times weakened with divers and continual medicines in their members. The fame is also very profitable for those which are effeminate or defective, and eclipsed in their mind or courage, as also for those which are weak and feeble in their joyness, not by any hurt, or any other calamity being enfeebled, but being always so even from their childhood. A Musk-cat is an excellent remedy for those which are troubled with fear in their heart; and also for those which do commonly forget whether of any other thing throughout all the parts of their body. The fame is also very profitable and medicinal cure for those which are grievously vexed with any itch or pain in their head, or with any enormity or trouble in their liver, and also being given simply by itself, without any thing mixed in it, or compounded in Wine, very good and wholesome for the healing and curing of those who have any pain or grief in their stomach, which cometh by the occasion of any cold.

A Musk-cat being put unto the body of any man in the form or manner of a plaister, doth confirm and make strong both his heart and all the reit of his bowels, or interior parts; it doth moreover encreafe both strength and power in all his members, yea and in the very bones, the efficacy thereof is of such and power and vertue. The fame being laid or anointed upon the head is very effectual for the expelling or driving away of the rheume which falleth from the head into the nostrils, and by that means procureth heavines in the fame; and for the amending and curing of the swimming diszines or giddines in the head through the abundant humors which remain and stay therein, and also for the bridling and restraining of luft and venery.

The fame being used in the aforesaid manner doth temperate and confirm the brains of any man, besides it caufeth and helpeth those which have pain about their heart, by the which they suppose their very heart to ake. The smell of this Bealt is both profitable and hurtful; for unto those which are cold of constitution, the fcent is very pleafant in regard that it is hot of it fell, and is very delightful in their favours; but unto thofe which are hot of nature it is very noifome, in regard that the heat and strong fcent thereof overcometh their fenfes, and oftentimes caufeth their heads to ake, and be full of pain; and doth alfo fir up in them that peliferous disease called the Falling-ficknes: but unto women which are of a hot and fiery constitution it is more hurtful and noifome, for it breedeth in them a very peliferous disease, which choaketh their Matrice or Womb, and caufeth them oftentimes to fwoond, it is alfo called by fome the Mother. The freenings of a Musk-cat is an excellent remedy againft the refolution of the finews or the Palfe. A Musk-cat is very good and wholesome for the helping and curing of those which are troubled with any deafeines or aflorntment in any part of their bodies; as also for the driving away of melancholy and forrowful affiations out of mens minde, and for the inciting delightful mirth and pleafure in them.

A Musk-cat being mingled with dry plaisters which are used for the healing of the eyes, is an excellent remedie for the expelling and driving away of the white skin which doth ufually cover the fkin, and for the drying up of moist rhuines and humors, which in the night time do fall from the brain and the head, and by that means doth much hurt and damage the fight of the eyes, as alfo for the clarifying and healing up of any pain or diseafe therein.

A Musk-cat is an excellent remedy for thofe which have a defire to vomit and cannot, it doth alfo renew an appetit or rambach in thofe unto their virtuall which do loath and abtain from all futeinance, and doth loofen and diffolve all thick puffings or windines in the interior parts or members of any one.

A Musk-cat being mingled with a caufick medicine, is very profitable and wholesome for the bringing forth of thofe Womens menfes or fluxes which are stopped, and alfo for moving conception in thofe women which are hindered in it by the occa fion of some great cold. A medicine or suppository being made of Ambergreefe, and mingled with a gum comming out of Syria called Strax, and then mixed both together with a Musk-cat and fo beaten, until they come unto a certain falve, and laid unto the secret parts of a woman, is very good for the aforesaid disease. There is a certain juice or moifnes in a Musk-cat which being preffed forth or diffolved, and mixed with the Oyl called Palm Chrifti, and anointed upon the yard of any man, doth fir him up to luft and venery. If the leaft part of a Musk-cat be eaten by any one which is troubled with a finking breath, it will presently expel and take away the think thereof. And thus much shall fuffice concerning the cure and medicines of the Musk-cat.

Of the MULE.

The Mule is a Beaff, called by the Hebrews, Pered, from whence comes the feminine Pirdah of The fefedt.

King 1. and there be fome that fay that the rehnen of the Hebrew word is , from the separa tion and feriality of this Beaff, for it is Pered, quia non parsit. The Chriftian word is Cadama, the Arabi- an, Beaff; but Gen. 36. for the Hebrew word fium, many tranflate Mules. The Arabians, Kegi; but the Gracian Septuagints, Hemonus. The Gracian alfo call a Mule Aftrob, from the firmane of his body. The Latins call a Mule Mulus, and Semifius, that is, half an As, because on the one side he is an Horfe, and on the other side an As, and therefore in his conditions he more resembles

24
an Ass then an Horse, whereupon lyeth this tale. A certain Lydian Mule seeing his Image in the water, grew to be afraid of the greatness thereof, and thereupon took his heels and ran away as fast as he could; neither could he be stayed by all the wit of his Keepers: At length the Mule remembering that he was the son of an Ass, he stayed his course and came back again neighing. The Italians call a Mule Mulo, and the female Mula, like the Latins, and the Spaniards. The French, Mule, and the female Mule, from whence cometh the English word Mule. The Germans, Mulehen, or Malehen. The Illyrians, Malek, and the Flemings, Male.

Divers kindes of Mules.

There is another kind of Mules in Syria, divers from those which are procreated by the copulation of a Mare and an Ass, and they receive their names from the similitude of their faces. For there is no other cause, why wilde Asses should be called Asses, but only their similitude of tame Asses. And as among wilde Asses some of them are singularly swift, so also among these Syrian Mules, there are some excellent speedy Courfers. These Mules procreate in their own kind, and admit no mixture, which Aristotle proved by nine of them which were brought into Phrygia, in the dayes of
Of the Mule.

Pharnaeus, the father of Pharnabazus. Theophrastus also reporteth, that in Cappadocia, the Mules engender among themselves, which A'rfula remembrith in his wonders, and he might well have spared it, for they are a kind of Cattell among themselves. There be flocks of Asfs and Mares in India, where the Mares do willingly admit the Asfs in copulation, and bring forth red Mules, the bift of all other for running.

But among the Indian Phlylians, their Asfs, Mules, Oxen, and Horses, are no bigger then Rams. As the Mule is begotten betwixt an As and a Mare, so the Burdon is begotten betwixt a Horfe, and a Shee-as, wherefore the Indians call him Mule Baffardo, that is, a Baffard Mule. For as the Mule more reclencheth the As then the Horfe, fo the Burdon more reclencheth the Horfe then the As; the reafon is, because all kindes follow the father. The Mule have some parts proper to the As, as long ears, a terrible voice, a crofs upon the shoulders, small feet, a lean body, and in all other things it reclencheth a Horfe. The length of their ears ferveth instead of their fore-top, their colour is somewhat brown, but it varieth; for the Romans Cardinals have Mules of an ash-colour, and those very great ones with long tails.

They change their teeth, and have in number fix and thirty, their neck is like the neck of an Asf, long, but not standing upright, their bellies simple and of one quantity, They want a gall like all four-footed Beasts; and there is a thing in their heart like a bone, as we have shewed before in the story of the As.

They eat fuch food as Horfes and Asfs do; but they grow fat by drinking, yet they drink not like a Horfe, by thrifling in their nofters into the water, but only touch it with their lips.

They love Cucumbers above all other meats, but the flowers and leaves of Rhododaphne are poftion to Mules and Asfs, and to many four-footed Beasts. Both a Mule and a Horfe grow from the birth coming forth of their teeth, (by which their age is discerned) and after all their teeth are come forth, it is hard to know their age. The females in this kind are greater, more lively, and live longer then the males. It hath been found that they have lived to four-score years of age. Such a one was presented at Athens, at what time Pericles builded the Temple of Minerva, where by reason of his age, he was dehifhed from all labour yet afterwards he would not forfake his companions, but went, exhorting them with neighing to undergo the labour cheerfully; whereupon there was a publick decree, that the said Mule should have an ordinary of provender appointed him in Pytium, and that no body should drive him away from their Corn when he eat it, although it were in the Market place.

We have shewed already that this Beast is engendered betwixt an As and a Mare, and therefore if a man would create unto himself a notable breed of Mules, he must look to the choice both of his male and female. First of all for the female, that the be of a great body, of sound bones, and of fingular good shape, wherein he must not so much expect her velocity or aptnes to run, as her strength to endure labour, and especially to bear in her womb a discordant foal, begotten by an As, and to confer upon it both the properties of his body, and the disposition. For when Mares do unwillingly receive the genital seed of the As, the foal doth not grow to perfection in the Mares belly, until the hath been thirteen months, whereby it reclencheth more the left and dull nature of his father, then the vigour of his mother. But for the helping of their copulation, they pull certain hairs out of the tail of the female, and afterwards binde them together therewith.

There is no lesser regard to be had of the Stallion, left the want of judgement in the choice of him do frustrate the experiment; seeing therefore they are engendered betwixt a Mare and an As, or betwixt a Mare and a wilde As, and the Mule, begotten betwixt the wilde As and the Mare, both excel all others, both for swifhnes of course, hardnes of foot, and generofity of stomack; yet is the same As better for this breed then the wilde As, for he will be more beautiful in outward form, and more tractable in disposition; and the Mules engendered by wilde Asfs may be compered to these; yet can they never be fo tamed, but they retain some qualities of their wilde father; and therefore a Mule begotten betwixt them (I mean betwixt a wilde male As and a tame female As) are fitter for Nepheus then for foons: that is, their foals may beget good Mules, and such as are tameable and tractable, becaufe decent breafteth the corruption of nature, but themselves do never prove profitable.

And therefore it is moft commodious and neccessary to get such a Stallion As to the procreation of Mules, whose kinde by experiment is excellent, and outward parts every way acceptable, such as these are: a long and great body, a strong neck, strong and broad ribs, a wide breath full of muscles, loins full of finews, strong compacted legs, of colour blackish or spotted, for the Moufe colour isjtoo vulgur, and is not fit in a Mule. For it is but folly in a man to allow and approve every colour he looketh upon, and therefore (Columnella writeth) when there are spots upon the tongue and palat of a Ram, fuch also are found in the Wool of the Lamb he begeth.

And to foal if an As have divers coloured hairs upon his eye-brows, or upon his ears, the foal he bringeth forth hath fuch colours in his skin; And hereunto agree both Palladius, and A'rfulus, saying; he that will have a good breed of Mules, must get an As of elegant form, a great stature, square members, a great head not like a Horfes, his face, cheeks, and lips not small, his eyes standing out of his head, and not little or hollow, broad noftils, great ears, not hanging down, but standing upright; a broad and a long neck, a broad breath, rough with the plaights of his muscles, 

and
and strong to endure the kickings of the Mare: great breasts, plates, and other parts under his shoulders, and so down to his legs, which ought to be strong, broad, and corpulent, and standing far forward, so as he may easily cover the Mare.

A great back, and broad back-bone, neither hollow, nor standing up with bunches, bearing a direct line upon the middle. His shoulders not low, but standing up, the hip-bone full and long; not bending too narrowly nor pinde buttocks, nor standing out sharp, and they are bent which have the shortest tails.

Furthermore let his bones be great, his knees great and round, standing both alike, his legs bony and without fleth, nothing appearing in them but nerves and skin; nor standing awry, nor yet of divers colours, his patterns not high, nor yet over low: his feet not low nor bending inward; his hoof thick and hollow within; the inward part of it being clear, according to the saying of Juvenal:

Namque mundus niter ungula Mule.

His voice clear and not hoarse, for so the Mare will be terrified from copulation. His colour ought to be likewise clear, as all black, having no white belly; or somewhat looking towards purpure, and having one black spot upon his mouth, or rather a black tongue, and such as hath been brought up with Horses.

It is the fashion of some to take wilde Asses to tame them, to make Stallions for generation, for they beget the beast Mules, if they be liberally fed and not inclofed, and never wax wilde again if they be put among tame Asses. And the young one so gotten by him, will be like the sire: and if any have a desire to make the Mules of strange colours, they must cover the female with a cloth of that colour, wherewithal they desire the young one to be foaled, as we have shewed already in the discourse of Horses, whereby there are raised many excellent kinds and races; or else they bring in their presence at the time of their copulation some great Male Horse or Afs, by the flight whereof they are made more fruitful, or again, some base and despifable Beast being offered to their view, doth make them to conceive more noble Mules.

If the wilde Asses be at any time heavy, and not willing to cover the Mare, then let there be another female Afs brought into the presence, by the flight whereof his lust doth burneth, that he rages almost to madness for copulation: And therefore being denied, the Afs doth more willingly leap upon the Mare, whom before he loathed. Again, it must be regarded, that the Stallion be tyed and bound fast, so that he may not cover the Mare after the is with foal, nor yet have access unto her, lest by kicking and biting he cause abortion, for many times they break their bonds alinl, and greatly trouble the females with young, therefore they are accustomed to some labour, which taketh down the heat of their lust: yet at the time that they are to cover the Mares, you must use all diligence to awaken the drouifie nature of the Beitl, so that with greater spirit the seed of the male and female may meet together.

The Asses of Lybia will not cover Mares that have manes until they be shorn off, for it seemeth they diddian that their females should have more ornaments then themselves, which are their husbands.

We have shewed already in the discourse of the Afs, that Mares do not willingly admit any Stallion Afs to cover them, except it be such a one as did fuck a Mare, which we called a Horfe-fucking, or Equinomy. For this cause men that propound unto themselves to nourish races of Mules, take the Colt of an Afs so soon as it is foaled, and put it to a Mare, giving milk in some dark place, wherein the Mare not doubting any fraud, is deceived, and willingly yeeldeth her udders to the Afs foal; whereunto being accustomed for ten days together, at last the taketh it for her own; and such a Stallion Afs loveth Mares exceedingly: and on the other side, the Mare refuseth not him. And some fay, that although they fuck their mothers milk, yet if from the time of their weaning they be brought up among Horfe-cots, it is as good as if they had sucked Mares.

If the Afs be small which is a Stallion, he will quickly wax old, and his issue be the worse, therefore they must provide the largest and strongest Asses, and nourish them with the best Hay and Barly, that so his strength may abound before his copulation. He ought not to be under three years old, nor yet brought unto a Mare which never knew Male, for such a one will beat him away with her heels and mouth, and bring him into perpetual hatred with that kind; wherefore they use to bring some vile and vulgar Afs into the presence of the Mare, as it were to woo her, and provoke her to copulation, that so if she beat him away, it may be no hindrance to the Stallion; but if she seem to admit him, and desirous of copulation, then they take him away, and bring the appointed Stallion into his room, and so the Mule is engendered.

For the effecting of their copulation, there must be a place appointed for the purpose, betwixt two walls, having a narrow passagge, that so the Mare may not have liberty to fight with the Afs, and the Mares head must be tyed down to a Manger or Rack, the ground being so fashioned, that her fore-feet may stand much lower than her hinder, and so affend backward, to the intent that the Afs may more easily leap upon her back, and she receive the feed more deeply. When the Mare hath brought forth the Mule, the giveth it fuck half a year, and then driveth it away, which ought to be brought up in some Mountains, or hard places, that so the hooys may grow hard and indurable. Having
Of the Mule.

Having thus discoursed of the generation of Mules, it now followeth, that we should enquire, whether Mules thus engendered betwixt an Ass and a Mare, do likewise bring forth in their own kind. Observationem eff (Faith Pryn) & duobus diversis generebus tertius generebus, & neutri parentum effe similis, caus; idque esse nata juxta, non gignere, in omnino animalium genere, idicris Mula non parere. That is to say; It hath been observed, that out of two divers kinds, a third hath been engendered, and yet like to neither of the parents, and thofe so engendered did not procreate others in the universal kinde of Beasts, or among all creatures; and therefore Mules conceived betwixt Asses and Mares, do not bring forth young. Whereupon Camerarius made this pretty riddle of a Mule:

Diuersia patri, matri diversa figura
Confusi generis, generi non apta propaga,
Ex aliis nascere, nec quiquam nascitur ex me.

Democritus is of opinion also, that Mules cannot conceive, and that their secret places are not like other Beasts, and the issue of confufed kindes can never engender, but especially in a Mule, because it is made of divers sex, (I mean divers in quantity, and almost contrary) for the seed of the Ass is cold, and the seed of the Mare is hot.

Aristotle disputing of this matter concerning thofe kindes that are procreated of divers parents, writeth in this fort: thofe Beasts joyn in copulation, whole kindes although they are divers, yet are not their natures very disagreeable. If the quantity and if nature be alike, and the times of going with be young equal, yet they remain barren that are fo begotten, of which cause Empedocles and Democritus yeeld reason: Empedocles obfcurely, and Democritus more plainly, but neither of them both well; for they alleadge the fame demonstration about all Beasts out of their kinde. Democritus faith, that the paffages of the Mules are corrupted in their wombs, because their beginning doth not consist of one and the fame kinde; but this is no reason, for that it happeneth also to other Beasts that do engender.

Empedocles he yeelds a reason out of Plutarch, about the joynynge together of the seeds, and therefore compareth it to a commixtion of Tin and Brafs together, but he faith he doth not understand their meaning, and therefore procedeth to express his own opinion in these words. Firt (faith he) every one of the Mules do beget one of their own kinde, but the females cannot conceive, and this is no great wonder; because that Horfes are not alwayes fit for generation, nor Mares to bring forth Colts being covered: and therefore when Asses and Mares do couple together, their issue may be more barren, because they receive the greater hinderance in the diversitie of kinde; for besides the coldnes of the Asses seed which may be one great caufe of his barrenness, they have another property, if they do not breed and engender before the caufing of their Colts-teeth, they remain sterile and barren all their life long: for so doth the generative power of the Asses body rest upon a tickle and nice point, apt to rife, or easie to fall away to nothing.

And in like fort, is a Horse prone to barrenness, for it wanteth nothing but cold subftance to be mingled with his seed, which cometh then to pafs when the seed of the Ass is mixed with it, for there wanteth but very little, but that the Asses seed waxeth barren in his own kinde, and therefore much more when it meeteth with that which is befitting his nature and kinde.

This also hapnyeth to Mules, that their bodies grow exceeding great, especially because they have no menilurous purgation, and therefore where there is an annual breeding or procreation,by the help and refreshing of thefe flowers, they both conceive and nourish; now these being wanting unto Mules, they are the more unfit to procreation.

The extremities of their body in this kinde they purge with their urine, which appeareth because the male Mules never smell to the secrets of the female, but to their urine, and the residue which is not voided in the urine, turneth to encrease the quantity and greatness of the body, whereby it cometh to pafs, that if the female Mule do conceive with foal, yet is the not able to bring it forth to perfection, because those things are dispersed to the nourishment of her own body, which should be employed about the nourishment of the foal: and for this caufe, when the Egyptian describe a barren woman, they picture a Mule.

Alexander abridgeth writeth thus also of the ferility of Mules. Mules (faith he) seeme to be barren, because they confift of Beasts divers in kinde, for the commixtion of seeds, which differ both in habitt and nature, do evermore work something contrary to nature, for the abolishing of generation; for as the mingling together of black and white colours doth deftroy both the black and white, and produce a swart and brown, and neither of both appear in the brown; so is it in the generation of the Mules, whereby the habittual and generative power of nature is utterly destroyed in the created compound, which befor was eminent in both kinde, simple and several. These things faith he.

Alamanus, as he is related by Plutarch, faith, that the male Mules are barren by reason of the thinness and coldnes of their feed, and the females because their wombs are shut up, and the veins that should carry in the feed, and expel out the menilurous purgation, are utterly Roff. And Empedocles and Dioscorides say, that the womb is low, narrow, and the passages crooked that lead into it, and that therefore they cannot receive feed, or conceive with young. Whereunto I do alfo willingly yield.
yield, because it hath been often found that women have been barren for the same cause. To conclude therefore, Mules bear very seldom, and in some particular Nations if it be natural, or else their Colts are prodigious, and accounted monsters.

Concerning their natural birth, in hot regions where the exterior heat doth temper the coldness of the Affes feed, there they may bring forth. And therefore Columella and Varro say, that in many parts of Africk, the Colts of Mules are as familiar and common, as the Colts of Mares are in any part of Europe.

So then by this reason it is probable unto me, that Mules may engender in all hot Countries, as there was a Mule did engender often at Rome; or else there is some other cause why they do engender in Africk, and it may be that the African Mules are like to the Syrian Mules before spoken of, that is, they are a special kind by themselves, and are called Mules for resemblance, and not for nature. It hath been seen that a Mule hath brought forth twins, but it was held a prodigy. Herodotus in his fourth Book recorded these two stories of a Mules procreation; When Darius (faith he) besieged Babylon, the Babylonians scorned his Army, and getting up to the top of their Towers, did pipe and dance in the presence of the Persians, and also utter very violent & opprobrious speeches against Darius and the whole Army, amongst whom one of the Babylonians said thus: Quid quis deinde astro, quantasque abscidit, tunc expugnaturis nos cum perevertint Mule. Oye Persians, why do you fit here? wisdom would teach you to depart away; for when Mules bring forth young ones, then may you overcome the Babylonians. Thus spake the Babylonian, believing that the Persians should never overcome them, because of the common proverb, opem emissioni tequit, when a Mule beareth young ones. But the poor man spake truer then he was aware of, for this followed after a yeer and seven months: While the siege yet lasted, it hapned that certain Mules belonging to Zopirus, the son of Megabizus brought forth young ones, whereat their Master was much moved, while he remembered the aforefaid song of the Babylonian, and that therefore he might be made the Author of that fact, communicated the matter with Darius, who pretently entertained the device; therefore Zopirus cut off his own nose and ears, and so ran away to the Babylonians; telling them that Darius had thus used him, because he perfwaded him to depart with his whole Army from Babylon, which (he said) was in expugnable and invincible. The Babylonians seeing his wounds, and trusting to their own strength, did easily give credence unto him; for such is the nature of men, that the belt way to beguile them is, to tell them of those things they most desire, for so are their hopes perfwaded, before they receive any assuredness. But to proceed, Zopirus insinuated himself further into the favour of the Babylonians, and did many valiant acts against the Persian, whereby he got so much credit, that at last he was made the General of the whole Army, and so betrayed the City unto the hands of Dar-ius: Thus was Babylon taken when Mules brought forth.

Another Mule brought forth a young one, at what time Xerxes passed over Hellespont, to go against Græcia, with his innumerable Troops of Souldiers, and the said Mule so brought forth, had the genitals both of the male and female.

Unto this may adde another story out of Suetonius, in the life of Galba Caesar. As his father was procuring Augurins or Divinations, an Eagle came and took the bowels out of his hand, and carried them into a fruit-bearing-§ock, thenquiring what the meaning of that should be, received answer, that his posterity should be Emperours, but it would be very long first: whereunto he merrily replied: Saepe cum Mula perepetis: I fir, when a Mule brings forth young ones: which thing afterwards happened unto Galba; for by the birth of a Mule, he was confirmed in his enterprises when he attempted the Empire; so that, that thing which was a prodigy and cause of sorrow, and a wonder to all other people, was unto him an ominous confirmation of joy and gladness, when he remembered his Grand-fathers Sacrifice and saying. Therefore it was not ill said of Demetrius: Mule non natura opus, sed humana machinatione, adulterinum inventum, & satrum esse videntur. Mules are not the proper work of nature, but an adulterious invention of humane policy, robbing nature: for (faith he) when a certain Median found his Afe covering of his Mare, upone whereafter he fel to be with foal, and seeing the young one to communicate with both natures, they drew it into a custum to cover the Mares with their Affes, for the engendering of such a breed.

Some are of opinion that Mules first began among the Paphlogonian, which before the Trojan war were called Enei, and afterwards Veneti: but in Gen. 36. we finde that Aahub the son of Zibeon, keeping his fathers Affes, did invent Gemim, that is, Mules, as some interpret. But rather I believe, that while Affes and Horfes ran wilde in the Wildernefs among themselves, the wilde Affes first began this race. The male at seven years old may engender, because he is of a hotter nature than the female, and also doth not in his generation confuer any part of his bodily growth to the young one; and sometimes he engendereth when he hath lost his foremoft teeth, and after the first copulati- on, he never engendereth more. The young one so generated, is called Gimmus and Pamilus, for it is a very dawr, according to the observation of Martial:

His ubi de Mula non est meandrum vivus,
Affus in terris non sedere solus.

Such as these were kept in the Court of the Duke of Ferraria, and although in all things they resemble the mother, yet are named after the father, and such also are the Bardem before spoken of.
They are nourished with the same meat that Horfes and Affes are, annoyed with the same fickneses, and cured with the same means; generally blood-letting is good for them, and for their diet Bullimung. In Sythia they can abide no cold, and therefore the Horfes are there fed in bed of Mules. In some Countries the Horfes can abide no cold, but the Affes and Mules bear out (as Herodotus writeth,) and as we have thewed before in the Ritory of the Affes: when the Graecians were at Troy, and were destroyed by a confuming pestilence, the fift of all their company that dyed were their Dogs and their Mules, and the reafon of it was, because the pestilence arifing out of the earth, they by the fene of ftimming, which is very quick in both kindes, did dift of all draw in that poiy from them.

Columella faith, that the medicines for the Oxen do alfo cure Mules, yet there are special medici
cites not to be neglected, which we will express in this place. For a Mule that hath a Fever, give
her raw Cabbage; and for one that is short-winded hee blood-letting, and for a drink give it a pinte
of Wine and Oyl mixed with half an ounce of Frankincense, and half a pinte of the juice of Horeb
hound. For the scratches or difeafe in the hoofs, lay to it Barley meal, then make suppuration with
a knife, and cure it by laying two linen clothes, or by a pinte of the bift Garum, and a pound of Oyl
infud into the left nothus of the Mule, whereunto you may add, the whites of three or four Eggs
seperated from the yolks.

The female Mule may be burned in the feec, or let blood after the manner of Horfes, and some
Countrymen give in their food the herb Veretrum, or else the feed of Hyoscamus or Hen-bine taken
to powder and drunk in Wine. For the languishing of the chine or leannees, they make this drink;
have an ounce of beaten Brimfomé, a raw Ee, a penny weight of the powder of Myrrh; mingle
led all three together in Wine, and so poured down the Mules throat, is a preffent remedy to cure it.
As also for the pain in the belly and all manner of coughs, the herb Medicus is special good for
the said languishing difeafe. So alfo to fatt the Mule if it be given green, and not dryed like Hay,
a little at a time for the Beatt be fufficent with overmuch blood. When a Mule is tired or heated,
et the load be taken off, and turn her forth to wallow in fome convenient place. If that suffice not, take fome fat, and put it into her chaps; that fio the may fufficent down, and pour Wine
after it.

For to keep the necks of Mules from wringing and loofening their skin, use this medicine, take
two pound of Hoggs-grafe for three days, or unto the third part two pinte of Vinegar, and there
withal anoint the Mules neck. As we have thewed that the pains of a Horfes belly and guts are hee
of all cured by the fight of a Mallard, swimming in the water, whereby they are speedily delivered
from all manner of torment, to the fame hath as great or greater operation to cure the pains of the
Mules belly. It is reported by Avicen, that Mules fell into madness, and in that madness bite their ma
fer mortally. They are likewise fubjet to the Gout, and especially to swellings about the Crown
of their patterns, but they are cured as Horfes and Oxen.

The Mules live long, ordinarily to fifty years, and sometimes to fourtie and foure; the reafon thereof is given by Columella: Animelae qui frequenter consumbunt braciam fumvit vine, inde fit, ut Mules ejus superent, videndi quarumq
naturat, that is to fay, Thoie Beatts and creatures which oftentimes joyn in copulation have but fhort
lives, and from thence it cometh, that Mules live longer then Horfes.

The Epiftills of a Mule are thefe; pack-bearer, dirty, Spanifh, rough, and bi-formed. There is
an Adage or proverb called Mules Maritimus, and by it is figurative a man which is apt both for to obey
and to rule; it was taken from Marcus the great Roman Souldier and Commander, whose fashion
was, when he had commanded any of his Souldiers to fetch a burden, or do anyvide service, he
himfelf would put his hand unto it. It fignifieth properly a back, or Colt-Haffe, as we fay in English, whereupon poor men carry their burdens, and from thence it was tranflated into
to a proverb, to fignifie all that do obey commands. There be fome which give another reafon of
this proverb, for they fay, that when Scipio did besiege Numantia, he did not only determin to
look into the weapons of his Souldiers, but alfo to his Horfes, Mules, and Cartiers. Then Marcus
brought forth an Horfe, nourished by himself very delicately: Besides the Horfe a Mule of very
comely body, far excelling all other Mules both in gentlenenes and in strength. Therefore feeing the
Emperor was delighted with the Beatts of Marcus, and would now and then make mention of
the Mule, at length it came to a common jeft, to call a double diligent fervant Marcus Marnitu.
The Italians do commonly call thofe men Mules which are bafe born, and not by lawful
marriage.

Concerning the difposition of Mules, it is well obferved by Arifotle, that Mules are always
tame; and if at any time they be more wilde, they abate their untameable nature by drinking of
Wine, because by the operation of the Wine, their heels and hard parts do resolve and grow fof; by
the fame reafon that Apes by drinking of Wine loofe their nails, and men acclimatized to drunken
nels fall into paffives: for there is fuch a difpersing and difculping nature in Wine, that it diflofeth
all nerves and hard things in the bodies of Beatts, even as water diflofeth hard fruits and
Peafe, and Vinegar maketh lead as fof as an Egg; that it may be drawn through a Ring: and fuch is
the nature of Mules, that after they have drunk Wine, they feel themselves difarmed, and there
fore give over to refit, because by kicking backwards, they receive more harm then they give,
The History of Four-footed Beasts.

Mules were wont to be used for plowing, and for carrying both of men and burthens; but now in most parts of Europe, Judges and great Princes ride upon them until they be old, and then they sell them to the poor men, who turn them into the Mountains where they suffer them to run wild, till their hoofs be hardened for long travels, and then they take them up again. They have been also accustomed to ploughing, according to these verses;

Quantum mularum fulcos precedit in arvo,
Tantum in praecurrit.—

For the Mules did plough more speedily, and come to the lands end more quickly then either the Ox or Horse. And Martial, that they were used in Carts to draw Timber, according to these verses;

Visq; datur longos Mulorum vincere mandras,
Queq; trabi multa marmora vide  vide.

They were also used in race at the games of Olympus, as we have already shewed in the story of the Horse, but that custom dyed quickly, because that the Arcadian could not endure Mules. The price of Mules was great, for Crispus (faith Juvenal) gave six thousand pieces of mony for a Mule, and yet he faith it was not well worth fix pound; the verses of Juvenal are these:

—-Crispinus Mulam sax millibus emit
Equam fame paribus feftertia libris,
Ut perhibent qui de magis horie majoquarius.

The Cappadocians payed to the Persians every year besides Silver and Gold, fifteen hundred Horses, two thousand Mules, and fifty thousand Sheep, but the Medians payed twice so much. The dwarfh Mules called Gani were also much let by, not for use, but only for delight, as dwarfs are kept in Noblemen's houses. When Pylustratus the son of Hippocrates first of all affected Tyranny at Athens, and laboured to get the government to himself, as he came out of his Country, being drawn with a Chariot by Mules, he wounded himself and his Mules very grievously, and so drave them into the Market place, shewing his wounded body and Beasts unto the Athenians, telling them that fo he was wounded by his enemies, and that he escaped death very narrowly, but if it pleased them to grant him a guard of Souldiers to defend his body, he would take revenge upon their and his enemies whereunto they yeelded, and he having gotten a Band of Souldiers under that pretence, presently took upon him the government and Soveraignty.

To conclude this Story of Mules, I do read in Plutarch, that Serpents do love to feed on the flesh of dead Mules; and two things are very eminent in the nature of Mules, one of their understanding, and the other of their friendship. Concerning the first, Plutarch relateth this story of a Mule that was accustomed to carry Salt, who upon a season going through a water, fell down underneath his burden, so that the Salt took wet afterwards; the Beast perceived how by that means, his extream load melted away, and so became lighter and lighter; afterward the Mule grew to this custom, that whensoever he came loaded with Salt over that water, he fell down in it for the easing of his carriage; his Master perceiving his craft, on a day he loaded him with Wool, and Spunges, and so the Beast coming over the water, fell down as he was wont to do with his Salt, and coming out of the water, he felt his load to grow heavier then it was wont to do, in stead of lesening, whereas the Beast much mused, and therefore never afterward durft lie down in the water, for fear of the like increase of his load. The other observation of their love and friendship, ariseth from the Proverbe, Multi mulis faciunt, that is, Mules scratch one another, and help one another in their extremity; from whence cometh our proverb, One good turn asketh another; and the Latine proverb, Senes mutum faciant, old men rub one another; which did arise upon this occasion: as Adrian the Emperour so passeth a long on a day by a bath, he saw an old Souldier in the bath rubbing himself upon a Marblestone for want of a man to help him, whereupon in pity of his case he gave him maintenance for himself and a man; afterwards other old Souldiers seeing how well their fellow had sped, went likewise into the bath before the Emperours eyes, and rubbed themselves upon the Marble, thinking to get as much favour and liberty as their fellow had gotten, but the Emperor seeing them, and perceiving their fetches, bid them rub one another, and thereupon came that proverb. And thus much for the natural discourse of Mules, now followeth the medicinal.

The Medicines of the Mule.

The dust wherein a Mule shall turn or rowl himself, being gathered up and spread or sprinkled upon the body of any one who is ardently and fervently in love, will presently affwage and quench his
his inflaming desire. A man or woman being poiyioned, and put into the belly of a Mule or Camel which is new killed, will presently expel away the force of the venom or poiyion, and will confirm and make strong their decayed spirits, and all the rest of their members: For as much as the very heat of those Beasts is an Antidote or preservative against poiyion.

The skin or hide of a Mule being put unto places in any ones body which are burned with fire, doth presently heal and cure the same: it doth also heal sores and grievous ulcers which are not come unto Impotencies.

The fame is an excellent remedy for those whose feet are worn or wrung together through the pinching of their shoes, to help themselves withall, and for which are lame, and those which are troubled with those grievous sores called Fistulas. If any man shall take either in meat or drink the marrow of a Mule, to the weight or quantity of three golden crowns, he shall presently become blockish and altogether unexpert of wisdom and understanding, and shall be void of all good nutriment, and manners. The ears-laps or ear-lages of a Mule, and the stones of a Mule being born and carried by any woman, are of such great force and efficacy, that they will make her not to conceive. The heart of a Mule being dryed and mingled with Wine, and so given to a woman to drink after that she is purged or cleansed thirty times, hath the same power and that the aforesaid medicine hath for the making of a woman barren. The same effect against conception hath the bark of a white poplar tree, being beaten together with the reins of a Mule, then mingled in Wine, and afterwards drunk up. If the herb called Harts-tongue, be tied upon any part of a woman, with the spleen of a Mule, but as some have affirmed by it fell only, and that in the day which hath a dark night, or without any Moonshine at all, it will make her altogether barren and not able to conceive. If the two stones of a Mule be bound in a piece of the skin of the same Beast and hunged upon any woman, they will make that the shall not conceive to long as they shall be bound unto her. The left stone of a Weefil being bound in the skin or hide of a Mule, and steeped or sked for a certain space or time in Wine, or in any other drink, and the drink in which they are steoped given to a woman to drink, doth surely make that the shall not conceive. The stones of a Mule being put upon a barren and unfruitful tree, and put out, or quenchd with the fiale or urine of either Man or Beast which is gelded, being bound and tyed in the skin of a Mule, and hunged upon the arm of any woman after her menstural fluxes, will altogether refitit and hinder her conception. The righ stone of a Mule being burned and fatted unto the arm of a woman which is in great pain and travail, will make that the shall never be delivered until the same be loofened and taken away, but if it shall happen that a Maid or young Virgin shall take this in drink after her first purgation or menes, the shall never be able to conceive, but shall be always barren and unfruitful.

The matrix or womb of a female Mule taken and boiled with the fleth of an Afs or any other fleth whatsoever, and so eaten by a woman which doth not know what it is, will cause her never to conceive after the same. The worm which is called a Glowworm, or a Globird, being taken out of the womb or matrix of a female Mule, and bound unto any part of a womans body, will make that the shall never be able to conceive.

The duft or powder which proceedeth from the hoofs of a male or female Mule, being mixed or mingled with Oyl which cometh from Myrtleberries, doth very much help those which are troubled with the Gout in their legs or feet. The duft of the hoofs of a Mule being mixed or burned, and the Oyl of Myrtle-berries being mingled with Vinegar, and moisd or liquid Pitch, and wrought or tempered in the form or fashion of a plaitter, and opposed or put unto the head of any one whose hairs are too fluent and abundant, doth very speedily and effectually expel the same.

The liver of a Mule being burned or dryed unto duft, and mixed with the fame Oyl of Myrtle-berries, and so anointed or spread upon the head, is an excellent and profitable remedy for the curing of the aforesaid enamority.

The duft or powder of the hoofs of a female Mule is very wholesome and medicinable for the healing and curing of all grieves and pains which do happen or come unto a mans yard, being sprinkled thereupon. The hoof of a Mule being born by a woman which is with childe, doth hinder her conception. The filth or uncleanness which is in the ears of a Mule, being bound in the skin or hide of a little or young Hart, and bound or hanged upon the arm of a woman after her purgation, doth cause that she may not conceive. The same being in like manner mingled or mixed with Oyl which is made of Beavers stones, doth make any woman to whom it is given to drink, altogether barren. The dirt or dunge of a Mule being mixed with a flyrup made of Honey, Vinegar, and Water, and given to any one to drink that is troubled with the heart-swelling, will very speedily and effectually cure the pain thereof.

The dung of a Mule being burned or dryed and beaten small, and afterwards sifted, or seired and washed or steeped in Wine, and given to any woman to drink, whose menstural fluxes come forth before their times, will in very short space cause the same to stop. The flale or urine of a male or female Mule being mingled with their dirt or dung, is very good and medicinable for those to use which are troubled with corns and hard bunches of fleth which grow in their feet. As the same being mingled with the urine of a Mule to the quantity of a bean, and drunk, will altogether be an impediment and hinderance to the conception of any woman. The urine or urine of a Mule being taken to the quantity of eight pounds, with two pounds of the scum or refuge of silver, and a pound of old and moft clear Oyl; all these being beaten or pounded together until they come to the thick-
The History of Four-footed Beasts.

**Agusta.**

In the fat or sweat which falleth from mens bodies and boiled until they come unto to liquor and thin a juice, that they will speedily and effectually cure and help those which are troubleth with the Gout or swelling in the joints.

If a woman shall take the sweat which proceedeth from a Horse, and anoint it upon a Woolen cloth, and so apply it as a plaster or suppository unto her secret parts, it will make her altogether barren. There is an excellent remedy for those which are purifie or short winded, which is cometh as so by the Mule: which is this; To take or gather the froath or some of a Mule, and to put it into a cup or goblet, and give it in warm water, for a certain space or time to be drunk, either to the man or woman which is troubled with this enormity, and the party which do so use it, shall in short space have remedy; but the Mule will without any lingering of time, or confuming of time in pain andorrow die.

The milk of a male or female Mule, being drunk in a potion or juice made of Hony, Water, and Vinegars, to the value or quantity of three crozes or cups full, is commended for an excellent cure and medicine, for those which are troubled and grieved with that pellieverous and deadly disease called the Falling-ficknes, otherwise Saint Jobus Evil. There is an excellent remedy for those which are troubled in the voiding of their water, which is this; To take the Ring-wors or Terters which do grow upon both the legs of a Mule above their knees, and which do threke thercupon in the manner of a dried thick skin, and to burn or parch them, and afterwards to put or place them upon him which is troubled with the Strangury, or cannot void his water but by drops-meal, so that there be great care had to cover clofe with eleven or clefted cloths, or garments, the suffuration therc- of, left that the smell or fume do fade, and void away; and this being so used will be very effectual for the curing and driving away of the aforefaid disease.

The hairs of a Mule and an Ass being mingled together and dried, and put into some certain perfume, and so given to any one to drink which is troubled with the Falling-ficknes, will presently expel and drive it quite away. In the place or part of mans body wherein a male or female Mule shall bite, Pasteur affirneth, there will presently arise, and grow small pushies, or little blisters which are always full of red and pale humors, and filthy corruption, which can almost be healed and cured by no false, poison, or medicine, by any means applied therunto. There are some also which do suppose the biting of Mules to be poysion, for truly there doth not only follow the aforefaid pushies and blises, but also an extreme and almost indurabe inflammation and burning, through all the parts of the body, which doth greatly disempeasure and vex the same.

But it is affirmed by others, that the biting of Mules is to be curst after the same manner as the biting of a Cat, which is thus: First, to wash and clarify the wound or bitings where the corruption is with Vinegar mingled with Oyl of Rifes, and then to take Peny-royal, or the herb called Neppe, and boil it, and stroke or rub the wound very softly with it, and it will in time wholly cure it. And thus much shall suffice at this time concerning the cures and medicines of Mules.

**Of the Neades, Neides, or Naides.**

Hecules, Colus, Valateranrus, and Euphorion, do all-write that once the Isle of Santis was a Defert place, and that there were in it certain Beasts called Neader, whose voice was so terrible that they shook the earth therewith, and from thofe strange and great voices came the vulgar Greek proverbs, Melion mia toon Neaoram, matius un Neaoram. That is, One of the Neades was a great wonder, for it was used in ointmentation, to shew that there was nothing in the whole world comparable to their vaft and huge quantity. Of the parts of these Beasts there is no memory but only in Suidus and Aelianus, who affirm, that their bones were to be seen in their days. And this title I thought good to infect into this History, leaving the Reader to consider, whether he will take them for Elephants, or for any other greater Beast; for my opinion it if be defined, I think them rather (if there ever were any fuch) that they were Elephants of greater stature then ever fince were seen, and not any generation of Beasts now left and utterly perished.

Of the O U N C E, the description whereof was taken by Doctor Cay in England.

The names of this Beast.

The description of D. Cay.

Here is in Italy a Beast called Alphes, which many in Italy, France, and Germany, call Levand, and some Unzia, from whence Albertus, and Histio make the Latin word Unzia, and I take it to be the fame Beast which is called Lanasum, and for the description of it, I can follow no better Author then Doctor Cay, who describeth it in this fashion: The Ounce (faith he) is a most cruel Beast, of the quantity of a village or mastiff Dog; having his face and ears like to a Lions, his body, tail, feet, and nails like a Cats, of a very terrible Aspect, his teeth so strong and sharp, that he can even cut Wood in sunder with them: he hath also in his nails so great strength, that he only fighteth with them, and useth them for his greatest defence: The colour of the upper parts of his body being like white Oak, the lower being of the colour...
of ashes, being every where mixed with a black and frequent spot, but the tail more black then the rest of his body, and as it were obscured with a greater spot then the residue. His ears within are pale without any blacknes, without black, without any palenels, if you do but take away one dark and yellow spot in the midit thereof, which is made of a double skin rising, meeting in the top of the ear, that is to say, that which ariseth from the outward part of the jaw on the one side, and cometh from the upper part of the head on the other side, and the same may be easily seen and separated in the head being dried.

The rest of the head is spottet all over with a most frequent and black spot (as the rest of the body) except in that part which is betwixt the nose and the eyes, wherein there are none, unless only two, and they very small: even as all the rest are lefser then the rest, in the extream and lowest parts: the spots which are in the upper parts of the thighs, and in the tail, are blacker and more singular, but framed in the sides with such an order, as if all the spots should seem to be made of four. There is no order in the spots, except in the upper lip, where there are five rows or orders.

In the first and uppermost two which are severed; in the second, fix, being joyned in that manner, as if they should seem to be in one line: These two orders are free, and not mingled amongst themselves. In the the third order there are eight joyned together, but with the fourth where it endeth, they are mixed together. The fourth and fifth in their beginning (which they have to the nofe) being separated with a very little difference, do forthwith joyn themselves, and run together through all the upper lip, and do not make a spot through all the fame, but a broad line. In the Beafit being dead the spots do fo stand, (as I suppose for the contraction of the skin. In the Beafit being alive, those spots do feem separated every one in their own orders. In the very middle between the lower lip, although they do keep the quantity, do not obferve the order. The nofe is blackish, a line being softly led through the length, and only through the top of the outside thereof. The eyes are gray, the former teeth are only fix, not very unlike to men's teeth, except those which are placed in the middle are leffer, and they in the uttermost part are greater, as also higher then those which are low.

In this Beafit the teeth are both great, sharp, and long, being joyned to the rest in the lower jaw, and in the upper fåvered with fo great space, that the lower teeth may be received therein. Thêse when the Beafit liveth are covered with his lips, but when he is dead they are otherwise, his lips being through drines shrunk together. His fore-teeth are very big, and as long as two Roman fingers, for at the very root thereof it cannot be comprehended in less then two Roman fingers and a half compafs. In his tooth there is a certain small hollownes through all the length thereof, which notwithstanding doth not appear except the tooth be broken. The lower jaw is very hard and ifte having three teeth unequal in quantity, as the upper four. Between the great tooth and the first cheek tooth of the under jaw, there is a void space to the quantity of one finger, from which the first is pretently placed, lefser then the other two; to this there is another greater close adjoining: and after this there is also a third greater then the second. In the upper jaw in that middle space (which I said was of one Roman finger) between the great tooth and the first cheek-tooth, there is a very little tooth, and without any form, coming fo finally out of the jaw, that there is no lower tooth which may answer to the same. After that, in the space of half a finger there is a second, to which there is joyn'd a third, and after this a fourth, between themselves the upper and the lower cheek-teeth, and so are joyned together as they agree in the manner of a comb; the two first teeth in the lower jaw, and the second and third in the upper jaw are of the same figure, as the compafs of the tops of the Crowns of the Kings of England and France. The third is of the same figure in the lower jaw, and the fourth of the upper jaw, except that the interior side of both the
guns which is nearer to the throat, by nature is taken away. There was no other teeth joined to these in both the jaws. But I do not know whether there be any more teeth in the gum beyond the reach of one fingers, in the farthest row or behind the teeth. But this I know, that to all appearance there was none remaining, and it may be that his lips were cut or slit down beyond nature to swell his teeth. It liveth of flesh, and the female is more cruel than the male, though lefser, and one of either sex was brought out of Mauritania into England in a Ship, for they are bred in Libya. If they have any appointed time of copulation, it is near the month of June, for in that month the male coveteth the female. We have heard already that Lions may be tamed, and that also hath been manifest in London, both in the Tower and in the City, for there the Lions did play with their Keepers, and kis them without harm, (as Doctor Cay faith he saw them do) but thefe Beasts were fo fierce and wide as they could never be tamed, for when ever their Keeper should change or remove them from place to place, he was constrained firth of all to strike them hard with a club upon the head, that they should lie half dead, and so put them in a fack or wooden chett made of purpose with holes in it for respiration and expiration, to carry them to and fro from one lodging to another: after an hour they revived again like a Cat, but when they were to be taken out of the hut or chett, he was constrained likewise to allineth them again with his club: but afterwards they grew to invent an Engine to put the Beaff in, and take him out of the hut with a rope or cord, and fo do remove them from place to place. The Keepers affirmed, that they did feem much to disdain the Lions, and offtentimes endeavored to fight with them, but they were kept afunder with grates: they would not hurt a little Dog when he was put to them but when they were hungry; but if a great Dog were put unto them, they tore him in pieces, although their bellies were never fo full. When they are angry, they utter a voyce like an angry Dog, but they double the (Art) twice, and also bigger then any Dogs, proceeding out of a large breath and wide arteries, much like to the howling of a great Maliff, that is shut up in a clofe room alone against his will. Some fay it is longer then a Dog, but it did not fo appear in England, for we had many Maliffe Dogs as long as it, but yet was it every way greater then any other kinde of Dogs. It is but a vain report, that some have faid, when a Man or Beaffe is bitten with an Ounce, presently Mice flock unto him, and poyfon him with their urine.

For it was seen in England, that two of the Keepers were wounded and threethirdly bitten by one of the Ounces, and there followed them no other harm then that which followeth the biting of an ordinary Dog, or like a small incifion with a knife. He never fighteth but at the head, and that treacherously, if he perceive his adversary to be too strong or too great for him, and that by counterfeit- ing quietness, benevolence and peace, as if he meant no harm: for so he served a great Maliff Dog in England, at the firit fight he seemed to applaud his comming, looking cheerfully upon him, and wagging his tail, presently he fell down on his belly, as it were to invite the Dog to come near him by his submiffion; lastly, he got close unto him, creeping as though he would play with him, putting out one of his feet, as Cats do when they play, wherewithal the great Dog grew secure, and began nothing to misfruft the Beaffe, at length when the Ounce faw his opportunity, he suddenly leaped upon his neck, and took him by the throat, and pulled it out, after he had killed him, with his nails he opened the Dogs breath, and taking out his heart, did eat it before all the people in most cruel manner; thus far Doctor Cay fpeaketh of the Ounce, and befide him no other Author that I know.

The gall of this Beaffe is deadly poyfon, it hateth all creatures, and destroyeth them, especially men; and therefore it may well be faid to be poffeffed with some evil spirit. It loveth none but his own kinde. And thus much for the Ounce.

Of the ORYX.

His Beaffe in Pliny and Oppianus is called Oryx and Orjx, and my conjecture is, that his name is derived from Oryxen which signifieth to dig. Saint Jerom and the Septuagints for Theo, Deut. 14. and Isa. 51. tranflate Oryx: but David Kimbi, and the better learned men interpret it a wilde Ox. But the Hebrew Difbon may in my opinion be fo tranflated, yet herein I refer it to the learned Reader.

It is certain, that it is of the kinde of wilde Goats by the defcription of it, differing in nothing but this, that the hair groweth averte, not like other Beaffs, falling backward to his hinder parts, but forward toward his head, and so also it is affirmed of the Ethipbian Bull, which fome fay is the Rhinocerot. They are bred both in Libya and Egypt, and either of both Countries yeeldeth testimony of their rare and proper qualities. In quantity it refembles a Roe, having a beard under his chin. His colour white or pale like milk, his beards black, and some spots upon his cheeks; his back-bone reaching to his head, being double, broad, and fat; his horns flanding upright, black, and fo sharp, that they cannot be blunted against brafs or iron, but pierce through it readily.

Ariftotle and Pliny were of opinion, that this Beaffe was Eiflusius and Unicinis, that is, cloven-footed, and with one horn: The original of their opinion, came from the wilde-one-horned-goat, whereof Scenbergerus a late Writer writeth thus: Certain est minimus dubium in Carpatho monte; versus Roman Transaluminum, reperiri feras familias omnino supellex, except quod unicum cornu ex media fronte endofat, nigrum, dorso inflexum, simile omnino supellexprimorum cornulii, that is to fay: It is with-
out all controversy, that there are wilde Beasts in the Mountain Carpathus, towards Kufia and Trans-Carpathia, very like to wilde Goats, except that they have but one horn growing out of the middle of their heads, which is black and bending backward like the horns of wilde Goats. But the true Oryx is defcribed before out of Oppium, and it differeth from that of Pint, both in stature and horns. Ebianus faith, that the Oryx hath four horns, but he speakeoth of the Indian Oryx, whereof there are some yearly prentented to their King, and it may be both there and elsewhere, diversity of regions do breed diversitie of stature, colour, hair, and horns. Simeon Sethi affirmeth of the Musk-cat, that it hath one horn, and it is not unlikely that he hath seen such an one, and that the Oryx may be of that kinde.

But concerning their horns, it is related by Heraclitus, Pella, and Paur. Velia, that there were made instruments of musick out of them, such as are Citherns or Lutes, upon whose bellies the Musicians played their Mufick, by striking them with their hands; and that those Beasts were as great as Oxen; and all this may be true, notwithstanding we have shewed already, that they are as big as Roes, for Pint speaking that by relation, or by light, it is likeley that he had seen a young one.

There be also Sea-beasts called Oryxes, and Oric; and there is in Egypt an Oryx, which at the rising of Canis Syrinx, or the little Dog is perpetually sorrowfull; and this caufe the Libyans to mock the Egyptians for that they fable, the fame day that the little Dog-star rifeth, their Oryx speakeoth. But on the contrary selves acknowledge, that as often as the faid Star arifeth with the Sun, all their Goats turn to the East, and look upon it; and this observation of the Goats, is as certain as any rule of the Astronomers. The Libyans affirm more, that they do prefage great flore of rain, and change of weather.

The Egyptians also fay, that when the Moon cometh near to the East, they look very intentively upon her, as upon their overaigne Goddes, and make a great noise, and yet they fay they do it not for her love, but for her hate, which appeareth by knocking their legs against the ground, and fatenning their eyes upon the earth, like them which are angry at the Moons appearance: And the felf fame thing they do at the rising of the Sun.

For which caufe the ancient Kings had an observer, or one to tell them the time of the day, fitting upon one of these Beasts, whereby very accurately they perceived the Sun rising; and this they did by turning their tail against it, and emptying their bellies; for which caufe by an Oryx the Egyptians decipher an impure or godlesse wretch: for seeing that all creatures are nourished by the Sun and Moon, and therefore ought to rejoice at their appearing, only this wilty wretched diddinate and scorneth them.

The reason why they rejoice at the little Dog-star, is, because their bodies do perceive an evident alteration of the time of the year, that cold weather and rain are over-paffed, and that the vapors of the warm Sun are now depending on the earth, to clothe it with all manner of green and pleafant herbs and flowers.

There is another kinde of Oryx which according to Columella, was wont to be impaled among Deer and Harts, the flesh whereof was eaten, and used for the commodity of his Mafter: This was impatient of cold. It grew till it was four years old, and afterwards through age decreased, and loit all natural vigor.

But to return to the Oryx intended, from which we have digressed; their horns whereof we late spake, are not only strong and sharp like the horn of the Unicorn, and the Rhinocerot, but also solid, and not hollow like the horns of Harts. The courage and inward disposition of this Bealt, is both fearful, cruel, and valiant; I mean fearful to Men and Beasts, but fearless in it self: For faith my Author; Neg: omn Canis lupaturum tem, nec: apri effevoceptem feritatem, nec: tauri mugitum refugit, nec: Pantherarum trism venem, nec: ihsu Leonis vehementem mugitum perret, nec: item bominum robore movetur, ac foelo rubrum venatorem occidit: That is to fay; He feareth not the barking of the Dog, nor the roaring wrath of the wilde Boar; he flyeth not the terrible voyce of the Bull, nor yet the mounear cry of the Panthers; no, nor the vehement roaring of the Lion himfelf; and to conclude, he is not moved for all the strenge of man, but many times killeth the valiantest hunter that pursueth him.

When he feeth a Boar, a Lion, or a Bear, preently he bendeth his horns down to the earth, whereby he conformeth and eababiliseth his head to receive the brunt, flanding in that manner until the affault be made: at which time he eafily killeth his adversary, for by bending down his head, and letting his horns to receive the Bealt, he beheweth himfelf as skillfully as the Hunter, that receiveth a Lion upon his fpear. For his horns do eafily run into the breads of any wilde Bealt, and fo piercing them, caufeth the blood to issue, whereas the Bealt being moved, forgetteth his combate and falleth to licking up his own blood, and fo he is eafily overthrown. When the fight is once begun, there is none of both that may run away, but flangeth it out until one or both of them be flain to the ground, and fo their dead bodies are found by wilde and favage men. They fight with all, and kill one another, also they are annoyed with Linces, I mean the greater Linces: of the cruelty of this Bealt Martiall made this difcifhon:

Matutinarum non ultima præda ferarum
Saurus Oryx, confat qui mibi morte canum.
It is reported of this Beast, that it liveth in perpetual thirst, never drinking by reason that there is no water in those places where it is bred, and that there is in it a certain bladder of liquor, whereof who soever taphet, shall never need to drink. This Beast liveth in the Wilderness, and notwithstanding his magnanimous and unfittable strength, wrath, and cruelty, yet is he easily taken by fnares and devices of men; for God which hath armed them to take Elephants and tame Lions, hath likewise induced them with knowledge from above, to tame and destroy all other noisome Beasts.

Concerning the picture of this Beast, and the lively visage of his exterior or outward parts, I cannot express it, because neither my own sight, nor the writings of any credible Author, doth give me sufficient direction to deliver the shapre thereof unto the world, and succeeding Ages upon my credit; and therefore the Reader must pardon me herein. I do not allege the use of the flesh, or any other parts of this Beast, but only of the horns, as is already expressed, whereunto I may add the relation of Strabo, who affirmeth the Ethipian Sibyl, do use the horns of these Beasts in wars instead of swords and spears: for incredible is the hardness and sharpness of them, which causeth Xenodoch to write thus:

Ex Getulius Oryx bebetis lanitissima farto
Cediter.

For although of the own length they are not able to match a pike, yet are they fit to be put upon the tops of pikes, as well as any other artificial thing made of steel or iron; and thus I will conclude the story of this Beast.

The SCITHIAN WOLF.

Of the OTTER.

T

Here is no doubt but this Beast is of the kinde of Beavers, because it liveth both upon the water and upon the land, and the outward forme of the parts beareth a similitude of that Beast. The Italians do vulgarly call this Beast Lodra, and the Latines besides Lutra, Fluvialitis Cantucae, a Dog of the Waters; and some call them Cats of the Waters; the Latins besides Lutra, call it also Latria, and Lutra; the French, Une Loutre, or Ung Lautre; the Savoyans, Une Lautre; the Spaniards, Nutria; and the Ithians, Sidia; the Grecians, Lutra, because it theareth another of the roots of the trees in the banks of the Rivers. Some of the Grecians call it Enhydris, although properly that is a Snake living in the waters, called by Theophrastus, and Hermolaus, Lutria. Albeiro calleth it Later, and Andriz for Enhydris. Also Beazer by Sibatius; and the Grecians call filthy and thick waters Lutrai; for which cause, when their Noble ancient Women went to bathe themselves in water, they were bound about with skins called Oan Lodrida, that is, a Sheeps skin used to the water. The French men call the dung of an Otter, Esfranite de loutter; the fleps of an Otter, Lafe Marches; the whelps of an Otter, Chevas, by which word they call also the whelps of Wolves, Foxes, and Badgers.

Although they be a kinde of Beaver, as we have said already, yet they never go into the Sea, and they abound almost in all Nations, where there are Rivers or Fish-pools, as namely in Italy, France, Germany, Helvetia, England, and Scandinavia. Likewise in all Sarmatia, in the Bay of Bosphorus. They are most plentiful in Italy, where the River Padus is Joyned to the Sea. Also they abound in Naples. Their outward forme is most like unto a Beaver, faving in their tail, for the tail of a Beaver is fift, but the tail of an Otter is fith. They are lefs then Beavers, some compare them unto a Cat, and some unto a Fox; but I cannot confess unto the Fox. They are bigger then a Cat and longer, but leffer then a Fox, and therefore in my opinion they are well called Dogs of the water. They exceed in length, for in Switzia, and all the Northern Rivers they are three times so long as a Beaver. They have a rough skin; and the hair of it very soft and neat, like the hair of a Beaver, but different in this, that it is shorter and unequal, also of colour like a Chief-nut, or brownish, but the Bea

The several parts.
vers is white or ash-colour. It hath very sharp teeth, and is a very biting Beast, likewise short legs, and his feet and tail like a Dog, which caused Bellonius to write, that if his tail were off, he were in all parts like a Beaver, differing in nothing but his habitation. For the Beaver goeth both to the Salt waters, and to the fresh, but the Otter never to the salt.

Although it live in the waters, yet it doth not suck in water, but air; that is, it doth not breath like fishes through the benefit of water, and therefore it maketh his dens near the water, wherein also they are wont to bring forth their young ones: They make their dens so artificially, even as the Beaver, with bows, and spires, or licks, couching together in excellent order, wherein he fitteth to keep him from wetness. It hunteth fishes, and although it breatheth like another four-footed Beast, yet it will remain a great while under the water without respiration; for the greediness of fishes it runneth many times into nets, which are set by men in waters to take fish, whereinto being entered, it is suffocated for want of breath, before it can thereafunder the nets and make way for himself to come out.

For in the hunting of fish it must often put his nose above the water to take breath; it is of a wonderful swiftness and nimbleness, in taking his prey, and filleth his den so full of fishes, that he corrupteth the air, or men that take him in his den: and likewise infecteth himself with a recalling and noisome savour, whereupon as the Latins say of a flinking fellow, He smells like a Goat, so the Germans say of the same, He smells like an Otter. In the Winter time he comes out of the caves and waters to hunt upon the land, where finding no other food, he eateth fruits, and the bark of trees. Bellonius writeth thus of him, he keepeth in pools and quiet waters, terrifying the flocks of fish, and driving them to the bank-sides in great number, to the holes and creeks of the earth, where he taketh them more copiously, and more efficaciously; but if he want prey in the waters, then doth he leap upon the land, and eat upon green herbs, he will swim two miles together against the stream, putting himself to great labour in his hunger, that so when his belly is full, the current of the stream may carry him down again to his defigned lodging.

The females nourish many whelps together at their udders, until they be almost as big as themselves, for whom the hunters search, as for the dams among the leaves and boughs, which the over-growings of waters in the Winter time, have gathered together, and laid on heaps. It is a sharp biting Beast, hurtful both to men and dogs, never ceasing or loosing hold after he hath laid his mouth upon them, until he make the bones to crack between his teeth, whereupon it was well said by Olavo Magus, Latina mortal alia quadrato are. Otters are most accomplished biers.

It is a very crafty and subtle Beast, yet it is sometimes tamed, and used in the North to drive the fishes into the Fisher-men's nets.
The History of Four-footed Beasts.

for so great is the fragacity and fenfe of smelling in this Beast, that he can directly winde the fishes in the waters a mile or two off, and therefore the Fishers make great advantage of them, ye do they forbear his ule because he devoureth more then needeth, for he is never fo ramed, that he forgetteh his old ravening; being ramed, on the land he is very full of sport and game. I marvail how it came into the Writers heads to affirm, that the Beaver contraineth the Otter in the Winter time, to trouble the water about her tail. the intent it may not freeze, which opinion we have confurred already in the difcourfe of the Beaver; for herein I agree with Albertus. *Figer fauror es la tua, et eodijmenis dentibus, qua- proper eam vel expellis, vel occidit.* The Beaver is much stronger then the Otter, having also molt sharp teeth, and therefore either expelleth her out of the waters, because they live both upon one kinde of food, or else destroys her: wherefore it is unreasonable to believe that he preferveth her to keep his tail from freezing. The flesh of this Beast is both cold and filthy, because it feedeth upon flinking fishe, and therefore not fit to be eaten. Trogus writeth, that this notwithstanding is dresse to be eaten in many places of Germany, and I hear that the Carthusian Fryers or Monks (whether you will) which are forbidden to touch all manner of fishe, of other four-footed Beasts, yet they are not prohibited the eating of Otters. These Otters are hunted with special Dogs, called Otter-hounds, and also with special instruments called Otter-speares, having exceeding sharp points: for they are hardly taken, and Beasts do not willingly set upon them, specially in the waters: when they feel themselves to be wounded with the speare, then they come to land, where they fight with the Dogs very irrefullly, and except they be first wounded, they forfake not the waters: for they are not ignorant how safe a refuge the waters are unto them, and how unequal a combate they have with Men and Dogs upon the land, yet because the cold water annoyeth their green wounds, therefore they spin out their lives to the length of the thread, chufing rather to die in torments among Dogs, then to die in the waters. There is a kinde of *Afa* called *Benion*; a strong herb which being hung in a linen cloth near fishe-ponds, driveth away all Otters and Bevers. The hair of the skin is most soft, neither doth it leefe his beauty by age; for which caufe as alfo for that no rain can hurt it, when it is well dresse it is of great price and elimation, and is fold for vein or eight shillings: thereof also they make fringes in hems of garments, and face about the collars of men and womens garments, and the skin of the Otter is far more precious then the skin of the Beaver; and for this caufe the Swetian Merchants do transport many into Muscovia and Tartaria for cloves and other garments.

Thereof also in Germany they make caps, or else line other caps with them, and also make flocking-soles; affirming that they be good and wholesome against the Palfie, the Megrim, and other pains of the head. The bloud of an Otter is prescribed against the swelling of the Nerves. The Liver dried in an Oven against the Bouldy-flix, and against the Colick being drunk in Wine. The flones are also prescribed to be given against the Falling-ticknes, and all pains in the belly. And thus much for the Otter.

There be certain Beasts which are kynedes of Otters, which beece they live in the waters, and yet being unknown to us in England, I have thought good to express them in this place by their Greek, and Latin names. In the first place that which the Grecians call Latax, broader and thicker then an Otter, and yet liveth in the waters, or else goeth to the waters for his food, yet breatheth air and not water like Otters. The hair of this Beast is very harth, betwixt the fimilitude of a Sea-calf and a Hart, and it hath also strong and sharp teeth, wherewithall in the night feaon they shear under small boughs and twigs: It is called also tafios, Lamakyc, and Noerza.

There is another called Satyrium, and Fafluros, and Chrabalus, whose skin is black, and very pretious, and very much used for the edging of the best garments: these live also in ponds, lakes, and sill waters.

There is a third kinde called Satherium, Koeboben, and Kochymen, and Martaurus, having a white throat, and being as big as a Cat; and finally unto these may be added Porus, a four-footed beast living in the waters in the River Iflber: And Mezalos another four-footed beast living in some Rivers of India, being as big as a Calf.
Of the Panther.

Of the Panther, commonly called a Pardal, a Leopard, and a Libbard.

Here have been so many names devised for this one beast, that it is grown a difficult thing, either to make a good reconciliation of the Authors which are wed to their several opinions, or else to define it perfectly, and make of him a good methodical History; yet seeing the greatest variance hath arisen from words, and that which was devised at the first for the better explication and description of it hath turned to the obfuscation and shadowing of the truth, I trust it shall be a good labour to collect out of every Writer that which is most probable concerning this Beast, and in the end to express the bell definition thereof we can learn out of all.

First of all therefore for as much as all the question hath arisen from the Greek and Latin names, it is most requisite to express them, and shew how the different construction began. The Graecians do indifferently call Pardalos, Pardalis, and Panther the Latin, Panthera. Pardalis, Pardos, and Leopards, and these names are thus distinguished by the learned. Pardalis they say signifies the male, and Pardalis the female, and also Panthera among the Latins for the female, and Pardus for the male, and there are understood of a fimple kind without commixture of generation. Leopards the Leopard or Libbard, is a word devised by the later writers, compounded of Leo and Pardus, upon opinion that this Beast is generated betwixt a Pardal and a Lion, and so indeed it ought properly to be taken, if there be any such. Pliny is of opinion, that Pardus differeth from Panthera in nothing but in sex, and other way, that betwixt the Lions and the Pardals there is such a confused mixed generation as is betwixt Asses and Mares, or Stallions and Asses: as for example, when the Lion covereth the Pardal, then is the Whelp called Leopards, a Leopard or Libbard, but when the Pardal covereth the Lion, then it is called Panthera a Panther.

In this controversy the Hebrew and Arabian names which are generally indifferently translated Panthers or Libbards, do take up the strife and almost end the controversy, for Namen in Hebrew, and ALib or Alihed in Arabic, are so translated both in holy Scripture, and also in Avicen, as may appear by these places following, Eza. 11. Habitabit Lupus cum agno, &c. (Namen) Pardos cum hacta ac- cubabit. That is to say, The Wolf shall dwell with the Lamb, and the Pardal, Libbard, and Panther shall lie with the Kid. So in the vision of Daniel, chap. 7. among the four beasts coming out of the Sea, the Prophet feeth Namen a Leopard. In the 13. Revel. of S. John, he feeth another Beast rising out of the Sea, having ten horns, and he feith it was like Pardal, which Erasmus translateth Pardo, a Leopard. Jer. 5. Pardus (Namen) vigilat super civitatem eorum, ut omnem inde egrediem discepat. That is, a Panther or Pardal watcheth at the gates of the City, that he may tear in pieces every one that cometh forth. Falsus sun est ficut Leo, & ficut Pardus (ficut Namen) directus ad viam suam. For Namen in that place the Graecians translate Pardalis, a Pardal. In the 13. Jer. Si miserum postit Aschips pilum suam, aut Pardus malleas aetcri, &c. aut potestis beue facere, cum diueritatis malum. If the Blackmoore can change his skin, or the Leopard his spots, then may you do as which have learned to do. Cant. 4. Convertens de verrute Siner, & Hermou, de cubilibus Leorum de manibus Partherum. That is, Thou shalt be crowned from the top of Siner and Hermou, from the dens of the Lions, and the Mountains of the Leopards. Now according to Boecadus, the Mountain of the Leopards is distant from Tripolis, in the holy land two leagues.
A more exact definition of Pardals and Leopards.

leagues, <i>Lejis</i> and <i>Aurici</i>, two <i>Arabian</i>, do call the Panther and Leopard by one name, <i>Aigeb</i>, or <i>Albip</i>, so that by comparing all these together, the Panther, Pardal, Libbard, and Leopard, are but one Beast, called by divers names. For the farther manifesting hereof, it is good to examine what is said of the Pardal and Leopard in particular, that so having expressed that, it may be clear by the discourse proceeding, that there is no difference betwixt them and the Panther, or very small. First of all therefore it is said of the <i>Pardus</i>, that it differeth not from the Panther, but only in sex, and that the skin hath received a natural tincture of divers spots. <i>Aigeb</i> writeth thus of it, <i>Cumi Chamaelionis diffidium</i> &c. at <i>Pardus</i>. The skin of the Chamaelion is spotted like a Pardal, and in relation of <i>Lampridus</i>, where he sweareth how <i>Hellogale</i> was wont to shut up his drunken friends, <i>sum Lenibas</i>, <i>Pardus</i>, & cts, <i>in ut capergetudini in cubiculo edem Leones</i>, <i>ex</i> <i>Pardos cum luere</i>, <i>vel quod est</i> graus, <i>ut</i> herbavent, <i>ex</i> <i>quo</i> <i>pleni</i>, <i>examini sunt</i>, and fo forth.

By which words it is apparent, that those which in the first place he calleth Leopards, in the last place he calleth Pardals, and the only difference betwixt the Leopard, Pardal, and Lion, is that the Leopard or Pardal have no names: and therefore they are calleth <i>Lygosides Leones</i>. <i>Idibus</i> and <i>Salam</i> write in this manner: <i>Pardus secundum</i> <i>ex</i> <i>Pantheram</i> <i>ex</i> <i>genus</i> <i>varum</i> <i>ac</i> <i>velocissimium</i>, & <i>ex</i> <i>praecipu ad</i> <i>fugium</i>, <i>salu</i> <i>ad</i> <i>morim</i> <i>ruit</i>, <i>ex</i> <i>ad</i> <i>ulteria Pardi & Leone</i>, <i>Leopards</i> <i>nasifur</i>, & <i>tortiam originem</i> <i>effect</i>. That is to say, the Pardal is the next kinde to a Panther, being divers coloured and very swift, greedy after blood, and catcheth his prey by leaping: the Leopard is bred betwixt the Pardal and the Liones, and so maketh a third kinde: by which testimonie it appeareth that these names make three severall kindes of Beasts, not distinct in nature, but in quantity, through commixture of generation.

The greater therefore they call Panthers, as <i>Bellus</i> <i>uni</i> <i>atur</i> writeth. The second they call Pardals, and the third, leaft of all, they call Leopards, which for the same cause in <i>England</i> is called a Cat of the Mountain. And truly in my opinion, until some other can shew me better reason I will subscribe hereunto, namely that they are all one kinde of Beast, and differ in quantity only through adulterine generation. For in <i>Africa</i> there is great want of waters, and therefore the Lions, Panthers, and other Beasts do assemble themselves in great numbers together at the running Rivers, where the Pardals and the Lions do engender one with another: I mean the greater Panthers with the Liones, and the greater Pardals with the Panthers; and fo likewise the smaller with the smaller, and thereby it cometh to pass that some of them are spotted, and some of them without spots.

The Pardal is a fierce and cruel Beast, very violent, having a body and mind like ravening birds, and some lay they are ingendered now and then between Dogs and Panthers, or betwixt Leopards and Dogs, even as the <i>Leporckens</i> are ingendered betwixt Wolves and Panthers. It is the nature of these Pardals in <i>Africa</i>, to get up into the rough and thick trees, where they hide themselves amongst the boughs and leaves, and do not only take birds, but also from thence leap down upon Beasts and Men when they pity their advantage; and all these things do belong unto the Panthers.

Concerning the Leopard, the word it self is new and lately invented, for it is never found among any of the ancients, before <i>Julius Capitium</i> or <i>Spartianus</i>. <i>Sylvatikus</i> maketh no difference betwixt <i>Pardalum</i> and <i>Leopardum</i>, and the <i>Italians</i> generally call a Pardal Leopards, and never <i>Pardo</i>, except some of the Poets, for brevity sake in a verse. The Leopard is like to a Lion in the head and form of his members, but yet he is softer and nothing so strong: by the sight of a Leopard's skin <i>Geiger</i> made this description of the Beast:

The length (saith he) from the head to the tail, was as much as a mans stature, and half a cubit. The tail of it felt three spans and a half, the breadth in the middle three spans, the colour a bright yellow distinguishe into divers spots, the hair short and mouife.

The price of the skin was about five nobles, or forty shillings, for they differ in price, according to the Regions out of which they are brought, they which come farthest are sold dearest, and they which come leas way are sold cheapest. It is a wrathful and an angty Beast, and whensoever it is sick, it thistleth after the blood of a wide Cat, and recovereth by sucking that blood, or else by eating the dung of a man. Above all other things it delighteth in the Camphory tree, and therefore lyeth underneath it, to keep it from spoil, and in like fort the Panther delighteth in sweet gums and spices, and therefore no marvel if they cannot abide Garlick, because it annoyeth their sense of smelling; and it is reported by <i>S. Ambrose</i>, that if the walls of ones house or sheep-coat be anointed with the juice of Garlick, both Panthers and Leopards will run away from it, but of this matter we shall lay more afterwards.

The Leopard is sometimes tamed, and used in head of a Dog for hunting both among the Tartarians, and other Princes, for they carry them behind them on Horse-back, and when they see a Deer or Hart, or convenient prey, they turn them down upon them sodainly, who take them and destroy them; yet such is the nature of this Beast, as also of the Pardal, that if he doe not take his prey at the fourth or fifth jump, he falleth so angry and fierce, that he destroyeth whomsoever he meeteth, yea many times his Hunter. Therefore the Hunters have always a regard to carry with them a Lamb or a Kid, or some such live thing, wherewithal they pacifie him after he hath made his game, for without blood he will never be appeased; and thus much shall suffice to have spoken of the difference betwixt Panthers, Pardals, and Leopards, and their several names in <i>Greek</i> and <i>Latin</i>, from whom almost all Nations do derive their denomi-
Of the Panther.

denomination, for the last ius call it Leopardo; the French, Leopard, and Luipard; and German, Lip-.
vard, and Lemberg and Pantherstier; the Spaniards, Leoparal, and Leopardo; the Illyrians, Leohados.
the Chaldeans, Nimrod, and some make no difference betwixt this and the Arabian Wolf: The reason of
the Greek word Pardalis, or Pardalis, (for they signify both one) seems to me in most proba-
ality to be derived from the Hebrew word Par, signifying a Garden, because as colours in a Gir-
den make it spotted, and render a fragrant smell, so the Panther is divers coloured like a gar
d WN flowers, and also it is said to carry with him a most sweet favour whither forever he goeth,
and in ancient time they made their Ivory tables standing upon pictures of Panthers,
whereof Jowett wrote thus in one of his Satyres:

Omnex quaevi aboro mensa ficta,
At nunc virilium carmen nulla voluptus
—nisi jumilium artes

Grande eur, & magna sublimis Parus statu,
Dentibus ex illis quos mitit porta Syrens
Jam nimis capitis gravis, Etc.

For the same cause Pardalis was the name of a notable Harlot, for as the Panthers by their sweet
smells draw the Beasts unto them and then destroy them, so also do Harlots deck and adorn them-
theselves with alluring provocations, as it were with enchanted odours, to draw men unto them, of
whom they make spoil and rape: There is a precious stone also called Lapis Pantherus, brought out
of India, whereupon if a man look before the Sun-rising he shall see divers colours, namely, black,
red, green, rufes, purple, and Roa colour, and they say it hath as many virtues as it hath colours,
but I will not to follow the name any further.

The Countries breeding Panthers are Arabia in the Kingdom of Melarca, in the Ile of Sumatra.
Likewise in Africa, especially Syria, for there are none in Europe, all Africa over they are plentiful, as
in Libya and Mauritania, where about all Iore of wilde Beasts: Likewise beyond Cadirus; for Ap-
pli and his companions saw there many Lions and Panthers. In Arabia the furthest part, namely
the Promontory of Dyra towards the South, are the strongest Pards of the world, (as faith Strabo;)
Likewise in the Mediterranean Region beyond Barareza toward the South, unto Doctinabades, and to-
wards the East are all sorts of wilde Beasts, both Tygers and Panthers; and Dideron write that
in that part of Arabia, joining upon Syria, there Lions and Pards are both more in number and
greater in quantity then in Libya.

Also it is said by Valatarsus and Gallus, that the Panther of Lycaon and Caria are very long, but yet
weak and without carriage, being not able to leap far, yet is their skin so hard as no Iron can pierce.
Between the River Ganges and his bofis, Apollonius saw many Panthers. The Indians also breed many
and make them tame, and Leopards do live in the Woods of Barbadoes.

It is apparent by that which is already said, that the Panther isthe name of the greater Pardal,
and the Leopard of the lesser, which the Arabians call Alohen, and Al fine, Alohen is bigger then
a Lynx, but like a Leopard, having greater and sharper nails and feet, black and terrible eyes, and
then stronger, fiercer, and bolder then the Leopard, for it seeketh upon men, and destroyeth them.

Opiusus describeth both kinds in this manner; There are( faith he) two kinds of Par-
dalis, a greater and a lesser, the greater are broader back, and bigger in quantity, the lesser being,
less in quantity, but not inferior in strength; both of them have the same shape and colour of
body, except in their tail: for the greater Pardal hath the lesser tail, and the lesser either:
 either of them have solid and found thigs, a very long body, bright red eyes, the apples where-
of do glister under their eye-lids, which are gray and red within like to burning coals, their teeth
pale and venemous, their skin of divers colours, yet bright and pleasant, the spots standing like
many black eyes upon it: thus far Opiusus. Such skins are sometimes fold in the Marts of Europe,
which are brought in bundles twenty or thirty together, and it is not to be forgotten, which Pola-
teron cuteth out of Elium, that there is in this kind of Pardal a Beast called Eule, not unlike to
the vulgar Leopards in all parts, except that it wanteth a tail; and they say that if this Beast be seen
by a woman, it will infamously make her to be sick; but to proceed to the residue of the parts of these
Beasts, we must remember that which Aristotle wretteth in his Phisicognomy: it is recorded by Ada-
manus: Leoperdalis maner idean pro se fort, Pardalis vero feminam formam exprimit, crubbi-
tum excepit, quibus ad inroculendum softire illitur, that is to say: Among all Beasts the Lion doth
most resemble the male, and the Pardal the female, except in the legs where the male to take her
prey,

As it hath a little face, a little mouth, little eyes, somewhat white, plain, and not much hollow, a long
forhead, ears rather round then smooth or broad, a neck very long and slender, the breast not
well set out with ribs, because they are small; the back long, the buttocks and thighs very fleshy, the
parts about the small of the belly or loins are more smooth, less hollow and bouncy; the colour dis-
cours, and the whole body inarticulate, and not well compounded the outward firk: ( for it is to
be remembered faith Carus) that all ravening Beasts are like a Cat, as Lions, Panthers, Lynxes,
and Pards, for they have in common the length and strength of their claws, beautiful party col-
loured skins; a little head and round face, a long tail, nimbleness of body, and widnes of nature,
living upon the near the they get in hunting.

The Persians call a Pardal Barbert, and Scaliger describeth it thus: In his red or yellow hair he is
like a Lions, but feth with divers black spots both in length and breadth, as if they were painted.
In hath a browne face, asperated with black and white, and it is to be remembered, that as other

Beasts.
The History of Four-footed Beasts.

Beasts are either all black, or all red, or all white, or all of one colour by nature, so also it is natural to Pea-cocks and Panthers, to have divers colours in them, for there are in Hircania Panthers with little round spots like eyes, both black, white, blew, and green, as both Solinus and Claudius tell, which caused Martial to write thus; Pito quod juvenescit, color juvenescit. There is a land called Terraramborum, inhabited by the Troglodytes and Sarazen in Libya, where the upper face of the earth is compared unto the Panthers skin, because through the heat of the Sun it is burned, and died as it were into divers colours; so that ye shall fee divers spots of white, black, and green earth, as if it were done of purpose by the hand of man. The teeth of the Panther are like faws as are also Dogs and a Lions; their tongue of such incredible sharpnesses, that in licking it graeth like a file.

The males have four udders in the midit of their belly, the heart is great in proportion, because he is a violent Beast, terrifying man. There are many figures in their feet. Their former feet have five distinct claws or fingers, and their hinder-feet but four, for little ones among four-footed beasts, have five fingers upon their hinder-feet: when they go, they hide their nails within the skin of their feet, as it were in sheaths, never bringing them forth but when they are in their prey, to the intent they should never be broken nor dulled. Their tails have no long hairs at the end like a Lions or Oxes, and the Leopard hath a wider mouth then the Pardal.

The female is oftener times taken then the male, the reason is given by Velateran; because she is inford to seek abroad for her own meat and her young ones. The place of their abode is among the Mountains and Woods, and especially they delight in the tree Camphory. They raven upon flesh both Birds and Beasts: for which cause they hide themselves in trees, especially in Maurikos, where they are not very swift of foot, and therefore they give themselves to take Apes, which they attain by this policy: when they see the Apes, they make after them, who at their first approaching chime up into the tops of trees, and there fit to avoid the Panthers teeth, for he is not able to follow them so high, but yet they can cut the Apes, and therefore make with more fight then to take them, that where nature hath denied her bodily power, there she might supply that want by the gifts of the minde. Forth therefore the goeth, and under the tree where the Apes are lodged, she lyeth down as though she were dead, stretching out her limbs, and restraining her breath, flushing her eyes, and shewing all other tokens of expiration. The Ape that fit on the tops of the tree behold from on high the behaviour of their adversary, and because all of them with her dead, they more easily believe that which so much they desire, and yet dare not defend to make tryst. Then to end their doubts, they chuse out one from among them all, whom they think to be of the best courage, and him they send down as it were for an eyry, to certify all the residue: forth then he goeth with a thousand fears in his minde, and leapteth from bough to bough with no great halt; (for dread of an ill bargain:) yet being come down, darest not approach nigh, but having taken view of the counterfeit, and repressed his own fear, returneth back again: After a little space he defendeth the second time, and cometh nearer the Panther then before, yet returneth without touching him. Then he defendeth the third time, looking into his eyes, and maketh trial whether he draweth breath or no, but the Panther keepeth both breath and limbs immovable, by that means imboldning the Ape to their own destruction; for the Spie-ape fitteth down beside the Panther, and fitteth not: now when those which are above in the tree, see how their intelligence abideth constantly beside their adversary without harm, they gather their spirits together, and descend down in great multitudes, running about the Panther, first of all going upon him, and afterwards leapin with great joy and exultation, mocking this their adversary with all their apith toys, and reffifying their joy for her supposd death: and in this fort the Panther fuffereth them to continue a great seafon, till he perceieth they are thoroughly wearied, and then upon a sudden he leapeth up alive again, taking some of them in his claws, destroyin and killing them with teeth and nails, till he have prepared for himself a rich dinner out of his adversaries flesh. And like as Ulysses endured all the consuemes and reproaches both of his masts and Wives fisters, until he had a just occasion given him of revenge, so doth the Panther the disdainful dealing of the Ape: whereupon came the proverb, Eadi mortem dissipamin, Tumam Pardales hypemnimus, against a cunning difsembling fellow, such a one as Brum was, who counterfeited madness that he might get the Empire.

So great is the love of this Beast to all Spices and Aromatical trees, that they come over all the Mountain Taurus through Armenia and Sylia, when the windes bring the favour of the sweet gum unto them, out of Pamphulia from the tree Storax: whereupon lyeth this Rory; There was a certain Panther which was taken by King Ariaces, and a golden collar put upon his neck, with this inscription: Rex Ariaces Deo Nifae, that is, King Ariaces to the God Bacbus: for Bacbus was called Nifae, of a City Nifae in India. This Beast grew very tame, and would suffer himself to be handled and broked by the hands of men, until the Spring time that he winded the favour of the Aromatical trees, and then he would run away from all his acquaintance, according to his kind, and so at last was taken in the neather part of the Mountain Taurus, which was many hundred miles diant from the Kings Court of Armenia.

We have shewed already how they love the gum of Camphory, watching that tree, to the end to preserve it for their owne, and indeed as Aelius faith: Admirabilem quanam odoris suavissimam ... Pardalos, quam bene edendi prescribant divini munere donantes, cum fidi praecriam plane tene, tum vero cetera animalia ejus banc vicem praclare fientium: that is to say, The Panther or Pardal smelleth most sweetly.
sweetly, which favour he hath receives from a divine gift, and doth only feel the benefit of it himself, but also bewray unto other Beasts: for when he feeth himself to be hungry and stand in need of meat, then doth he get up some rough tree, and by his favour or sweet smell, draweth unto him an innumerable company of wilde Goats, Harts, Hoes, and Henders, and such other Beasts, and so upon a sudden leapeth down upon them, when he epyeth his convenient time.

And Salmoius faith, that the sweetnefs of his favour worketh the same effect upon them in the open fields, for they are so mightily delighted with his sported skin and fragrant smell, that they will always come running unto him from all parts, thriving who shall come nearest him to be satisfied with the fight, but when once they look upon his fierce and grim face, they all are terrified and turn away: for which cause the subtle Bealt, turneth away his head, and keepeth that from their sight, offering the more beautiful parts of his body, as an alluring bait to a Moufe, and destroyeth: and from hence there are some which are of opinion, that he receiveth his name Panthera, of congregating together all kinde of Beasts to look on him, for Pan signifies all, and Theseis signifieth Beasts. Albertus is of opinion, that the report of the Panthers favour or sweet smell is but a fable. because (he faith) it is written as a Maxim among Philosophers, that Cetera animula praeter hominem rea, sauvatori neque, molestia adhibunt usque, that is: That no creatures (man excepted) can be fained either sweetly or sourly: and Theophrastus writeth, Animal nulhum panter adhaim est nisi quum discerit Paradisum, bellumum cenjui bene ole, that is: There is no creature that can be fain to be so odorous, except the Pardal foom to smell well to the incents of other Beasts: for it is certain, that there are some favours and incents which Beasts do follow and refuse, being led thereunto only for the choice of their meat; for by their noses they chose that which is the convenient and agreeable to their natures, but that they should be drawn by any favours or merits merely, and for no other cause but the pleasure of the incents, as it is a reasonable part in man, so it is unreasonable, to attribute the very fame unto a Bealt.

Yet herein by the favour of Albertus I differ from him, for it being granted, which all men yeeld unto, that either the spots of his skin, which feem to be as many eyes as colours, or else the sweet favour which cometh from him is the occasion of the Beasts assembling about him: then followeth, that when he is from the earth, and lodged in a tree, and so not visible to the eyes of the bealls, if then I say they assemble about the tree wherein he is lodged, there is no cause to draw the Bealts unto him, but the attractive power of his sweet favour: and what want of reason can it be justly deemed, to say that Beasts love sweet favours, seeing both Albertus, and all other learned men that I know, do confidently affirm, that many wilde Beals do forfaie their meat to hear musick: and also the Badger doth forfaie his own den when he perceiveth the Fox hath emptied his belly therein.

Therefore I will conclude this point with admiration of the work of the Creator, to consider how wisely he hath disposed his goodnes, and how powerfully he communicateth the affections of his divinity even unto brute Bealls, who doth not diftinguish them more otherwise by their outsides and exterior parts, nor yet by their insides and qualities of their mindes, but also by the air they draw in, and the favour they send forth.

Among all kinde of Beals the male is most courageous and fierce, except in Bears and Panthera, for the female Panther is more generous then the male. At the time of their lust, they have very peculiar voices, which caused the Poet to write thus:

Panther caruit amans, Pardus blandz felit.

At the found of those voices other Beasts come about them, as both Lions, Lionesses, Wolves, and Thoes. They never bear above once, because when the young ones begin to fhir in the dam's belly, and gather strength for birth, they cannot tarry the just time of their delivery, but tear out the womb or bag wherein they lie with the sharpnes of their nails, and therefore their dam is forced for the avoiding of pain to call them forth of the womb both blinde and deformed, which yet the nouriheth tenderly, but afterwards can never conceive again, by reason that her womb is so torn with the claws of her first whelps, that it is not able to remain to perfection the received seed of the male.

Panthers live together in flocks or herdes, and greatly delight in their own kinde, but in no other that I know, and therefore I wonder from what Author Iseuros writeth. Panther omnis animium amicos el excepto Dragon. That the Panther is friendly to all Beasts except the Dragon. It was not in vain, that the Poets feigned the Nurse of Beroeus to be turned into Panthers, and that they devoured him, because he said upon Beowulfe: for as a Lion doth in mult things imitate and resemble the very nature of Man, so after the very self same manner doth the Panther of a Woman, for it is a fraudulent, though a beautiful Bealt, or (as Adamantius writeth) panthera ingenium mollc ell, efamfratam, fracoam, insidijcum, & fraudulentam, timidum fimul & audax, his musculus corporis titam forma respondit: that is: The disposition of the Panther is wanoen, effeminate, outrageous, treacherous, deceitful, false, and yet bold: and for this occasion, in holy Scriptures it is joined with the Lion and the Wolf, to make up the triplicity of ravening Beals: and therefore also we read, that the wise of the Egyptians, when they will signifie a cunning man covering the secret corruption and evil disposition of his minde, pretending good, and yet intending evil, they picture
a Panther; for we have chanced already, how he doth cover both his head and his body to take
his prey.

This Beast is never so tame but that he falleth into his wilds fits again. Their love to their young
ones is exceeding great, for if at any time while they are abroad to forage, they meet with Hunters
that would take them away, they fight for them unto death, and save them from blows. Interpose
their own bodies, receiving mortal wounds, but if they finde their young ones taken out of their den
in their absence, they bewail their los with loud and miserable howling.

Demetrius, the Philosopher, relateth this story of a Panther, that lay in the high way to meet
with a man to help her young ones out of a ditch or deep pot wherein they were fallen, at length
there appeared in her sight the father of Philippus a Philosopher, who prefently began to run away
as soon as he saw the Beast, but the poor disreased Panther rowled after him in humble manner, as
though she had some fate unto him, and took him lightly by the skirt of his garment with one of
her claws: the man perceiving that the gave suck by the greatness of her Udders hanging under her
belly, began to take pity upon her, and layed away fear, thinking that indeed which happened, that
her young ones were taken from her by one means or other; therefore he followed her, the drawing
him with one of her feet unto the cave whereunto her young ones were fallen, out of which he delivered
them to the mother as ranfome for his own life, and then both the and the young ones did
follow him rejoicing, out of the danger of all Beasts, and out of the Wildernefs, dismilling him
without all manner of harm, which is a rare thing in a man to be so thankful, and much more in a
Beast: and unto this story of their love and kindnecfs to their young ones, I may add another, wort-
ythy to be remembered out, of Philippus:

There was (faith he) a man which brought up a tame Panther from a whelp, and had made it fo
gentle, that it refused no society of men, and he himself loved it as it had been his wife. There
was also a little Kid in the Houfe brought up tame, of purpose to be given unto the Panther when
it was grown to some stature or quantity, yet in the mean while the Panther played with it every
day: at last it being ripe, the Master killed it, and laid it before the Panther to be eaten, but she
would not touch it, whereupon he failed till the next day, and then it was brought unto him again, but
he refused it as before; at last he faid the third day, and making great moan for meat, according
to his usual manner, had the Kid laid before him the third time; the poor Beast seeing that nothing
would serve the turn, but that he must either eat up his chamber-fellow, or else his Master would
make him continually fail, he ran and killed another Kid, disdaining to meddle with that which was
his former acquaintance, yea though it were dead: herein excelling many wicked men, who do not
pare those that have lived with them in the greatest familiarity and friendship, to undo and over-
throw them alive for the advancement of themselves.

The harms of

Panthers.

West have said already, that they most of all resemble Women, and indeed they are enemies to all
creatures. The Leopards of Barbary do little harm to men that they meet, except they meet them in
some path way where the man cannot decline the Beast, nor the Beast the Man, there they leap most
forcibly into his face, and pull away as much fether as they can lay hold upon, and many of them with
their nails do pierce the brains of a man.

They use not to invade or force upon flocks of Sheep or Goats, yet wherefoever they see a Dog,
they insatiably kill and devour him. The great Panther is a terror to the Dragon, and so soon as the
Dragon feeth it, he flyeth to his cave. The leffer Panthers or Leopards do overcome Wolves being
ingle, and hand to hand as we say, but by multitude they over-matter and destroy him, for if he
endeavour to run away, yet they are swifter and easily overcome it.

There is alfo great hatred and enmity between the Hyena and the Panther, for in the preface of
the Hyena, the Pardal dare not reft; and that which is more admirable, if there be a piece of an
Hyenas skin, about either man or beast, the Panther will never touch it, and if their skins after they
be dead be hung up in the presence of one another, the hair will fall off from the Panther; and
therefore when the Egyptians would dignifie how a Superiour was overcome by a Inferiour, they
picture those two skins. If any thing be anointed with broath wherein a Cock hath been foddern,
neither Panthers nor Lions will ever touch it, especially if there be mixed with it the joyce of
Garlick.

Leopards are afraid of a certain tree called Leopards-arbor, Leopards-tree. Panthers are also
afraid of the skull of a dead man, and run from the sight thereof: yet it is reported, that two
year after the death of Francc King of France, two Leopards, a male and a female were left unknoc-
ked in France into the Woods, either by the negligence or the malice of their Keepers, that is, a male
and a female, and about Oreianre tore in pieces many men and women; at last they came and killed
a Bride, which was that day to have been married, and afterward there were found many carcufes
of Woman destroyed by them, of which they had eaten nothing but only their breasts: Such like
tings taught express many in this place, whereby the vengeance of Almighty God against man
kind for many sins, might seem to be executed by the raging miniftrey of wildlife, savage, and un-
genteel Beasts.

For this cause we read in ancient time how the Senators of Rome gave laws of punishment against
them that should bring any Panthers into Italy, especially any Africain Beasts: and the first that
gave dispensation against those laws was Cneius Ascidius the peoples Tribune, who permitted them
for the sake of the Circenian games: and then Senecam in the office of his rudiility brought afio in an
hundred and fifty: After him Pompey the great, four hundred and ten, and laftly Angulius that ever
remem-
Of the Panter.

remembered and renowned Emperor, four hundred and twenty. Thus laws which were first made by great men and good Senators, for the safety of the common-wealth, became of no great value, because as great or greater then the Law-makers, had a purpose to advance themselves by the practise of those things which law had juttly forbidden: for if those decrees had stood effectual, as the victorious Champions had lost that part of their vain triumphs, so many people had afterward been preserved alive, who by the cruelty of these Beasts were either torn in pieces, or else received mortal wounds.

It was not in vain that the blessed Martyr of Jesus Christ Ignatius, who was afterwards torn in pieces by wilde Beasts at Rome, did write thus in his Epistle to the Roman Christians concerning his handling by the Roman Souldiers, as he was brought prisoner out of Syria to Rome. *A Syria Romana, cuius spiritus de morte terminatur, die tolle quibus cum domum Leopards, etc., etc.*

The nature of tame Panthers. The taking of Panthers.

The taking of Panthers. Disconsolates.

There is a kind of Henbane which is called Fardelankscher or Libbard-bane, which the Inhabitants of Syria are wont to use in the Mountains for the destroying of Leopards, Pards, and Panthers. This herb is not much known at this day, yet I take it to be the same which grew in many places of France, and Spain, and it is called Tara, by the root thereof beaten to powder, and stopped up in fith, north of the Alps, but also Wolves and Swine, as wilde Boars are destroyed, if they talk thereof: when the Beast perceiveth himself poysoned, presently he seeketh for mans dund, for without that he cannot be delivered; wherefore the Hunters do also place near unto it some veffel of it hanging in a tree, with the mouth or way open that leadeth into it, whereinto the greedy Beast leapeth, and being in, cannot get forth again but rather dyeth with hunger, or else is taken and killed; or else the veffel is hanged up so high, that the Beast by straining himself to leap into it, and get his desired medicine, (but all in vain) doth spend out the time of his recovery till the poyson hath thoroughly corrupted his body, and every part and member, for otherwise he doth not live to his adversary, although his guts and intrails hang about his legs out of his belly.

Therefore the Panthers of Syria do more often perish by poyson then by other violence of Swords, Spears, or Dogs: for by this poyson the Beast many times falleth to such a loozeness of his belly, and withal such a weakness thereby, that he is taken alive. Likewise in Armenia there are certain Fishes which are poyson to Lions, Beasts, Wolves, Lynxes, and Panthers, the power of this fish the Inhabitants put into the sides and feth of their Sheep, Goats, and Xydes, without all harm to these Beasts; but if the Panthers or any ravening Beast come and devour any of those Sheeps so dreeded, presently they die by poyson.

When they are hunted and forced in the presence of the Hunters, then they leap directly unto their heads, and therefore the Hunter taketh great care both of his standing and also of holding his spear, for if he receive not the Panther in his leap, and gore him to the heart, or else otherwise wound him mortally, he is gone, and his life is at an end. *Oppidum also sheweth, that he is taken as Lions are, especially by these means following:* for when the Hunters perceive the way or path which he useth to his water, therein they make a deep ditch (but not so great as they make for a Lion) whereon they erect a wooden pillar or great post, unto that they tie certain engins, and withall
withall a male little Dog, whose stones or tender cords they binde with some string or cord, so as the young beast may whine and cry for pain, by which voyce he inviteth and calleth the Panther to his destrucion: For the greedy beast wending the voice of the Dog, belittreth himself to meet with his defined prey or booty; at last finding the ditch, and seeing the Dog down, he leapt, where the engins take pretent hold upon him and destroy him: and so he describeth the same means to take great fishes by the fight of little fishes swimming in a Net.

In hunting of wilde beastes the wary Wood-man must make good choice of his Horfe, not only for the metal and agility which are very necessarie, but also for the colour, as we have already expreffed in the story of the Horfe: for the gray Horfe is fitteth for the Beare; and moft terrible to him; the yellow or fire colour against the Bore; but the brown and reddith colour against the Panther.

The Mores also use other devizes to take Panthers and all such noifome beastes, they enclofe in a little house certain rotten flefh, which by the favour thereof when it thinketh, draweth the wilde beastes unto it: For they make a dore, or a gate of reeds unto the fad house, through which the filthy smell breaketh out and differeth it fell into the wide air; prefently the wilde beastes take it up, and follow it with all speed they can,for there is not any Musk or other sweet thing wherewithal men are so much delighted, as ravening beastes are with the favour of carnion: therefore like an amorous cup it draweth them to the snare of perdicion: for beside the rotten flefh, they erect many engins and unavoidable traps to snare in the beaft when he cometh to raven.

The Christians of Africa, did institute a general hunting of Leopards, inclosing the ends of the ways through which the beastes were to pafs: The Leopard when he was flitted ran to and fro distracted, because in all his paffages he found Horfe-men ready to refift him, neither left they any way for him to escape: at length wearied with many windings, turnings, and provocations, the Horfemen might easily come unto him and pierce him with their spears: but if it fortunate that the Leopard escaped, and brake away from the Hunters; then he at whose corner he brake forth, was bound by ancient custome to make the residue a dinner or banquet.

Among the Chalmoni, there was a certain young Nobleman which loved a Virgin called Antippe, the which two lovers were walking together a good feanon in a Wood: It happened while they were there, that Cibyra the Kings Son profecuted a Pardal in hunting: which was fled into that Wood, and seeing him, bent his arm against him and call'd his Dart: the which Dart miffed the mark and killed the Virgin Antippe, the young Prince thought that he had flain the beaft, and therefore drew neer on Horfe-back to rejoice over the fall of the game, according to the manner of Hunters; but at his approach he found it far otherwise, for in heed of the effufion of the blood of a beaft (that which was more lamentable) his right hand had flied the blood of a Virgin: For when he came to them he faw her dying and drawing her laft breath, and the young man held his hand in the wound to flanch the bldou: for sorrow whereof he prefently fell distracted in his minde, and ran his Horfe to the top of a fharp Rock, from whence he call'd down himself headlong and fou perifhed.

The Christian after they underſtood this fearful accident, and the reaſon of it, compaſsed in the place where he felle with a wall, and for the honour of their dead Prince built a City where he loft his life, and called it Cibyra after his own name.

Leopards and Panthers do also love Wine above all other drink, and for this caufe both Bacchus was refembled to them, and they dedicated to him: Bacchum sacro affimilant & Pardalis, quod homines ebrietatis etuiam ingenia referant, & omnino violenter agant, quidem enim tunc simul frumentum inflatus, & pugnetur fieri: ut Pardales, quin Plato in his fecond Book of laws, they refemble and compare Bacchus to a Bull, or Pardal, becaufc drunken men in all their actions do imitate the difpoſition of thofe wilde beastes, both in their folly and violence: For fome of them are wrathfull like Bulls, and fome of them wilde apt to fight, like Pardals: Bacchus was also called Nebris, becaufe he wore the skin of a Hinde-calf, which is spotted almoft like a Panther: and therefore a fearful man, or a drunken, variable and inconstant man, is faid to wear a skin of divers colours, but the chief caufe why Panthers were dedicated to Bacchus, was for their love of Wine; for all Writers do conſtant and with one conſent affirm, that they drink Wine unto drunkennes: the manner and end thereof is elegantly described by Oppianus in this fort: When the Inhabitants of Libya do obſerve fome little fountain arifing out of the land, and falling down again, (as in the manner of small Springs which cannot encreafe into great Rivers) whereat the Panthers and Pardals ufe to drink early in a morning, before it be light; after they have been at their prey in the night time, the Hunters come and pour twenty or thirty pitchers of old sweet Wine into the faid Fountain, then a little way from it they lie down and cover themselves with clothes, or with straw, for there is no shelter either of tree or bulthes in that Countrie.

In the morning the Panthers ardently thirfting, and being almoft dead for want of drink, come unto the fame fountain, and taking of the Wine drink thereof great abundance, which prefently falleth to work upon their brains, for they begin firft of all to leap and sport themfelves, until they be well wearyed, and then they lie down and sleep moft soundly, at which time the Hunters that lye in wait for them, come and take them without all fear or peril: Thus far Oppianus.

Concerning the ufe of their ferveral parts, I finde little among the ancients, except of their skins, for the foot-men and ancient Souldiers of the Mores did not only wear them for garments, but also slept
Of the Poephagus.

If the skin or hide of a Leopard being taken and dyed, be covered or laid upon the ground, there is such force and vertue in the same that any venemous or poyllonome Serpents dare not approach into the same place where it is so laid. The fleth of a Panther being roufled or boiled at the fire, and smelled by any one which is troubled with the Palfie, or shaking in the joynets, as also by them which are troubled with the beating and continual moving or turning of the heart, is a very profitable and excellent remedy for the same.

The same fat or fewer of a Leopard being mixed or mingled with the Oyl which proceedeth from the Bay-tree, and then mollified both together, and so anointed upon any one which is troubled with the scurfe or mangy, the feabs whereof doth cut or pierce the skin, doth presently and without any grief or pain cure the same. The twigs of a Vine-tree being dyed and beaten into small dull or powder, and mingled together with the fat or grease of a Leopard, and so anointed upon the face of any one who is grieved with aking and dwelling thereon, will not only cure and heal the same without any pain or follow, but also preserve the same free from blemishes in the time of healing. The grease also of a Leopard by it self, being anointed upon the head of any one who doth fde or call his hair, or is troubled with the Foxes evill, doth immediately help and cure the same. The blynd of a Panther being anointed upon the veins or finews of either man or woman who is grieved with any swelling or aking therein, is very profitable and curable to expel the same away. The brains of a Leopard being mingled with a little quantity of the water which is called a Canker, and with a little Jasmine, and so mixed together and then drunk, doth mitigate the pain or ach of the belly. The brains of the same beast being mixed with the juice of a Canker, and anointed upon the genital of any man, doth incitate and hur him up to lechery, but the marrow which cometh from this beast, being drunk in Wine doth eafe the pain or wringing of the guts and the belly. The gall of a Panther being received into the body either in meat or drink, doth inflantely and out of hand kill or poyfon him which doth fo receive it. The right stone of a Leopard being taken of a woman of a far spent age, doth restore unto her, her menstrual purgation being ceasid, and doth make her to purge, if the doth heartily receive her meat more often.

Of the Ponephagus.

There is a beast in India called Poephagus, because he feedeth upon herbs and grafs like a Horfe, whose quantity he doth exceed double, for he is twice fo big, his tail is molt thick and black, the hairs whereof are thinner then the hairs of a mans head: and therefore Indian women make great account of them, for with them they binde up their own hair, plaiting it, and folding it in curious manner, every hair is two cubits in length, and upon one root twenty or thirty of them grow together: this great beast is one of the fearfuleft creatures in the world: for if he perceiveth himfelf to be but looked at of any body, he taketh him to his heels as faft as he can go, and yet although his heart be light, his heales be heavy, for faith my Author, Maga fludiofe quam celenter fugam peragi. That is, He hath a good will to run apace, but cannot perform it: but if he be followed upon good ftwift Horfes, or with nimble Dogs, fo as he perceiveth they are near to take him, and he by no means can avoid them, then doth he turn himfelf, hiding his tale, and looketh upon the face of the Hunter with some confidence, gathering his wits together, yet in fearful manner, as it were to face out his purfuer or hunter, that he had no tale, and that the re-idue of his body were not worth looking after: but while he flaneth flaring on his Hunter, another cometh behind him and killeth him with a Spear, fo they take off the skin and tail, and throw away the fleeth as unprofitable, for the other recoumbe their labour for their pains. Volaterranus relateth this a little otherwife, and faith that the beait biteth off his own tale, and so delivereth himfelf from the Hunter, knowing that he is not defeed for any other caufe.

Nicolaus Venetus an Earl, writing of the farthest part or Province of Arj, which he calleth Mec- tum, and I think he meaneth Serica, because he faith it lyeth betwixt the Mountains of India and Cathay, there are a generation of white and black Oxen which have Horfes tails, but reaching down to their heels, and much rougher. The hairs whereof are as thin as the feathers of flying birds, thefe he faith are in great estimation; for the Knights and Horfemen of that Countrey do wear them upon the top of their lances and spears for a badge or cognizance of honour, the which I thought fit to be remembered in this place, because I take them to be either the fame with thefe Indian beafts, or very like unto them.
The History of Four-footed Beasts.

The Porcupine or Porcupine.
I cannot learn any name for this Beast among the Hebrews, and therefore by probability it was the several unknown to them: The Grecians call it Acanthoceras and Hispries, that is, fætus foæta, a hairy, or bristly, or thorny Hog, for their quils which they bear upon their back, are called both Pili, fæta, villi, pinna, awesli, and pinse, that is, both hairs, bristles, rough hair, pins, prickles, and thorns. The Arabians call it Adalbub, and Adaluib, Adulb, Adulabi, and some Aherba, which by Ausen and his Glossographer, is defined to be Mountain Ericius babens jimis sagitalis, an Hedgehog of the Mountain, having quills upon his back which he shoots off at his pleasure. The Gre- Glolographer, is derived or rather corrupted of Acanthoceras. The Italians call him Prorinumo and Hisprius or Istrius, without an Aspiration; the Spaniards, Parescopis; the French, Porcsopic; the Lycians, Porcofoimo, and Marskofiusindius implanting therein the German, which call a Sea-hog, Ein Meerschweyn: The German in some places call it Taran, and in other places Dornkonw, that is a Thoray-hog, by a feigned name in imitation of other Nations, and also Parotick, following the Italian, Spaniards, French, English, and Ljpians: I will not fland to confuse them, who write that this Beast is a Sea-beast, and not a Beast of the land, nor yet those that make question whether it be a kinde of Hedge-hog or not, for without all controversy, as the Arabians, Pliny, Albertus, Bellanurus, and other do affirm, the vulgar Hedge-hog, is Ericius Systhstrus, and the Porcupine Ericius Montanus.

There are bred in India and Africk, and brought up and down in Europe to be seen for mony: Likewise about the City Caffern in Tartary, by the flight of one of thefe it appeared, that it was three foot long, the mouth not unlike to a Hare's, but with a longer slit or opening: so also the head of the fame fimilitude, the ears like to the ears of a man; the fore-feet were like the feet of a Badger, and the hinder-feet like the feet of a Bear: it hath a mane standing up in the upper part right or direct, but hollow or bending before: Upon the bunches of his lips on either side of his mouth, there grew forth long black bristles. The general proportion of his body is like a Swine, and they never escaped the nature of a Swine of half a year old.

The four formof teeth hang over his lips, and that which is most admirable in him, the Quils or Thorn, growing upon his back in head of hair, he ufeth for hands, arms, and weapons.

They first grow out of the back and sides, which are of two colours', that is, partly black, and partly white, whensoever he pleafeth, he moveth to and fro like as a Peacock doth his tail: they grow in length two, three, or four hands breadth: they fand not in any confused form of colours, but in well formed diftinguifhed ranks, being sharp at the points like a knife: When they are hunted the Beast fretcheth his skin, and caffeth them oft, one or two at a time, according to the neceffity upon the mouths of Dogs, or legs of the Hunters that follow her, with fuch violence, that many times they stick into trees and Wood, wherefore Selinus writeth thus, and Afo Paulus Verus: Cum captinant, fipnas sues fepe homine, & canes ladunt: nam canes in eum provocati, adeo irritant feras illos, ut simul concurrenter terga fua quibus fipnae inimicat, vel baseman contra movemant, atq. in viciniores homines, & canes vibris. That is to fay, When they are taken many times hurt both Dogs and men, for when the Dogs being provoked by them, run upon the backs which bear the quils, they are fo far firued, that they cafl them off upon all that fland near them, and therefore they fight fying.

The Hunters to fave their Dogs do devise engins and traps wherein to take them: besides the quils that grow upon their backs, they have alfo some upon their heads and necks, which they never cafl off, but keep them on as a Horfe doth his mane. The pilgrims that come yearly from Saint James of Compostella in Spain, do bring back generally one of their quils in their Caps, but for what caufe I know not. The pace of this Beast is very flow and troublesome unto it, and therefore it is hardly drawn out of his den, which it diggeth like a Badger, from which it never goeth far, but feedeth upon thofe things which are near unto it: It is a filthy Beast, f melling rank because it liveth fo much in the earth, being wild it never drieth, and I think it eateth Apples, Roots, and rinfes of trees, and pereventures Snail, and fuch reptile creatures, but being tainted, it eateth alfo many kindes of fruit, likewise bread, Pe-cruit, and fuch things broken small. It drinketh alfo water, but above all other, Wine or brine agle with water: In the day time it sleepeareth, and in the night time it wakeith, by which we gather, that being wild it feareth the light, and therefore travelleth in the night time for his meat and living. It is a general live creature, and begetteth other in his own kind: the female bearing the young ones in her belly, as long time as a Bear, that is, thirty dayes; and alfo it hideth it felf four moneths in the Winter time, like a Bear, but whether for cold or any other caufe the Authors do not exprefs.

In my opinion for cold rather then for any other reafon, although there be fome that affirm it lyeth hid in the Summer time, and cometh abroad in the Winter time, contrary to the course of all other Beasts, and therefore fuch a Paradox doth want the teftimony of fome credible Writers, which I should affirm it upon their own experience, or else it were requisite to bring sufficient reafons to lead their Readers to believe it, but neither of which is difcharged by them, and therefore it is fafer for us to follow Aritifate and Pliny, who hold the fift opinion, then Albertus and Agricola who encline to the later. In all other things, both of their lying hid, of their procreation, of the coming out of their cave and nourishing their young ones, they imitate the manners and conditions of Bears.
Concerning the use of their parts, I finde none but only of their quils, for with them it is said, if men scrape their teeth they will never be loofe, likewise women were wont in ancient time to use them for parting afunder their hair in the top of their crowns.

The flesh of this Beast is like a Hedge-hogs, neither very natural for meat and nourishment, nor yet very medicinable: yet it is said to help a weak and over-burthened stomach, to procure looseness of the belly, and to diminish all Leprosies and scabbed Exulcerations and pustules: Being salted it is good against the Dropkie, and also very profitable, as Pliny writeth, to be eaten by them that cannot contain urine in their beds: yet the Gracians attribute no such quality unto this, but to help the stomach and loosen the belly, they attribute to the Sea-hog; and against the leprosie, scabs, and incontinency of urine to the Hedge-hog; but peradventure the saying of Pliny, (Qua de Herinacea dictatur omnia tanta magis valent in Hispania) leadeth them to attribute these things to the Porcupine. The powder of their quils burnt, drunk or eaten in meats or broth, doth promote and help conception: Thus faith Avicen, and herewithal I conclude this short discourse of the Hedge-hog.

Of the Reiner, or Rainiger.

His Beast is called by the Latines, Rangifer; by the Germans, Rein, Reiner, Rainiger, Reinsifer; by the French, Rangier, and Ranglier; and the later Latines call it Reingue. It is a Beast altogether unknown to the ancient Gracians and Latines, except the Macros; that Pliny speakeoth of be it; But we have shewed already in the story of the Elk, that Alcey and Mboi are all one. This Beast was first of all discovered by Olam Magnus, in this Nor-
Northern part of the world, towards the pole Artique, as in Norway, Sweden, Scandinavia, at the first sight whereof he called it Raingifer, quafi Ramifer, because he heareth horns on his head like the boughs of a tree. The similitude of this Beall is much like to a Hart, but it is much bigger, stronger, and swifter. It beareth three orders or rows of horns on the head, as by the direction of Valerius Grævius, and Benediclus Martinus are here expressed.

This Beall changeth his colour according to the time of the year, and also according to the quality of the place wherein he feedeth, which appeareth by this, because some of them are found several parts, to be of the colour of Aes, and shortly after to be like Harts. Their breast is full of long bristles, being rough and rigid through the same. The legs hairy, and the hoofs hollow, cloven, and movable, which in his course he spedeth whereupon the deepest snows, without preffing his footsteps far into them: and by his admirable cruelty he avoideth all the wide Bealls which in the Valles he in wait to destroy him. He beareth very high and lofty horns, which presently from the root branch forth into two items or pikes, I mean both the horns severally into two, which again at the top disperse themselves into pikes like the fingers of ones hand; in the middle of the horns there is a little branch flandeth out like a knob, or as a huckle in the hinder-part of a Beall's leg, from thence again they ascend upwards a great height, and do grow abroad at the top, where they are divided like the palm of a hand.

The horns are white, distinguished with long apparent veins, differing both from the horns of Elks, and the horns of Harts, from Elks in height, and from Harts in breadth, and from them both in colour and multitude of branches: When he runneth he layeth them on his back, for when he stands still, the lowest branches coming forth of the roots of the horns, do almost cover his face with their lower branches.

In the Winter time when he is a-chief, and cometh to the frozen waters he breaketh these: being wide he liveth upon such fruits as he findeth in the Woods, especially the gum that cometh out of the Trees, and with the mosses that groweth upon them, making himself shadowed dens and retiring places in the Mountains: but in the deep cold weather he cometh into the Mountains of Norway, towards Mosberg, and other hills. He is taken by the Countrie people for private uses, for he is profitable after he is tamed, both for the plough and travails in journeys. The people called Lappi, or Lappones, do use them in stead of Horses and Oxen, for they have a kind of Cart made in form and fashion of a fishers boat whereunto they join the Bealls to draw them, and the Carter hath a convenient seat fitted for him on the fore-part thereof, wherein he sitteth with his legs fastened to the Cart, to the intent he be not call off when the Beall runs speedily: he carrythe the reins whereby he governeth them in his left hand, and in his right hand a flaffe, wherewith he sustainth the Cart when it is in danger of falling, and in this course they will continue indeatagibly twenty German miles a day which is more than three score English miles. At night when the Bealls are unyoaked, of their own accord, without guide or leader they will go to their feeding places, or accustomed stables. It is a very sociable creature, for they do live together in herds above a thousand in a flock, whereunto it may be the Lord alluded in the 50. Psalm, when he said by the mouth of Apsb, All the Bealls of the field are mine, and the flocks of thousand which ran wilde on the hills. The females want horns, and their milk is the greatest part of food to those Northern people: they have been seen at Auffurge in Germany faddled and bridled, for in their travails they need not have any provender carried with them, for if ye turn them out in the midit of the Winter, they finde certain roots and moss under the snow whereof they eat, and consume themselves. Their best food is grass. They are used both in Mosfonia, Polonia, Bohemia, Scandinavia, and Muscovia, yet they can endure no heat, for being brought into Bohemia they die.

Their Carts which they draw must be made with a sharp edge at the bottom like a boat or flup as we have said already, for they are not drawn upon wheels, but like drays and sleds upon the earth. There was a Lapponian which brought one of these into Germany in December, & he professeth he never felt so much heat of the Sun in all his life, as he did at that time, which is our coldest time in the year, and therefore how great is the cold which both men and Bealls endure in that Countrie?

The horns of these Bealls are to be seen both in Berne and at Auffurge in Germany; the feet are somewhat white, being rounder than a Harts feet, and more cloven or divided, wherefore at some times one part of his hoof may be seen upon a stone, while the other part reflecth upon the earth, and in the upper part of the hoof where it beginneth to be cloven near the leg, there is a certain thick skin or membrane, by vertue whereof the foot may be iutretched in the diuision without harm or pain to the Beall.
The King of Swedia had ten of them nourished at Lappo, which he caused every day to be driven unto the Mountains into the cold air, for they were not able to endure the heat. The mouth of this Beast is like the mouth of a Cow, they many times come out of Lapponia into Swedia, where they are wonderfully annoyed with Wolves, but they gather themselves together in a ring, and loose against their enemies with their horns. They are also in their own natural Country annoyed with Gulions, and generally all Beasts that live upon the soil of Beth, are enemies unto them, and desire to destroy and eat them. In their pace, both slow and speedy, the articles of their legs make a noise like the cracking of Nuts. There was one of these Beasts given unto the Duke of Saxony, in the year of our Lord 1561. In Scandinavia they use them for the carriage of metals, drawing of Chariots and riding, and the nerves of them when they are dead make bows, and for want of nails, they do fallen planks and boards together.

Of the RHINOCEROS.

We are now to discourse of the second wonder in nature, namely of a Beasts every way admirable, both for the outward shape, quantity and greatness, and also for the inward courage, disposition and mildness. For as the Elephant was the first wonder, of whom we have already discoursed; so this Beasts next unto the Elephant filleth up the number, being every way admirable, as he, if he do not exceed him, except in quantity or height of stature. And being now come to the story of this Beasts, I am heartily sorry, that I find not any outside, as by figure you may perceive, yielding no doubt through the Omnipotent power of the Creator, an answerable inside, and infinite testimonies of worthy and memorable vertues comprised in it. Should through the ignorance of men, be unfolded and obscured before the Reader's eyes: for he that shall but see our stories of the Apes, of the Dogs, of the Mice, and of other small Beasts, and consider how large a treatise we have collected together out of many Writers, for the illustration of their natures and vulgar conditions, he cannot chuse but expect some rare and strange matter, as much unknown to his minde about the story of this Rhinoceros, as the outward shape and picture of him, appeareth rare and admirable to his eyes: differing in every part from all other Beasts, from the top of his nose to the tip of his tail, the ears and eyes excepted, which are like Bears. But gentle Reader, as thou art a man, so thou must consider since Adam went out of Paradise, there was never any that was able perfectly to describe the universal conditions of all sorts of Beasts; and it hath been the counsel of the Almighty himself, for the instruction of man, concerning his fall and natural weakness, to keep him from the knowledge of many divine things, and also humane, which is of Birds and Beasts, Fishes and Fowl, that so he might learn the difference between his generation, and his degeneration, and consider how great a loss unto him was his fall in Paradise; who before that time knew both God himself and all creatures; but since that time neither knoweth God as he should know him, nor himself as he shall know it, nor the creatures as he did know them.
The History of Four-footed Beasts.

But for my part which write the English story, I acknowledge that no man must look for that at my hands, which I have not received from some other: for I would be unwilling to write any thing untrue, or uncertain out of mine own invention; and truth on every part is so dear unto me, that I will not lie to bring any man in love and admiration with God and his works, for God needeth not the lies of men. To conclude therefore this Preface, as the Beast is strange and never seen in our Country, so my eye-sight cannot add any thing to the description: therefore hearken unto that which I have observed out of other writers.

First of all that there is such a beast in the world, both Pliny, Salinus, Dioscorus, Aelianus, Lampridius, and others, do yeeld irrefragable testimony. Heliodorus had one of them at Rome. Pompey the great, in his publick spectacles did likewise produce a Rhinoceros (as Seneca writeth.) When Augustus rode triumphing for Cleopatra, he brought forth to the people a Sea-horfe and a Rhinoceros, which was the first time that ever a Rhinoceros was seen at Rome (as Callius writeth.) Antonius Pius the Emperor, did give many gifts unto a Bull into the air with his horn, as if he had been a Tennyce ball, the Epigram is this;

O quadrupites exorsit prandias in iras,
Quintus erat cornu, cui pila Taurus erat!

Lastly to put it out of all question, that there is such a Beast as this Rhinoceros, the picture and figure here expressed, was taken by Gisner from the Beast alive at Lyons in Fontagale, before many witnesse, both Merchants and others; so that we have the Testimony both of antiquity and of the present age, for the Testimony of the form and fashion of this Beast, and that it is not the invention of Man, but a work of God in nature, first created in the beginning of the world, and ever since continued to this present day.

Concerning the name of this Beast, the Greeks because of the horn in his Nose, call him Rhino-
ceros, that is, a Nose-horned Beast, and the Latins also have not altered that invention, for although there be many Beasts that have but one horn, yet is there none that have that one horn growing out of their Nose but this alone: All the residue have the horn growing out at their foreheads.

There be some that have taken this Rhinoceros for the Monoceros, because of this one horn, but they are deceived, taking the general for the special, which is a note of ignorance in them, and occasion of error unto others; yet it is better to take the Rhinoceros for the Monoceros, because there is nothing in the special which is not contained in the general, according to the maxime in Logick, Nihil est in specie, quod non prius fuit ingenere: And yet that is also absurd, considering that Monoceros is not only a word of generality for all one-horned Beasts, but of particularity a name for the Unicorn, whereby is meant the Indian Afe, as we shall shew in the story of the Unicorn.

This Beast in the Hebrew is thought to be called Reem, or Karas, and therefore Munfher so tranla-
teth it, Deut. 33. Tauri decor ejus, cornua Rhinoceris cornua ejus, in eius ventilatis nationes ad summum usq; terrae. His beauty is like the beauty of a Bull, and his horns like the horns of a Rhinoceros, with the which he shall winnow the Nations to the tops of the Hills.

And Terrillian writing against the Heretique Praxices, doth so tranliterate it. If a man compare togethcr the Greek word Rhimuceros, and Reem, and Karas, or Rimna and Karas, he will easily think that either the Greeks have joyned together the two Hebrew words, as Rhinoceros quasa Reem Karas, or Rimna Karas; or else the Hebrew have parted under the Greek word, for Reem and Rimna may very wel come of Rhin, and Karas of Karos, yet here I leave the Readers to their own judgement. The Indians call this Beast in their tongue, Scandabenames, as Fefius writeth, but we will leave the name and come to the description of it.

In quantity it is not much bigger then an Ox: Pliny maketh it equal in length to an Elephant, and some make it longer then an Elephant, but withall they say it is lower, and hath shorter legs. Strabo in his 16. book speaking of the Ethiopian Region, near India, calleth these Rhinocerotes, Ethiopia-
pian Bulls, and faith that they are bred only in that Countrey, and by the relation of Artemidorus he writeth thus; Outul de microrn apoleiptontur eti eletontos ati rimocerotes, after Artemidorus phorsip, epis fraro,

That is to say, The Rhinocerotes are exceeded by the Elephants in length, but in height they almoost equal them (as Artemidorus saith) he saw by one that was at Alexandria, and the colour thereof was not of like a Box-tree, but rather like an Elephants, his quantity greater then a Bull, or as the greatest Bull, but his outward form and proportion like a wilde Boar, especially in his mouth, except that out of his Nose groweth a horn, harder then any bones, which he uteth in the stead of arms, even as a Boar doth his teeth; he hath also two girdles upon his body like the wings of a Dragon, coming from his back down to his belly, one toward his neck or mane, and the other to-
ward his loins and hinder parts. This far Strabo.

Wherunto we may add the description of other parts out of Oppianus, Pliny, and Salinus. His colour like rinde or bark of a Box-tree (which doth not differ much from an Elephant) and on his forehead there grow haires which seem a little red, and his back is distingishted with certain purple spots upon a yellow ground. The skin is so firme and hard, that no Dart is able to pierce it: and
Of the Rhinoceros.

and upon it appear many divisions, like the thills of a Tortoise set over the scales, having no hair upon the back. In like manner, the legs are scaled down to the hooves, which are parted into four distinct claws; upon his nose there groweth a hard and sharp horn, crooking a little towards the crown of his head, but not so high: flat and not round, to sharp and strong, Ut quid impetris, aut mensibus, aut perficiis, & forum etiam & fusa transfigat, faith Oppianus and Alcimus, that is, whatsoever it is set to, either it calleth it up into the air, or else boreth it through though it be iron or stones.

Eucherius faith, that the Rhinoceros hath two horns in his nose, but that is utterly false, as you may see in the picture: Although Martial seem to express so much in these Verses:

Namque gravem cornu geminos sic extulit usum,  
Faciat ut impetris Taurus in effus pilas.

The Rhinoceros cast up a Bear into the air, even as a Bull would do a ball which were laid upon his two horns: we shall not need to apply Geminos cornu to the Bull, as Politianus doth, but rather take it figuratively for a strong horn; and if it must needs be literal, it is apparent by the Picture that there is another little horn, not upon the nose, but upon the wither of the Beast, I mean the top of his shoulder next to his neck, so that the error of Eucherius lyeth not in the number, but in the place; and that it may appear that this horn is not a fagged thing, Paulianus above two thousand years ago writeth thus. Rhinocerotis in summò naso cornu singulare eft, & aliquis supra ipsum non magnum, in capite nullum.

I do marvel how it came to passe that men which can mock and deride others cunningly should be called proverbially Nātuli homines, except the proverb were taken from the Rhinoceros, who by reason of his crooked horn is said to have a crooked nose; for indeed a deformed nose is more subject to derision then any other part or member of the body, which causeth Martial to write thus:

Majores nunquam rhodobii: juvenesq; senesq;  
Et fecund nasum Rhinoceròs habent.

And thereupon Horace also faith thus:

— Nāsō suspendis aduncō.

Oppianus faith, that there was never yet any distinction of sexes in these Rhinocerotes: for all that ever were found were males and not females: but from hence let no body gather that there are no females, for it were impossible that the breed should continue without females: and therefore Pliny and Solinus say, that they engender or admit copulation like Elephants, Camels, and Lions.

When they are to fight they whet their horn upon a stone, and there is not only a discord betwixt these beasts and Elephants for their food, but a natural description and eminency: for it is confidently affirmed, that when the Rhinoceros which was at Lissborne, was brought into the presence of an Elephant, the Elephant ran away from him. How and in what place he overcometh the Elephant, we have thewed already in his story, namely how he fasteneth this horn in the soft part of the Elephants belly. He is taken by the same means that the Unicorns is taken, for it is said by Albertus, Isidorus, and Alcimus, that above all other creatures they love Virgins, and that unto them they will come be they never so wilde, and fall asleep before them, so being asleep, they are easily taken and carried away.

All the later Physitians do attribute the virtue of the Unicorns horn to the Rhinoceros horn, but they are deceived by imitation of Isidorus and Albertus: for there is none of the antient Greeks that have ever observed any medicines in the Rhinoceros. The Indians make bottes of their skins, wherein they put their Lycius, or succum medicatum, and therefore I will conclude this story, with the riddle of Franciscus Niger made upon the excellency of the horn that groweth upon the nose.

Dic mihi que superis sint acceptissima dona.

Whereunto the answer is made in the next Verse:

Principium noli Rhinoceròs amant.
The Hebrews have divers names, whereby they signify a Sheep, and all that kind, as Zim, and Zebeth, for which the Septuagint do always render Prebata, Sheep or little Cattell. The Arabians, Cabaris. The Chaldeans, Anu. The Persians, Goopand, also Bacell in Hebrew, the plural whereof is Rebelem, which signifyeth Sheep; Kefeb, and Kafba, or Kifba, l. a. 53. Tabell. Nebulam, that is, a dumb Sheep, where the Hebrews have Rebeel, there the Cabalis translate Bacellak. The Aramains, Akelek. The Persians, Comeftban tus. Kibbs and Kifba signify a Sheep, male and female under a year old, and Alil, and Cel, for a Sheep above a year old, male and female. In Levit. 22, the Chalde tranlately for Kebis, Imar. The Arabains, Ezel. The Persians, Bara, and Kefeb in Hebrew is the same that Kefeb, Seb also signifyeth a Sheep, although it be sometime taken for a Lamb or Kid. Likewise Takelb and Tebleb Elai. 40. signifyeth a Lambe that fheep. And Fipbaniam writeth, that by the same word the Hebrew Altronomers signify the sign Arietis in the Zodiac. The Saracens at this day call a Sheep Guneme, and Cattle Garien, and the dung of Cattle Harad Garien. The Grecians call a Sheep Ovis, and Probon: the Latins Ovis, and by excellency Pecus; the Italians, Pero, the French, Brebi: the Spaniards, Ovies: the Germans, Schaff; the Iriams, Owce, or Skop. These and such like I might add more concerning the names of this Beast, and the abundance of the names thereof in the Hebrew tongue, is a notable testimony of the singular account which God himself made of this beast. The Lattins have so honored it that after it they have named many of their children, and stories make mention of moft noble and gallant men, so called. Such was Osuvinus Camillus, Severus Osuvinus, Iabus Maximus Osuvelus, Oileus, Oileus Ajax, Ois, the wife of Channipsus, and many such other, if it were necessary to this story to relate them, but I will not trouble the Reader with any such unnecessary circumstances. I will therefore first of all begin with a relation of the Sheep of other Countries, and so in the end make a more particular discovery of our own at home. For the difference of Regions do very much enlighten the description or history of Sheep. It is reported that about Erythrose, one of the Islands of the Gades, there is such abundance of good pasture and Hears of so grateful a Sheep, that if they be not let bloud once in thirty days, they perish by suffocation, and that the milk of those Sheep yeeldeth no whey, wherewithall they make abundance of Cheefe, although they powre water into it. The herbage of that Island is dry, yet profitable to Cattle and milch Beasts, and from thence came the original of the fat Cattell of Geryon. The Sheep of Greece are leffer then the Sheep of Egypt, and the Oves Pyrhyca, were like Boys Pyrhyca, namely, of exceeding stature, which name was derived from Pyrhyca their master and owner. Among the Phibians in India, their Rams are greater then our Lambs, and Aecchelades in his books of husbandry affirmeth, that the Sheep of the Ile Chius, are very small, and yet their Milk maketh very laudable Cheefe. In Spain their bell Sheep have black fheeces: at Polenia near the Alps, they are gray or hony-woolded: in Afia and Batia, called Erythros, they are red like Foxes, and from thence came the term of Erythros Oves. As Caunsium the Sheep are yellow, or Lion-tauny, and so also at Tarmentum. Ifsea and Libania yeeld Sheep having woolle which is so curious and rough, that it may rather seem to be hair then wool, and therefore never fit for fine garments, nor for any other use, except by the singular art of spinning in Portugal. And the like to this is the wool of the Sheep of Pijeme, and in Egypt, of which latter it is said, that if it be dyed again after it is thread-bare, it will endure almoft for ever. For the antients (as Homer writeth) had the use thereof (although the thread were rough) in their works of Tapeltry, and this was dresed divers ways, for the French in Europe dresse it one way, and the Partisans in Afia another way.

The Sheep of Apulia gave the name to Lania Italic, for excellent wool, and yet was it short and courfe, good for nothing but for clokes to ride in, and wear in rainy weather: unto these I may add the Calabrians, Milisians, and Arentian Sheep, yet in the days of Vartto they covered their Sheep with other skins to keep the Wool both from loose, and other infection, so that it might be the better washed, dyed, and prepared, for these were nourished most of all in houes.

The French Sheep about Alim, and also those that are saddled are flabled in the plain and barren fields of Parma and Matina. The Sheep of Helvetia feed in the tops of the Mountains, whereas the Goats keep beneath the trees and gather fruits on the sides of the hills. The Flemish Sheep have a soft and curled hair.

There be in general two kinds of Sheep, one called Telsum, the other Colonicum, as if you would fay house-sheep, and field-sheep, for the Grecian Sheep which before we have called Tarentina, and weare also called Taritina, because of their soft wool, lived in houes, and they were also called Peltite, but the field Sheep having by nature a greater, courfer, and rougher hair, are suffered to lodge abroad in the fields.

Likewise the Sheep of Mileto and Attica, and the region Gadilonea, reaching to Arminia, have very soft and gentle Wool, which thing feldom cometh to passe in Pontus, or Cappodocia. In Scotland also in a place thereof, called by Helgi Feltibus Bathingubans, are great store of Sheep, bearing good wool, from whence almost all that Countrie fetch their breed. The Sheep of Euxibia bear no wool at all, but in stead thereof their hair is rough like Cames hair. Amongst the Albuines, and the Bradians, both Eltimus and Nicomachus the Son of Arhisile do tellifie, that all their Sheep are black, and that there was never white Sheep bred in those Countries. In Gortyn their Sheep are red and have four horns: In the fortunate Islands of the red-fea all their Sheep are white, and none
Of the Sheep.

of them have crooked horns. In Bestia there are four Rivers which work strange effects upon Sheep after they drink of them; namely, Molus, Cepbifus, Penius, and Xanthis. The Sheep drinking of Molus and Penius grow black, of Cepbifus white, and yet Pliny, faith, that this River cometh forth from the same fountain that Molus doth. They which drink of Xanthis grow red. I might add hereunto another special observation of difference between the Sheep of Penius and Naxus, for in Penius they have no gau, and in Naxus they have two gauls.

In some parts of India their Sheep and Goats are as big as Affes, and bring four or four Lambs at a time, but never less then three, both Sheep and Goats. The length of their tails reacheth down to their hinder-legs, and therefore the Shepherds cut them off by the secret; to the intent that they may better suffer copulation, and out of them being cut off, they express certain Oyl; also their tails, the ends whereof do afterward close fo nearly and naturally together, that there appeareth not any fear or note of the fiction. In Syria and India the tails of their Sheep are a cubit broad.

There are two kinds of Sheep in Arabia, which are distinguished by the length and breadth of their tails: the one sort have tails three cubits long, by reason whereof they are not suffered to draw them on the ground for fear of wounding; and therefore the Shepherds devise certain engines of wood to support them: the other kind of Sheep have tails like the Syrian Sheep. All Sheep that live in hot and dry Regions have larger tails, and barther wool, but those that live in the most Regions and salt places, have softer wool and shorter tails. There were two of the Arabian Sheep brought into England, about the year 1560. whose pictures were taken by Draper Cey, and therefore I have expressed them here with their description.

The Arabian Sheep with a broad tail.

The Arabian Sheep with a long tail.

The Arabian Sheep (that be) is a little bigger then our vulgar Sheep in England, but of the same wool, figure of body, and colour, only the thin, and fore-parts of their face, are a little red: the broad tail in the top was one cubit, but lower it was narrower, and like the end of a vulgar Sheep's tail. They being brought on ship-board into England, were taught through famine and hunger to eat not only grass and hay, but flesh, fish, bread, cheese, and butter.
Flocks of
wilde sheep.

Oppianus.

The several
parts of sheep.

Herodotus faith, that such kinde of Sheepe are no where found but in Arabia: the long tailed Sheepe he calleth Macreros, and the broad tailed Sheepe Planakens: yet Leo Afer faith, that these are of the African Sheepe, for thus he writeth: His arriebus nullum ab aliis disserem eft, praterquam in icauda quam laitfermam circumcitant, quae cuicui: quae opinion est, carear obligat, adeo aumanus libris decern, aut vigilis pendantes, omnes suone impinguntur. There is no difference betwixt these Rams and other, except in their broad tail, which whereas it grows in fairest growth in breadth, for if they fatten of their own accord, it hath been found that the tail of one of these Sheepe have weighten ten or twenty pound, and not only there, but also in Egypt, where they cram and feed their Sheepe with Barly, Corn, and Bran: by which means they grow so fat, that they are not able to fir themselves, for that their Keepers are forced to devife little engins like childrens Cartes, whereupon they lay their tails when they remove their Beafe: and the fame Leo Afer affirmeth, that he faw in Egypt in a Town called Aipta, flanding upon Nilus, a hundred and fifty mile from Alcoit, a tale of one of these Sheepe that weighed fourescore pound, and while he wondred at it, scarcely believe that which his eyes faw, there were some present, that affirmed it to be an ordinary thing, for they faiid according as he writeth: Seuidiffi que femi ducentis libros expendunt: That is, they had seen some of them weigh a hundred pounds: and except in the Kingdom of Tunis in Africk, and Egypt, there are none fuch to be found in all the world, and by it, it appearreth, that all the fat of their bodies goeth into their tails. Among the Garments their Sheepe eat fleth and milk, and it is not to be forgotten which Aristotle, Dionysius, Afer, and Varro do write, namely, that all Sheepe were once wilde, and that the tame Sheepe which now we have, are derived from those wilde Sheepe, as our tame Goats, from wilde Goats: and therefore Varro faith, that in his days in Eboria there were flocks of wilde Sheepe, whereof as out of Africk, and the Region of the Goates, there were annually brought to Rome both males and females, of strange and admirable colours, and that his great Uncle bought divers of them and made them tame: But it appearreth that these wilde Sheepe or Rams were Muimons, of which we shall discourse afterwards: For wilde Sheepe are greater then the tame Sheepe, being fitter to run, stronger to fight, having more crooked and piked horns, and therefore many times fight with wilde Beares and kill them.

The Subu doth also appear to be a kinde of wilde Sheepe, for after that Oppianus had discoursed of the Sheep of Crete, he falleth to make mention of the Salbus, which he faith is of a very bright yellow colour like the Sheep of Crete, but the wooll thereof is not fo rough, it hath two large horns upon the fore-head, living both on the water and on the land, eating fith, which in admiration of it in the water gather about it, and are devoured, as we thall shew afterwards in his due place. The Colus also spoken of before, and called Snake, femeth to be of this kinde, for it is in quantity betwixt a Sheepe and a Hart. It hath no wooll, and when it is hunted, the Hunters use neither Dogs nor other Beasts to take it, but terrifie it with ringing of little bells, at the found whereof it runneth to and fro distracted, and fo is taken: And thus much I thought good to express before the general nature of Sheepe, of the divers and strange kinds in other Nations, that so the judicious Reader may admire the wonderful works of God, as in all Beasts, fo in this, to whom in holy Scripture he hath compared both his Son and his Saints: and as much as their glory to be mingled with the other, would have been exorbitant and far different from the common nature of vulgar Sheepe, and fo to have been mixed amongst them, might have confounded the Reader: It was much better in my opinion to express them at together, and fo to proceed to the particular nature of vulgar Sheepe.

And first of all the description of their outward parts: the Sheepe ought to be of a large body, that fo their wooll may be the more, which ought to be soft, deep, and rough, especially about the neck, shoulders, and belly, and those that were not so fo the ancient Grecians called Apokis, the Latiners, Apicis, that is, peild Sheepe, for want of wooll, which they did reject as unprofitable for their flocks: for there is no better signe, as Pliny faith, of an acceptable breed of Sheep, quam crarium brevitas, et ventris subitus. The thornets of the legs, and a belly well clothed with Wooll.

The female are admitted to the male after two years old. Till they are five year old they are accounted young, and after seven unprofitable for breed. In your choice of Sheepe evermore take those which are rough with wooll even to their eyes, without any bald place upon them, and those females which bear not at two year old utterly refuse, avoid likewise partly coloured or spotted Sheep, but choose them that have great eyes, large tails, and strong legs: let them be young also, and of breed, Namceter eft efta ete, quam sequitur pes, quam et quam sequitur mort, & probabilis progenies, si aegus solent procreare formosos (faith Peterus Crefer,) that is, that age better which hope followeth, then that which death followeth: and it is a good breed of Sheepe which bringeth forth beautiful Lambs. And concerning their Woolle, it is to be observed, that the soft woolle is not always the best, except it be thick withall, for Hares have soft but thin woolle, and in Sheepe it ought to be contrary, and therefore the most useful have the finest hair, the Sheepe of Scythia in the cold Countries have soft woolle, but in Sarumstia they have hard woolle. Florentinus prefereth, that the fine woolle of a Sheepe is not curled, but flaneth upright, for he faith, that curled woolle is easily corrupted or falsified.

The head of the Sheepe is very weak: and his brain not fat: the horns of the female are weak if they have any at all, for in many places they have none, like Hindes, and in England there are both males and females that want horns: And again the Rams of England have greater horns then any other Rams in the world, and sometimes they have four or fix horns on their head,
 hath been often seen. In Africa their male-sheep or Rams are yeaned with horns, and also their females: and in Pontus neither males nor females have ever any horns.

Their eyes ought to be great, and of a waterish colour, and all Beasts that want hands have their eyes standing far distant on their heads, especially Sheep, because they had need to look on both sides, and because they are of a simple and harmless disposition, as we shall shew afterwards: for the little eye, such as is in Lions and Panthers, betoken craft and cruelty; but the great eye, simplicity and innocencü. Their teeth stand in one continued row or bone, as in a Horse, but in the upper cham there are no fore-teeth: the male having more teeth then the female.

There be some that write, that Virgil calleth Sheep Bidentes, because they have but two teeth, but they do it ignorantly, for we may read in Servius, Nigidium and Nepos, that Boars are called Bidentes, and all Beasts of two years old, for they were first of all called Bidentes queis Biennis, by interpolation of the letter D. according to the other words, as we do not say reire, but dure; nor reamare, but redamare; nor reargua, but redargua; and fo Biennis, for Biennia; because sacrifices were wont to be made of Sheep when they were two years old. If ever it happen that a Sheep have but two teeth, it is held for a moniter, and therefore a Sheep is called Ambidentis, and Bidentes, because he hath teeth both above and beneath. The belly of a Sheep is like the belly of a Bealt that chews the cud. The milk proceedeth from the ventricile or maw. The stones hang down to the hinder-legs. The females have their udders bew!zie their thighs, like to Goats and Cows: some of them have galls, according to the ordinary custom of nature, and some of them have none at all, for in Pontus where by reason they eat Wormwood they have no galls. Likewise in Calcis: some we have shewed have two galls, and the Scythian Sheep have galls at one time, and not at another, as Eolius writeth, for he laith in the very cold Countries, when snow and winter covereth the earth, there Sheep have no galls, because they keep within doores, and use no change of meat, but in the Summer when they go abroad again to feed in the fields, they are replenished with galls.

There is a Region in Asia called Scopis, wherein they say their Sheep have little or no milts. The reins of a Sheep are equal, and there is no Bealt that hath them covered with fat like unto it. Sheep are also apt to grow exceeding fat, for in the year 1547, there was a fat Sheep given to the King of France in Pickardy, whereof the inward hoofs or cloves of his fore-feet were grown to be as long as eight fingers are broad: the tops whereof were recurred backward like the horns of a wilde Goat. Concerning their tails we have spoken already, for the vulgar Sheep have hairy tails like Foxes and Wolves. And thus much shall suffice to have spoken of their several parts.

In the next place we are to consider the food and diet of Sheep—and then their inclination, and the utility that ariseth by them, and lastly the several diseases with their medicines and cures. It is therefore to be remembered, that the Ancients appointed shepheards to attend their flocks, and there was none of great account, but they were called Shepheards, or Neathards, or Goathwards, that is busists, Opliones, and Apoll, as we have shewed already in the story of Goats: and the Gentiles do report, that the knowledge of feeding Oxen and Sheep came first of all from the Nymphs, who taught Asia in the land of Co. The Greeks therefore call a shepheard Poivies, that is a feeder, or Panmarin to feed: and the Poetics also use Pismar for a shepheard, and the shepheard Dogs, that keep the flock from the Wolf, Pominias kunas, for the Sheep being not kept well, be overcome by the Woolfs, according to the saying of Virgil:

Nam lupus insidias explorat ovilia circum,

And Ovid likewise faith:—

Incublitium caprat ovile Lupus.

The whole care therefore of the Shepheard must be, first for their food; secondly, for their fold; and thirdly, for their health, that so he may raise a profitable gaine, either to himself or to him that oweth the Sheep. To begin with the food, Their diet doth not much differ from Goats, and yet they have some things peculiar which must now be expressed. It is good therefore, that their pastures and feeding places look towards the sun-setting, and that they be not driven over far, or put to too much labour: for this cause the good shepheard may safely feed his Sheep late in the evening, but not suffer them to go early abroad in the morning. They eat all manner of herbs and plants, and sometimes kill them with their bittes, so as they never grow more. The beft is to give them always green meat, and to feed them upon land fallowed or ploughed to be sown with corn: and although by feeding them in fall pastures they come to have a softer wool or hair, according to the nature of their food, yet because they are of a moift temperament, it is better to feed them upon the salt and short pasture: for by such a diet, they both better live in health, and also bear more precious wool.

In dry pastures they are more healthy then in the fenny, and this is the cause why it is most wholesome for them to keep in ploughed ground, wherein they meet with many sweet and pleasant herbs, or else in upland medows, because all moisture breedeth in them rottenness: he must avoid the Woods and shadowy places, even as he doth the fens, for if the Sun come not upon the Sheeps food, it is as hurtfull unto him as if he picked it out of the waters: and the shepheard must not think that

there
there is any meat to grateful unto this cattle, but that uie and continuance will make them to loath it, wherefore he must provide this remedy, namely to give them falt oftentimes in the Summer when they return from feeding, and if he do but lay it in certain troughs in the folds, of their own accord they will lick thereof, and it will encrease in them great appetite.

In the Winter time when they are kept within doores, they must be fed with the foallest hay, such as is cut down in the Autumn, for that which is fiper is lefs nourifhable to them: in some Countries they lay up for themselves especially green Ewe leaves, or Elm, three-leaved-grafs, fowed-vines, and gaffe or peace, when other things fail: where there are flore of Vines, they gather their leaves for Sheep to eat thereof without all danger, and very greedily, and I may fay as much of the Olive, both wide and planted, and divers fuch other plants, all which have more vertue in them to fat and raife your beaft if they be alperfed with any falt humor: and for this caufe the Sea-wormwood excel-leth all other herbs or food to make fat Sheep. And Mythus writeth, that in Pomus the Sheep grow exceeding fat by the moft bitter and vulgar Wormwood. Beans encreafe their milk, and allo Three-leaved-grafs, for that is moft nourifhable to the Ews with young. And it is obferved for the fault which in Latine is called Luxuria fegatum, and in English rancknels of corn, there is no better remedy then to turn in your Sheep in May when the ground is hard, if not before, for the Sheep love well to crop fuch italks, and alo the corn will thrive never the worse, for in fome places they eat it down twice, and in the Country about Babylon thrice, by reafon of the great fertility thereabouts, and if they fhould not do fo, it would turn or run all into italk and idle and unprofitable leaves. The fame exatfe is reported to follow Sheep when they have eaten Cirine, that we have expreffed alo in the History of Goats, namely, that they all fland flill, and have no power to go out of their patures, till their Keeper come and take it out of their mouths. It is reported that they are much delighted with the herb called Luperipitum, which first purgeth them, and then doe fat them exceedingly: It is therefore reported that in Cyrene, there hath been none of this found for many years, because the Publicans that hire the patures are enemies to Sheep. For at the first eating thereof the Sheep will {teep, and the Goat will fall a neezing. In Indis, and especially in the Region of the Persians, it raineth many times a dew like liquid Honey falling upon the herbs and grafs of the earth: wherefore the shepheards lead their flockes unto tho fuch places, wherewithal their cattle are much delighted, and fuch as is the food they eat, fuch alo is the tale of the milk they render; neither need they to mingle Honey with their Milk, as the Gracians are contrained to do, for the sweetness of that liquor favel them of that charge. Such a kinde of dew the Hebrews call Mannu; the Gracians, Aeromelos, and Drofomelos; the Germans, Himmelburg; and in English Honey-dew; but if this be eaten upon the herbs in the month of May, it is very hurtful unto them. We have shewed already, that in fome parts of Aftrick and Ethiopia, their Sheep eat fhef, and drink milk; and it is apparent by Poliphrat that when Apollonium travelled towards India, in the Region Pegadia, inhab-ited by the Orfe, they fed their Sheep with fiftles, and alo they do among the Carmenians Indians, which do inhabit the Sea-coasts: and this is as ordinary with them, as in Caria, to feed their Sheep with fiftles, because they want grafs in that Country: and therefore the fiftles of the Sheep doth taft of fift when it is eaten, even as the fiftles of Sea-fouls. The people of that Country are called Isbybopybagi, that is fift-eaters: Likewise the Sheep of Lydia and Macedonia, their Sheep grow fat with eating of fiftles. Anius also writeth of certain fiftles about the bignefs of Frogs which are given unto Sheep to be eaten. In Arabia in the Province of Aedan, their Oxen, Camels, and Sheep, eat fiftles after they are dried, for they care not for them when they be green: the like I might fay of many other places, generally it must be the care of the shepheard to avoid all thorny and fliny places for the feeding of his Sheep, according to the precept of Virgil:

\[
\text{Si tibi lanicium cura, primum aspera Silva}
\]

Lappes; tribulis; abint.

Because the fame thing, as he writeth, maketh them bald, and oftentimes scratcheth their fkin, under, his words are thefe;

\[
\text{Turpis oves tenetat foibles—}
\]

Vulpis; corum tenuis ad hujus Sudor, & bursati bomatum corpora egress.

Although a Sheepe be never fo found, and not much subject to the Peftilence, yet muff the shep-heard regard to feed it in choice places: for the fat fields breed ftrait and tall Sheep, the hills and fhort patures broad and square Sheep: the Woods and Mountain places, small and slender Sheep: but the belt places of all are the plowed grounds. Although Virgil prefcribeth his shep-heard to feed his flock in the morning, according to the manner of the Country wherein he lived, for the middle part of the day was over hot, and not fit for cattel to eat in: yet other Na- tions, (especialiy Germany and England and thefe Northern parts of the world) may not do fo. The whole cunning of the shepheards is excellently defcribed, for the ordering of their Sheep in thefe verities following:
When they return from their feeding, the shepheard must regard that he put them not into the folds hot, and if the time of the year be over hot, let them not be driven to pastures a far off, but feed them in those which are near and adjacent to their folds: that so they may easily have recourse unto the shade: they ought not also to be turned out clustering all together, but dispersed abroad by little and little, neither mull they be milked while they are hot, until they be cold a little, fo likewise in the morning, let them be milked fo soon as day appeareth, and the little Lambs be turned out unto them which were from them. But if there appear upon the grass Spiders webs, or Cobwebs which bear up little drops of water, then they must not be suffered to feed in those places for fear of poyfoning: and in times of heat and rain, drive them to the heightest hills or pastures, which do most of all be open to the winds, for there shall the cattle feed most temperately: They must avoid all sandy places, and in the month of April, May, June, and July, they must not be suffered to feed overmuch, but in October, September, and November, let them have their full, that so they may grow the stronger against the Winter time. The Romans had a special regard to chuse some places for the Summering of their Sheep, and some place for their Wintering, for if they summered them in April, they wintered them in Summer; and therefore (Varro saith) the rocks of Apulia betimes in the morning in the Summer season are led forth to feeding, because the dewy grasses of the morning is much better then that which is dry in the middle of the day, and about noon when the season groweth hot, they lead them to shadowy trees and rocks, until the cool air of the evening begin to return, at which time they drive them to their pasture again, and cause them to feed towards the Sun-rising: for this is a general rule among the shepherds: Quod manu ad folis occasum, & vereere ad solis ortum pasturatur ever. That is, in that the morning they feed their Sheep towards the Sun-setting, and in the evening towards the Sun-rising, and the reason of it is: Quia inimicitismmum pecor caput, aeris sole, paece cogenendum. Because the head of Sheep is moist weak, therefore it ought to be fed turned from the Sun. In the hot Countries a little before the Sun-setting they water their Sheep, and then lead them to their pasture again, for at that time the sweetness feemeth to be renewed in the grases, and this they do after the Autumnal Equinocial. It is good to feed them in corn fields after harvest, and that for two causes: Firl, because they are exceedingly filled with such hearbs as they finde after the plough, and also they tread down the chubble, and dung the land, whereby it becometh more fruitful against the next year. There is nothing that maketh a Sheep grow more fat then drink; and therefore we read in holy Scripture how Jacob watered the Sheep, and the Daughters of Jeabs their Sheep, at what time Moses came unto them, therefore it is best oftentimes to mingle their water with Salt, according to these verses;

Of the Sheep.

At cui laetius amor, oitissum laticis, frequentes,
Te manu fatisq. fervas preepibus herbis,
E veris oman fluvis magis, & magis ubera tendunt,
Et falsa scatium reficat in latte jaquerem.

There be many that trouble themselves about this question; namely, for what cause the Sheep of England do never thirst, except they see the water, and then after seldom drink, and yet have more Sheep in England, then are in any other Country of the world; infomuch that we think in a prodigious thing that Sheep should drink: but the true cause why our English Sheep drink not, is, for there is so much dew on the grass, that they need no other water; and therefore Articolis was deceived, who thought that the Northern Sheep had more need of water then the Southern. In Spain those Sheep bear the belt fleeces of wool that drink least. In the Island of Cepharene as we have fitted in the story of the Goat, all their Cattle for want of water do draw in the cold air; but in the hotter Countries every day once at the leaft about nine or ten a clock in the morning they water their Sheep; and so great is the operation of drink in Sheep, that divers Authors do report wonders thereof, as Vellera Maximus, and Theophrastus, who affirm that in Macedonis, when they will have their Sheep bring forth white Lambs, they lead them to the River Alathan; and when they will have them to bring forth black lambs, to the River Axios, as we have shewed already. It is also reported that the River Scamander doth make all the Sheep to be yellow that drink thereof: Likewise there are two Rivers in Asterindria which turn Sheep from black to white, and white to

S I
The History of Four-footed Beasts.

...black, and the like I might add of the River Borpes, or the two Rivers of Beaus, all which things do not come to pass by miracle, but also by the power of nature, as may appear by the History of Jacob, when he served his father in law Laban.

For after that he had covenanted with Laban, to receive for his fipend all the spotted Sheep, the Scripture faith in this manner: Then Jacob took rods of green Poplar, and of Hael, and of the Chefsnut tree, and piled white fitches in them, and made the white appear in the rods. Then he put the rods which he had piled into the gutters and watering troughs, when the Sheep came to drink, before the Sheep, and the Sheep were in heat before the rods, and afterwards brought forth young of party colour, and with small and great spots. And Jacob parted these Lambs, and turned the faces of the flock towards these party-coloured Lambs, and all manner of black among the Shep p of Laban, so he put his own ficks among these himselfes, and put them not with Labans flock. And in every Ramming time of the stronger Sheep, Jacob layed the rods before the eyes of the Sheep in the gutters, that they might conceive before the rods, but when theSheep were fheele not to put them not, and so the fheeler were Labans, and the stronger were Jacobs. Upon this action of the Patriarch Jacob, it is clear by testimony of holy Scripture, that divers colours laid before Sheep at the time of their carnal copulation, do cause them to bring forth such colours, as they see with their eyes: for such is the force of a natural impression, as we read in Stories, that fair women by the fight of Blackamores, have conceived and brought forth black children, and on the contrary, black and deformed women have conceived fair and beautiful children; whereas there could be no other reason given in nature, but their only cognition of and upon fair beautiful men, or black and deformed Moors, at the time of their carnal copulation.

So that I would not have it seem incredible to the wise and discreet Reader, to hear that the power of water should change the colour of Sheep: for it being once granted, that nature can bring forth divers coloured Lambs, being holpen by artificial means, I fee no caufe, but diversity of waters may wholly alter the colour of the elder, as well as whited fitches ingender a colour in the younger. And thus much shall suffice to have spoken concerning the Summering of Sheep. For the Wintering I will lay more when I come to entreat of their fasting or houching.

Now then it followeth in the next place to discourse of copulation or procreation; for there are divers good rules and necessary observations, whereby the skillful shephard must be directed, and which he ought to observe for the better encrease of his flock. First of all therefore it is clear, that Goats will engender at a year old, and sometime Sheep also follow that season, but there is a difference between the Lambs so engendered, and the other that are begotten by the elder: therefore at two year old they may more safely be suffered to engender, and so continue till they be five year old, and all their Lambs be preserved for breeding; but after five year old their strength and natural vertue decreaseth, so that then neither the Dam nor the Lamb is worthy the nourishing, except for the knife, for that is born and bred of an old decayed substanct, will also resembel the qualities of his fires.

There be some that allow not the Lamb that is yeanded before the parents be four year old, and so they give them four years to engender and breed, namely till they be eight year old, but after eight years, they utterly caft them off: and this opinion may have some good reason, according to the quality of the Region wherein they live, for the fooner they begin to bear young, the sooner they give over; and herein they differ not from Cows, who if they breed not till they be four year old may continue the longer, and so for this caufe I will express the testimony of Alberius, who writeth thus: Oves parere usit ad annum octavum posita, et si bene curatur vil in unedum facultatis partendi praebeat, quod tempus est tota fere vita, even in quibusdam tamen terris arbore ubi ficcata et saepe bebet uinum, viruntur per viginti annos & pariri. That is to say, Sheep may breed until they be eight year old, and if they be well kept until they be eleven, which time is for the moit part the length of their days, although in some Countries upon the Sea coasts, they live till they be twenty year old, and all that time breed young ones, because they feed upon dry and salt pastures, and therefore Aristotle also faith, that they bring forth young ones all the time of their life.

The time of their copulation, as Pliny and Varro write, is from May till about the middle of August, and their meaning is, for the Sheep of those hot Countries. For in England, and other places shephards protract the time of their copulation, and keep the Rams and Ewes afunder till September, or October, because they would not have their Lambs to fall in the cold Winter season, but in the Spring and warm weather: and this is observed by the ancient shephards, that if the strongest Sheep do first of all begin to engender and couple one with another, that it begeteth a very happy and fortunate year to the flock but on the contrary, if the younger and weaker Sheep be first of all stirred up to lust, and the elder be backward and flow, it preageth a perfent and rotten year.

They which drink salt Water are more prone to copulation then others, and commonly at the third or fourth time the female is filled by the male. There is a great similitude and likeness between Sheep and Goats. First, for their copulation, because they couple together at the same time. Secondly, for the time they bear their young, which is five moneths, or a hundred and fifty days: also many times they bring forth twins like Goats, and the Rams must be alwaies fowthing, as admitted as the Lambs may fall in the Spring of the year, when all things grow sweeter and greener; and when...
Of the Sheep.

when all is performed, then must the males be separated from the females again, that for all the time they go with young, they may go quietly without harm.

In their conception they are hindered if they be over fat, for it is with them as it is among Mares and Horses, some are barren by nature, and others by accident, as by overmuch leanness or overmuch fatness. *Pline* maketh mention of an ancient custom among the *Grecians*, that they were wont to drive their Sheep to the habitation of *Aegor*, to be covered by his Rams: And I know not whether he relate it as a story, or as a *Proverb* to signify a fruitful and happy Ramming time. I rather incline to the latter, because he himself faith in the same place, that *Aegor* was a wife and skilful King, Master of many flocks, whose breed of Sheep was accounted the best of all that Nation, and therefore either that they felt their females to be covered by his Rams, or else they signified a happy conjunction of the Rams and Ewes together. *Pliny* writeth, that if the right Rone of a Ram be tyed or bound fast when he leapeth upon an Ewe, he will engender a male, but if the left Rone be tyed, he will beget a female.

Near the City *Patra* there are two Rivers, one of them called *Milletus* and the other *Cheradrum*, and the Cattle that drink of this water in the Spring time, do beget males, and therefore fheepheards when they bring their Sheep and Goats to that River, they drive them to the farther side of the River, because they would have more females then males: for that vertue lyeth in one of the sides, but their Knee suffer to drink on that side, because among their heard the male is best for Bulls and Oxen serve them for sacrifice, and to till the earth, and therefore the male in that kinde, but in all other the female is more acceptable.

Both males and females are begotten as well by the vertues of waters, as by the vertue of the Rams, and likewise by the vertue of the *winter*: for when the North winde bloweth for the most part males are conceived, but when the South winde females: and therefore *Aristotle* faith: In admissa tampeore obovatis *Pecus* *dibus* *babilis* *fepientiales*, ut contra ventum gregem *pasaum*, & cum *fpectus* *amissimus* *pecus*, ut *facina* *generanda* sunt, *animalis* *flebas* *captive*, ut *eadem ratione* *natiuris*. That is to say, In the Ramming time you must observe the blowing of the Northern winde in dry days, and not only feed the flock against the winde, but also cause the Ram to leap the Ewe with his face to the North: but if you would engender females, then mift you in like manner observe the Southern winde. Unto this experiment do *Plutarch*, *Eliasius*, and *Colombella* agree, and these things are necessary to be obseried about the engendering of Lambs.

Now after that the Ewe is filled by the Ram, the diligent shepheard must have as great regard to keep her from abortment, or caunting of her Lamb: therefore *Aristotle* faith, if prefixedly after copulation there fall a fhowre, or if when they are great with young they eat Wallnuts or Acorns, they will call their Lambs: and likewise if in time of Thunder the Ewe with young be alone in the field, the claps of Thunder will cause abortment; and the remedy thereof, for the avoiding of that mischief, is preferred by *Pliny*: *Tontius* (faith he) *collatius obius abortum infirmit*, *remediurn est con- gregare eam ut coitu rumenur*: that is, to call them together in times of Thunder, is a remedy against abortment. Therefore he requireth of a skilful shepheard a voice or whifhel intelligible to the Sheep, whereby to call them together, if they be scattered abroad feeding, at the first appearance and note of thunder. It is also reported, that there are certain veins under the tongue of a Ram, the colour whereof do prefage or fore-fesh, what will be the colour of the Lamb begotten by them: for if they be all white, or all black, or all party coloured, such alfo will be the colour of it that they engender.

*Ewes* bring forth for the most part but one at a time, but sometimes two, sometimes three, and sometimes four, the reason whereof is to be attributed either to the quality of the food whereof they eat, or else to the kinde from which they are derived: For there be certain Sheep in the *Ocean*, which always bring forth two at one time, and many of them six. There are alfo Sheep in *Magnetia*, and *Africa*, that bring forth twice in the year: And *Aristotle* in his wonders writeth, that the *Sheep* of *Umbria* bring forth thrice in a year, and among the *Babians* there are Sheep and Goats, that bring forth twice in the year, two at a time, yet sometimes three, or four, or five, and that they nourith them all together, with their abundance of milk, and besides some of their milk is milked away from them. *Egypt* is so plentiful in grains, that their Sheep bring forth twice in a year, and are likewise twice lipped: so likewise in *Mesopotamia*, and in all moist and hot Countries.

Many times itt is falleth out, that the Ewe dyeth in the yeaining of her Lamb, and many times they bring forth monthers: so alfo do al other Beasts that are *mulipara*: between a Goat and a Ram, is a Mulimon begotten, and betwixt a Goat-buck and an Ewe is the Beatt *Cirrins* engendered; and among the *Babians* many times there are mixed monthers brought forth, for in the hinder-parts they are Goats, and in the fore-parts Sheep: for Rams when they grow strong, old and wanton; leap upon the female Goats, upon which they beget such monthers, but they die for the most part immediately after the yeaining.

Sometimes wilde Rams come to tame Sheep, and beget upon these Lambs, which in colour and woolle do most of al resemble the ffather, but afterward when they bear young, their woolle begineth to be like to other vulgar Sheep: when the Ewe is ready to be delivered, the travaileth and laboureth like a Woman, and therefore if the shepheard have not in him some Midwives skill, that in cases of extremity he may draw out the Lamb when the members fchew croft.
Custody of Ewes and young Lambs and means to encrease their milk.

Having thus brought the Sheep to their delivery for the multiplication of kind, it then relish to provide that the new born Lamb may be secured from Dogs, Wolves, Foxes, Crows, Ravens, and all enemies to this innocent Beast, and also to provide that the Ewe may render to her young one sufficient food out of her udder; therefore they must be well and extraordinarily fed. We have shewed already the use of Salt, and then also it is very profitable when the Ewe is newly delivered of her Lamb, for it will make her drink and eat more liberally. In the Winter time for the encrease of their milk, in stead of green pastures, and such other things as we have expressed, it is requisite to give them corn, and especially plenty of Beans.

For this cause some prescribe to be given unto their Sheep the herb Lararia, which they affirm to be profitable to be given to encrease milk; some the Rone Galactes to be beaten to powder, and anointed upon the Ewes udder; and some prescribe to sprinkle water and salt upon them every morning in the house or field, before the Sun rising.

But herein I leave every man to his own judgement, hoping it will not be offensive to any, to relate those things before expressed, and reeling in opinion, that both the food that is received inwardly, and also the Ointments that are applied outwardly, will be sufficient means to procure abundance of milk in the Summer and Winter feasons.

Now therefore it followeth to enreat likewise of the Wintering of Sheep, for as there is more colt to keep them in cold weather then in warm, so doth require at our hands some discourse thereof. Then it behoveth you to provide for them warm folds and stables, whereof the Poet writeth in this manner:

Incipiens, flabulis caelo in mollibus herbam
Carpeta eves, dom max: frondoja reductura est:
Et multa duram sigula silicunque manipula
Sternere suber humum; glacies ne frigula ledet
Male pecus foabiens; ferat, turpius; podagrum.

Whereby it is evident that the cold Winters do beget in Sheep divers and many diseases, and for that cause it was the counsel of a wife and learned man, that our Sheep should not be turned out to feeding neither in cold or warm weather, until the frost were dissolved and thawaed, from off the grafs and earth.

The Tarentine, Grecian, and Asian Sheep, were wont to be altogether kept in stables within doors, lying continually upon plancks and boards bored through, so that their precious fleeces might be the better safe-guarded from their own filth and urine; and three times in the year they let them out of their stables, to wash them and anoint them with Oyl and Wine: and to have them free from Serpents, they burned in their stables, and under their crutches, Gallanum, Cedar-wood, Womans hair, and Harts-horns: and of thefe Tarentine and Grecian Sheep, Columella writeth in this manner: It is in vain for any man to flore himfelf with thofe Tarentine Sheep, for they ask as much or more attendance and costly food then their bodies are worth; for as all Beasts that bear wool are tender, and not able to endure any hardnes; fo among all Sheep, there are none so tender as the Tarentine or Grecian Sheep, and therefore the Keeper of them must not look to have any playing days, nor times of negligence or sluggifhnes, and much lefs to regard his covetous minde, for they are cattell altogether impatient of cold, being feldom led abroad, and therefore the more at home to be fed by hand; and if by covetouines or negligence, one withdraw from them their ordinary food, he shall be penny wife, and pound foolish: that is, suffer a great los in his cattell, for faving from them a little meat.

Every one of them all the Winter long, were fed with three pints of Barley or Peafe, or Beans three times a day, befdie dried Ewe-leaves, or Vine leaves, or Hay late mown, oriftonches, or chaff. Besides there cannot be any milk taken from the dams, for at the firft yeaning there is no more then to serve the little or leaff Lambs, and after a few days, even while they smell and taste of their dams belly, they were to be killed for want of fuck, that every Lamb which was to be prefervd for breed might have two dams or Ewes to fuck, and fo the poor Ewe was forced to a double miferie; firft to loose her young one, and afterward to lend her paps and milk to a stranger. And moreover, they were forced to nourish more males then females, for that at two year old they were gelded, or killed, to fell their beautiful skins to the Merchant, for their wool was moft precious, by reason that never or seldom they went abroad to the fields. Their custody in the house from Serpents and other annoyances, is thus described by the Poets:

Difsic & odoratam flabulis incinerare cedrum
Gallanum, egsare graves nidoce cheylodas,
Sapes sub immo Baths papebus, aut mala taffu
Vipera delinuit, colunoo, extrittus fugit,
Ani telto affuctus colluber.
Concerning the ancient forms of their Sheep-Itales, I finde this to be recorded by the ancients. First, they made them low and not of any high or lofty building, so stretching them out in length, and not in height, that it may be warm in the Winter time, for although there be no creature better clothed by nature than a Sheep, yet is there not any more impatient of cold, nor more apt to take harm thereby. It must not be over-broad, yet so as the Ewe and her Lamb may lie both together, and the breathing place not left open at the top of the house or the sides, for that will let in too much air, but at the door or porche of their entrance, and that very low, that so the fresh air may quickly and easily come to their low heads and bodies, and also their breath the better avoid out of the stable.

They also had a care to cover all the floor with straw or dry boared boards, or some such other matter, whereby they might stand continually dry and warm, and also clean and sweet, to the end they might not be annoyed in their own flanlings; and therefore the floor was made shelving or falling low on the one side, or else of hurdles like baskets to let out their urine, for they often make water; and these were often changed, cleaned, and turned. In this stable there were eight to divisions or partitione, wherein in time of necessity and sickness, they may easily abide alone and be parted from the residue, and feed without annoyance of one another, and especially that one may not ride another, and during the time of the Winter, they did not let their castr'd drink above once a day.

And these were the cures of the Ancients about their flocks of Sheep. For upon them they lived, they bought and sold, and herein also it is profitable to observe the ancient manner of their bargains about these creatures: for when a man came and bought Sheep, he made this protestation to the seller: \textit{tanti sunt nabi empti?} To whom the seller answered, \textit{sale:} Then the buyer draweth his money with these words: \textit{Sic illice over qua de re agitur, finas relle ete uti pecus ovillum, quod relle sanum est, extra luscam minam v. ventre glabra, nec de pecore morbo eae, habere relle etre sibi responde?} or.

First, the buyer faith, shall I buy these Sheep for such much money? and so draweth his money, to whom the Merchant or seller answered, you shall: Then faith the chapman or buyer again to him, Do you promise to me then that these Sheep are as sound as Sheep should be, without fault of wind or limb, without blindnes, without deafe, without pield bellies, not coming out of any infected flock, and so as it shall be lawful for me to enjoy them without all mens contradifition, if these things be true, on I will strike up the bargain: and yet doth not the seller change the property of his Sheep, nor lose his Lordship over them until the mony be paid. And hereupon it cometh to pats that the buyer may condemn the seller, or the cattel be not so good as his bargain, or if he do not deliver them? even as the buyer is subject to the same judgement, if he do not deliver the price. And concerning shepheardes, and cuttody of flocks I may add a word or two more: First of all for the number of the Sheep, how many may safely be kept in every flock.

There is no need that I should give any rules about this businessman, for the Ancients were wont to set one shepheard over a hundred rough or course woollid Sheep, and two shepheardes over a hundred dreed fine woollid Sheep: the common flocks were meantry, or fourccore, and the shepheard that followed them, was charged to be both vigilant and gentle, and therefore his discipline was: \textit{Duis proprius esse quam domino, & in ogendis, recipienda qui est ovibus, adslamation, at baculo mina, nec unquam tenuit emitat, neque ab his longius recedat, nec aut recubet, aut concidiat, nam maa procedit, habe debet, quantum grex quidem officium officium eis, ali tempore, velatius peculium, desiderat, at nec; tardiore, & gravius dom cum daturum, nec agite & si quidum dom promunt, separati a caetera finat, ne far aut bebis bullam tetram paullum decipiat, & dare offere:} He must rather be a guide unto them then a Lord or Maller over them, and in driving them forward, or receiving them home after they have fraglen, he must rather use his chiding voice, and make hisaffe at them, then call either flome or darte at them: neither must he go far from them at any time, nor sit down, but stand fill, except when he driveth them, because the flock defereth the direction of their Keeper, and his eye likea lofty watch-tower, that so he suffer not to be seperated away, either the heavy Ews great with young, because of their flow pace, nor yet the light and nimble ones which give suck, and are delivered of their young, which are apt to run away, lest that some raving beast or thief defive the loitering shepheard by taking away from him the hindmost or formost. There may also be more in a flock of Sheep then in a flock of Goats, because the Goats are wanton, and so disperse themselves abroad, but the Sheep are meek and gentle, and for the most part keep round together: Yet it is better to make many flocks then one great one, for fear of the Pettifine.

In the fory of the Dogs we have hefew already, how necessary a shepheard Do is to the flock, to defend them both from Woolfs and Foxes, and therefore every shepheard must obserbe those rules there expressed, for the provifion, choice, and institution of his Dog: and to conclude this discouure of the shepheard, when the Lambs are young he must not drive their dams far
The History of Four-footed Beasts.

to pasture, but feed them near the Town, Village or Houfe, and his second care must be to pick and call out the aged and sick Sheep every year, and that in Autumn or Winter time, left they die and infect their fellows, or left that the whole flock do go to decay for want of renewing and sublimation of others, and therefore he must still regard that when one is dead, he supply the place with one or two at the least, and if he chance to kill one at any time for the hou behold, the counsel of *Astartepanes* is profitable to be followed; *Nias tantum malum debeo* over ex quibus nullas amplius frustus, vel cædi vel velites, vel laitis, vel agnorum persuitet. That is, to kill those Sheep from whom you can never expect any more profit by their Lamb, Milk, Cheefe, or Fleece.

Of the diseases of Sheep, and their causes in general.

IN the next place it is necessary for the wife and discreet shepherd to avoid all the means whereby the health of his flock should be indiginer, and those are either by reason of their meat and food that they eat, or else by reason of natural sicknefles arifing through the corruption of blood, and the third way is by the biting of venemous beafts, as Serpents and Wolves, and fuch like; and a fourth way, fcrabbs, Gowts, fwellings, and fuch like outward diseafes.

of venomous meats or herbs unto Sheep.

There is an herb which the *Laureans* call *Herba Sanguinaris*, *Viola*, *Numularia*, and by the *Germanus* and *English* called Fumgreek, and by the *French* because of the hurt it doth unto Sheep, they use this circumcriptions of it: *L'orbe qui et la brelis*. The herb that destroys the Sheep. It is called also Serpentine, because when Snakes and Adders are hurt therewith, they recover their wounds by eating thereof, when a Sheep hath eaten of this herb, the belly thereof swelleth abundantly, and is also drawn together, and the Sheep caleth out of his mouth a certain filthy fume or frottage, which smelleth unfavourably, neither is the poor beast able to escape death, except presently he be let bloud in the yein under his tail next to the rump, and alfo in the upper lip: yet is this herb wholesome to all other cattle except Sheep alone, wherefore the Shephards must diligently avoid it. It is a little low hearb, creeping upon the ground with two round leaves, not much unlike to Parley, it hath no favour with it, onsmelleth not at all, the flower of it is pale and fmelletl strong, and the flalk not much unlike the flower. It groweth in moift places, and near Hedges and Woods.

If in the Spring time Sheep do eat of the dew called the Hony-dew, it is poufion unto them, and they die thereof: Likewise cases in the Autumn do make their belly swel unto death, if they drink presently after they have eaten thereof, for that meat breaketh their guts, and the hke may be laid of Savine, Tamarisk, Rhodendron, or Rofe-tree, and all kindes of Henbane.

The female Piemerpell doth likewise destroy Sheep, except affo as they have eaten of it, they meet with the herb called *Fenus-occus*, Wilde-eye; but herein lyeth a wonder, that whereas there are two kindes of this herb, a male and a female, they should earneflly defire a male, and eagerly avoid a female, seeing that both of them have the fame taife in the palat of a man, for they taste like the raw roots of Beets.

There is an herb in *Normandy* called *Duna*, not much unlike Rubarb, or great Gentian, but narrower leaves, and flanding upright, the nerve whereof in the middle is red, and it groweth about the waters, and therefore I conjecture it may be Water-forrell, or Water-planton, whereof when Sheep have eaten, they fall into a disease called also *Duna*, for there is bred in their liver certen little black Worms or Leeches, growing in small bags or skins, being in length half a finger, and so much in breadth, wherewithall when the Bealt is infected, it is unconcurable and therefore there is no remedy but to take from it the life: and that this is true, the Butchers themselves affirm, how many times they do finde such little worms in the Sheepes liver, and they lay, they come by drinking of Fenny or Marshy-water. And to conclude, there is a kinde of *Pannick also*, whereof when Sheep have eaten it destroyeth them, and there be other herbs which every common shephard knoweth are hurtful unto Sheep; and the Bealt it felf, though in nature it be very simple, yet is wise enough to chufe his own fooed, except the vehement necellity of famine and hunger caufeth him to eat poufioned herbs.

In cafe when their bellies fwell, or when they have worms in their belly which they have devoured with the Herbs they eat, then they pour into their bellies the urine of men, and because their bellies prefently fwell and are puffed out with winde, the shepheard cut off the tops of their ears, and make them bleed, and likewise beat their fides with their flaff, and so most commonly they are recovered. If Shepherd chance to drink in their heat, fo as their greafe be cooled in their belly, which Butchers do finde many times to be true, then the shepheard muft cut off half the Sheepes ear, and if it bleed the Bealt fhall be well, but if it bleed not, he muft be killed and eaten, or else he will starve of his own accord. If at any time a Sheep chance to devour a leach, by pouring in Oyl into his throat, he fhall be fafe from danger.
Of the Cold of Sheep.

Sheep are known to be subject to cold, not only by coughing after they have taken it, but also by their strength before they take it; for the shepherds do diligently observe, that when any froth or ice falleth upon a Sheep, if he endure it, and not shake it off, it is a great hazard but the same Sheep will die of cold, but if he shake it off, and not endure it, it is a sign of a strong, found, and healthy constitution: Likewise for to know the health of their Sheep, they open their eyes, and if the veins appear red and small, they know they are found, but if they appear white, or else red and full, they know they are weak, and will hardly live out Winter or cold Weather: also when they are taken in their hands, they press their back bone near the hips, and if it bend not they are found and strong, but if they feel it bend under their hand, they hold them weak and feeble: Likewise if a man take them by the head or by the skin of the neck, if he follow him easily when he draweth him, it is a sign of weakness and imbecility, but if it doth liftive, and follow with great difficulty, then it is a token of health and soundness.

Of Scabs, and the causes of them.

The true original of Scabs is either as we have said already, leannes, or else cold, or wet, or wounds in the flesh by clipping or for to conclude, by the heat of the Beatt in Summer not washt off, by thorns and prickings of bushes, or by cutting upon the dung of Mules, Horfes, or Atles. Now when this first of all beginneth, it is easie for the shepheard to observe by these signes and tokens, for the ticking or itching humor, lying betwixt the skin and the flesh, caueth the poor Sheep either to bite the place with his teeth, or to scratch it with his horn, or to rub it upon a tree or wall, or if he can do none of thefe, flamp hard upon the ground with his fore-feet, for which it is good pretiely to separate the Sheep so affected from the flock. The description and cure whereof is thus exprefsed by Virgil:

\[\text{Topis ovem tentat scabies, ubi frigida lumen.}\]
\[\text{Altius ad viorem perficit, & horda cano.}\]
\[\text{Bruma gelu: vel cum tonis illius adhibet.}\]
\[\text{Sudor: & his faii fecundarii corpore vepres.}\]
\[\text{Dulcis hercis flavus pecus omnem magistri.}\]
\[\text{Perfundunt, uidi, aries in purgato vilis.}\]
\[\text{Mefcur, misfiaq: & fecunda defini ani.}\]
\[\text{Ati tonihm trifii contemptum corpus amaret.}\]

\[\text{Et spumas mifcent argenti, vitaq: sulphura.}\]
\[\text{Ideas: misce, & pingues minguem cetas.}\]
\[\text{Bellumq: helleborosq: graves miserq: bitumen.}\]
\[\text{Non tamen alla maijs prefent: fortuna laborasti.}\]
\[\text{Quam q: quiet ferro potas reformis ivanum.}\]
\[\text{Ulcere or: altum vitium, vitioq: legendo.}\]
\[\text{Dum medicus adibere manus ad vulnera peslor.}\]
\[\text{Abriget.}\]

which may be Englishfed in this manner: When the poor Sheep through wet flowers, cold Winter, Summers sweet, or pricking of thorns, doth incur the filthy disease of scabs, then it concerneth his master to wash him in sweet Rivers over head and ears, yea to caft him in to fwin for his own life, or else to anoint his body after it is clippd with the spume or froth of Oyl, and of Silver with Brimstone, and soft Ideen Pitch, with Wax, Hellebore, Black-earth, or the flesh of Shrimps; or if it be possible to cut off the top of the wound with a knife.

Of the Cold of Sheep, the first remedy.

His disease the French men call Lette, and of all other it is one of the most contagious, for our English proverb julifheth, one flobbered Sheep infecteth a whole flock, and Textor writeth thus of it; Oves frequentium quam ullam aliud animal infensatur scabies, quam factit macies, ut maxim insopia cibi, hinc morbo nisi occurritur una qua totem pecus coquinabilt, nam ovibus contagione vexantis. Thatis to fay, Sheep are more oftentimes infected with scabs then any other creature, whereinto they fall through leannes, as they fall into leannes through want of food; and therefore if a remedy be not pro-\nvided for this evil, one of them infected will defile all the residue, for Sheep are subject to contagion: for remedy whereof in France they use this medicine: Firft of all they fhear the Sheep, and then they mingle together the pure froath of Oyl and water, wherein Hops have been sod, and the lees of the falt Wine, and fo let it soak in two or three days together: afterwards they wash them in Sea water, and for want of Sea water in falt water: and this medicine is approved, whereby both scabs and tikes are removed from the Sheep, and also the wool growth afterwards better then ever it did before; but it is better if a man can cure them without fhearing then by fhearing, as Varro writeth; and furthermore to wash Sheep oftentimes with this medicine, doth preveure them from scabs before they be infected: and others add unto this medicine little flicks of Cypress wood foked in water, and fo wash them therewith; some again make another medicine of Sulphure or Brimstone, Cypress, white Lead and Butter, mingled all together, and fo anoint their Sheep therewith. Some again take earth which is as fofit as dirt, being fo foftned with the fale of an Als, but evermore they have the feabped place firft of all, and wash it with cold or fale urine, and generally in Arabia they were never wont to ufe other medicine then the gum of Cedar, whereithall they purged away by Ointment all scabs from Sheep, Camels, and Elephans.
pharts: but to conclude, there is no better medicine for this evil then Urine, Brimstone and Oyl, as Diophanes writeth.

Another medicine for the Scabs.

Take the lees of Wine, the froath of Oyl, white Hellebore mingled with the liquor of fodd Hops, also the juce of green Hemlock, which is expresssed out of the flake before it hath feed, after it is cut down and put into an earthen vessele with any other liquor mingled, with scorched falt, so the mouth of the vessele being made up close, set it in a dunghill a whole year together, that so it may be concocted with the vapour of the dung, then take it forth, and when you will use it, warm it, first of all scraping the ulcerous or scabbed part with an Oyfter shell, or else with a sharp pumice flone, until it be ready to bleed, and so anoint it therewith.

Another medicine of the fame.

Take the froath of Oyl fodd away to two parts, I mean three parts into two, put thereinto the flake urine of a man, which hath been heated by calling into it hot burning Oyfter-fheles, and mingle a like quantity of the juce of Hemlock, then beat an earthen pot to powder, and infufe a pinte of liquid Pitch and a pinte of fryed or scorched falt, all which being preferred together, do cure the scabs of Sheep so often as they are used.

Another medicine.

Drink being made of the juce of Hops, and the herb Chamælion, and given unto them cureth them. Likewise the fame being fodd with the roots of black Chamælion, and anointed warm upon the place, according to Dioscorides, have the fame operation. Likewise Pliny writeth, that the scabs of Sheep may be cured by falt water alone, either taken out of the Sea, or made by art, and forasmuch as there is great danger in the decoction thereof, left that the water overcome the falt, or the Salt overcome the water, he prescribeth a mean how to know it, namely the equal and just temperament thereof, for (faith he) if it will bear up an Egge then it is well tempered, fo that the Egg will swim and not fink, which you shall find by addition of equal and just quantity of water and Salt, that is, two pintes of water, a pinte of Salt, and fo lefs to lefs, and more to more. But if there be any bunch or great scab which covereth any part of the skin, then open the scab and bunch, and pour into it liquid pitch and scorched falt: and thus much for the dilace of the scabs.

Of the Holy fire which the Shepheardes call the Pox, or the Blitters, or Saint Anthonies fire.

This evil is uncurable, for it neither admittext medicine nor fecution by knife, and therefore whensoever a Beafe is infected therewith, it ought presently to be separated from the residue of the flock, for there is nothing that spreadeth it felf more fpeedily: whenever you adventure to apply any thing unto it, it prefently waxeth angry, and perplexeth the whole body except it be the milk of Goats, and yet my Author fpokeneth of it: quod infusio taniune velet, ut blandiatur igneam feuitiam, differens magis occifenum gregis, quam problemat. That is, it femeeth to clofe with raging fire, as it were to flatter it a little, rather deferving the death of the Beafe, then doing away the difafe. It is therefore prescribed by the moft memorable Author of all the Egyptians, that men do oftentimes look upon the backs of their Sheep to fee the beginning of this ficknes, and when they finde a Beafe affected herewith, they dig a ditch or hole fit for him at the entering in of the Sheep-coat or flable, wherein they put the Sheep alive with his face upward, and back downward, and caufe all the residue of the flock to come and pife upon him, by which action it hath been often found (as Columella writeth) that this evil hath been driven away, and by no other means.

Of the Warts, and C Rachtes of Sheep.

This difafe is called by the vulgar shepheardes the Hedhgoft, and it doth annoy the Sheep two manner of ways: Firft, when some gauling or matter ariseth upon the paring of the hoof, or else a bunch arife in the fame place having hair growing in the middle like the hair of a Dog, and under that a little worm, the worm is bell drawn out with a knife, by cutting the top of the wound, wherein mull be used great warmnes and circumcision, because the worm be cut flinder in the wound, therefore cut out of her such a venemous pullulate matter, that poiyoneth the wound, and then there is no remedy but the foot mull be cut off. But the wound being opened, and the worm taken out alive, presently with a Wax-candle you mull melt into it hot burning fewe, and if there be no bunch but only scabs, take Allum, liquid Pitch, Brimstone, and Vinegar, mingled all together, and apply it unto the wound, or else take a young Pomgranate before the grains grow in it, and bake it with Allum, calling upon it Vinegar, sharp Wine, and the rust of Iron fryed all together.
Of the Falling-sicknes.

T cometh to passe sometimes that Sheep are infected with the Falling-sicknes, but the cure hereof can never be known, nor yet the sicknes well till the Bealt be dead, and then (as Hippocrates wreteth) by opening of the brain it will evidently appear, by the over great moistnes thereof.

Of the pains in the Eyes.

T is reported by Theophrastus and Pliny, that for clouds and other pains in the Eye of a Sheep, horned-poppy and Colunellite are very whollome.

Of Phlegme in Sheep.

Or the Remedy of this Diseafe, take Penyroyal, Marjoram, or wilde Nep made up together in wool, and thrust into the Nofe of the Sheep, there turned round till the Bealt begin to sneeze, also a stalk of black Hellebor bored through the ear of the Sheep, and there tyed falt for the space of four and twenty hours, and then taken out at the fame time of the day that it was put in, by Pliny and Columella is affirmed to be an excellent remedy against the Phlegm.

Of the swelling in the Jaws.

Hereis sometimes an inflammation or swelling in the Jaws of Sheep, which the Latins call Tonsillæ, coming by reafon of a great flux of humors from the head unto that place, which may be cured two manner of ways, firft, by incifion or opening the skin where the bunch lyeth, whereby all the watery tumors are evacuated, and the Bealt cured; or else if through the coldneffe of the weather or some other accident you lift not to cut the skin, then anoint it with liquid Pitch, prepared in such manner as is before expreffed for the Scabs, by operation whereof, it will be diffolved and difperfed: When this evil arifeth in the begining of the Spring, many times it is cured without any remedy, because the Bealt for the greedines of the sweet graffe floopeeth down her head, and stretcheth her neck, by which the straining and forenffe of her jaws and throat depaarteth, and this ficknesse in a sheep is like the Kings-evil in a man. There be some that cure it by putting falt among the meat of these Beasts, or by Juniper berries, and Harts-tongue leaves beaten to powder.

For the Cough, and pain in the Lungs.

Shepherds for these disease do take the powder of the root of Foal-foot, and mingle it with Salt; fo give it unto the Sheep to lick, whereby they are perfwaded, that the Lungs of the Bealt are much conforted and strengthened, and furthermore against the Cough, they take blanced Almonds, and beat them to powder, and fo-tempering in them two or three cups of Wine, do infue it in at the Sheeps Nostrils, and likewise Vervine which is called a kinde of Germander, but falsely, because it hath no good smell, is given by shepherds at this day unto their Sheep against the Cough.

Of sighing and shortness of breath.

Or Sheep that are affected with much sighing, they ufe to bore a hole with an Iron through their ears, and remove the Sheep out of the place where they feed to some other place, and if it come from the sicknes of the Lungs, then the herb called Lungwort or Creswort, is the moft present remedy in the World: If the root thereof be drunk in water, or a piece thereof tyed under the Sheeps tongue, or (as Celsus faith) give unto it as much Vinegar as the Bealt can endure, or half a point of a Mans flate urine warmed at the fire, and infue into the Nostril with a little horn, this also is a remedy against Flegm in the Summer time.

Of the loathing of Sheep, and encreasing of their stomac.

If at any time the Sheep forsake his meat, then take his tail and pull of{t from it all the Wool; afterwards bind it as hard as ever you can, and fo he will fall hard to his meat again; and Pliny affirmeth, that the fame part of his tail which is beneath the knot will die after fuch binding, and never have any lene in it again.
The History of Four-footed Beasts.

Of the Fluxes of Sheep, and looseness of the belly.

For this disease the Shepherds take no other thing but the herb *Tormentilla*, or Set-foyl, whereby they stop all manner of fluxes, but if they cannot get the same herb, then they take salt and give it unto them; and if having increased their thirst, they give unto them black Wine, whereby they are cured.

Of the milk of Sheep.

In April and May, through the abundance of thick grosse blood, the Milk of Sheep is stopped and filled, then the Shepherds will take two of their fingers, and thrust them within the Nostrils of the Sheep, there rubbing them until they make them bleed, and so draw from them as much blood as they can.

Of the sickness of the Spleen.

Forasmuch as a Horse, a Man and a Sheep, are troubled with the same diseases, they are also to be cured with the same remedies, and therefore Spleen-wort given unto Sheep, as to a Man and a Horse (as we have already expressed) is the best remedy for this Malady.

Of the Fevers of Sheep.

Sometimes a shaking rage through an incensed and unnatural heat of the blood in the Sheep begeteth in him a Fever, the best remedy whereof is to let him bloud, according to these Verdes:

```
Quintianum imma dolor habeamus lapsus ad asfa,  
Cem furit, ait; artus depacijiter arida fabris:  
Frasul incensos ejfus avertre: & inter  
Ima ferite pedis saltentem fanguiine venam,  
Quam procud aut moiti succedere feptus umbra.
```

Viderie, aut summos carpentem ignavius herbas,  
Extremamq; fequi, om medio procumbere campo  
Palpentem, & fora holam decedere nobis.  
Continuo ferre culpam comprofe: pristiquam  
Dira per incuatum sepelat contagio vulgus.

In which Verdes the Poet denifeth the signs of this disease and the cure. The signs he faith are foilatine, and a careless feeding, or bicing off the top of his meat, following always the hindmost of the flock, and lying down in the middle of the field, when others be a feeding, also lying alone in the night time, and therefore he witheth tolet them blood under the pattern or ankle bone of their foot, but by often experiment it hath been proved, that to let them blood under the eyes or upon the eares, is as available as in the legs; but concerning the Fever we will say more in the discours of the Lambs.

Of the Pestilence or Rottemess of Sheep.

The sickness first of all cometh unto Sheep out of the earth, either by some earthquake, or else by some Pestilence humor corrupting the vitall spirit: for *Senea* writheth, that after the City *Pompeii* in *Campania* was overthrown by an Earthquake in the Winter time, there followed a Pestilence which destroyed six hundred Sheep about that City in short time after, and this be faith did not happen through any natural fear in them, but rather through the corruption of water and air which lyeth in the upper face of the earth, and which by the trembling of the earth is forced out, poysoning first of all the Beasts because their heads are downward and feed upon the earth; and this also will poyson men if they were not supersed and overcome by a multitude of good air which is above the earth. It were endless to describe all the evils that come by this disease, how some confume away by crying and mourning, filling both fields and hills with their lamentations, leaving nothing behind them, no not their skins or bowels for the use of Man: For the cure whereof, First change the place of their feeding, so that if they were infected in the woods or in a cold place, drive them to the hills or to sunny warm fields; and so on the contrary, if in warm places and cement air, then drive them to more turbulent and cold pastures: remove and change them often, but yet force them gently, weighing their sick and feeble eftate, neither suffer them to die through lazines and idlenes, nor yet to be oppressed through overmuch. When you have brought them to the place where you would have them, there divide them sfnder, not permitting above two or three together, for the disease is not so powerful in a few as in a multitude; and be well assured that this removing of the air and feeding is the best Physick. Some do prefer the three leaved graffe, the hardest roots of Reeds, and of the Mountain, and such other Herbs or the remedy of this; but herein I can promife nothing certain, only the Shepherd ought oftentimes to give this unto his Sheep when they are found. I will conclude therefore this discours of the Pestilence with the description of Virgil:
Of the Sheep.

It is reported by John Stowe, that in the third year of Edward the first, and in Anno 1275, there was a rich man of France, that brought a Sheep out of Spain (that was as great as a Calf of two year old) into Northumberland, and that the same Sheep fell rotten, or to be infected with the Peltinance, which afterward infected almost all the Sheep of England: and before that time the Peltinance or rottenness was not known in England, but then it took such hold, and wrought such effects, as it never was cleared since, and that first Peltinance gave good occasion to be remembered, for it continued for twenty and six years together. And thus much for this disease of the Peltinance caufed in England for the most part in mild and wet years.

Of Lice and Ticks.

I neither Lice nor Ticks do molest Sheep, take the root of a Maple tree, beat the same into powder, and make it in water: afterwards clip off the wool from the back of the Sheep, and pour the said water upon the back, untill it hathcompassed the whole body: some use for this purpose the root of Madder, and some the roots of Cypresse, and I finde by good Authors, that all of them are equivalent to rid the Sheep from these annoyances: To conclude therefore the discourse of Sheeps diseases, it is good to plant near the Sheep-coats, and pastures of Sheeps, the herb Hysen, or wild Gallow-grasse, for it is very wholesome for Goats, and Sheeps; likewise the flowers of wormwood dried and beaten to powder given unto Sheep with Salt, dostallwage all inward diseases and pains, and also purge them throughly.

The juice of Centory is very profitable for the inward diseases of Sheep, and likewise the flowers of Ivy. the Hoom tree hath four kinds of fruit, two proper, the Nut, and the Grain; two improper, the Line, and Hipehar. this Hipehar is very profitable for Sheep, and it is nothing else but a confection made out of the barks of the Hoom tree: the word it is called an Arcadian word, signifying no other thing than Ipsi and Salsa. Sheep also delight in the branches of Maiden-hair, and generally the Wool of Sheep burned to powder and given to them to drink, is very profitable for all their inward diseases. And thus much shall suffice to have spoken of the several infirmities and sicknesses of Sheep, which I desire the English Reader to take in good part, wondering very much at the manifold wits, and flouting pens of these days, wherein I think our times may be compared to the most flourishing times that ever were since the worlds beginning: yet none have adventured to apply their wits and wits for the explication of the several sicknesses of Sheep and Cattle.

I know there are many Noblemen, Knights and Gentlemen of the Land, and those also which are very learned, that are great masters of Sheep and Cattle, and I may say of them as the Prophet David saith: Their Oxen are strong to labour, and their Sheep bringeth forth thousands and ten thousands in their fields: Whereby they are greatly enriched, and yet not one of them have had so much consideration, either towards the poor Cattle, in whose garments they are warmed, or Charity to the World.

For the better direction to maintain the health of these creatures, as to publish any thing in writing for the benefit of Adam's children, but such knowledge must reit in the brealls of silly Shepherds: and for the masters, either they know nothing, or else in strange visitation and mortality of their Cattle, they ascribe that to Witchcraft and the Devil, which is peculiar to the world of nature.

Horses, Dogs, and almost ever creature, have gotten favour in Gentlemen wits, to have their natures described, but the silly Sheep better every way then they, and more necessary for life, could never attain such kindnesse, as once to get one page written or indited for the safegard of their natures. I do therefore by these presents from my soul and spirit, invite all Gentlemen and men of learning, not only to give their minds to know the defects of this beast, but also to invent the best remedies that nature can afford, for it is a token of highlest mercy unto brute beasts to feed them when they are hungry, and to recover them when they are sick.

Columella and Varro two great Romans, and such as had attained to some of the greatest place of the Common-wealth, being men of excellent wits and capacity, yet had their names been forgotten and they never remembered, if they had not written of rustic and country matters, and it is no little honour unto them to have left that behind them in Print, or writing, which themselves had observed from following the Plough. Therefore it shall be no disgrace for any man of what worth soever to bellow his wits upon the Sheep: for certainly it is no lefe worthy of his wit, that it is of his teeth; and how necessary it is for the nourishment of man, we all know to this day, and besides there is nothing so magnifeth our English Nation as the price of our Wool
in all the kingdoms of the World. But what account the antients made of Sheep, I will now tell you; for their greatest men both Kings and Lords were Shepherds, and therefore you which succeed in their places shall bellow much leafe labour in writing of Sheep then they did in keeping: with the picture of a Sheep they stamped their antient money, and it is reported of Man-
draculam that having found a great treasure in the earth, in token of his blind thankfulness to God, did dedicate three pictures of Sheep to Juno, one of Gold, another of Silver, and a third of Braffe; and besides the antient Romanus made the penalties of the laws to be Oxen and Sheep, and no Man might name an Ox untill he had named a Sheep.

Among the Tragedyts they had their Wives common, yet their Tyrants had lawes to keep their wives to themselves, and they thought it a great penalty for the Adultery of their wife, if the Adul-
terer payed them a Sheep.

The Poets have a pretty fiction, that Endymion the Son of Mercury fell in love with the Moon, who defipd him, and that therefore he went and kept Sheep; afterward the Moon fell in love with his white Sheep, and defired some of them, promising to grant his requelt, if he would gratifie her choice: whereupon the wife-man (as Probw writeth) divided his flock into two parts, the whiter on the one side which had the couler Wool, and the blacker on the other side which had the finer Wool, so the Moon chose the white ones and granted him her love, whereupon Vir-

gil thus writeth;

Pan munere nivos Luna captiv te Luna serelit.

It may appear alfo in what great regard Sheep were in antient time, for that their Priests
made holy Water and facrifices for their fanctification, whereof I finde those relations in Grec-
dian Virgil, and others. At the fuffuration of Sheep there was another manner of fanctifying then at other times, for the Shepherd rofe betimes in the morning, and sprinkled his Sheep all over with Water, making a perfume round about the fold, with Sulphur, Savine, Lawrell, Wine and fire, singing holy verses, and making facrifice to the God Pan for they did believe that by this fuffuration the health of their Sheep was procured, and all consuming difeases driven away.

It is reported that when Sheep of strange colours were sprinkled with this water, it signified great happines to the Princes of the people, and they were gifts for the Emperor, whereupon Virgil made these Verfes;

Ipsa fed in pratis aries jam suave rubenti
Muriae, jam crecoro mutabit tellera into.

When men went to receive answers of the Oracles, they flept all night in the skins of Sheep. There was a Noble facrifice among the Paganis called Eiocantome, wherein were facrificed at one time a hundred Sheep at a hundred several Altars.

It is reported of King Pofias, that he facrificed at one time twelve hundred Oxen and eight and thirty hundred Sheep; so great was the dignity of this Bealt, that God himfelf placed in the death thereof one part of his worship: and whereas it was lawful among the Heathens to make their facrifices of Sheep, Goats Swine, Oxen, Bens, and Gjeefe; they made reckoning that the Lamb and the Kid was belt of all, for that God was not pleased with the quantity, but with the quality of the facrifice. The antient Egyptians for the honor of Sheep, did neither eat nor facrifice them, and therefore we read in holy Scripture, that the Israelites were an abomination to the Egyptians, because they both killed, and facrificed Sheep, as all Divines have declared.

There is a noble fior of Clitus who when he facrificed at the Altar, was called away by King
Alexander, and therefore he left his facrifices and went to the King, but three of the Sheep that were appointed to be offered did follow after him, even into the Kings preffe, whereas Alex-
ander did very much wonder (and that not without caufe) for he called together all the Wife-men and Sooth-fayers to know what that prodigy did forefhow, whereunto they generally anfwered that it did forefhow some fearful events to Clitus, for as much as the Sheep which by appointment were dead, that is, ready to die, did follow him into the preffe of the King, in token that he could never avoid a violent death: and so afterwards it came to paffe; for Alexander being dif-
pleated with him, because (as it is faid) he had rafed on him in his drunkennefs, after the facrifice commanded him to be flaine, and thus we fee how divine things may be collected from the natures of Sheep. These things are reported by Plutarch and Pauflanias.

Another note of the dignity of Sheep, may be collected from the cufmom of the Lacedemoniuns: When they went to the wars they drove their Goats and their Sheep before them, to the intent that before they joyned battle they might make facrifice to their Gods: the Goats were appointed to lead the way for the Sheep, for they were drove forfolt, and therefore they were called Catesedes, and on a time this miraculous event fell out, for the wolves let upon the flocks, and yet contrary to their raving nature, they spared the Sheep, and defroyed the Goats: which notable fact is wor-
thy to be recorded, becaufe that God by fuch an example among the Heathen Paganis did demon-
strate his love unto the good in fparing the Sheep, and his hatred unto the wicked in defroying the Goats, and therefore he referred the Sheep to his own Altar:

Idibus
Of the Sheep.

Ilibum alba Jovi, grandior agna odit,
So faith Ovid.

Nigrum bibent pecudem, ze'phiria solitum album,
So faith Virgil.

And again,

Huc aestim Hilíta
Nigrum multo pecudum te sanguine duct.

To Jupiter and to the Sun, they were wont to sacrifice white Sheep or Lambs, but to Pluto and to the Earth, they sacrificed black Sheep or Lambs, in token of deadness, therefore Tibullus writeth;

Interes nigras pecudes promittite Divi.

And Virgil faith;

Duc nigras pecudes, ea prima piscula sunt.

When the Grecians sent their spies to the tents of the Trojans, to discover what order, strength, and discipline they observed: Neper and the ancients of Greece vowed unto the Gods, for every one of the Captains a special gift that was, Om melam, keles hystera, that is, a black Sheep great with young: the reason whereof is given by the Scholiast, they vowed (faith he) a black Sheep, because the spies went in the night time, blackness being an emblem of darkness, and a Sheep great with young because of good fortune, for they spied well in Troy. In Apollonia there were certain Sheep that were dedicated to the Sun, and in the day time they fed near the river in the bell pasture, being lodged every night in a goodly spacious cave near the City, over whom the greatest men both for wealth, strength, and wit were appointed every night to watch by turns for their better safeguard: and the reason of this custody, and the great account made of these Sheep, was for that the Oracle had commanded the Apollonians to do so unto them, and make much of them: Afterwards Evenium a noble man among them keeping watch according to his turn, fell asleep, so that three of the said Sheep were killed by Wolves; which thing came in question among the common Magistrates to know the reason of that fact, and how it came to pass, whether by negligence or by some other violent incursion: Evenium being no ways able to defend it, was condemned to have both his eyes put out, that so he might be judged never more worthy to see the light with those eyes, which would not wake over their charge, but wink and sleep when they should have been open. And to conclude, I will but add this one thing more, that whereas the Egyptians worshipped the Sheep for a god, God permitted the same unto the Jews to be eaten among common and vulgar meats, and also be burned at the Altar for sacrifice; and whereas the said Egyptians did not only eat but sacrifice swines flesh, God himself did forbid his people that they should never eat or touch of Swines flesh as an abominable thing: by which he signified how contrary the precepts of men are to his own laws, for that which he forbade, they allow; and that which they allow, he forbidde: and therefore how far the people of God ought to be from superstition, and from the traditions of men, is most manifest by this comparison, for that was never comforted that came not into the Temple, and that was never lawful which was not approved by God: and those things which in his law have greatest appearance of cruelty, yet are they most just and equal then the most indifferent inventions of men, which seem to be flushed out with mercy, and gilded over with compassion.

And these things most worthy Readers, I have thought good to express this in the dignity and honorable account which the greatest men of the world in former times have made of Sheep, and thereby I would incite and ill you up, if it were but one noble spirited learned man, which is furnished with wit, means, and opportunity, to dive and pierce into the secrets of English Sheep, and Shepherds, and to manifest unto the world, the belt and most approved means and medicines, for the propelling and driving away of all manner of diseases from those innocent profitable beasts, and for their conservation in all manner of health and welfare.

I am forry that our times are so far poysoned with Covetousnes, that there is no regard of God, man, or beast, but only for profit and commodity: for as for the service of God, we see that common devotion of men, and practice of their Religion, is founded upon a meer hope that therefore God will better prosper them in worldly affairs, and if it were not for the reward in this world, the professors of Religion would not be half so many as now they are; and that is true in them which the Devil flenderously objected to Job, namely, that they do not serve God for nothing, and they had rather with Dives have the Devils favour in rich garments and delicate fare, then with Lazarus with misery and contempt, enjoy the favour of God, and to set up their hopes for an other world. As for Men, we see that the Son loveth his Father but for patronymy, and that one man maketh much of another, for hope to receive benefice and recompence by them; and therefore it is no marvell if the silly beasts have obtained so little mercy, as to be loved, not because they are Gods creatures, but for that they are profitable and serviceable for the necessities of men: for this cause you nourish them, and not like the Apollonians aforesaid for the Oracles sake, but
The History of Four-footed Beasts.

for their fleeces and their flesh. Therefore if you have any compassion, learn how to help their miseries, and publish them to the world for the general benefit; for he cannot be good which is not merciful unto a beast, and that mercy doth easily die which growtheth but in one heart of one mortal man.

There were a company of people in Egypt called Lyopolitis, who worshipped a Wolf for a God, and therefore they alone among all the Egyptians did eat Sheep, because the Wolf did eat them; even so I can make no better reckoning of those men that nourish Sheep for their profit only, then I do of the Lyopolitis, which worshipped a Wolf, for such men have no other God but their belly, and therefore I trust their reasons shall peradventure some one or other to write a larger discourse of our English Sheep.

Now in the next place we are to discourse of the utilities that cometh by Sheep, for as it is the meekest of all other Beasts, so as the reward of meekness, there is no part of him but is profitable to man: his flesh, blood, and milk is profitable for meat, his skin and wool both together and separate for garments, his guts and entrails for musick, his horns and hoofs for perfuming and driving away of Serpents, and the excrement of his belly and egestion or dung, for the amending and enriching of plowed lands, and for these occasions did the Egyptians worship it for a God, for that they could see no creature in the world, but had some parts altogether unprofitable unto men, but in this they found none at all.

First of all therefore to begin with their flesh, although Physitians have their several conceits thereof, as Galen (who faith) that the flesh of Hares is better then the flesh of Oxen and Sheep; and Simeon Zebhi, who being forced to confess the goodnes of Mutton or Sheeps-flesh in the beginning and middle of the Spring, yet writeth that it is full of superfuctious and evil juice, and hurtful to all stegmy and moisttomacks. Grefcontienus also writeth, that the flesh of Sheep hath an unpleasant taint through overmuch humidity, and fit for none but for Country labourers: Indeed I grant the opinion of Bataling, who writeth thus concerning Rams: Quem arietem desivitis ne attinges, non modo enim ejus caro non prodeat, etsim etiam vehementer obest; that is, That Rams flesh we ought never to touch, for it is not only through the craft or subtilty of the Butchers, or else through Covetousnes. But in many houes (as I have heard) there is a kinde of Venison made of the flesh of Rams, which is done by this means; First they take the Ram, and best them with stripes on all parts till the flesh grow red, for such is the nature of the blood, that it will gather to the sick affected places, and thence stand to comfort them, so by this means after the Ram is killed, the flesh looketh like Venison: But as in other discourses, namely, Hares and Conies, we have already shewed our hatred of all cruel meat, so also I utterly dislike this, for if it be not sufficient to kill and eat the beast, but first of all put it to Tyrranical torment, I cannot tell what will suffice, except we will deal with beasts, as PILATE did with CHRIST, who was first of all whipped and crowned with thorns, and yet afterward did crucifie him.

But for the taking away of that Rammy humour and rank moistnes which is found in the Male-sheep, they use to geld them when they are young and lack their dams, or else within the compass of a year after their yeaming, whereby the flesh becometh so temperate, sweeter, and favorious, as any other flesh in the world; and if they passe a year, then do they use to knit them, and so in time their flames deprived of nourishment from the body by reason of knitting, do dry and consume away, or utterly fall off, whereby the whole flesh of the Beast is made very feafome and wholesome. It is granted by all, that when they are young, that is to say, a year old, their flesh is very wholesome, and fit for nourishment of mans nature, but that they increase much phlegm, which evil is allayed by eating Vinegar and drinking wine unto it. In many places they sell their Murtons when they are killed, and so eat them out of the pickles, or else roast them in the smock like Bacon. Within the territory of Helvetia, there is a publique law whereby the Butchers are forbidden to buy any forain Sheep, after the feast of St James; that is, the five and twenty day of July, for although that after that time they grow fat, yet is their flesh then leffe wholesome, and their fat more haurfull, then which is gotten in the Spring of the year.

It were needless for me to set down the division of a dead Sheep into his quarters, shoulders, legs, loins, rakes, heads, and purtunances, for that they are commonly known, and the relation of them can minister small learning to the Reader, but every part hath his use, even the blood that is taken from him when his throat is cut, hath his peculiar use for the nourishment of man, and above all other things the fat of his loins commonly called his sweat wherein it excelleth all other beasts whatsoever, for their reins are covered all over with fat.

There is no lesse use of their milk not only for young, but for old persons, as well for the rich to beautifie their tables, as for the poor to serve their hungry appetites: and there be some people in Africa that have no corn in all their Countrie, and therefore in head of bread, their common food is milk, the goodnes whereof is thus expressed by Herrias.

Quad premat & Capra, post & Ovir, inde boves.

Evermore the milk of an Ewe is belt that is newest and thickest, and that which cometh from a black Sheepes preferred before that which is milked from a white, and generally there is no beest whereo
whereof we eat, but the milk thereof is good and nourishing, therefore the milk of Sheep is preferred in the second place, and there is no caufe that it is put in the second place but for the fanners thereof, otherwise it deserved the firft, for as the fanners make it let pleasant to the palace and stomach of man, yet is it more precious for making of Cheefe and we have showed already that in some places as in the Iland Ery bras, the milk of Sheep yeeldeth no whay, and that they can make no Cheefe thereof, but by mingling abundance of water with it: they make abundance of Cheefe in the Amazon hills, and in Lylyra the Cheefe of Sitilia is made of Gofts and Sheeps milk, and generally Cheefe made of Sheeps milk is the better the more new it is. The nature of a Sheep is to give milk eight moneths together, and in Italy they make Butter alfo of the milk of Sheep, all the Summer time unto the fault of St. Michael; they milk them twice a day, but after that, until they cupple with their Rams, they milk them but once a day: the faults of Cheefes made of their milk is either because they are over dry or hollow, and full of eyes and holes, or else clammy like birdlime, the lat proceedeth from the want of prelling, the fenth through overmuch falt, and the third by overmuch drying in the Sun. And thus much fhall suffice to have fpoken of thofe things in Sheep which are fit to be eaten.

In the next place we come to difcourfe of their Wool, and of the shearing or clipping of Sheep, for although their flefh be preuous, yet it is not comparable in value to their fleeces. For that when they are once dead, they yeeld no more profit, but while they live they are thorn once or twice a year, for in Egypt they are thorn twice a year; and alfo in some parts of Spain. And it appeareth that in antient times there were great fleaths at their Sheep-sheerings, as is apparent in the holy Scripture in many places, and especially by the history of Abafan, who after he had once conceived malice againft his Brother Amnon, he found no opportunity to execute the fame, until his Sheep-shearing feast, at which time in the presence of all his brethren the Kings fons (even at dinner) when no man suspected harm, then did Abafan give a fign to his wicked servants to take away his life, which they performed according to their Maffers malice.

It appeareth by the words of Fliny, who writeth thus; Oves non ubi; tendentur, durasque bilam in locis vellendi nos, qui eum non vellam, ante triduo iudice habent quo longe imman radice lana retinent; that is, Sheep are not every where thorn, for yet unto this time in many places they do commonly observe the old custom of pulling the wool off from the Sheeps back, and which they do now pull the wool and not thorn it, do alwayes caufe their Sheep to fall three days before, that to being made weak the roots of the wool may not thiek to fall, but come off more easilie.

And indeed I am confirmed in this opinion by the Latine word V.Plus, which signifieth a fleec, which can be derived from no other Radix or Theam, nor admit any other manner or kind of no- ratio, then a vellendo, that is, from pulling.

Cato alfo in his Book of Originals writeth thus, Palatini collis Roma altera pars Vellidea appellata fuit, vel vellenda lana ante Histrionem tofleam invita montifram, that is to fay, There was one part of the hill Palatine at Rome, which was called Vellidea, from the pulling of wool, for it was their custom there to pull their wool, before the inhabitants learned the Histrion manner of shearing Sheep: by which testimonie we fee evidently the great torment that the poor Sheep were put unto when they lost their fleeces, before the invention of shearing, for it is certain by the antient pictures and statues of Men, that there was no use of shearing either hair or wool, from Men or Sheep.

But the hair of Men grew rude, and in length like Womans, and Sheep never loift their fleeces but by pulling off: and therefore Varro writeth, that four hundred and fifty years after the building of Rome there was no Barber or Sheep-shearer in all Italy, and that Plautus Tullius Menas was the firft that ever brought in that custom among the Romans, for which there was a monument erected in writing in the publick place at Ardea, which untill his time was there sincerely preferred.

Now concerning the times and feasons of the year for the shearing of Sheep, it is not only hard, but alfo an impossible thing to fet down any general rule to hold in all places. The beft hath ever I read is that of Didimus, nec frigido adhuc, nec jam effuso tempore, sed medio vero Oves tendente sunt; That is, Sheep muff neither be thorn in extreme cold weather, nor yet in the extreme heat of Summer, but in the middle of the Spring.

In some hot Countries they shear their Sheep in April, in temperate Countries they shear them in May, but in the cold Countries in June and July, and generally the best time is between the Vernal Equinox, and the Summers solstice, that is, before the longest day, and after the days and nights be of equal length; there be fome that shear their Sheep twice in a year, not for any necessity to disburden the heat of the fleece, but for opinion that the often shearing caufeth the finer wool to arife, even as the often mowing of the graffe maketh it the fweeter. In the hot Countries the fame day that they shear their Sheep, they alfo anoint them over with Oyl, the lees of old wine, and the water wherein Hops are fod, and if they be near the Sea fide, three days after they drench them over head and ears in water, but if they be not near the Sea fide, then they wash them with rain water fod with Salt: and hereby there cometh a double profit to the Sheep; firstly, for that it will kill in them all the caufe of lefs for that year, fo as they fhall live fave from that infection; and secondly the Sheep do thereby grow to bear the longer and the foffer wool. Some do shear them within doors, and fome in the open fun abroad; and then they chufe the hottest
and the calmest days, and these are the things or the necessary observations, which I can learn out of the writings of the antients about the shearing of Sheep.

Now concerning the manner of our English Nation, and the customs observed by us about this business, although it be needleless for me to express, yet I cannot contain my self from relating the same, considering that we differ from other Nations. First, therefore, the common time whereat we shear Sheep is in June, and Lambs in July; and first of all we wash our Sheep clean in running sweet waters, afterward letting them dry for a day or two, for by such washing all the wool is made the better and cleaner: then after two days we shear them, taking heed to their fleeth, that it be no manner of way clipped with the sheares, but if it be, then doth the shearer put upon it liquid pitch, commonly called Tar, whereby it is easily cured and kept safely from the flies. The quantity of wool upon our Sheep is more then in any other Country of the world, for even the least among us (such as are in hard grounds) as in Norfolk, the uppermost part of Kent, Hertfordshire, and other parts, have better and weightrier fleeces then the greatest in other Nations: and for this cause the forein and Latin Authors do never make mention of any quantity of wool they shear from their Sheep, but of the quality.

The quantity in the least is a pound, except the Sheep have lost his wool, in the middle sort of Sheep two pounds or three pounds, as is vulgar in Buckingham, Northampton, and Leicester: But the greatest of all in some of those places, and also in Knebbs marsh in Kent, four or five pounds, and it is the manner of the Shepherds and Sheep-masters to wet their Rams, so to keep their wool two or three years together growing upon their backs, and I have credibly heard of a Sheep in Buckinghamshire in the flock of the L.P. that had thorn from it at one time, one and twenty pound of wool. After the shearing of our Sheep, we do not use either to anoint or wash them, as they do in other Nations, but turn them forth without, leaving them like maddowes new mowen, with expectation of another fleece the next year. The whole course of the handling of our Sheep is thus described by the flower of our English Gentlemen husbands Maifer Thomas Tuffter:

"Wash Sheep fast the better where water doth run,  
And let him go cleanly and dry in the Sun,  
Then shear him and spare not, at two days an end,  
The sooner the better his coats will amend,  
Reward not thy Sheep when ye take off his coat  
With twitchers, and flasties as broad as a great.:"

And in another place of the husbandry of Sheep he writeth thus:

"Good farme and well stor'd, good housing and dry,  
Good corn and good dairies, good market and nigh,  
Good shepherds, good till-man, good Jack and good Gill,  
Make happy husband and baseprice their toivers to fill:  
Let pasture be stord and fenced about,  
And tillage set forward as needeth without."

And in another place speaking of the time of the year for gelding Rams, and selling of wool which he admonisheth should be after Michaelmas, he writeth thus:

"Now geld the gelder, the Ram and the Bull,  
Sow ponds, amend dams, and sell Welfter the woe.

But of the milking of Sheep he writeth thus:

"Put Lamb fro Ewe, to milk a few,  
Be not too bold, to milke and fold,  
Five Ewes allow, to every Cow,  
Sheep wrigling tail, hath made without fail."

And thus far Tuffter, besides whom I finde little discourse about the husbandry of Sheep in any English Poet.

And for the conclusion or rather farther demonstration of this part, concerning the quality of our English wool, I can use no better testimonie then that of worthy Mr. Camden, in his Britannia, for writing of Buckinghamshire he useth these words, Had tonse fere campellris est, sola item argillace, tenaci & facundo, Paulus quisque immunes ovium greges paeuit, quamquam mollie & tenuissima vellera ab Asiae quisquis gentibus exportatur; that is to say, The whole County of Buckingham is of a clammy, champaign, fertile soil, feeding innumerable flocks of Sheep with his rich and well-grown pastures or medowes, whose soft and fine fleecs of wool are desired of the people of Asia; For we know that such is the trade of Merchandise and transportation of English cloth, the rare fineness and smoothness thereof is admired in Asia; namely, in Palestina, and other Kingdoms of the Turk,
Of the Sheep.

Turk, and therefore they have English houes of Merchants, both at Anporto, Trinelt, and other places. Again speaking of lenfetero, or lenfeter woollen Herforfdhre, he writeth thus: Sed ei præcipuebide gloria est una in circun vicinis agis (Lenfeter are vacant) qui excepta Apula & Tarentum, palmae defunt Europæi annos. The greatest glory of that foil is in their wool, which ariseth from Sheep, feeding in the fields and pastures adjoining thereunto, (which wool they call Lenneter orel) and all Chriftendom yeeldeth praffe and price unto it next after the Apulan and Tarentinum wool.

And indeed so sweet is the gain that cometh by Sheep, that in many parts of the Luld there is a decay of tillage and people, for their maintenance, and therefore the said Mr. Camden faith most worthily, even like himself, that is honest and unpartial in all his writings, for in the beginning of his description of Northamptonfhire, where I think above all parts depopulation and defroying of Towns is most plentiful, (fo that for Christians now you have Sheep, and for a multitude of good house-holders, you shall have one Shepheard Swain and his Dog lying upon forty fillings a year, or little more) he writeth in the words of Hypederus after the commendation of the Sheep and wool of that Country: Ovibus opleta & quasi obfefs, quæ (ut Hypederus hic dixit) tam meis effe tamque exiBo ali folomans, nunc (ut fatirc) tam eludes atque indomitas effe caperunt ut boves de novem, ipis agris, domo apitius, ac depopulentur: which worlds I cannot better English then in the words of an Epigrammatarian in our age, for to this effect, according to my remembrance he writeth;

Sheep have eat up our poflerities, our medowes, and our downes, Our Mountains, our Men, our Villages and Towns;
Till now I thought the common proverb did but jefts,
That fayer a black sheep is a biting beefs.

Concerning the goodness of English Wool, and the difference of it from others, the reason is well given by Giffers and Camden: Lame earum mulies & cripte jant, ideeq; nunæ ut eodem Milefa celebratur: nec mirum cum nullum animal venenatum mitat Anglia, & fine laporum mœv pœn-vagitur: nulli enim in Anglica bovis perfortunatur. Rore call fllar hiodant greges, al omní alo ftate arcutor quod alio vi obvius fint existant: that is to say, The wool of English Sheep is soft and cured, and therefore it is now commended as highly as ever was the Milefair wool in ancient times: and not without just cause, for they are neither infected with the fear of any venomous Beast, nor yet troubled with Wolves and therefore the strength of their nature and peaceable quiet wherein they live, doth breed in them the better wool; and besides they never drink, but quench their thirst with the dew of heaven. And thus much for the discourse of English Woyl.

I am never able sufficiently to describe the infinite commodities that come unto men by wool, both for gardens, for hangings, for coverings, for hats, and divers such other things, and therefore it shall not be unpleasant I trust unto the Reader, to be troubled a little with a farther discourse hereof. I blot some paper in describing the quality of the belt wool in other Nations. First of all therefore we are to remember these two things, that the belt wool is soft and cured, and that the wool of the old Sheep is thicker and thinner then the wool of the younger, and the wool of the Ram followeth the fame nature, of whom we will speak more in his story. Only in this place our purpose is to expresse the examination of wool as we finde it related by Authors, according to their several Countries. Therefore as we have said already out of Mr. Camden report, the Tarentinum and Apulian must have the first place, because the Sheepe of those Countries live for the mow part within doors, and besides that, are covered with other skins. In Spain they make greatest account of the black wool, and it appeareth by good History, both in our English Chronicle and others, that the Sheep of Spain were of no reckoning till they were flored with the breed of England.

There is a little Country called Polentia near the Alpes, of the wool whereof Martial maketh mention, as also of the Canusina red wool, and therefore Ovis Canusina was an Emblem for precious wool, his Verbes are these:

Non tanum pullus gentes wellere landis,
Romana moris suis vexitur Gallia ruffis,
Canusinae mitto Syrm effere jadis.

We have spoken already of the wool of Ithria and Liburnia, which if it were not for the spinning in Portugal, and the Weftlers ar thereupon, it were no better for cloth then hair. Stobo writeth that the wool of Mauna, whereby he meaneth all the Country that lyeth upon the Scutana, is very soft and gentle, and the belt of Haly, but that of Liguria and Milain, is good for no other but for the garments of servants.

About Padua their wool is of a mean price, yet they make of it moft precious works of Tapestry, and Carpets for tables, for that which was rough and thick in antient time was used for this purpole and also to make garments, having the flags thereof hanging by it like rugs. There is a City called Feltrum and the wool thereof by the Merchants is called Feltrianus, Felt-wool, they were wont to make garments hereof neither woven nor fewed, but baked together at the fire like hats and caps, whereof Pliny writeth thus, Lana & per fo colecta vestem faciunt, & ei adiecur actuam etiam ferro reficunt.
The History of Four-footed Beasts.

resistent, into vero etiam ignium navifimo sui purgamento quippe abeiis coquentiam extral videbantur usi venierum ut arbitror inventi, certe Gallorum ut arbitror inventi, certe Gallorum etiam igni, certe Gallorum igitur inventi. Wool hath this property, that if it be forced together it will make a garment of it self, and if Vinegar be put unto it, it will bear off the blow of a sword, drest at the fire and purged to the last, for it being taken of from the brazen coffer whereon it was drest, it served for clothing, being as he thought an invention of the Gods, because it was known by French names, and from hence we must see the beginning of our felt-hats. The Biteria wooll is celebrated by Juvenal, when he speaketh how Catullus fearing shipwreck, was about to cast him out into the water:

*Infest nativa pecus, fed & egregius fans*

**Viribus occulit & Biterium adjunct aer.**

Of the colours of Wool.

For the colour of Wool in that Country growth mixed, not by any art, but naturally through their food, or their drink, or the operation of the air. The Lauritian Wooll is also celebrated, not only for the softneffe of it, but for the colour, for that it is as black as any Raven, and yet there are some there of other colours, and for this cause the Spanish Wooll is commended, especially Turditian, and Cornus (as Strabo writeth) for he faith the gloffe of the Wool was not only beautiful for the purity of the black, but also it will spin out into thin a thread as was admirable, and therefore in his time they fold a Ram of that Country for a talent. I may speak also of the Wooll of Parma, and Altinum, whereof Martial made this dittochon;

**Vellera primus Appulia; Parma secundus**

**Nobilis, Altinum tertia lundat ovus.**

We may also read how for the ornament of wool, there have been divers colours invented by art, and the colours have given names to the Wool, as Solaria lana, wool of Sea-water-colour, some colour taken from an Amalybi flone, some from brightnefs or clearnefs, some from Saffron, some from Roses, from Mirtles, from Nuts, from Almonds, from Wax, from the Crow, as Coehor coeacum, and from the purple flith, as from the Colouline, or the Tyrian, whereof Virgil writeth thus;

*He quoq ton cura nabie duore tuende,
Neceinm visis erit, quamvis Milifia magno*

**Vellera matenior Tyrian inconla rubores.**

From hence cometh the chalke colour, the Lettece colour, the Loot-tree root, the red colour, the Azure colour, and the Star colour. There is an herb called Fullers-herb, which doth soften Wool, and make it apt to take colour, and whereas generally there are but two colours, black and white that are fimple, the antients not knowing how to die Wool, did paint it on the outside; for the triumphing garments in Homer were painted garments. The Phrygian garments were colours wrought with needle-work, and there was one Attalus a King in Asia, which did firft of all invent the weaving of Wool and Gold together, whereupon came the name of Vefis Attalica, for a garment of cloth of gold.

The Babylonians and the Alexandrians loved diversity of colours in their garments alfo; and therefore Metellus Scipio made a law of death against all fuch as should buy a Babylonian garment, that was carpets or beds to eat upon for eight hundred Sesterces. The shearing of cloth or garments made of thorne cloth, did firft of all begin in the dayes of St. Augustine, as Penfella writeth. The garments like popples had the original before the time of Lucullus the Poet, as he maketh mention in Targumat.

The casting of Wooll.

There was a fashion in antient time among the Romans, that a dilaffe with Wool upon it, was carried after Virgins when they were going to be married: the reason thereof was this (as Varro writeth) for that there was one Tanapulus, or, Caius Geirus, whose Dilaffe and Wool had endured in the Temple of Sangi many hundered years, and that Servius Tullius made him a cloake of that Wool, which he never used but in the temple of Fortune, and that that garment afterwards continued 500 and 60 years, being neither conformed by moths, nor yet growing threadbare, to the great admiration of all which either saw it or heard it. And thus much I thought good to add in this place concerning the diversity of Wool, distinguished naturally according to several regions, or else artificially after sundry tinctures. Lakewife of the mixing and mingling of Wool one with another, and diversities of garments, and lastly of the casting and enduring of Wool and Garments, for it ought to be no wonder unto a reasonable man, that a woollen garment nor eaten by moths, nor worn out by use, should last many hundered years, for seeing it is not of any cold or earthy nature, but hot and dry, there is good cause why it should remain long without putrefaction: and thus much in stead of many things for the Wool of Sheep.

As we have heard of the manifold use of the Wool of Sheep, so may we say very much of the Skins of Sheep for garments and other ues: and therefore when the Wool is detracted and pulled off from them, they are applied to Buskins, Brent-plates, Shooes, Goves, Stomachers, and other ues, forthey are also dyed and changed by tincture into other colours, and also when the

The use of Sheep skins,
Wool is taken off from them, they dress them very smooth and stretch them very thin, wherefore it is made writing parchment, such as is commonly used at this day in Eng.watt, and I have known it practiced at Tuscany, called once Tripantium in the County of Northampton: and if any part of it will not stretch but remain stiff and thick, thereof they make writing tables, whereas they write with a pencil of Iron or Brass; and afterward deface and rake it out again with a sponge or linnen cloth. Hereof also (I mean the skins of Sheep) cometh the coverings of Books, and if at any time they be hard, stubborn, and stiffe, then they soften it with the Sheep's sweeter or tallow.

The bones of Sheep have also their use and employment for the fastening of knives. The bodies of the urine of Sheep do make a kind of counterfeit Nitre. And Ruflius, that if a man would change any part of his Horst's hair, as on the forehead, take away the black hairs and put them into white, let him take a linnen cloth and wet it in boiling milk of Sheep, and put it so hot upon the place that he would have changed, so oftentimes together till the hair come off with a little rubbing, afterward let him wet him with the same cloth in cold Sheeps milk, and lay it to the place two or three days together, and the hair will arise very white (thus faith he;) and there are certain flies or moths which are very hurtful to gardens, if a man hang up the panch of a Sheep, and leave for them a passage or hole into it, they will all forake the flowers and herbs, and gather into that ventricle, which being done two or three times together, make a quiet riddance of all their hurts, if you please to make an end of them.

The Swallows take off from the backs of Sheep flocks of Wool, wherewith the provident Birds make their nests to lodge their young ones after they be hatched.

With the dung of Sheep they compaffe and fat the earth, it being excellent and above all other dung necessary for the benefit and increase of Corn, except Pigeons and Hens dung which is hotter, and the sandy land is fittest to be amended with Sheep's dung, also plants and trees if you mingle therewith ashes.

Now we are come to the gentle disposition of Sheep, and to express their inward qualities and moral ume, and first of all considering the innocency of this Beast, I marvel from whence the *Gyptianus* Cretian custom proceeded, which caused Adulterers for their punishment to ride throughout the whole City crowned with Wool, except that so they might signify his tender and delicate efficiency; and therefore as some are crowned with gold in token of virtue and valiant acts, so vice (especially the wantonness of the flesh) deferveth to be crowned with Wool, for the leoneness and basilines thereof, not because such a crown was a sufficient punishment, for an opprobry and continual badge of ignominy, even as forgers and perjured persons ride with papers on their heads, upon bare horse backs, and so forth.

By the behaviour of Sheepe at their Rutting or Ramming time the Shepherds observe tempers, rains, and change of weather. If they be very lustful and leap often upon their females, but if they be slow and backward, then is the poor naked man glad, for that thereby he conceiveth hope of a gentle Winter, and temperate weather. Also if in the end of Autumn they ramp upon the ground with their feet, it betokeneth hard weather, cold Winter, much Frost and Snow, about the time of the first rising of the Pleiades or seven Stars. Which thing is thus Poetically expressed by *Avienus*:

*Si deniq. terra*

*Laurea solutis capitis, ut tensantur in auribus,\*  
*Cum modius per marmor turbida condit,\*  
*Pliadas occidunt, cum brume in frigor arduis,\*  
*Frugifer Autumnus, ruat aether concitus imber.*

Concerning the simplicities of Sheepe, I must say more, and also of their innocency, yet the simplicity thereof is such, and so much, that it may well be termed folly, or *Animal inepistimum*, for *Aristotle* writeth thus concerning it, *Reptis in debita fine causa, byme objiciante ipsum sese egrediebat stabulo, occupatam a nuncio, nisi pater conspiceret, abide non valit, sed perit deficiens, nisi metas a prollo decantaret, ita enim religios greges se fugaverint*, that is, Without cause it wandereth into deficit places, and in the winter time when the air is filled with cold winds, and the earth hardened with hoare frostes, then it forsaketh and goeth out of his warm coat or fable, and being in the cold Snow, there it will tarry and perish, were it not for the care of the Shepherd, for he taketh one of the Rams by the horns, and draweth him in adiors, then do all the residue follow after. They are also very obedient to the voice and call of the Shepherds, and to the barking and cry of their Dogs, and no leffe is their love one toward another, every way commendable, for one of them pityeth and forroweth for the harm of another, and when the heat of Sun offendas them, *Avestor* writeth, that one of them interpothes his body to shadow the other.

Their Dam or Ewe loveth her Lamb, and knoweth it by fmelling to the hinder parts, and if at any time the Dam do not love or make reckoning of her young one, they give her the herb Pennywort or Water-well to drink in water, and then as the *Sehalii* affirmeth, natural affection increaseth in her. Of the foolishnes of Sheepe, there was an Emblem to signifie by a man riding upon a golden Fleece, one ruled by his servante or wife;
The History of Four-footed Beasts.

Transt aquas residunt pretiosi in vellere Pbyrxyu, 
Et lamiam impavidus per mare tandit ovem.

Ego qui id es? vis senju habeti sed drite geza,
Conjuus aut servi quem regit arbitrium.

And therefore Aristophanes reproving the folly of the Athenians, calleth them Sheep: And Orig- 
gen writing upon Lebions, faith, Ovium immotato aefellium saltorum, & irritationeullium certulio. The 
Sacring and killing of Sheep, is nothing else but the correction of our foolish and unreasonable 
affections. We have shewed already in the story of the Goat, of a Goat that nourished a Wolf's 
whelps, which in the end did destroy her, and the self fame is ascribed also to a Sheep.

They observe great love and concord with Goats, and live in flocks together, and for this cause 
it happeneth, that more Goats are destroyed by Wolves then Sheep, for that the Goats forfake 
their fellows, and fraugle abroad for food, but the Sheep very seldom: and it is observed, that 
if a Wolf kill a Sheep, and afterwards any garments be made of the wooll of that Sheep, they 
easily and more speedily breed Lice and vermin then any other, and also procure itch in the bodies of 
them that wear them, whereof Car\dran giveth this reason; Haud mirum videri debet ovis pellem a Lupo 
dilaniata pravitatem mutaret, nam ob vehementem mutem, tum etiam ob contratium naturam mul aflcitur, et si 
mari enim ultimum sit sapientium, majus tamen affiliotur corpus in uo quantum in altero gener. metuit homo magis 
in maris flunctum quam coram bofibus. It ought not (faith he) move any man to wonder, that the wooll 
of a Sheep torn afunder by a Wolf should beget and breed itch, for that affection ariseth from both, 
from the vehemency of fear before it be dead through the sight and sense of the Wolf, and also by 
reason of a contrary nature that is oppressed and devoured by another, and although death be the 
least punishment, yet we see divers affections follow carcasses after death, and as a man is more 
afraid of the Sea when he is in peril of death therein, then of the face of his enemy, fo is it in this cafe, 
between the Sheep and the Wolf.

The same Cardan affirmeth, that Sheep are afraid of Wolves even after death; for the wooll of a 
Sheeps skin will fall off in the presence of a Wolf. Unto this subcribeth Oppianus, or rather Al- 
bertus received it from Oppianus, and furthermore (it is said) that if the string of a Sheeps and Wolves 
guts be fastened to one and the same Instrument, they will never make good Harmony; and furthermore, 
if a Drum be made of a Sheeps skin, and another of the Wolves skin, the Drum of the Sheeps skin will jar, and found unpleasantly in the presence of the Wolves skin: but of these things 
I have no certain grounds, only I say, there may be natural reason from the substance and 
matter, both of one and other, why this accident may chance without discord and hatred of each 
other, but from the difference and folly of the matter; as for example; the guts of a Wolf are 
strong and hard, and will abide greater strain then the guts of a Sheep; if therefore the Musitain 
will strain the one like the other, it must needs fly afunder: likewise the skin will give a deeper and 
lowered found upon a Drum, by renfon of the substance, than a Sheeps; and fo some may ignorantly 
ascribe that difference to an antiopathy in nature, for as a Candle in the presence of a great Torch 
or Fire, giveth lefs light to the eye, fo doth a drum made of a Sheeps skin, lefs found to the sense 
of hearing, in the presence of another made of a stronger and harder beasts skin: and to conclude, 
as a twine thread will not hold tretching in the presence (I mean in comparison) of a silk thread, al- 
though it be of the same quantity, even fo will not a Lute string made of a Sheeps gut, in compa- 
riffion of another made out of a Wolf. But all the question is, how it cometh to pass, that one of 
the skins hanged up in the presence of the other should be consumed before other, that is, a Sheeps 
skin in the presence of the Wolves, as a Goofes skin will loose the feathers before the Eagles. The 
answer is easy, for the dryer that the body is, the lefs excremental humor it containeth: and fo will 
lift the longer, and all wilde fiveltraile beasts are dryer then the tame, modern, and domesfical, as 
for example, the Wolf then the Sheep; the Lion then the Dog; the Pheasant then the Cock; the 
Eagle then the Goofe: and for these causes the skins of the one doe waffe before the other, nor for 
fear or secret opposition, but for want of better enduring subsistance.

The Poets do ascribe unto their Gods Lanus pedes, feet made of Wool, for that they come softly 
and suddenly without noise to take vengeance upon malefactors; and therefore when they describe 
Saturn ryed up a whole year with bands of wool, their meaning is, shew how with patience he 
forbare his wrath and indignation. Bees are enemies to Sheep; and there are no cateel that do so 
much innrich men as Sheep and Bees.

There is a story in Suidas and Hefcibius, of one Chryfamis, who was very rich in Sheep in the Iland of 
Cow, and there came every year an Eel, and what away his best Sheep among all the flock, at last 
he met with it and flew it; afterward the ghost of the Eel appeared to him in the night, warning 
him (for fear of other harm) to fee him byued. Chryfamis neglected it, and therefore he and all his 
family perished. By which story I cannot guess any other meaning, but that some man stole away his 
Sheep, and for that he took upon him a private revenge, mock inhumanely suffering him to be unbu- 
ried, and setting more by a beast then the life of a man, as a just punishment of God he perfired: and 
thus I conclude this natural and moral discourse of the Sheepe with that fiction of Efop, who writeth, 
that on a time as the Shepherds were making merry in a Cabbage, and eating a Sheep, the Wolf came 
and looked in, saying unto them: Asqui ego si tantum facerem, quantum curis virum tumultum? If I should eat a 
Sheep as you do, you would all rise in an uprore: which is fitted against them that make good laws, 
and observe none themselves.
Having thus made a general description of the Sheep, wherein we have spent no more time than was fit and convenient, we are now forced to the several species and kindes, and first of all, order and nature teacheth us to discourse of the male, which in our English language is called a Tup or Ram, derived I do not doubt from the French, Ram, although also they call him Belier; the Germans, Haden widers, and Hammell; the Italius, Montone, and Ariete; the Spaniards, Carneros; the Helvetians, Ramchen; the Greeks in ancient time Krios, Ariacha, Cerse, and now in these days Kris; the Hebrews, Di, or Eel; the Chaldees, Dikrins; the Arabicans, Kaha; and the Persians, Ne-rumusch. Now concerning the Greek and Latin names, there is some difference among the learned about their notation, etymology, or derivation; for although they all agree, that Aries sti dux et mat-rius proorum, yet they cannot content from what root, item, or fountain, to fetch the same. Isid- rus bringeth Aries ab aris, that is, from the Altars, because the sacrificing of this beast was among all other Sheep permitted, and none but this except the Lambs. Others derive it of Aretes, which signifieth
The History of Four-footed Beasts.

The chief of Rams for breed.

Crescentius.

And therefore for as much as the young ones do commonly resemble the father, and bear some notes of his colour, let your Ram be all black, or all white, and in no cafe party-coloured; and for the stature and habit of his body let it be tall and straight; a large belly, hanging down and well clothed with wool; a tail very long and rough; a broad fore-head; large horns; crooked wind-horns toward his snout, having his ears covered with wool, a large breast, broad shoulders and buttocks; his fleece pressed close to his body, and his wool not thin nor flanding up. And for the horns, although in all Regions Rams have not horns, yet for windy and cold Countries the great horned Beasts are to be preferred, for that they are better able through that defence to bear off windy and weather, yet if the climate be temperate and warm, it is better to have a Ram without horns, because the horned Beast being not ignorant what weapons he bears on his head, is as apt to fight with the pold Sheep, and also more luxurious among the Ewe, for he will not endure a rival or companion-husband, although his own strength and nature cannot cover them all; but the pold Ram on the other side is not ignorant how naked and bare and unarmed is his head, and therefore like a true coward, fleepeth in a whole skin, being nothing so harmful to his corrivals, nor to the females, but well indureth partnership in the work of generation.

There is no Beast in the world that so much participate with the nature of the Sun as the Ram, for from the Autumnal Equinolium unto the Vernal, as the Sun keepeth the right hand of the Hemisphere, so doth the Ram lie upon his right side; and in the Summer feaston as the Sun keepeth the other hand of the Hemisphere, so doth the Ram lie upon his other side. And for this cause the Lyrians which worshipped Ammon, that is the Sun, did picture him with a great pair of Rams horns. Also, although in the heavenly or celestial sphere or Zodiac there be nothing firr or lat, yet the Egyptians have placed the Ram in the first place, for their Astronomers affirm, that they have found out by diligent calculation, that the fairest day which was the beginning of the worlds light on the face of the Earth, then was the sign Aries in the midit of Heaven, and because the middle of Heaven is as it were the crown or upper-most part of the World, therefore the Ram hath the first and uppermost place, because it is an Equinoctial sign, making the days and nights of equal length, for twice in the year both the Sun pas through that sign, the Ram fitting as it were judge and arbiter twice every year, betwixt the day and night.

There be poetical fictions how the Ram came into the Zodiac; for some fay, that when Bacchus led his Army through the Deferts of Lybias, wherein they were all ready to perish for water, there appeared to him a goodly Ram, who fowed him a most beautiful and plentiful fountain which relieved and preferred them all; afterward Bacchus in remembrance of that good turn erected a Temple to Jupiter Ammonius, also in that place for so quenching their thirst, placed there his Image with Rams horns, and translated that Ram into the Zodiac among the Stars, that when the Sun should pas through that sign, all the creatures of the world should be fresh, green and lively, for the fame cause that he had delivered him and his Hoatt from perishing by thirst, and made him the Captain of all the residue of the signes, for that he was an able and wise Leader of Souldiers. Other again tell the tale somewhat different, for they fay, at what time Bacchus ruled Egypt, there came to him one Ammon.
Of the Ram.

Amon, a great rich man in Africa, giving to Bacchus great store of wealth and cattle to procure favour unto him, and that he might be reckoned an inventor of some things: for requisit heereof Bacchus gave him the land of Thesos in Egypt, to keep his Sheep and Cattle, and afterward for that invention he was priceted with Rams horns on his head, for remembrance that he brought the first Sheep into Egypt, and Bacchus also placed the sign of the Ram in Heaven: These and such like notions there are about all the signs of Heaven, but the truer observation and reason we have shewed before out of the Egyptian learning, and therefore I will cease from any farther prosecution of these fables.

They ought to be two year old at least before you suffer them to joyn in copulation with the Ewes, and for two months before to be separate and fed more plentifully then at other times, that so at their return they may more esperly and perfectly fill the Ewes: and then also before copulation, and at the time that they are permitted in some Countries they give them Early, and mix Oats with their meat, and feed them with the herb Salomon's seal, for all these are vertuous to ftrir up and incease their nature. And likewise one kinde of the Satyrium and salty water, as we have said in the discourse foregoing.

Now, at the time of their copulation they have a peculiar voice to draw and allure their females differing from the common bleating, whereof the Poet speaks, Blaterat hine ater, & pia balatvow: This Bealt may continue in copulation, and be preferred for the generation of Lambs till he be eight year old; and it is their nature the elder they be, to seek out for their fellows the elder Ewes or females, forfaking by a kinde of natural wildom.

Now concerning the time of their admittance to copulation, although we have touched in the former Trettise, yet we must add somewhat more in this place. In some places they suffer them in April, and some in June, that so they may be paff danger before Winter, and be brought forth in the Autumn, when the grapes after harvest is sweet, but the belt is in October, for then the Winter will be over-paffed before the Lamb come forth of his dam's belly. Great is the rage of these Beasts at their copulation, for they fight irrefuly till one of them have the victory; and for this cause Aries among the Writers is a word to express singular violence:

Arietat in porto & duos objice poster.

And Sibis of Dioecippus,

Arietat in primos obiectis; immania membri.

And so Seneca in his book of Anger, Magno imperatori antequam ateris inter se arietarent, cor exilixat: And indeed great is the violence of Rams, for it is reported that many times in Rhetia to try their violence, they hold betwixt the fighting of Rams a flick, or bat of Corn-tree, which in a bout or two they utterly dimnish and bruise in pieces.

There is a knowne fable in Alfinius, of the Wolf that found a couple of Rams, and told them that he must have one of them to his dinner, and bad them agree betwixt themselves, to whom lot that death should happen, for one of them must die; the two Rams agreed together, that the Wolf should stanf in the middle of the clofe, and that they twain should part one into one corner, and the other into the corner of the field, and so coming runne to the Wolf, and he that came last should lose his life to the Wolves mercy; the Wolf agreed to this their device, and chose his standing, while they conferred with their horns, when they came upon him to make him sure enough from hurting any more Sheepe: forth therefore went the Rams, each of them unto his quarre, one into the East, and the other into the West, the Wolf standing joyfully in the midit, laughing at the Rams destruction; then began the two Rams to fet forward with all their violence, one of them so attending and observing the other, as that they might both meet together upon the Woff, and fo they did with vengeance to their enemy; for having him betwixt their horns they crushed his ribs in pieces, and he fell down without stomach to Rams flesh.

This invention, although it have another moral, yet it is material to be infected into this place to shew the violence of Rams; and from this came so many warlike inventions called Arietet, whereewith they put down the walls of Cities, as the Readers may see in Vitruvius, Valerius, and Alfinius, for they lay that the warlike Ram was made of wood, and covered over with fheels of Tortoise, to the intent it should not be burned when it was set to a wall, and it was also covered with the skins of fack-cloth by rows artificially contrived, within the same was a beam which was pointed with a crooked iron, and therefore called a Ram; or rather because the front was so hard that it overthrow walls, when by the violent strength of men it was forced upon them; and whereas it was shaped over with Tortoise fheels, it was for the true resemblance it bare therewith; for like as a Tortoise doth sometime put forth his head, and againe sometime pull it in, so also doth the Ram sometime put forth the ficke, and sometime pull it in, and hide it within the frame, so that by this engine they did not over-throw the walls, but also they caused the ftones to fly upon the enemies like thunder-bolts, striking them down on every side, and wounding with their fall or stroke like the blows of an armed man; and against these forces there were counter-forces devisd on the part of the besieged, for because the greatest thereof was such as it could not be moved without singular note and ostentation, it gave the besieged time to oppose against it their instruments of war for their safeguard, such were called

Coldites.
The History of Four-footed Beasts.

Cingul, Lappi, Lappi ferum. made like a pair of tongs, whereby as Palleus writhe, many times it came to pass, that when the wall was overthrown the enemies durst not enter, saying: Certe hostes sumpsit ab orbibus dieis mortuum ingredi in urbem non ambulant. And thus much for the force of Rams both their true and natural strength, and also their artificial imitation by men.

Now on the other side the wife the shepherds want not desires to till them in the heart of the impetuous Beasts. For Epicharmus the Syrus faith, if there be a hole bored in the barker part of his crooked horn near his ear, it is very profitable to be followed, for seeing that he is a Captain of the flock, and that he leads all the residue, it is most necessary that his health and side-guard be principally regarded; and therefore the ancient shepherds were wont to appoint the Captain of the flock from the prime and first appearance of his horns, and to give him his name, whereof he took knowledge, and would lead them at the appointment and direction of his Keeper.

When he is angry he beateth the ground with his foot, and they were wont to hang a board of a foot broad, wherein were drawn many sharp nails with the points towards the head, so that when the Beast did offer to fight, with his own force he woudeth his fore-head. They were wont also to hang a thimph at the horn of the Ram, and then the Wolf will never set upon their flocks.

And concerning their horns which are the noblest parts of their body, most regarded, yet I must speak more, for there was wont to be every year amongst the Indant a fight between men, wide Beasts, Bulls, and tame Rams: and a murtherer in ancient time was wont to be put to death by a Ram, for by art the Beast was so instructed, never to leave him till he had dafhed out his brains.

It is reported of a Rams horns consecrated at Delos, brought from the coast of the red Sea, that weighed twenty and six pounds, being two cubits, and eight fingers in length. There was a Ram in the flocks of Pericles, that had but one horn, whereupon when Lampeus the Poet had looked he said: Ex duasque in urbi vigenter falliubus, fore ut altera obfurator ad annum Periclis, apud quem visum fo- rent pectorum, residerit civitatis potestas. That whereas there were two contrary raging factions in the City, it should happen that Pericles, from whose possessions that moniter came, should obscure the one, and take the whole government of the City.

It is reported by Rafi & Alberius, that if the horns of a Ram be buried in the earth, they will turn into the herb Sprage, for rottennes and putrefaction is the mother of many creatures and herbs. There was, as Aridus reporteth in his Wonders, a child born with a Rams head: and it is affirmed by Ovid, that Mnes inclofed an old decrepit Ram in a brazen vessel, with certain kinds of medicines, and afterwards at the opening of the said vessel, she received a young Lamb, bred upon the Meta- morphosis of his body.

Concerning Phrixus, whereof we have spoken in the former part of our discourse of the Sheep, there is this story. He was the son of Athaman, and Nephela: Afterward his mother being dead, he feared the treachery of his mother in law, and flep-dame Inua, and therefore with his father Helle, by the consent of their Father, he swam over a narrow arm of the Sea upon the back of a Ram, carrying a golden fleece, which before that time his Father had bestowd upon him. His father Helle being terrified with the great roaring of the water, fell off from the Rams back into the Sea, and thereof came the name of Heliosfoi, of Helle the Virgin, and Ponto, the Sea, but he came safely to Colchis to King Actae, where, by the voyce of a Ram, who spake like a man, he was commanded to offer and dedicate him to Jupiter, surnamed Phrixus, and allo that golden fleece was hanged up and revered in the Temple of Colchis, until Jason by the help of Medea aforesaid, did fetch it away, and the Ram was placed among the Stars in his true shape, and was called Phrixus, of Phrixus, who was the Father of the Phrygian Nation.

Of this fabulous tale, there are many explanations and conjectural tales amongst the learned, not unprofitable to be reherced in this plaice. Callus and Palæphatus say, that the Ram was a ship, whose badge was a Ram, provided by Athaman for his son to sail into Phrygia: and some say, that Ariés was the name of a man that was his foster-father, by whose counsel and charge he was delivered from his step-mother Inua.

Other say, that there was a Book of parchment made of a Rams skin, containing the perfect way to make gold, called Alchimy, and thereby Phrixus got away. But in Avent there was reserved the Image of this Phrixus, offering the Ram (upon which he was born over the Sea) to the God Lapplifi- us: and whereas there are in Colchis certain Rivers out of which there is gold growing, and oftentimes found, whereupon some of them have received their name, as Chalybous, and the men of that Countrey said to be greatly enriched thereby, they gave occasion of all the Poetical fictions about the golden fleece. There are in some places of Africa certain Sheep, whose wool hath the colour of gold, and it may be, that from this occasion came the tale of golden Fleece. It is said, that when Aretus reigned in Pel-pomnesia, he vowed to Diana the belft whatsoever should be brought forth in his flock, and it fortune that there was yeased a golden Lamb, and therefore he neglect- ed his vow, did not offer it, but that it up in his chest. Afterward when he gloried and boast- ed of that matter, his brother Jbnys greatly envied him, and counterfeiting to give his wife Aretus, he received from her the golden Lamb. Then being in possession thereof, he contradicted Aretus before the people, affirming that he had had the golden Lamb thereof to be King, and to reign among them, and so laid a wager of the whole Government or Kingdom thereof with Aretus, where-
Of the Ram.

Mollis Pityxis jecuri collis marit,
Hoc meruit tunicum quiti jape debitis.

Mollis Pityxii secusii colla mariti,
Hoc meruit tunicum quiti jape debitis.

And seeing that I have entered into the discourse of these Poetical fables, or rather riddles, which Transmutari seem to be outwardly clothed with impossibilities, I trust that the Reader will give me leave a little to prosecute other Narrations, as that Nepiune transforming himself into a Ram, deceived and de- floured the Virgin Bapty, and the Ancients when they swore in jett and merriment, were wont to swear by a Ram, or a Goofe. When the Gyants waged war with the Gods, all of the Gods (as the Poets write) took unto them several forms, and Jupiter the form of a Ram, whereof Ovid wrote, he was called Jupiter Ammonius:

---Unde recurris
Nunc quoque formatis Lybis effe omn crucibus Amnon.

There be some that say that at what time Hercules defird very earnestly to see Jupiter, whereunto he was very unwilling, yet he cut off a Rams head, and pulled off his thick woolly rough skin, and put it upon him, and so in that likenes appeared to Hercules, and for this cause the Thebans to this day do not kill rams, but spare them like sanctified things, except one ounce in a year, which they sacrifice to Jupiter, and say, that Jupiter was called Ammonius aries, because that his answers were my Strabo. Sacrificing of Rams among the Greeks.

—Ita rex plebra sacrorum
Nomina langere conjuge debet Ovis.

There was at Tanagrum a statue of Mercury, carrying a Ram (and therefore he is called the Ktesphos Hermes, and by that name was worshipped of all the Tanagrians. Now there was a cunning workman of Calamis that made that statue, for they say, that when the City was grievously afflicted with a pestilence, Mercury by carrying a Ram about the walls, delivered the same; and therefore they did not only procure that statue for Mercury, but also ordained that every year one of their most beautifull young men shoule carry a Sheep on his shoulder round about the walls. In January they sacrificed to Jupiter a Ram, and in February a Ram. Pliny writes a strange Riddle, which is this; Cina- monum in Ethiopia signatur, nec mittur usi permisit Deus. There is Cinnamon growing in Ethiopia, and yet it is not reaped by men, except the God thereof gave permission or leave, whereby some understand Jupiter, whom they called Sabius, and the Latines, Asfabinus. Now Pliny saith, that if they had sacrificed forty and four Oxen, Buck-goats and Rams, with their intrails, they purchasid leave to gather that Cinnamon.

When the Romans observed their Soli-Taurilia, they sacrificed a Bull, a Goat, a Ram, and a Boar, but unto Jupiter they held it not lawful to offer a Ram. Ulysses offered to Neptune a Ram, a Bull and a Boar; and to conclude this discourse of the Rams sacrifices, I finde a lory worthy the noting, recorded by Paulus Venetus, although it be altogether superstitious and full of humane blindnes and error.

There is a City of Tartary called Sachin, the Inhabitants whereof are Mahometans and Idolaters, all as any of them have a fon born, he presently commendeth him to one Idols tuition and protection or other. Therefore together with his young Son he nourisheth a Ram tamed in his own house: at the years end, he offereth his Son and the Ram at the next festival day of that Idoll which he hath chosen; that is, he presenteth his childe and killeth his Ram, with great solemnity and ceremony in the presence of all his kindred, friends, neighbours, and acquaintance, and maketh earnest request to that Idoll to protect his son, and to guide and govern him all the time of his life, and therefore he hangeth up the flesh of that Ram in his presence, and afterward they take away again the same flesh, and carry it to another private place, wherewith the said Father and all the Kindred assembed do make a great and rich feast, revering the bones for religious fake: And thus we see how miserable men beguiled with error, do not only make fiew of false Religion, but also play the hypocrities in that which is erroneous, thinking it an ese thing to deceive Almighty God.

Concerning other things of Rams, they concur with that which is said already of Sheep in general, except their medicinal parts, which I will referre to the due place: And herein add one thing more of the horns of the Arabicans Rams, and in some places of Italy, namely, that after
be five, six, or seven years old, they bring forth under their great horns two other little horns, and that these Rams are weak of body, and have but rough and course wool. In other places, if at any time they chance to bear more horns then two, it is prodigious and unnatural. And thus much of the Ram.

Of the WEATHER-SHEEP.

A I though this Beef have all things in common with the Ram aforesaid, for he is a male-beef, and in nature different not from him, but only by the art of man. I might very well have con- founded and conjonied his story with the precedent; but seeing that all Nations do dilignough him from the Ram, because of one property or defect of him, for that he is not fit for generation, I will follow the stream, and not strive against my Authors, nor rare from their method. Therefore in Latin it is call'd \textit{Versex quadra verba natura}, for that his natural feed is changed and turn'd in him, for his stones are taken away, and so he remaineth libbed and gelded, being an Eunuch among Beasts. The 

Grecians call him \textit{Krion Tomion}, that is, a gelded Ram, for they have not one word to express him. The 

Latines do also call him \textit{Setarius}; and \textit{Felius} rendeth this reason thereof, \textit{Quia eum fqueqantur egini}, because the little Lambs love his company and follow him: and indeed by reason of his unaptness to generation, the Ewes forfake his company, and the Rams cannot endure him, therefore in stead of other he associateth himself with the Lambs. In some parts of \textit{Germny} they call him \textit{Fribbling}, and also \textit{Hammel}, which word feemeth to be derived from the Arabin word \textit{Lefan Albam}, a Ram tongue. The Italians call him \textit{Caftrone}, \textit{Castrato}, and \textit{Montone}; the \textit{French} \textit{Mouton}; and the \textit{Illyrians} \textit{Beram}.

Concerning the gelding of Rams or making of Weathers, I have not much more to say, then that which is already express'd in the general tractate of the Sheep, and for the manner I do refer the Reader, not only to that part, but also to the discourse of the \textit{Caif and Oxe}, wherein I truth I shall finde satisfaction for this point, whether he will do it by a knife, by reed, by finger, or by hammer, for all those ways are in differently proposed. The best time for the gelding of Rams, ought to be in the wane or decreafe of the Moon, at five months old, so as he may neither be troubled with extremity of cold or heat. And if it be not libbed at that age, but prolonged till two, three or four year old; we have wethed already the \textit{English} manner for knitting of Rams.

Being thus libbed or knit, their horns grow not so great as the other males ungelded, but their fleth, and lard, or fewet, is more acceptable then of any other Sheep whatsoever, except they be over old for that it is neither for moist as a Lambs, nor yet so rank as a Rams or Ewes, whence \textit{Baprisa Fiera} made these verses;

\begin{quote}
\textit{Annicius placeat, vel si fines terribilis agnis, Pinguior est budo quincalet olla, vores.}
\textit{Hunc amò si duri per poxum monis ambolas. Maluros, si sunt velere dures eis.}
\end{quote}

Platina also writeth thus of the flesh of Weathers, \textit{Versecum caro factis salubris est & melior quam agn- na, catida eum & humida heluet, ad temperamentum tendens, illo vero plus humiditatis quam caliditatis habet.} This is to say; The flesh of Weathers is wholesome enough, and better then the flesh of Lambs, because it is hot and moist, but that hath in it more moisture than heat, and therefore this tendeth to a better temperat. Munter writeth, that the Inhabitants and people of \textit{Valus} take this flesh of Weathers, and lat it, afterward dry it in the air where no smoke may come unto it; afterward they lay it up in straw, and so hold it much more delicate then that which is raked in the smoke.

As the flesh of these Beasts grows better for their gelding, because they live more quietly and peaceably, for that their fore-heads grow weak and tender, and their horns small, so also it is reported that their tails grow exceeding large and fat. In some Regions, as in \textit{Arabia Felix}, and other places, and because the report shound not seem feign'd by me, I will describe it in the Authors own words, \textit{Pudus Venustus} writeth thus of the Weathers of \textit{Seopia}, and in the Region \textit{Camundia}, sub- ject to the great \textit{Tartar}. In \textit{Tartaria Regione Camundia} arietex non minores asfnis sunt, caude tam longe & late, ut triginta libraram pondus acquent. In \textit{Camundia} a Territory of \textit{Tartaria} there are Rams like Asles in stature and quantity, whose tails are fo long and broad, that they balance in weight thirty pound. \textit{Vartaman writeth}; in \textit{adibus reis Arabium} fuiffe prapinquem vervecum, cujas cauda ades obesa fact, ut libra quadraginta appendaret, & prope \textit{Keame urbem Arabice falisci, veravecum genero reperturum, quorum caudam animadvertere pondo efe libraram quadraginta quattuor, current cornibus, adeos, efe obesi &pingues ut vir incedere poffint. Circa Zeclam urbem \textit{Ethiopiae} veravecum non nulli ponderofisimis trahunt caudus, ut- pote pondo sedecim libraram. Hic caput & collam nigricant, caeteris alb fum. Sunt etiam veravecum pro- fus abscientes, cujas cauda subitatis est longitudinis modo elaborat vieti, palaeara ut tabula a mento pendent, que humum prope vurrum. That is to say, In the ouhle of the King of \textit{Arabia}, there was a Weather very fat, whose tail weighed forty pound, and near unto \textit{Reamia}, a City in \textit{Arabia Felix}, there are a breed or race of Weathers, whose tails for the most part weighed four and forty pound. They want horns, and are so fat that they can scarcely go. Alfo of some the City \textit{Zecla} in \textit{Ethiopia}, the Weathers draw long tails, weighing fifteen pound. Whereof some have their heads and neck black, and all the other parts of their body
body white, some of them again all white, having a tail but of a cubit long, like a curious and planted Vine, their crests and hair hanging from their chin to the ground. Thus far of the Arabian Weathers. Of the Indians he writeth thus in another place: 'Circa Tarentum, ibem India tanta est produxum copia extensius verticeti singulò aureo venen. Confutatione igitur verticeti alii, cornualum alii simplicia dum habentem, norris longe majores ferturque. Circita verticeti in pergini regiuntur tanea jacta, quatuor multus apud nos vertes. Contingit hic quae bullum fibrum post animal, & inter quinquedecim signum fibrum, concepta ex altera extensō nequeant, ne pinguinum immensa, extensi etiam effum et nervum parum, quem hominum naturae vetus plices saper incrementio atq. sanct. That is. About the City Tarentor in India, there is such a great plenty of Cattel, that they fell twelve Weathers for a noble, and yet there are Weathers which have horns like to the horns of Deer, being longer, greater, and fiercer then our Rams, and their tails in foreign and friege Countries are fatter then any Weathers among us, as the reafon hereof is, because it is the moste and coldest creature among all four-footed Beasts: and becaufe the bones are not enlarfed to receive that moisture, and left that it should destroy the Beaste by exuberance and abundance, therefore nature hath provided this remedy to fend it forth into the tail, whereby in ftreth and fat it groweth exceedingly, the bones and nerves whereof are not a little extended, for they are also of a millet nature like fibers, and therefore apt to encrease and grow immeasurably.

Thus much say they of the tails of Weathers, now I know such is the solidify of divers Readers and people, that for these reports, they will presently give both these Authors and me the Whetstone for rare untruths and fictions: I do not marvel, for such (I dare assure my self) do not believe all the miracles of Christ, having short and shallow concepts, measuring all things by their own eyes, and because they themselves are apt to dye for their profit, therefore they are not athamed to lay like imputations upon honeft men, yet I could shew unto them as great or greater wonders in our own Nation (if we worthy to be confuted) for which other Nations account us as great liars (as any as these Infidel fools) do them, and yet they are common among us.

The use of the several parts of this Beaste, is no other then that which is already reported of the Sheep and Ram, and therefore I will not band to repeat that which is lately related, and for the remedies or medicinal vertues, I finde few that are special except those which are common between this and others of his kinde. It feemeth by Plautus, that a Weather. Sheep is accounted the moit foolish of all other, a coward and without courage; for speaking of a mad doitth fellow, he writeth thus: 'Ego ex huc fiatua vertecea volo trigiter, mea nimina quid fit fatum filio. That is. I will demand of this blockhead Weathers picture, (meaning his foolish servant) what is become of my younger fon.

These were among the Pagans sacrificed, but not among the jews; for they have not so much as a name for it, and it is probable, that feeling it is an unperfect Beaste, God forbidde it into his sanctuary: when the Gentiles brought a Lamb at the side of a Weather to be sacrificed, they called them Ambeal, and so also a Lamb and an Ox. Aevius maketh this pretty emblem of a Weather which with a Hegg-hog is the Arms of Millan, wherewith I will conclude this discourse.

Of the LAMB.

The Lamb is diversely termed by the Hebrews, as is already shewed in the story of the Sheep, (in some part) and now more particularly, Soth signifieth a Lamb, Keseth and Kebet, a Lamb of a year old, also Gedi, according to the opinion of David Kimbi; in Greek, Arminus, and Arnus, and Arnos, and at this day Am; the Italian, Agna, Agnus, Agnello; the Spanish, Cordos; the French, Agneau, and Agenele; the German, Lamb, and Lamben, and as the first year we call it in English a Lamb, to the second a Hog, Lamb-hog, or Tet if it be a female, the third year Hoggris and Thaves: the Latine calls it Agna, of the Greek word Agnis, calls us quie of bullus purus & immanentis aptus. That is, that which for a female is pure and clean, and fit for sacrificing. And the common Ephithes expressing the nature of this Beaste are thirfe, rough, yeaning, weak, unripe, fucking, tender, butting, fat, milk-eater, merry, sporting, bleating, affable or gentle, field-wanderer, horn-bearer, horn-lighter, unarmcd, vulgar, wool-skinned, wool-leater, wanton, meek, delicate and fearful: and all these are the Ephithes of a male Lamb, but of the female l finde their following: dumb, snow-white, neat, young, fearful, black, tame, humble, and tender, and the Graciouis, Hopbtminus, because of the sweet smell that is found in them when they are young and suck their dam's milk.

We read that the Lamb of Africa, both males and females, are yeaned with horns, the reason whereof is shewed in another place, and it is a common and natural thing to them all assoon as they are fallen out of their dams belly, they presently leap and run about their dams, and also learn to know them by whom they are nourished, according to the saying of Lucretius.
S. Ambrose writeth thus of the inclination of a Lamb to his mother, and the love of her milk. *Agrius simplicissimus ovium recognoscenti locum parentis,* etc., *matre quandas, avertit,* *regnantem tam baluatu extasiem, multijies lacte et facie, etibis omnibus, fatisfinit et eas mus, qui quoniam bibi & posuimus delineant, neueur transirem parentem eam ubera, hinc humere laitis grandias evamendam, fain, materum lacti fontes requirit.* The Lamb is a most simple Beast, and erreth many times from his mothers sides, having no other means to provoke his mother to seek him out but by bleating; for in the midst of a thousand Sheep it differeth the voice of his parent, and so hasteneth to her when it heareth her; for such is the nature of this poor Beast, that although there be many other Eues which give suck, yet they pass by all their udders to taste of their mothers fountains, and the Ewe knoweth her young one by smeling to the backe part: The Lamb all the while it sucketh waggles and playeth with the tail. When the Lamb is newly fall, in some Countries they put them up close into a stable for a day, or two, or three, till they grow strong, and are well filled with Milk, and know their Dams, and so long as the Rams feed with the females they keep in the Lames, that so they may be clear day and night from all violence of the Rams, for at night they lodge fingle and alone by their dams sides. The like regard is to be had if they do not suck their mothers; they must anoint their lips with butter or Hogs-grease and milk, and for two months after their yeaning it is not good to rob them of any milk, but suffer them to suck all that their Dams can breed, for so their Lambs will grow more strong, and also their wooll more fine. And when they are to be weaned, they must first of all be brought out of love of their mothers milk, left after their separation they languish, and lose all natural joy, whereby they are never likely to come to good: afterward let them be herded or drove to field, but after their yeaning it is profitable when they are a week old to give them Salt, and so the second time after they be fifteen days old. It is never good to nourish the firstling or first Lamb of an Ewe, for that commonly they are weaker and more tender then any other, but the beft to be nourished are twins.

They are also the beft and strongest which are bred in the Spring time. and much fatter, and more able then those which are yeaned in the Autumn. And yet there are some that affirm, that they which are bred in the Winter are fatter then those which are bred in the Summer, for strength of nature be able to live out the Winter at the first yeaning, much more will they be able to endure when they are elder: in the first sucking of a Lamb, the bleedings must be milked out, for they are apt to fall into many diseases, such as are already mentioned in the discourse of the Sheep generally to preserve them in health, they give them Ivy when they are vexed with an Auge, and separate them from the Ewes, lest by ticking them infect their mothers, then must they be milked alone, and their milk mixed with rain water, and so given to the sick Lamb and if they will not take it willingly, then infile it into her throat with a horn, and if they be troubled with Scabs, take Hydrop and Salt, of each an equal quantity: and if the mouth be broken out and blistered, then rub the afflicted place therewith, afterward wash them with Vinegar, and then anoint them with liquid Pitch and Hogs grese: there must be also a care had to keep them from Lice:

Concerning the use of their several parts, we have already shewed in the story of Sheep, and therefore we need not prosecute it in this place. Their skins are fitter to clothe men, then the skins of their dams, and therefore the *Herdwai* say that they are fitteft for the garments of young men, for they encreaseth their strength and natural vigor. The Skinners make great account of these Lambs skins, and use them for the linings of many garments, such as are killed they call the skins of slaugther-lambs. The beft are brought out of *Itay and Apulia,* and all those parts which are beyond *Rome; Nerbis,* and *Spain,* yeeld plentiful store of black Lambs, and their skins are sold by Merchants; and white skins are plentiful in England.

Their fleth is nourishable and convenient for food, but yet inferior to Weather Mutton, for that it containeth more moisture then heat. To conclude this discourse of the Lamb, the greatest honor thereof is, for that it pleased God to call his blessed Son our Saviour by the name of a Lamb in the Old Testament, a Lamb for Sacrifice, and in the New Testament, filled by *John Baptista,* the Lamb of God that taketh away the sins of the world. There is a proverb in *Greeck,* *Agnus fidea lepakken agonis bibi locutor ejus,* A Lamb hath spake this unto you, and it was a proverbial speech to express a divine Revelation of some fulness, that men cannot attain unto by ordinary and common means, because either it is concealed, or else it concerneth things to come. For it is reported by *Suidas,* that once in *Egypt* there was a Lamb that spake with a mans voice, upon the Crown of his head was a regal Serpent having Wings, which was four cubits long, and this Lamb spake of divers future events.

The like is laid of another Lamb that spake with a mans voice, at what time *Romulus and Remus* were born, and from these miraculous events, came that common proverb: and so for this story I will conclude with the verse of *Valerius: Ageni praecipua contrarius aqua loco. There is in *Mosevia* reer *Voce,* a certain Beall of the quantity and form of a little Lamb, the people call it *Eoma,* and it is reported by *Sigismundus,* in his description of *Mosevia,* that it is generated out of the earth.
Of the Musmon.

I have thought good to referre this Beast to this place, for that it is a kinde of Sheep, and therefore of natural right and lineage to this story, for it is not unlike a Sheep, except in the wool which may rather seem to be the hair of a Goat; and this is the same which the antients did call Umbrice ovem, Umbrian Sheep, for that howsoever it differeth from Sheep, yet in simplicity and other inward gifts it cometh nearer to the Sheep. Strabo calleth it Musmo, yet the Latins call it Musmon. This beast by Cato is called an Affe, and sometimes a Ram, and sometimes a Mufmon. The picture which here we have expressed, is taken from the sight of the Beast at Caen in Normandy, and was afterwards figured by Theodore Beza. Muyter in his description of Sardinia remembret this beast but he faith that it is speckled, whereat I do not much wonder, seeing that he confesseth that he hath all that he wrothe thereof, by the Narration of others.

Some say it is a Horse or a Mule, of which race there are two kinds in Spain, called by the Latins, Afircones, for they are very small; but I do not wonder thereat, seeing that those little Horses or Mules are called Musmones, because they are brought out of those Countries where the true Musmones (which we may interpret Wilde Sheep, or Wilde Goats) are bred and nourished. There are of those Musmons in Sardinia, Spain, and Corsica, and they are said to be gotten between a Ram and a Goat, as the Cervus between a Buck-goat and an Ewe. The form of this Beast is much like a Ram, savie that his bell is more rough and hairy; his horns do grow from his head like vulgar Rams, but bend backward only to his ears: they are exceeding swift of foot, so as in their celerity they are comparable to the swiftest Beall. The people of those Countries wherein they are bred, do use their skins for breastplates. Pliny maketh mention of a Beall which he called Opium, and he faith he found the remembrance of it in the Grecian books, but he thinketh that in his time there was none of them to be found in the world; herein he speaketh like a man that did not know God, for it is not to be thought, that he which created so many kinds of bealls at the beginning, and conferred of every kinde two, male and female at the generall deluge, would not afterward permit them to be destroyed till the worlds end, nor then neither: for seeing it is apparent by holy Scriptures, that after the world ended, all creatures and bealls shall remain upon the earth, as the monuments of the first six days works of Almighty God, for the farther manifestation of his glory, wisdom, and goodnes, it is an unreasonable thing to imagine that any of them shall perish in
The History of Four-footed Beasts.

The bodies of such as are beaten, and have upon them the appearance of the stripes, being put into the warm skins of Sheep when they are newly pulled off from their backs, eate away the outward pain and appearance, if it continue on a day and a night. If you leethe together a good feedon the skin of the feet, and of the snowt of an Ox or a Sheep till they be made like glee, and then taken forth of the pot and dried in the windy air, is by Silbus commended against the burthenes of the belly.

The bloud of Sheep drunk, is profitable against the falling sicknes in. Also Hippocrates prescribeth this medicine following; for a remedy or purification to the belly, first make a perfume of Barly steeped in oyl upon some coles, and then leethe some Mutton or Sheep flesh very much, and with decoction of Barley leet it abroad all day and night, and afterward leethe it again and eat or fup it up warm, and then the next day with Hony, Frankincenfe, and Fariely, all beaten and mingled together, make a Suppository, and with wool put it up under the party, and it shall ease the diftret. The same flesh burned and mixed in water by washing, cureth all the maladies or diletases arising in the secrets, and the broth of Mutton, Goofe, or Veal, will help against the poifon by biting if it be not drawn out by cupping gaffe nor by horse-leach. The fewet of a Sheep melted at the fire, and with a linen cloth anointed upon a burned place, doth greatly ease the pain thereof.

The Liver with the fewet and Nitre causeth the scares of the flesh to become of the same colour that it was before the wound, it being mixed with toasted Salt, scattereth the bunches in the flesh, and with the duft of womens hair, cureth fellons in fingers, or any part of the bodies. The fewet of Sheep or Goats, being mingled with the juice of Rhenish wine grape, and fining horse flies, doth without all scruple or doubt, ease the pain of the milt, if it be anointed thereupon. The fat of Sheep doth very easily expell the roughness of the nails.

The fewet of Sheep or any other small beast, being mixed with the herb called Melander, and pounded with Sulphur, afterward baked together, and wrought into the manner of a Seren-cloth, doth very much ease those which are burned by fire in any parts of their body, being well applied thereupon. The fewet of a Sheep being also applied to those which have kibes in the heels, or chilblaines in their feet, will presently heal them.

The fewet of a Sheep mixed with womens hair which is burnt to powder, doth very effectually cure those which have their joynts or articules looie, being anointed thereupon.

The fat of Goats or Sheep moistened with warm water, and boiled together, being anointed upon the eyes, doth speedily cure all pains, spots, or blemishes in the same whatsoever. The fat of a Sheep boiled and drunk with sharp wine, is an excellent remedy against the cough. The same medicine is also effectually used for the expelling of horsey coughes. The fewet of a Sheep being boiled with sharp wine, doth very speedily cure the obstruction of the small guts, bloody flux, and any cough of what continuance ever.

The same being in like manner drunk while it is hot, is accounted for an excellent remedy against the Collick passion. The fewet of a Sheep, or of a Male goat, being mingled with the fume or dung of a Female-goat, and Saffron, doth very effectually cure those which are troubled with the Gozt or swelling of the joynts, being anointed upon the place so grieved. It is also reported that the outward fewet of Sheep (between the flesh and the skin) between the hinder legs, is very wholesome for the curing of sundry pains and diletases.

Sheeps fewet or the fat of any other small beast being gathered from the reins, mixed with salt, and the duft of a pumice stone, being applied unto the yard of any man, doth speedily cure all pains, aches, or swellings therein. The fat of Sheep which is gathered from the caul or cell, being mingled with the aforesaid medicines do heal all other pains in the privy members of man or woman whatsoever. The same fewet doth stay the great exces of bleeding in the nose, being anointed thereupon.

Sheeps fewet being mixed with Goofe grease and certain other medicines, being taken in drink, doth help abortments in women. The live: of a Sheep is accounted an excellent remedy against the shedding of the hair on the eye lids, being rubbed thereupon. The same being also baked or boilied,
Of the Sheep.

is accounted very profitable for Sheep's eyes, if it be well rubbed thereon. The marrow of Sheep is very good to anoint all aches and swellings whatsoever.

The horns of Sheep or of Goats pounded to powder, mingled with parched Barley which hath been well steamed, and altogether mixed with Oyl, being taken in a certain perfume, doth help Women of their fevers, and refethcth to them their mensurall fluxes. Sheep horns burned and beaten in wine until they be tempered like a pill, the right foot being anointed with the right horn, and the left foot with the left, will mitigate the sorrow of those which are very sore pained and troubled with the gout.

Rheumatick, or watry eyes, being anointed with the brains of Sheep are very speedily and effectually cured. The brains of the same beast is exceeding profitable for the breeding of young childrens teeth, being anointed upon the gums. The lungs or lights of small beasts, but especially of a Ram, do restore the true skin and colour of the fleece, in those bodies are full of crops and scars.

The lungs or lights of the same beast concocted upon the uppermost skin of any man, and applied very hot thereunto, do diminisht the black or blew places therein, which have been received by the occasion of any stipes or blows.

The lungs of Sheep being new taken out of their bellies, and applied while they are hot unto beaten or bruised places, doth quite abolish the signes thereof, and in short space procure remedy. The lungs of Sheep or small Cattle being roasted and taken by any man before he drinketh, will refit all kind of drunkennes.

The lungs of Sheep taken out of their bellies, and bound about the heads of those which are phrenisic while they are hot, will very speedily ease them of their trouble. The lungs of Sheep being hot and bound to the head, is accounted very profitable for those which are troubled with the peliferous disease called the Drowsie evil.

The lungs of Sheep being boiled with Hemp-feed, so that the fleth be eaten, and the water wherein it is sod be drunk, doth very effectually cure those which are grievous with exsorations in their bellies, and the bloody flux. The lungs of Sheep being applied while they are hot, doth heal the Gout.

The liver of white Sheep well boiled, made moist with water, throughly beaten and applied unto the eye-lids, doth purge Rheumatick eyes, and caule them to be of a more clear and ample sight. If a woman bearing young, shall be puffed up with windes, give her the liver of a Sheep or Goat beaten into small powder while it is hot, being pure andwithout mixture for four days together, to eat, and let her drink only wine, and this will very speedily cure her.

The gall of a Sheep mingled with hony, heateth the Ulcers of the ears, and procureth easie hearing. The gall of a Sheep mingled with sweet wine, if it be tempered in the manner of a glycer, and afterwards rubbed upon the ear-laps, the ulcerers being quite purged, will procure a speedy cure and remedy. The gall of the same beast distilled with a womans milk, doth also most certainly heal their cares which are broken within, and full of matterly corruption.

The gall of a Sheep being mixed with common oyl, or oyl made of Almonds, doth also heal the pains of the ears, being powdered therein to. Cankers, or the corruption of the fleth being anointed with the gall of a Sheep, is very speedily and manifestly cured. The Dandrafte or scarres of the head being anointed with the gall of a Sheep mixed with fullers-earth which is hardened together while the head burneth, are very effectually abolished, and driven quite away.

The gall of little cattle, but especially of a Lamb, being mixed with hony is very commended for the curing of the Falling evil. The milk of a Sheep new taken out by magical precepts is accounted very good for the curing of the pain in the mit, he saying which may be healed that he maketh a remedy for the mit. After these things the Magicians command that the grievous party be included in his Doctor or Bed-chamber, and that the doors be feeted up, and that a verfe be spoken thrice nine times. The milk of a Sheep being parched and beaten in wine, and afterward taken in drink, doth refit all the obstructions or stopping of the small guts. The same being used in the like manner is very medicable for the whining of the guts.

The duft of the uppermost of a Sheepes thigh, doth very commonly heal the loofeness of the joints; but more effectually if it be mixed with wax. The fame medicine is made by the duft of Sheepes jaries, a Harts horn, and wax mollified or allwaged by oil of Rofes. The upper parts of the thighs of Sheep decocted with Hemp-feed, do refreh those which are troubled with the bloody flux, the water whereof being taken to drink For the curing of a Horfe waxing hot with wearines and longitude of the way; mingle Goats or Sheepes ewer with Coriander, and old dill, the Coriander being new gathered, and diligently pounded in the juice of Barley, and so give it thoroughly strained for three days together.

The huckle-bone of a Sheep being burned and beaten into small duft, is very much used for the making of the teeth white, and healing all other pains or aches therein.

The bladder of a Goat or Sheep being burned and given in a potion to drink, made of Vinegar and mingled with water, doth very much avail and help those which cannot hold their water in their fleeth. The skins which cometh from the Sheep at the time of their young, doth very much help very many enormities in women, as we have before rehearsed in the medicines arising from Goats.

The milk of Sheep being hot, is of force against all poisons, except in those which shall drink a venomous fly called a Wag-leg, and Libbards bane. Oatmeal also doth cure a long lingering disease, a pinte of it being sodden in three cups of water, until all the water be boiled away: but afterwards you must put thereunto a pinte of Sheeps milk or Goats, and allo Hony every day together.

Some men do command to take one dram of Swallows dung in three cups full of Goats milk or Sheeps milk before the coming of the quarter.Ague. Goats milk, or Sheeps milk being taken when it is newly milked from them, and gargarized in the mouth, is very effectual against the pains and swellings of the Almonds. Take a pinte of Sheeps milk, and a handful of sifted Amifeed, and let them sethe together, and when it is somewhat cold let it be drunk, and it is very good to loozen the belly. Medicines being made of Goats milk and Sheeps milk, and so being drunk, is very good for the shortness of breath.

A hot burning gravel stone being decocted in Sheeps milk, and so given to one that hath the Bloudy flux, is very profitable to him. Goats milk or Sheeps milk given alone luke-warm, or sodden with Butter, is very profitable to those that are brought very weak with the passions of the stone, and fretting of the guts. To wash one face with Sheeps milk, and Goats milk, is very good to make it fair and smooth. Evenings milk of Sheep, that is, the left milk that they give that day, is very good to loozen the belly, and to purge choler. The hairs of the head of a Dog burned into ashes; or the gut of the privy place sodden in Oyl, is a very good and sovereign remedy for the loofenets of the flesh about the nails, and for swelling of flesh over them, being anointed with Butter made of Sheeps milk and Hony. An Oyl sodden in Hony, and Butter made of Sheeps milk, and Hony melted therein, is very profitable to cure ulcers. Old Cheefe made of Sheeps milk, is very good to strenthen those which have been troubled and made weak with the Bloudy flux. Again, old Cheefe made of Sheeps milk, taken in meat, or scratch upon it, and being drunk with Wine, doth caele the passion of the Stone.

There was a certain Phyllitian being skilful in making medicines, dwelling in Asia by Hellespont, which did use the dung of a Sheep washed and made clean in Vinegar, for to take away Warts and knots rising on the flesh like Warts, and kernels, and hard swellings in the flesh. Alfo he did bring Utiers to cicatrizing with that medicine which were blased or seaded round about, but he did mingle it with an emplaifer made of Wax, Rofin, and Pitch.

The dung of Sheep also doth cure puthe rising in the night, and burnings or scaldings with fire, being smeared over with Vinegar without the commixture of any other things. The dung of Sheep being mixed with Hony, doth take away small bumps rising in the flesh, and also doth diminith proud flesh: and also it doth cure a disease called an emitor, as Kaffis and Albertus say. The dung that is new come from the Sheep being first worked in thy hands, and applied after the manner of an emplaifer, doth eat away any great warts growing in any part of thy body. The dung of a Sheep being applied to thy feet, doth conjure and waife away the hard flesh that groweth thereon.

Sheeps dung doth also cure all kinds of swellings that are ready to go into Carbuncles. It is also good being sodden in Oyl and applied after the manner of an emplaifer, for all new wounds made with a sword, as Galen faith:

\[
\text{Aut si conclusion feruuit tibia vulrus,}
\text{Stercus ovi placidae junger, adipis, metarust,}
\text{Pandere qui potenter bulcus, patulqs mederi.}
\]

The dung of Sheep and Oxen being burned to powder, and smeared with Vinegar, is very good against the bitings and venemounets of Spiders; And again it is very effectual being new come from them, and sodden in Wine against the huggings of Serpents. Sheeps dung being mixed with Hony, and applied to Horfes whose hoofs are broken, is very effectual.

The dung of Oxen and Sheep being burned to powder, and intermixed therewith, is very effectual against Cankers, and also the bones of the Lambs thigges, being burned into ashes, is very profitable to be applied to thofe ulcers which cannot be brought to cicatrize. Alfo Sheeps dung being made hot in a Gally pot, and knaewed with thy hands, and afterwards applied, doth presently caele the swellings of wounds, and doth purge and cure Filitas, and also dizes in the eyes.

The Oyl of Cyprus and Hony, is very effectual against Alopecia, that is, the falling off of the hair. An emplaifer made of Sheeps dung, and the fat of a Goofe and a Hen is very effectual against hair rising in the root of the ear, as Kaffis and Albertus say. Sheeps dung being applied hot, is very effectual against the swellings of womens paps or dugs.

Sheeps dung being put into the decoction of Wood-bine, or Hony and water, and so drunk, is very profitable against the Yellow-jauders. If the Spleen be outwardly anointed with Sheeps dung and Vinegar, it doth leffen the rising of it. The dung of Oxen and Sheep which is very moist, doth caele all manner of Gouts. The thin or outmolb skin which is taken from the privy part of Sheep, is very profitable against the disease called the flowers in Women. The dung alfo hath the fame operation. The Urine of Sheep is very profitable against the Hydrofe being mixed with Hony. But Kaffis faith otherwise, which is, that the dung being drunk with Hony is available against the Dropfe.
Of the Sheep.

To take the weight of a penny of Ox dung and Sheeps dung, and a grain of Myrrh, and two ounces and a half of Wine, doth stay or retst the coming of the Kings evil. The ninth which is Pleg. taken out of the ears of these beasts is said to be very effectual against the flowers. It doth make a barren woman to conceive with child also, as Serenius faith in these Verstes:

Pendenteum [pumam melt deducet auro,  
Autoris in fidibus sfrallis sum ramina herbis,  
Angi iladem meminit misfa potare salerno.

The sweat of a Horse being made warm and mixed with Vinegar, is very convenient against the Falling sickness, and is used against venemous bites. And also the sweat of Sheep is very much profitable unto it. If the hoof or ankle-bone of an Ox chance to be cut with a Plough-thare, Pitch and fat with Sulphur is very good, but you must roul round about the wound Wool.

Unwashed Wool doth very much profit those that are frenzie being applied with a fume that stoppeth the sweat or blood or hudors from running to and fro. It is also said to be very good being dipped in Hony (and so rubbed upon the teeth or gums) for to make one breath or gaspe easier. Unwashed Wool being smeared over with Hony, and rubbed upon the teeth, doth make them look white presently after. Unwashed Wool with a little salt put to it and tyed clofe in a hinnen cloth, and so scorched and beaten to powder, is very good to keep the teeth from pain, being rubbed upon them.

Unwashed Wool being mixed with Niter, Brimstone, Oyl, Vinegar, and with Tar, being applied twice a day, doth safe all pains of the knuckle and ankles. Sheeps dung and other things with unwashed Wool is very effectual against the stone in the bladder, as it is spoken above in the cure and remedies of Sheeps dung. Unwashed Wool doth cure all the diseases in the privy parts of men or women being applied thereunto. The black Wool of Sheep, is very profitable for all swellings in the bones or code of men. The gall of Bees put upon unwashed Wool, is very profitable for the flowers of women. Unwashed Wool being applied unto those parts that are dead, doth very much good unto them.

White fleeces of Wool being either applied alone, or with Brimstone, is very good for hidden pains and griefs. Pieces of Wool given in a fume with Brimstone, is very good for the remedy of the Kings evil. Wool being dyed of a purple colour, and so applied, is very good against the pains of the ears. There are moreover very many remedies made against diseases by unhorn Wool, besides the expelling of cold, being taken in Oyl, Wine, or Vinegar, for as much as the same being applied to the members which are out of joynt, or to any pains in the Nerves, doth very speedily and tenderly heal the same.

Sheeps Wool being mixed with Herbgrace and Sheeps greasfe, is very much applied unto those which are bruised, or have hard swellings in any parts of their body. Unwashed Wool being often put into the fores which are bitten by mad Dogs, doth perfectly cure them in seven daues.

Sheeps wool in cold water doth being remedy unto those whose skin is loose about the Nailes. The same being steeped in hot Oyl may be well applied unto moift or running fores: but mingled with Hony is very medicinable for old fores or felters: and steeped in Wine, Oyl, Vinegar, or cold water, doth heal any new wound which feemeth to bring the wounded party in danger of death. Disforbiter doth also affirm that Sheeps wool being unwashed is curable for all kinds of wounds whatsoever.

The same is very much applied unto those whose bones are bruised or broken, if it be mixed with the brains of a wanton Dog, and bound hard upon the grieved place in a linen cloth. The Carthaginian Shepherds do use the unwashed Wool of Lambs of the age of four years, for the curing of the Temples, or the crown of the head. If the plough-thare chance to hurt the huckle-bone or hoof of an Ox with hard Pitch and Baton grease mingled with Brimstone, and ravelled in unwashed Wool, and mark the wounded place with all these together with a fiery hot iron, it will bring present help and remedy.

Unwashed Wool being taken in some certain perfume doth cure those which are Frantick, and restore them to their former wits. Spleen wound being boyled in Hony and mixed with unwashed Wool which was steeped' in Oyl or Wine, is very good for the aforesaid diseases, being bound about the forepart of the head in a broad linen cloth. Sheeps wool being also applied in the same manner, is an excellent cure for those which are troubled with a certain watery rheum running in the eyes, as also the ach in the forepart of the head.

Unwashed
Unwashed wool boiled in Vinegar and applied unto the eares, doth expell all filth or moisture therein, and the slue thereof being afterwards stopped, the fame kind of wool, is very speedily cured. Sheeps wool is also very good and effectual for the curing of the pains of the ears, which are but new coming up on them. Unwashed wool being mixed with Oyl of Roses and put into the Nostrils of any man, the ears being stopped close with the same kind of wool, will stay the issuing of the bloud at the Nofe, how fluent ever it be.

The same being also steeped in Oyl and put in the Nofe, doth restrain the bleeding thereof. Wool being plucked or wreted from the back of Sheep, and kept unwashed, doth colinde the abundance of bloud, being steeped in pure liquid Oyl of Roffes. The fame being taken from the back of a Ram, doth stay over much bleeding at the Nofe, the joynts of the fingers being bound as hard as possible can be suffered. Unwashed wool steeped in Hony and rubbed upon the teeth or gums, doth make the breath of any man more sweet and delightful then it hath been accustomed.

The same being used in the said manner, doth procure a very great whitnenesse and clearness in the teeth.

Unwashed wool being parched and bound in a linen cloth, a third part or portion of fake being afterwards added thereunto, and all beaten together in small dust or powder, and rubbed upon the teeth, will keep them from any pain or grief therein. Unwashed wool being dipped in Nitre, Brimstone, Oyl, Vinegar and liquid Pitch, being all boiled together, doth affwage all pains in the hanches or loins whatsoever, being twice a day as hot as possibly may be suffered thereunto. Sheeps dung mingled with unwashed wool and certain other things, is very much applied against that troublesome and painful disease called the flone or gravel.

Unwashed wool in cold water, doth cure diseases in the privy parts of any man or woman whatsoever. The wool of black Sheep is commonly reported to be very commodious and helpful for those whose Cods or stones are much swelled. The gall of an Ox being mixed with unwashed wool, doth help the purgation or menstrual fluxes of women; but **Olympe the Theban** affirmeth, that Hyfop and Nitre ought to be mixed with this wool for the helping of the same. Unwashed wool being applied unto the secret parts of women, doth caule a dead child to come forth. The same doth also slay the fluxes of women. The pure or clear cleeves of Sheep either by themselves, or mingled with Brimstone, do cure all hidden or secret griefs whatsoever: and **Pliny** commendeth them above all other medicines whatsoever. Fleeces of wool mingled with quickfliver, are very profitable to be taken for the same diseases in certain perfumes. The root of a Mallow being digged up before the rising of the Sun, and wrapped in undyed wool, doth cure the Wens or matter impostumes of those Sheep which have lately brought forth young. Sheeps wool being dyed in purple colour, doth very much profit the ears: but some do steep it in Vinegar and Nitre, to make the operation more effectual.

The duff of wool being burnt, doth bring forth the matter or corruption lying hid under feabs, restrain the swellings in the flehs, and bringeth all Ulcers to a secret. Wool being burnt hath a sharp force, and like wise hot together with the liddenemes of the parts, it doth therefore very speedily cleanse and purge the fores in the flehs, which are molt and too much full of matter. It is also put in drying medicines. It is burned as if there were many other things init, filling a new pot, which may be covered with a cover which is bored through with many holes like unto a live. The powder of unwashed Wool is anointed upon divers fores and is very curable for them as bruised, new wounded, and fores half burnt, and it is used for the curing of the diseases in the eyes, as also in the easing of the Fistulaes and corrupt matter fores in the ears. The power of the powder of unwashed wool is cleansing, and doth very effectually purge the eye-balls or cheek-bals. It doth also cleanse and cure for the most part all diseases, as **Serena** saith in these Verces;

\[
\text{Succida cum tepido nelineur lana Lyce,}
\text{Ambuleuu cinis compliti vulneris ora,}
\text{At tu succofe cinerem perdutio lane.}
\]

The hairs which grow about the secret hole of Sheep being burned, beaten and drunk in sweet wine, doth help the shortness of the breath, and ease the purgations of the thorow. The wool of a little Sheep being pulled from betwixt his thighs and burnt, and afterwards dipped in Vinegar, doth very speedily cure those which are troubled with the head ache, being bound about the temples. The duff of Sheeps fleeces is very medicinable for the curing of all diseases in the genital parts whatsoever. The duff of Sheeps wool, doth heal all passions in Cattle. The **Grecians** Plautier (called **Ennepharmaeaum**) composed of nine several things, and amongst the rest of unwashed wool. The filth which sticketh to the Sheeps wool and groweth thereunto, from which the thing which the **Grecians** call **Olypsion** is made, hath the force of digestion like unto Butter, and also a like ability of concoction.

In a certain medicine of **Antoniamachus**, for the curing of the disease of the secret parts, unwashed wool is added to the rest: but **Lepus** (as **Galen** saith) for unwashed wool doth add Goose greafe in the same quantity. Some do allo for unwashed wool use the marrow of a young calf, and apply it in the aforesaid manner; but this unwashed wool is termed of the **Grecians**, **Arepa**, and therefore being by divers Authors set down diverly concerning the making and virtue thereof,
of the Sheep.

of, I have thought good to let down the true and excellent way to make the same (as Dioscorides) whom in this I suppose bet to follow, reporteth; First to take new thorn wool which is very soft, and not trimmed with top-wed, and wash it with hot water; then to prefile all the filth forth of the same, and call it into a Cauldron which hath a broad lip, and afterwards to pour the water in, and to stir it up and down with a certain instrument with such great force as it may foam again, or with a wooden rod still greatly to turn and trouble it, so that the filthy froth or spume may more largely be gathered together, afterwards to sprinkle it over with Sea water, and the fat remaining which did swim upon the top, being gathered together in an earthen vessel, to pour the water into the Cauldron; then must the froath be powdered again into the Sea water; and lastly, taken out again: this is so often to be done, that the fat being consumed, there will not any froath be left remaining; the Aesopus then being gathered together, is to be mollified with men's hands, and if there be any flith therein, it must out of hand be taken away, and all the water by little and little excluded, and being fresh poured in, let it be mingled with one hand, until the Aesopus being touched with the tongue of any one, may lightly bind it, but not favour either sharp or tarally, and the fat may seem very white, and then let it be hid in an earthen vessel, but let there be great care had they been done in the hot sun. But there are some which use another manner of way to make the same, which is, to cleanse the fleeces, and wash away all filth, and preffe it forth of the same, and boyl them in water over a hot fire in a brown vessel, then to wash the fat which swimmeth on the top being gathered together with water, and being strained in another platter which may have some hot water in it to hide or overcast it with a linnen cloth, and lay it forth in the sun until it be very white and thick enough.

Some also do use another way, as this, to wash the fat being strained with cold water, and to rub it with their hands, not much otherwise then women do a fear-cloth, for by that means it is made more white and purer.

There is yet another kind of way to make Aesopus, described by Aetius in these words, Take (faith he) the greffe Wool which groweth in the shoulder pits of Sheep, and wash them in hot water, being thick and soft, and squeeze all the filth forth of the same, the washing whereof you shall put in a vesell of a large mouth or brim, calling afterwards hot water in the same, then take the water in a cup, or in some other such like instrument, and pour it in and out, holding it up very high until there come a froath upon it, then sprinkle it over with Sea water, if you shall get any, if not, with some other cold water, and suffer it to stand still; when it shall wax cold take that which shall flow on the top away with a ladle, and call it into any other vesell, afterwards having put a little cold water in it, stir it up and down with your hands, then having poured out that water, put new hot water in it, and repeat again the same thing all together, which we have now taught, until the Aesopus be made white and fat, containing no impure or filthy thing in it at all, then dry it in the sun, being hid for some certain days in an earthen vesell and keep it. But all these things are to be done when the Sun is very hot, for by that means it will be more effectual and whiter, and not hard or sharp.

There are moreover some which gather it after this manner; They put new thorn wool which is very filthy and greasse in a vessel which hath hot water in it, and burn the water that it may somewhat wax hot, afterwards they cool it, and that which swimmeth above in the manner of fat, they fume it off with their hands, and put it away in a vesell of Tin, and so do fill the vesell it self with rain water, and put it in the Sun covered with a thin linnen cloth, and then we must moiten it again, and put up the Aesopus, for it hath strength mollifying and releasing with some sharpness, but it is counterfeited with wax, feuer, and Rozen, and it is slights ways perceived, and forasmuch as the true Aesopus referveth the scent of the unwashed wool, and being rubbed with any one's hand is made like unto Cereufe, or white lead.

Even the fift and sweat of sheep, cleaving to their wool, hath great and manifoldt use in the world, and above all other which is most commended which is bred upon the Athenian or Grecian Sheep, which is made many ways, and especially this way; First they take off the wool from those places where it groweth, with all the fewer or filth there gathered together, and so put them in a brown vesell over a gentle fire where they boyl out the sweat, and so take of that which swimmeth at the top, and put it into an earthen vesell, setting again the firft matter, which fat is wafted together in cold water, so dryed in a linnen cloth is scorched in the Sun until it become white and transparent, and so it is put in a box of Tin. It may be proved by this, if it fwell like the favour of sweat, and being rubbed in a wet hand do not melt, but wax white like White lead, this is most profitable against all infallamation of the eyes, and knots in cheeks, or hardenes of skin in them.

Of this Aesopus or unwashed Wool the Grecians make great account, and for the variety of drefling or preparing it, it divide diversely, sometimes the call it Oesopus Pharmaceina, sometimne Oesopus Keroticus, or Keroticen, sometimne Oesopus Hygrot, and such like. Of it they make Pliisiers to affwage the Hypochondria infallamation and venoocity in the fides. Some use Aesopus for Oesopus; but ignorantly, and without reason, it is better to let it alone, but in the collection hereof it must be taken from the found and not from the scabby Sheep. But when we cannot come by the true Oesopus, then in stead thereof we may take that which the Apothecaries and Ointment-makers do ordain; namely, Mediceo uo. 5. Cardamone uo. 2. Hygrop herb. uo. 2. with the unwashed Wool taken from the hams or flanks of a Sheep. Myrisph use this Oesopus against all Gowts and aches in the legs or articles.
.articles, and hardneis of the spleen. Galen calleth it \textit{jus lane}, and prescribeth the use of it in this fort; Make (faith he) a Plaister of \textit{Oefipm} or \textit{jus lane} in this fort, Take Wax, freth greafe, \textit{Scomontie}, old Oyl, one ounce of each, of Fenny-greek six ounces, then feethe or boil your oyl with the \textit{jus lane}, and Fenny-greek very carefully, until it equal the oyl, and be well incorporated together, and then again set it to the fire, with the prescripition aforesaid; and also he teacheth how to make this \textit{jus lane}, for (faith he) take unwashed Wool and lay it deep in fair water until it be very soft, that is by the space of fix days, and the seventh day take it and the water together, that feethe well, taking of the fat which ariseth at the top, and put it up as is aforesaid; these things faith Galen.

\textbf{ Dioscorides.}

The use of this by reason it is very hot, is to display Ulcers and tumors in wounds, especially in the secrets and seat, being mixed with Melilot and Butter, and it hath the fame vertue against running fores. The same also with Barly meal and ruff of iron, equally mixed together, is profitable against all swelling tumors, Carbuncles, Tatters, Serpgoes, and fuch like, it catcheth all proud fith in the brims of Ulcers, reducing the fame to a natural habitude and equality, also filling up the fore and healing it, and the fame vertue is by Dioscorides attributed to Wool burnt, also in bruises upon the head when the skin is not broken, a Poultreis made hereof, is said by Galen to have excellent force and vertue. The fame mingled with Rofes, and the oar of brafie (called Nil) cureth the holy fire, and being received with Myrrh steeped in two cups of wine, it encreafeth or procureth fleep, and also is very profitable against the falling-ficknes. And being mixed with Corfick Hony, it taketh away the spots in the fkin, because it is molt fharp and cibliche, whereunto fome add Butter, but if they be whealed and filled with matter, then prick and open them with a needle and rub them over with a dogs gall or a Calis gall mingled with the faid \textit{Oefipm} also being filled into the head with oyl, it cureth the Megrim, and furthermore it is used against all forenes of the eyes, and fcars in their corners, or upon the eye-lids, being fod in a new fheil: and the fame vertue is attributed to the smoke or foot thereof, if the eye-brows or eye-lids be anointed therewith; mixed with Myrrh andwarmed, it is thought that it will reftore the fhair that is wanting and fallen off: but Marcellus prescribeth it in this manner, You must take \textit{Oefipm} or fweat of Sheep from under the wool of their shoulders, and adding unto it a like quantity of Myrrh, beat them together in a morter, and with a warm cloth anoint the bare places.

If there be any bruife in the eyes, then you must anoint them firit with Goose greafe, and the bloud of a Mallard, and afterward with the fweat of a Sheep, and the fame cureth all Ulcers in the mouth, ears, and genitals, with Goose-greafe. This is also mixed with a Sear-clot, and laid against the Pithifis (as \textit{Actium} writeth) with a moif cloth against the Plurifie, also a Plaifter made hereof with Goose greafe, Butter, Allum, and the brain of a Goose, is very profitable against the pains in the reins, and all other incontinencies of the back, and for the fame caufe it is applieth to women, for it provoketh their monthly courses, and alfo caueth an eafefull delivery in childe-birth, it healeth the Ulcers in the secret and privy parts of men and women, and all infiltration in the feet, especially being mixed with butter, Goose greafe, and Melior: and fome add thereunto the oar of Brafie and Rofes. If there be a Carbuncle in the privy parts, take this \textit{Oefipm} with Hony and the froath of lead, alfo white lead, womens milk, and this Sheeps fweat, cureth the Gows, at the leaft marva-loufly affwageth the pain thereof, and fome Phyflitans for this evil take Greafe, Goose greafe, and the fat of Buis, added to \textit{Oefipm}, alfo unwarfed wool with the gall of a Bull laid to a womans secrets, helpeith her monthly purgation, and \textit{Olimpis} added thereunto \textit{Nitre}. The dung which cleaveth to Sheeps tails made into small bals, and fo dryed, afterward beat into powder and rubbed upon the teeth, although they be loofe, falling out, or overgrown with fith, yet \textit{Pliny} faith, they will be recovered by that fricaffing. If the which is fick of a Droffe drink this sweat or \textit{Oefipm} in wine with Myrrh of the quantity of a Hafeel nut, Goose greafe, and Mittle oyl, it will give him great eafe, and the fame vertue is acribed to the fweat of an Ewes udder, which is and hath been said of all the former \textit{Oefipm}.

\textbf{The medicines of the Ram.}

Even as the skins of other Sheeps newly plucked from their backs and applied warm, do take away the ach, swelling, and pains of ftripes and blows from bodies, fo also have the skins of Rams, the fame property. \textit{Arniodius} commendeth a plaifter made of a Rams skin for burfting and falling down of the gums, and this is found ready prepared in many Apothecaries shops, and the happy effects thereof is much commended by \textit{Atliius}. If a man take the flones of a fighting cock, and anoint them with Goose greafe, and so wear them in a piece of a Rams skin, it is certain that it will cohbithe and refrain the rage of venereal luff, and a woman wearing about her the right fide of a dunghil cock in a Rams skin shall not suffer abortion. The washed fleece of a Ram wet in cold Oyl, putriyeth the inflammation of the secrets; and likewife the black wool of a Ram wet in water, and then in oyl, and fo put to the fick places, keepeth the fundament from falling, and also affwageth the pain. Alfo the wool of a fighting Ram taken from betwixt his horns, and perfumed into a fmoke, caufeth the pain, and some take the pound thereof in Vinegar for that Malady. They say that \textit{Lais} and \textit{Salpe} cure the bitings of mad Dogs, and also Tertian and Quar tan Agues, with the menthous purgation taken in a piece of Rams wool, and inclosed in a bracelet of filver. Alfo they write that a woman fhall have an eafefull travall if the wear in the wool of a Ram, fed
Of the Ram.

The breast of the rump of a Ram is commended against blisters. The flesh of a Ram being burnt and anointed upon the body of any leprous person, or any whole body is troubled with Ringworms or itch it is very effectual to cure them. The same force hath it against the bites of Serpents, and stings of Serpents, and Algeracæ; it is also being taken in wine is good for the bitings of mad dogs, and healeth the white skins in the eyes. The fat of a Sheep or Weather hath the same in it, as Pork grease, and cureth the suffocation of the womb, and all other difficulties incident unto the secret parts, and also helps places in the body being burnt by fire. The fat of a Ram being mingled with red Arsenic and anointed upon any fcal or fcarb, the same being afterward pared or scraped, doth perfectly heal it. It doth also being mixed with Allum, help those which are troubled with Kibes or Chilblains in their heels.

The fewer of a Ram mingled with the powder of a pumice stone and salt, of each a like quantity, is said to heal felonions and inflammations in the body. The Lungs of small Cattle, but especially of a Ram doth relieve chaps or scars in the body to their right colour. The same vertue hath the fat of a Ram being mingled with Nitre. The gall of a Ram mingled with his own fewer, is very good and profitable for those to use who are troubled with the Gowt or swelling in the joyns. The horn of a Ram being burned, and the durt of the same mixed with oil, and so pounded together, being often anointed upon a faven head, doth caufe the hair to rifie and curl. Acomb being made of the left horn of a Ram, and combed upon the head, doth take away all pain upon the left part thereof, if likewise there be pain in the right fide of the head, the right horn of a Ram doth cure it. For the curing of the lofe of one was springing from the imperfection of the brain, take the head of a Ram never given to venery, being chopped off at one blow, the horns being only taken away, and feethe the whole with the skin and the wool in water; then having opened it, take out the brains, and add unto them these kinds of spices: Cinnamon, Ginger, Mace, and Cloves, of each one half an ounce; there being beaten to powder, mingle them with the brains in an earthen platter diligently tempering of them by a burning cole, not very big, for fear of burning, which might easily be done, but that must great care be had that it be not too much dried, but that it might be so boiled that it be no more dryed then a Calls brains being prepared for meat.

It shall be sufficiently boiled when you shall well mingle them at the fire, then keep it lid, and for three days give it daily to the sick person failing, so that he may abtain from meat and drink two hours after. It may be taken in bread, or in an Egge, or in whatsoever the sick party hath a desire unto: but there must be regard that he be not in a clear place, and that he use this forty days space, which they are wont to use whose blood is withdrawn or fled away: and let him abstain from wine affaying his head.

There are those which are holpen in a short space, some in six or eight weeks by this Medicin being received. But it is convenient that it be required for three months, and then it will have the more power therein. The Lungs of a Ram while they are hot applied unto wounds wherein the flesh doth too much increase, doth both repress and make it equal. The Lungs of small Cattle, but especially of Rams being cut in small pieces and applied whiles they are hot unto bruised places, do very speedily cure them and reduce them to the right colour.

The same doth cure the feet of such as are pinch'd through the straightnefs of their fhooes. The Lungs of a Ram applied unto Kibed heels or broken Ulcers in the feet; doth quite expel away the pain, notwithstanding the exceeding ach or prickling thereof. One drop of the liquor which is boil'd out of a Ram lungs put upon the small nails upon the hand, doth quite expel them. The like operation hath it to expel Warts being anointed thereupon. The corrupt blood of the Lungs of Ram unroasted, doth heal all pains in the privy members of man or woman; as also expel Warts in any place of the body. The juice of the Lungs of a Ram while they are rosted upon a Gridiron being received, doth by the suction thereof purge and drive away the little black Warts which are wont to grow in the hair or privy parts of any man.

The liquor which distil'd from the Lungs of a Ram being boyl'd, doth heal Tertian Agues, and the difeafe of the reins which grow therein. The Lungs of a Lamb or Ram being burned, and the dust thereof mingled with Oyl, or being applyed raw, do heal the forenefs of Kibes, and are accounted very profitable to be bound upon Ulcers. The Lungs of a Ram being pull'd forth and bound hot unto the head of any one that is enfireze, will presently help him. Against the pestilent disease of Sheep, take the belly of a Ram and boyl it in wine, then being mixed with water; give it to the Sheep to drink, and it will bring present remedy.
The gall of a Ram is very good for the healing of those which are troubled with any pains in the ears, coming by the casualty of cold. The gall of a Ram mingled with his own sweat, doth ease those which are troubled with the Gout. The gall of a Weather mingled with the wool and placed upon the navel of young children, doth make them loose in their bellies. The stones of an old Ram being beaten in half a penny weight of water, or in three quarters of a pint of Affes milk, are reported to be very profitable for those which are troubled with the filling tickens. The stones of a Ram being drunk in water to the weight of three half pence, cureth the same diseafe.

The delt of the inward parts of a Rams thigh being lapped in rags or cloths, washe very exactly before with womens milk, doth heal the ulcers or running of old fores. The dut of the hoof of a Ram mingled with horse, doth heal the bitings of a Shrew. The dung of Weathered mingled with Vinegar and infused in the form of a Plaifter, doth expel black spots in the body, and taketh away all hard bunches ariling in the fleth. The same being applied in the like manner, cureth St. Antonies fire, and healeth burned places.

The fifth or sweat which groweth between the thighs of a Ram being mingled with Myrrh and the Herb called Hart-wort, and drunk of each an equal part, is accounted a very excellent remedy for those which are troubled with the Kings evil. But Pliny commendeth the fifth of Rams ears mingled with Myrrh, to be a more effectual and speedy remedy against the said diseafe.

The medicines of the Lamb.

The best remedy for bitings of Serpents is this, presently after the wound to apply some little creatures to the same, being cut in small pieces, and laid hot unto it, as Cocks, Goats, Lambs, and young Pigs; for they expel the poison and much ease the pains thereof. An ounce of Limbs blood being fresh before that it doth congeal mixed with Vinegar, and drunk for three dayes together, is an excellent remedy against the vomiting or spitting of blood. The like force in it hath the blood of a Kid. The blood of a Lamb mingled with wine, doth heal those which are troubled with the Falling tickens, as also those which have the foul evil. For the conception of a Woman, take the yard and gall of a Buck, a Kid, and a Hare, with the blood and fweat of a Lamb, and the marrow of a Hart, and mix them all together with Nard and Oyl of Roses, and after her purgation, let them be laid under her, and this without all doubt, will make her apt to conceive.

The skins of Serpents are anointed with water in a bath, and mingled with wine and Lambs sweeter, doth heal the diseafe called St. Antonies fire. The marrow of a Lamb melted by the fire, with the Oyl of Nuts and white sugar, distilled upon a clean dish or platter, and so drunk, doth dissolve the stone in the bladder, and is very profitable for any that piffeth blood. It also cures all pains or griefes of the yard, bladder or reins. The skin of a Lamb being daubed or anointed with liquid pitch, and applied hot unto the belly of any one that is troubled with excoriations of the bowels or of the Bloody flux, will very speedly cure him, if he have any fente or feeling of cold in him.

If a Virgins menstrual fluxes come not forth at the due time, and her belly is moved, it is convenient to apply Lambs skins being hot unto her belly, and they will in short space caufe them to come forth. A garment made of Lambs skins is accounted very good for the corroboration and strengthening of young men. The skins of Lambs are more than then Kids skins, and are more profitable for the confirming of the back and the reins. The little bone which is in the right fide of a Toad being bound in a young lambs skin being hot, doth heal both Quartin and all other Fevers being applied thereunto. The durt of Lambs bones is very much and rightly used for Ulcers which have no chops, or lars in them. The durt of small Cattles dung being mingled with Nitre, but especcially of Lambs, hath in them great force to heal Cancers: the durt of Lambs bones, is very much commended for the healing and making of green wounds sound and solid, which thing by the Saracens is much verified in regard that at all times they go to war, they never forget to take of the same along with them.

The Lungs of Lambs do very effectually cure those whose feet are wrung or pinched by their shoo-foles. The Lungs of Lambs or Rams being burned, and the durt thereof mingled with Oyl is very profitable for the curing of kibes or ulcers, being applied thereunto. It hath the same virtue being raw and bound upon the fore.

The runner of a Lamb is of very great force against all other evil medicines. The runnets of small Cattle, but especially of a Lamb, is very effectual against all kinds of poyson. The runnets of a Kid, a Lamb, and a hid-calf are conveniently taken against Wolf-bane drunk in wine. The runnet of a Hare, a Kid, or a Lamb taken in wine to the weight of a dram is very effectual against the Fork-fish, and cureth the bites or strokes of all Sea-fishes. The runnet of a Lamb drunk in wine is an excellent cure for the bitings of a Shrew. The runnet of a Lamb drunk in water is accounted for a safegarde to young children who are vexed with thick and concrete milk: or if the default shall happen by curded milk, it will be soon remedied by a Lambs runnet given in Vinegar. A Lambs runnet bid or powdered into water, doth speedily cohibit the bleeding of the nofe, when nothing else can stay it. The gall of small Cattle, but especially of a Lamb being mixed with hony, are thought to be very medicinable for the curing of the Falling tickens.
Of the Strepsigeros.

The places which are infected by Cankers, being anointed over with the gall of a Lamb are very speedily and effectually healed.

There is also by the Magicians delivered unto us a speedy means for the curing of the milt, which is this, to take a Lamb new born, and infantly to pluck him in pieces with one hand, and when Marcellus, the milt is pulled out to put it hot upon the milt of the party so grieved, and bind it on fast with swaddling clothes, and continually to say, I make a remedy for the milt; then in the last day the same being taken from his body to put it to the Wall of the bed wherein the diseased party is wont to lie, it being first daubed with dung thereof, to the better lick, and to sign the durt with seven and twenty marks, laying at every mark. I make a remedy for the milt: this remedy being done three times it will heal the diseased party, although he be very weak and full of danger. But this is the opinion of the Magicians, which I here set down that they should rather see their folly than believe, knowing them to be mere fopperies. For making the wool to grow flower, the gelders of Cattle against the bloud which cometh from the stones of gelded Lambs, which being anointed, doth proft fit very much for haws being pulled away, as also against poison. The dung of Lambs before they Ply, have tafted of any grasse, being dried in the shadow, and rubbed to powder and applied in the manner of a plaiter, doth heal and cave all kinds of pain in the chaps or jawes. And thus much for the medicines of the Sheep.

Of the STREPSIGEROS.

Here is in Crete near the Mountain Ida, a kind of Sheep called by the Shepherds Strepsigeros, Bovinus, which is not different from the vulgar Sheep, except only in the horns, for they bend not like other, but stand straight and upright like the Unicorn, and besides are circled about with certain round speers like a Goats horn. This liveth in flocks, and we have here besides the figure of the beast, expressed a double form of their horns, and fore part of their head, the figure of a Harpe being fasting to one of them as it was presently drawn. The description whereof was taken by Doctor Cat of England, in these words following.

The horns of this Strepsigeros are so lively expressed by Pliny, and so fitly fitt to bear Harps, that they seem not to ask any further narration of words. I will therefore only add this, they are hollow within, and long, about two Roman feet and three palms if you measure them, as they are straight; but if you take their canting and length as they crook a little, then are they about three foot long, they are in breadth where they joyn to the head, three Roman fingers and a half, and their whole compass in that place is about two Roman palms and a half. In the top they are smooth and black, but at the root they are more dusky and rugged, growing lefser and lefser to a sharp point. They with the dried face did weigh seven pounds and three ounces, and the face which remaineth is joyned to the horns, and likewise the hair of the neck and face. It is said that this Beast is as great as a Hart, having a red hair like a Hart.

But whether his nostrils were so ato I could not conjecture, by reason that the age and long use of the piece had defaced the nose which was dried up, and also the hair was worn away, so as it was bald, but by that which was most apparent unto it, I rather inclined that it resembled a Hart, from hence
hence it was that the drawer made the nostrils less; then might answer the proportion of the face, and that which is seen betwixt the horns it is a piece of the neck, by which relation I cannot believe that the Cretian or Ileian Sheep is a Strepsiceros, because the horns thereof do not bend at all, although it answereth not the name, but the true horns of the Strepsiceros do as I have said resemble the ancient fashion of harps, among our fore-fathers, especially the handle being taken away, and the face of the beast placed in stead thereof.

Unto this I may add another horn, which is to be seen in the Castle of the L. William Wernere Count of Cambrie, being black, hollow, and of the length of one arm, and as thick as a great staff, and it was said, that the beast beareth two of them, which are to be seen among the rare monuments of Ferdinandus the Emperor.

Of the Squirrel.

The name of this Beast is by the Grecians called Sciuros, and it was given them from the fashion and proportion of their tail, which covereth almost the whole body, for that which is fabulously said of the Scipodet to have feet that cover their whole body, is more truly verified of a Squirrel's tail, for in the day time being out of her nest, she hideth her self there under both from sun and rain.

The first Author that ever wrote of this Beast was Oppianus, who lived in the days of Antoninus Caesar, and the Latins have no proper or native name for it, but borrow from the Grecians, although some of the latter writers call it Pirolo, and Spinum, I think they would say Sciurus, for so it is vulgarly termed in Latin; some also call it Scirum a currente, because of his nimble running upon boughs. But all the Nations of the world derive their several denominations from the Grecians, as the English Squirrel from Sciurus is not far fetched; the French words Escurieu, and Escurian, from whom the German borrow their words Eschen, or Eschen, or Esch bora, or Esch bora, that a Wessel of the tree, and Das Eschen.
Of the Squirrel.

The Lutherans call it Scurivole, and the Venerians (as Mauritian teiltthith) Scurivolt, the Spaniards Parda, and Eqisto, and some do interpret Coma diera Fora a Squirrel; the Iriatians, Wemerve, and some of the Populians, Vite Wymjck, and so they turn the Moufe Varius, as we have said else where in this History, and some of the Germans call Vore, and Voreh.

Now Albertus and Agricola say, that there is no difference between the Moufe Varius and the Squirrel, but only in the Region which alters the colour, and therefore we have expressed the same figure thereof, remitting the Reader to that which is said in that History, for this (say they) in Germany is red after it be a year old, but before that time it is blackfth, that is till it be a year old: In Poland it is of a red-ah colour, or branded gryffell, in Buffia of an ordinary ahs colour, and for the quantity, food, and manner, or natural inclination, it hath the same in all parts with the moufe Varius.

Varius and Hezeblis say, that the Grecians call this beast also Cmptettites, and Hippocart, and some call the Captivatous Moufe Nocio a Squirrel; the Neris at this day call a Squirrel Coach, for it is apparent that in ancient time till they came into these parts of the world into Geneva and Europe, they never knew or saw this beast; and this shall suffice to have said of the name.

A Squirrel is greater in compass than a Weasel, but a Weasel is longer then a Squirrel, the back parts and all the body is red, except the belly which is white. In Helvetia they are black and branded, and they are hunted in the Autumn at the fall of the leaf, when the trees grow naked, for they run and leap from bough to bough in a most admirable and agile manner, and when the leaves are on, they cannot be so well discerned. They are of three colours, in the first age black, in the second a heavy Iron colour, and last of all when they be stricken in age, they are full of white hoar hairs. Their teeth are like the teeth of Mice, having the two under teeth very long and sharp, their tail is always as big as their body, and it lyeth continually upon their back, when they sleep or sit full; It seemeth to be given them for a covering as we have said already. The mauget differeth from all other, for it is C Trentum, that is, as I take it without a passages out of it into any other part the other guts, or like a mans bladdery and it was great as their ventricle, which in digestion hath been found full fluid with excrements. The genitalis like a bone, as Vesivial writeth.

They use their fore feet in head of bars, for they sit upon their buttocks, and move their meat to their mouth with them, in this point rephembling every little vulgar Moufe, yet being put to the mouth, they hold it in their teeth. They will eat Nuts and Almonds very greedily, and also Apples, Bucknails, Acorns, and sometimes herbs, especially Lettuce, and all other fower fruits. Their feet are cloven like Mice, and their hinder parts very neatly to sit upon. In the summer time they build them nefts, (which in our Country are called Draey) in the tops of trees, very artifically of twigs and moss, and such other things as woods do afford them.

The mouth of their neft is variable, sometimes at the fides, and sometimes at the top. But most commonly it is shut against the winde, and therefore I think that the make most passages, stopping and opening them as the windeth me. In Summer time they gather together abundance of fruits and Nuts for winter, even so much as their little Draey will hold and contain, which they carry in their mouths, and they lodge many times together, a male and female (as I suppose.) They sleep a great part of the Winter like the Alpine Moufe, and very Gould, for I have seen when no noise of hunters could awake them with all their cries, beating their nefts on the outside, and shooting bolts and arrows through it, until it were pulled afunder, wherein many times they are found killed before they be awaked.

They are of incredible agility and motion, never standing still, as it appeareth by them which are tame. When they leap from tree to tree, they use their tail in head of wings, which is most apparent, because many times they leap a great distance and are supported without finking to mans appearance.

And again I have seen them leap from the top of very high trees down to the ground in such an ordinary pace as Birds flee from trees to light on the earth, and receive no harm at all: for when they be hunted, men must go to it with multitude, for many men cannot take one with bowes and bolts with Dogs, and except they dart and rouse them in little and small slender woods, such as a man may shoke with his hands, they are seldom taken.

Bowes are requisite to remove them when they cull in the twills of trees, for they will not be much terrified with all the hollowing, except now and then they be shock by one means or other. Well do they know what harbour a large Oak is unto them, and how secure they can lodge therein from Men and Dogs; therefore seeing it were too troublesome to climb every tree, they mall supply that busines or labor with bowes and bolts, that when the Squirrel refeth, preffently the may feel the blow of a cunning Archer, he need not fear doing her much harm, except be hit her on the head, for by reason of a strong back bone and fleshy parts, she will abide as great a throw as a Dog: yes, I have seen one removed from a bough with a fhot to the ground.

If they be driven to the ground from the trees to creep into hedges, it is a token of their wearisome, for such is the lateley minde of this little Beath, that while her limbs and strength lalfeht, the tarryeth and faveth her fell in the tops of tall trees, then being defenced, she falleth into the mouth of every Cur, and this is the use of Dogs in their hunting.

The admirable wit of this Beath appeareth in her swimming or paffing over the Waters, for when hunger or some convenient prey of meat constraineth her to paffe over a river, she seeketh out some rinde or small bark of a Tree which the fetteeth upon the water, and then goeth into it.

X x 3
and holding up her tail like a tail, letteth the winde drive her to the other side, and this is wit-
nessed by Olaus Magnus in his description of Scandinavia, where this is ordinary among Squirls,
by reason of many rivers, that otherwise they cannot passe over, also they carry meat in their
mouth to prevent famine whatsoever befall them, and as Peacocks cover themselves with their tails
in hot Summer from the rage of the Sun, as under a Shadow, with the same disposition doth the
Squirrel cover her body against heat and cold.

They grow exceeding tame and familiar to men if they be accustomed and taken when they are
young, for they run up to mens shoulders, and they will oftimes sit upon their hands, creep into
their pockets for Nuts, go out of doors, and return home again; but if they be taken alive, being
old, when once they get loose, they will never return home again, and therefore such may well be
called Semiferi rather then Cleveres.

They are very harmful, and will eat all manner of woollen garments, and if it were not for that
discommodity, they were sweet-sportful beasts, and are very pleasant playfellows in a house.

It is laid, that if once they tattle of Garlic, they will never after hire any thing, and this is prescribed
by Cerdan to tame them, their skins are exceeding warm, and well regarded by skinners, for
their heat is very agreeable to the bodies of men, and therefore they are mixed also with the skins
of Foxes. Their flesh is sweet, but not very wholesome, except the Squirrel were a black one. It is
tender and comparable to the flesh of Kids or Conies, and their tails are profitable to make
brushes of.

The medicines are the same for the most part which are before expressed in the Dormouse, saving
that I may add that of Archigenes, who writeth, that the fat of a Squirrel warmed on a rubbing
cloth, and so infilled into the ears, doth wonderfully cure the pains in the ears. And so I conclude
this history of the Squirrel with the Epithets that Martial maketh of a Peacock, a Phoenix, and a
Squirrel, in a comparision of a beautiful Virgin Erosion.

Cui comparatum indecens erat pavo,
Inamabilis fæterus & frequent Phoenix.

Of the Getulian Squirrel, described and figured by Doctor Cai.

The Getulian or Barbarian Squirrel, is of mixt colour, as it were betwixt black and red, and from
the shoulders all alone to the tail by the sides, there are white and ruffet striakes or lines, which
in a decent and feemly order stand in ranks or orders; and there be some of those Squirrels which
have such lines of white and black, with correspondent lines in the tail, yet they cannot be seen ex-
cept the tail be stretched out at length, by reason there is not much hair upon it. The belly feem-
eth to be like a blew colour upon a white ground. It is a little lefse then the vulgar Squirrel, and
hath not any ears extant or flanding up as that, but close press'd to the skin round, and ariling a
little in length by the upper face of the skin. The head is like the head of a Frog, and in other
things it is very like the vulgar Squirrel, for both the outward shape, the manner, and behaviour,
the meat and means of life agree in both, and she also covereth her body like other Squirrels.
This picture and description was taken by him from one of them alive, which a Marchant of London
brought out of Barbary.

They are very pleasant and tame, and it is very likely that it is a kinde of Egyptian or African
Mouse, whereof there are three sorts described by Herodotus, the first called Bipedes, the second
Zegersis, and the third Echines, of which we have already spoken in the story of divers kinds of
Mice, and therefore I will here end the discourse of this Beast.
Of a Wilde Beast in the New-found World called Su.

There is a Region in the New-found World, called Gigantes, and the Inhabitants thereof are called Pantogates; now because their Country is cold, being far in the South, they clothe themselves with the skins of a Beast called in their own tongue Su, for by reason that this Beast liveth for the most part near the waters, therefore they call it by the name of Su, which signifieth water. The true Image thereof as it was taken by Thevetius, I have here inferred, for it is of a very deformed shape, and monstrous presence, a great ravener and untamable wilde Beast. When the Hunters that desire her skin set upon her, she flyeth very swift, carrying her young ones upon her back, and covering them with her broad tail: now for so much as no Dog or Man darest to approach neer unto her, (because such is the wrath thereof, that in the pursuit she killeth all that cometh near her;) the Hunters dig several pits or great holes in the earth, which they cover with boughs, ficks, and earth, so weakly that if the Beast chance at any time to come upon it, she and her young ones fall down into the pit and are taken.

This cruel, untamable, impatient, violent, ravening, and bloody Beast, perceiving that her natural strength cannot deliver her from the wit and policy of men her hunters, (for being inclofed, she can never get out again,) the Hunters being at hand to watch her downfall, and work her overthrow, first of all to save her young ones from taking and taming, she destroyeth them all with her own teeth; for there was never any of them taken alive; and when the feet the Hunters come about her, the roareth, cryeth, howleth, brayeth, and uttereth such a terrifying noise, and terriblecli- mor, that the men which watch to kill her, are not thereby a little amazed, but at last being animated, because there can be no resistence, they approach, and with their darts and spears wound her to death, and then take off her skin, and leave the carcass in the earth. And this is all that I finde recorded of this most savage Beast.

Of the SUBUS, a kind of wilde Water-sheep.

This Beast is called by Oppianus Soubis, and therafter the Latines call it Subus. Bodine in his interpretation of Oppianus, doth make it one beast with the Strepsiceros, but because he expresseth no reason thereof, I take it that he was deceived by his conjecture, for we shall manifest, that either the colour or feat of living, cannot agree with the Strepsiceros, for he faith only it is the same Beast which Pliny calleth a Strepsiceros.

But we know by the description of Oppianus, that this Beast is of a red-gold-colour, having two strong armed horns on the head, and liveth sometimes in the Sea, and Water, sometime on the land. Of all kinds of Sheeph this is the worst and most harmful, ravening after life and blood; for it goeth to the water, and therein swimmeth: when the silly little fishes see this glorious shape in the waters, admiring the horns, and especially the golden colour, they gather about him in great flocks and abundance, especially Shrimps, Lobsters, Mackerel, and Tenches, who follow him with singular delight on either side, both the right and the left, presuming that shall come nearest, to touch and have
The History of Four-footed Beasts.

have the hullet sight of him; so they accompany him in ranks for love of his strange proportion. But this unkind and ravenous Beasts, defpising their amity, society, and fellowship, make but a bait of his golden outside and colour, to draw unto him his convenient prey, and beguile the innocent fishes, for he snatcheth at the nearest, and devoureth them, carrying no longer in the water than his belly is filled, and yet these simple foolish fishes seeing their fellows devoured before their faces have not the power or wit to avoid this devourers society, but still accompany him, and weary him out of the waters till he can eat no more, never hating him, or leaving him, but as men which delight to be hanged in silken halters, or flabb'd with silver and golden bodkins, fo do the fishes by this golden-coloured-devouring-monster. But such impious cruelty is not left unrevenged in nature, for as the gathereth the fishes together to destroy them, fo the Fishermen watching that concourse, do entrap both it and them, rendering the same measure to the ravener, that it had done to his innocent companions. And thus much shall suffice for the Subu or Water-sheep.

Of the SWINE in general.

Being to discourse of this beast, although the kindes of it be not many as is in others, yet because there are some things peculiar to the Bore, and therefore he deserveth a special story by himself, I will first of all deliver the common properties in a general Narration, and afterward descend to the special. For the names of the beast, there are many in all languages, and such as belong to the several sex and age of every one. For as in English we call a young Swine a Pig, a Weaning Pig, a Shead, a Yealk, and so forth: likewise a Hog, a Sow, a Barrow, a Libd-hog, a Libd-low, a Splayed Sow, a Gelt Sow, a Bafs, for the elder Swine, so in other Nations they observe such like titles. The Hebrews call a Bore Chajir, and a Sow Chafertab, the Chaldees, Deut. 4. for Chajir translate Chajira; the Arabians, Kanifer; the Persians, Maron-bak; the Septuaginis, Hut; and S. Hieron, Sus; the Arabians also use Hazir, and Acambil, for a Hog, Acheira, and Scrofa.

The Grecians do also use Sus, or Zat, Chensos, and Snaros. The wilde Hog is called Kapron, from hence I conjecture is derived the Latine word Apex; the Italians do vulgarly call it Porco; and the Florentines peculiarly Cicas; and also the Italians call a Sow with Pig Scrofa, and Tretata, or Porco fastice. The reason why that they call a Sow that is great with Pig Troyata, or Troyaria is for the similitude with the Trojan Horse, because as that in the belly there-of did include many armed men, so doth a Sow in her belly many young Pigs, which afterward came to the table and dines of men. A Barrow hog is called Majdrin Latine, and the Italians, Porcoignare, and Lo Majale. The French call a Swine Fasecon, a Sow

The several names.

Sylvaticus.

Alumnus.

Eostraus.
Of the Swine.

For Tiuye again, a thing among foot-prints and grains, and indeed for this cause the Egyptians kept their Swine in the hills all the year long, till their feed time; for when their corn was fowen, they drove them over their now plowed lands, to tread in the grain, that the Pows and Birds might not root it or scrape it forth again, and for this cause also they feared Swine from Sacrificing. But in mine opinion it is better derived from Hyle, the Greek word: For the Latine, Porca, is thought to be fercet, & from Parellus, because his stout is alwaystretched forth, and he feedeth, digging with it in the earth, and turning up the root of trees; but I better approve the notation of Iiforus, Parum gaffi speciosus cano & timo favulent. That is, because it roweth and walloweth in the mire. Pareeta or Perca for a Sow that hath but one arrow, and Sowpa for a Sow that hath had many. The Grecians had in their Swine their Swine-herds, and the Swine-herds did in the Swine their meats: they served Sigiz in one Countrey their feeders cry Tiq, Tiq, Chiro, of their feeding and nourling their young ones. And indeed from Swine we finde that many men have also received names, as Setps Suartic, and Tremellus or Sowfa, whereupon lyeth this history as he wrote: when Lithinus Nerous was Praetor, his great Uncle was left Querel in his absence for Macedonia, until the Praetor returned. The enemies thinking that now they had gotten opportunity and advantage against their besiegers or assailants, causeth an overt to be made, and a flight to be offered; then his Uncle exhorting the Roman-Souldiers to arms, told them, Secrullus boles disjuturnum in Sowfa porcella. That he would as easily call them off and scatter them, as a Sow doth her Pigs sucking her belly, which he performed accordingly, and so obtained a great victorie, for which Nerous was made Emperor, and he was always evermore afterwards called Sowfa.

Macrobius telleth the occasion of the name of the family of Sowfa somewhat otherwise, yet pertaining to this discourse. Tremellius, faith he, was with his family and children, dwelling in a certain Village, and his servants fattting a fayr Sow come among them, the owner whereof they did not know, presently they flew her, and brought her home. The neighbour that did owe the Sow called for witnesses of the fact or theft, and came with them to Tremellius, demanding his Sow or Sow again. Tremellius having underfoot by one of his servants the deed, laid it up in his Wives bed, and covering it over with the clothes, causeth her to lie upon the Sows carcasse, and therefore told his neighbour he should come in and take the Sow, and he did go and brought him where his wife was, and swore he had no other Sow of his but that, shewing him the bed, and so the poor man was deceived by a deeming oath, for caufe (he faith) the name of Sowfa was given to that family. There was one Pope Sergius, whose christen and first name was Ot pard, Hogs face, and he being elected Pope, changed his name into Sergius, which custom of alteration of names, was that the beginning, for it hath continued ever since that time among all his successors. Likewise we read of Porcellus a Grammorian, of Porcellus, a Poet of Naples, who made a Chronicle of the affairs of Frederick Duke of Urbino, Porcius, Suetius, Verres the Praetor of Sicilia, Sydus, Sybaistas, H. et, Hygias, Gryphus, Porcella, and many such other give sufficient testimony of the original of their names to be drawn from Swine, and not only men, but people and places, as Hyatta, Sudes, Cenarette, some names of the Dori in Greece: Hysa a City of Lucera, Hyamena a City of Me- frequa, Hyamelen a City of Troy, Hymampis a City of Phocis, whereby to all politerit it appeared, that they were Swineherds at the beginning: Esut Hyantanos incantus regna per agros. Hyatta, Hysa, a City in Iberia, Hysa a City of Bætis, and Plun calleth the talle people of Easter, which were eight cubits in height Sybaista, and the like I might adde of many places, Cities, People, Fountains, Plains, Engins, and deviles, plentiful in many Authors; but I will not trouble the Reader any longer with that, which may be but thought to be unnecessary. Only I cannot contain my selfe from the fiction of a Swines name and Teflation, or fay Will for the murther and wit thereof, as it is renmbred in Ca- iv, and before in S. Jerome, and lately by Alexander Broccorum, and Geo. Fabricius, I will express both in Latin and English in this place.

A fiction of a Hogs will and testament.
The History of Four-footed Beasts.

In English without offence I may translate it thus; I, M. Gruter Hog-fon little Pig have made this my last Will and Testament, which because I could not write with my own hand, I have caused it to be ended by other. Magirur the Cook said unto me, come hither thou underminer of houses, thou roister up of land, fearful, fuggitive little Pig, I mult this day take away thy life. To whom Hog-fon made this answer; if I have done any harm, if I have offended, if I have trod in pieces any velvets of worth under my feet, then I intreat thee good M. Cook pardon me, and grant me my requit. But Magirur the Cook said, Run (if Kitchin-boy) and bring me a knife out of the Kitchen, that I may let this little Pig bleed; presently I the little Pig was taken by the servants, and by them led the xvi. day of the Calends of Torch-light into the place of Cool-worts, when Fiery-furnace and Pepper-space were Confuls, and when I saw no remedy but that I must die, I entreat the Cook but an hour's space to make my Will. Which when I had obtained, I call’d my Parents and Friends about me, and made my Will in manner following: Of all my meat and provision left behind me, first I give unto Bore-brown my father 30 bushels of Buck-maft. Item I give to my mother Town-\footnote{Town, 40 bushels of the belt Wheat.} following, 40 bushels of the belt Wheat. Item I give my father Whine-pig 30 bushels of Badly, and for my bowels I bellow them in manner following: I bequeath my bristles to the Cobblers and Shoemakers, my brains to Wranglers, my ears to the deaf, my tongue to Lawyers and Pratlers, my in-trails to the Tripe-makers, my thighs to the Pye-makers, my loins to women, my bladder to boys, my tail to young maids, my muscles to shameless Dancers, my ancle-bones to Lcases and Hunters, my hoofs to Thieves. Item I give unto this (unworthy to be named) Cook the Knife and the Pefle, that I brought out of the spiny of an Oak, into my ftye, and so let him tie his neck with a halter. Also my Will is, that there be made for me a monument, wherein shall be ingraven in Golden Letters, this inscription or title, M. Gruter Hog-fon, Little-pig, lived nine hundred ninety nine years and a half, and if he had lived but one half year longer, he had lived a thousand years. And you my Lovers and best Counsellors of my life, I beseech you do good to my dead carcasse, Satt it well with the best feaston of Nutmegs, Pepper, and Hoany, that so my name and memory may remain for evermore. And you my Masters and Kindred which have been prevalent the making of my Will, I pray you cause your marks to be put thereunto.

Witnifies;

\begin{itemize}
  \item \textit{Wood-bogs mark, Brffle-backs mark, Town-boars mark, Mountain-hogs mark, Bacon-backs mark, Swill-hogs mark, Merf-bogs mark.}
\end{itemize}

I have expressed this discourse for no other purpose but to shew the Reader, what proper fignified names have been or may be given to Swine, and so not to hold him any longer in this discourse, I will proceed from the names to the natures of this Beast. And first of all to begin with the common and vulgar epithets, which are as so many short definitions as they are words, as that of \textit{Heroces, Amica fui hats}, a dirt-lover, cloven-footed, beaty, clamorous, Acrion-eater, rough, horrible, fearful, flourish, filthy, unclean, impatient, loud, glad of food, miry, fat, wet, follower, moit, greedy, tender, and milk-fucker, according to the Poets sayings;

\begin{itemize}
  \item \textit{Laete meo pastum pig et mihi matris alunnum,}
  \item \textit{Ponut et \textit{Etla} de fue divers edas.}
\end{itemize}

Countries wherein Swine do not breed.

Swine are in the most Countries of the world. Yet Arifhate and Elian report, that there are none in \textit{India}, and \textit{Arabia Scien} \textit{s} and moreover there is in the people of those countries such a deflation of them that they cannot endure to eat their flesh, which is not wrought in them by any instinct or opinion of Religion (as it is in the \textit{Jews}) but rather by a natural inclination of the place and Region wherein they live, for it is said also, that if Swine be brought thither from any other place, they die within short space.

\begin{itemize}
  \item \textit{Pliny} affirmeth, that there are Boars among some of the \textit{Indians} which have horns, and the like is affirmed of the \textit{Ethiopians}. The Swine of \textit{Sicily} are accounted the best of all other for food. In \textit{Bavaria} they are lean, but in \textit{Burgundy} or the neather \textit{Germany}, they are fierce, strong, and very fat. Those which are carried into \textit{Hispamula}, are said to grow to the natur of Mules.
\end{itemize}

Pet Martyr.

Now concerning the several parts of Swine, it is most certain that inwardly they do more rememble
Now r the 3VCI by obferved this meat, and their thicknefs is due to their temples, and their under chap there are teeth which grow out of their head, and the Boars have some which the females have not. For even as the Elephant hath two teeth growing downward, so hath the Boar two growing upward. The male as we have faid, hath more then the female, and neither of both do lose or change them by any course of nature. As the Horfe hath his mane, so hath a Swine certain bristles on his neck (called therefore by the Grecians, Lopha) this neck is broad and thick, and in it lyeth the strength of the beast, and it is therefore observed by the Physiognomers, that a man with fuch a neck is an angry fool.

The collar next to the neck called vulgarly Collum, ought to be broad and flifte. It is faid of fore Harts, that they have their gall in their ears, and indeed in the ears of Swine there is found a certain humor not much unlike to a gall: yet lefs liquid, and therefore by reafon of the density or thickness thereof, comparable to the humor of the Spleen. The ventricile is large to receive much meat, and to concoct it perfectly, we call it vulgarly the Buck, and there are in it but few smooth ribs or trefts, and in the liver parts which are very great, there is a certain hard thing white like a bone. The females have twelve udders or dugs under the belly, but never lefs then ten, if they want of twelve; and the Boars have their ilones on their feat behind them joined together, which being taken off, are called by the Latins, Polimenta.

But in the female there is a great miracle of nature, for the place of conception is only open to the udders, or downward, but when her lust comes on her, by often tickling and driving the tumeth it about to meet with the Boars inuirtment in generation. And this bag is called Atris, which hangeth in the female inward, as the ilones of the Boar do outwardly.

In some places there are Swine which are not cloven-footed, but whole hoofed like a Horfe, yet this is very seldom or accidental, for the molt part all are cloven-footed. Aritfale affirmeth, that there are Swine whole hoofed in Africa, Paonia, and Macedonia, and Albertus faith, that he hath been informed of some such leen in England, and also in Flanders. The Anckles are doubtful, as it were in proportion between the Anckle of a whole and a cloven hoof. Now by this that hath been faid and shall be added, we must make up the defcription of a perfect Swine, for the better knowledge of the Reader, which may be of this, a right and small head. The body is to have large members, except the head and feet, and of one uniform colour, not parted or variable, not old, but of a good race or breed. There be some that for the choice of their Swine do make this observation, they chufe them by their face, by the race, and by the Region, by the face, when the Boar and Sow are of good and beautiful aspects: by the race, if they bring forth many and safely, not casting Pigs: by the Region, when they are not bred where they be of a small, slender, or vile nature, and especially this is observed in the male, because that in all beasts they are oftentimes more like the fire then the dam; therefore it is better in Swine to have a thick, round, and well fet Hog, then a long fided one, howbeit some approve Hogs with long legs. The buttocks ought to be flifty, the belly large and prominent, and the snows short and turning upward, yet the Sow is best, that hath the largest fides, if all the other members be correspondent.

Likewise in colde Countries they muft chufe their Swine with rough and thick hair, but in warmer and more more temperate Countries, any hair be it never fo small will serve the turn, especially if it be black. And thus much fhall serve in this place for their several parts and members: Now we will proceed on to their nourishment and copulation.
It is most certain that Swine are of a hot temperament, and for that cause it cometh to pass that they do not lose their Winter hair, for by reason of the fat near to their skin; there is abundance of heat which keepeth fall the roots of the hair. Their food therefore and nourishment is easily digested in every part, for that which is so strong in the nourish of the hair, must needs be correspondent power in other parts. Some have thought that Swine care not for grags or herbs, but only roots, and therefore hath a peculiar smot to attain them, but I finde by experience, that they will eat grags above the earth, as well as roots beneath, and they love to feed in herds together. They love above measure Acorns, and yet being given to them alone they are hurtful, and bring no less damage to them then to Sheep, (though not so often) especially to Sows that be with Pig. The belt time for gathering of Acorns is in November, and it is a work for women and children. The Woods of Italy are so full of Acorns, that they nourish abundance of Swine, and that therewith are fed the greatest part of the Roman people.

They delight also in Buck-mast, and that meat maketh the Swines flesh light, easie of digestion, and apt for the stomach. In some Countries Haws have the same vertue to fat Hogs, that is in Acorns, for they make them weighty, straight, neat, and sweet. The next unto this Holm-berries do fat Hogs, saving that they procure looseness, except they be eaten by little and little. There is a tree which hath bitter fruit (called Halipheum) whereof no beast will take, hereof Hogs will taft, but in extreme famine and hunger, when they are without all other food and meat.

The fruit or Apples of Palm-trees (especially such as grow in salt grounds near the Sea sides, as in Cyrene of Africa, and Judea, and not in Egypt, Cyprus, Syria, Helvetia, and Africa) do fatten and feed Hogs: And indeed there is scarce any food whereof they do not eat, as also no place wherein they pick not out some living, both in Mountains and Fens, and plain fields, but belt of all near waters, wherein by the banksides they gather many sweet and nourishable morets.

There are no better abiding places for Hogs then are the Woods, wherein abound either Oaks, Beeches, Cork-trees, Holm, Wilde Olives, Tamarisk, Hafels, Apples, or Crab-trees, white Thorn, the Greek Carobs, Pine-trees, Corn-trees, Loce-trees, Prune-trees, Shrubs, Haws, or wild Pears, or Medlers, and such like; for these fruits grow ripe successively one after the other, for there is no time of the year wherein some of them are not to be gathered soft and nourishable, whereby the herds of Swine may be maintained.

But if at any time this food cease, and not to be found, then must there be some other provision out of the earth, such as corn, or grains, and turn your Hogs to moist places, where they may pick up worms, and suck up fat tenny water, which thing is above all other things grateful to this beast; for which cause it pleased the holy Ghost in Scripture, to compare the pleasur that beastly men take in sinning, to the wallowing of Swine in the mire. The Dog (faith S. Peter) is returned to his vomit, and the Sow that was washed to wallow in the mire. For this cause also you must suffer them to dig in the water, and to eat Canes and Wilde Bulrushes likewise the roots and tops of Water-creefles; and you must provide to lay up for them in water Acorns, and not spare corn to give it them by hand, as Beans, Peafe, Fitches, Barly, and such like. And Calamela (from whom I have taken these instructions) addeth moreover, that in the Spring time before your Hogs go abroad to bite at the sweet and fresh growing herbes, let they provoke them to looffenest, you must give them some fodder drink, wash or wof, by vertue whereof that itchie must be avoided, for it is not, such leannes will follow, that it will overthrow and kill them.

In some Countries they also give them the scapes or refuse Grapes of Vintage, and moreover the fruits of yew tree, which is poyson to Dogs, Aesforaemata the Athenians by many and sundry praifes advanced three-leaved-grafs, and among other, for that as when it is greene it is commodious for Sheep, so being dried it is wholefome to Swine. They love green corn, yet it is reported that if Swine eat of it in the Isle of Salamine, their teeth by the law of the Country are beaten out of their mouths. It is wholefome to give them crude or raw Barly, especially to a Bore when he is to couple with a Sow, but unto a Sow with Pig fod.

There is in Bavaria a kind of Scallion which beareth a red purple-flower, like to the flower of the Lilly of the Vallies, which is greatly bought and devised by Swine. They also seek after wilde Vines, and the herb called Hogs-bread, and the root of wilde rapes, which beareth leaves like unto Violets, but sharper, and a white root without milk: By fome it is called Buclfcip, because it groweth in Woods among Beeches. They eat also fluff, and abhain not from fat Bacon, and herein they differ from most of the raving creatures, for Dogs will not taste of Dogs fluff, and Bears of Bears, yet will Hogs eat of Swines fluff, yea many times the dam eateth her young ones: And it is found that Swine have not abatiment from the fluff of men and children, for when they have been slaine by thieves, before they could be found, the greatest part of their body was torn in pieces and eaten by wilde Swine: And indeed as we see some Hens eat up the Eggs that they themfelves have laid, so shall we observe some Sows to devour the fruits of their own wombs, whereas we ought not to marvel at a monftrous prodigious thing, but rather acknowledge a natural voracity, constrained in them through famine and impatience.

They also eat Snails and Salamandrers, especially the Boars of the Mountains in Cilicia, and although there be in Salamanders a very deadly poyson, yet doth it not hurt them at all, but after
afterward when men or beasts fall of such a Swines flesh, the operation of the poyson worketh upon them mortally: neither is this any marvel, for it is when a Hog eateth off a Toad: and whereas if a man eat Hemlock, presently all his blood congealeth in his body and he dyeth, but if a Hog eat thereof, he not only not dyeth, but thriveth and groweth fat thereby. Antiquity reporteth one great wonder of a place about Three(As he faith) wherein for the compass of twenty paces there groweth Barly, whereof men eat safely, but Oxen and Sheep, and other creatures avoid it as mortall poyson, and Swine will not vouchsafe to taff of mens excrements that have eaten thereof, but avoid them carefully.

As Swine delight in meat, so also they delight more in drink, and especially in the Summer time, and therefore they which keep suckling Swines, must regard to give them their bellyful of drink twice a day, and generally we must not lead them to the waters as we do Goats, and Sheep, but when the best of Summer is about the risings of the Dog-star, we must keep them all together by water sides, that so they may at their own pleasure, both drink and lie down to wallow in the mire, and if the cold be so dry that this cannot be obtained or permitted, then must they have water fea in troughs and vesells, whereof they may taff at their own pleasure, for otherwise they want of water they grow Liver and Lung fick.

The merry water doth most quickly make them fat, and they will drink Wine or Beer unto drunkenness, and in those Countries where Grapes grow, if the Swine come into the Vintage they grow drunk with eating of Grapes. Also if the Lees of Wine be mingled with their meat, they grow fat above measure and fentile in their fat, whereby it hath been seen that a Mouse hath eaten into the sides of a fat Hog without the resistace of the beast: and the like is reported by Pliny of the fat of L. Apronius who had been a Conful. for his body grew so fat that it was taken from him, his body remaining immoveable. And in the Spring time Swine of their own accord grow fat, many times they cannot stand on their legs their bodies be so heavy, nor go anywhere, so that if they are to be removed, they are not to be driven but to be carred in a Cart.

Varro and Ctesienniis, do report admirable things of the fatten of Swine. For first Varro faith that he received knowledge of a credible honest man in Portugal, of a Swine that was there killed, the offal whereof with two ribs was sent to Volumnius a Senator, which weighed twenty and three pounds, and the fat betwixt the skin and the bone, was a foot and three fingers thick. Unto this he addeth the story of the Ataedian Sow, who suffered a Mouse to eat into her fat, and breed young ones therein, after she made a nest: which thing he likewse affirmeth of a Cow. And Ctesienniis reporteth of another Luicanian Swine, which after the death, weighed five hundred and fivey pounds, and the Lord of that Hog was one foot and three fingers broad. And the like may be told of a Hog at Saflit, nourished by a certain Ovli-man, in whose Lord or fat, after his death were found many paffaggs of mice to and fro, which they had gnawed into his body without the fenie of the beast. Hogs grow fat in short time. In antique days (as Pliny writeth) they put them up to fatting threeoere days, and first of all they made them fat three days together, after five days they may febibly be perceived to grow fat. There is not any beast that can better or more easily be accustomd to all kinds of food, and therefore doth very quickly grow fat, the quantity and Rature of their body considered, for whereas an Ox or Cow, or Hart, and such like beasts ask long time, yet a Swine which eateth of all sorts of meat, doth very quickly even in a moneth or two, or three at the most, prove worthy the knife and also his Malleys table, although in some places they put them up to fatting a whole year together, and how much they do profit & gather in their feeding, it is very safe for them to observe that plainly keep and attend them, and have the charge and overseeing of them.

And there must be he great care of their drink. In Thrace, after they put a Hog to fatting, they give him drink the first day, and then let him fast from drink two days, and so give him drink by that proportion till the seventh day, afterward they obverse no more diet for their Swine, but give them their fil of meat and drink till the slaughter day. In other Countries they diet them in this fort: After Beans and Pease they give them drink abundantly, because they are solid and hard; but after Oats and such like, as meall, they give them no drink, lest the meall might and down in their belly, and so be ejected into the excrements without any great profit. There is nothing whereon it lieth, but thereby it will grow fat except grazing, and therefore all manner of grain, Millet feed, Figs, Acorns, Nuts, Pears, Apples, Cucumbers, Roots, and such things saule them to rise in flesh gratefully, and so much the sooner if they be permitted to root now and then in the mere.

They must not be used to one simple, or unmingle, or uncombined meats, but with divers compounds, for they rejoice in variety and change like other beasts, for by this mutation of food, they are not only kept from inflammation and windines, but part of it also gaueth into flesh, and part into fat.

Some ule to make their fly wherein they are inclosed to be very dark and close, for their more speedy fatting, and the reason is good, because the beast is more apt to be quiet. You shall have Bakers that will fat their Hogs with Bran: and in Elisia a Country of Germany, they fat them with Bean meal, for thereby they grow fat very speedily, and some with Barly-meal wet with flat milk. And in the Alpes they fat them with Whay, whereby their fat and fleth groweth more white and sweet then if they were fatted with Acorns, yet Whay is very dangerous: for such is the ravening intemperancy of this beast, to wall in whatsoever is plesant to its taff, that many times in drinking of Whay their bellies grow extended above measure, even to death, except that they be dieted by a wife keeper, and driven up and down not suffered to rest till it flow forth again backward.

The meat and belt manner to fatten Hogs.

The great fats of Swine.

Of the Elisiaces.
Barly is very nourishable to them, whether it be sod or raw, and especially for Sowes with Pigs, for if he preferveth the young ones till delivery, and at the farrowing caufe them an easy and safe piggling. And to conclude this part, Millers and Bakers fat with Meal and Bran, Brewers with Ale, or Barly steeped in Ale, Oyl-men with the refufe of Nuts and Grapes.

Some again there be that grow fat with the roots of Fern. When a Sow is very fat the hath alway but little milk, and therefore is not apt to make any good tidy Pigs, and yet as all other beast grows lean when they give fucc, so alfo doth Swine. All swine in hot Regions by reason of a vifous humor, grow more fat then in the cold regions. In that part of Frisia neer Germany, they fat Oxen and Swine with the fume meats, for there you fhall have in one Sow and a Hog tyed behind him at the Swall, for the Ox being tyed to the rack esteth Barly in the fray and chaffe, which he swalloweth down without chewing, and fo the foffet thereof is digefted in his belly, and the other cometh forth whole in his dung, which the Hog licketh up and is therewithal ferved. And it is to be remembred, that Swine gelded or fplaited, do sooner fatten then any other.

To conclude, they love the dung of men, and the reafon thereof is, because the scat of their luft is in their Liver which is very rad and inftaflable, and there is nothing that hath a duller fenfe of fluming then this Beaf, and therefore it is not offended with any carrion or thinking smell, but with sweet and pleafant omtentions, as we fhall fhew afterwards.

Concerning their generation or copulation, it is to be noted, that a Boar or male Swine will not remain of validity and good for breed paft three year old, by the opinion of all the antient, for such as he engendereth after that age, are but weak and not profitable to be kept and nourished. At eight moneths old he beginneth to leap the female, and it is good to keep him clofe from other of his kinde for two moneths before, and to feed him with Barly raw, but the Sow with Barly sodden One Boar is sufficient for ten Sowes; if once he hear the voice of his female defiring the Boar, he will not eat untill he is admitted, and fo he will continued pining, and indeed he will fuffer the female to have all that can be, and groweth lean to fatten her; for which caufe Homer like a wife husbandman prefcribeth, that the male and female Swine be kept alfother till the time of their copulation. They continue long in the act of Copulation, and the reafon thereof is, because his luft is not hot, nor yet proceeding from heat, yet is his feed very plentiful. They in the time of their copulation are angry, and outrageous, fighting with one another very irefully, and for that purpofe they fufe to harden their ribs by rubbing them voluntarily upon trees. They chooe for the mofl part the morning for copulation; but if he be fat and young, he can endure it in every part of the year and day; but when he is lean, and weak, or old, he is not able to fatigue his females luft, for which caufe the many times finketh underneath him, and yet he filleth her while the lyeth down on the ground, both of them on their buttocks together.

They engender oftentimes in one year, the reafon whereof is to be ascribed to their meat or fome extraordinary heat, which is a familiar thing to all that live familiarly among men, and yet the wilde Swine couple and bring forth but once in the year, becaufe they are feldom filled with meat, endure much pain to get and much cold; for Venuis in men and beafis, is a compafion of fairety, and therefore they only bring forth in the spring time, and warm weather, and it is obferved that in what night lower a wilde Hog or fow farroweth, there will be no form or rain. There be many caufes why the tame domesticall Hogs bring forth and ingender more often then the wilde; firft becaufe they are fed with eafe; fecondly becaufe they live together, without fear, and by fociety are more often provoked to luft; on the other fide the wilde Swine come feldom tgether, and are often hungry, for which caufe they are more dull and lefe venefious, yet many times they have but one fow, for which caufe they are called by Aristophane and the antient Greatem Clother and Monarches.

But concerning the Sow, the beginneth to fuffer the Boar at eight moneths of age, although according to the diuerfity of Regions and air, they differ in this time of their copulation, for fome begin at four moneths, and other again tary till they be a year old: and this is no marvel, for even the male which engendereth before he be a year old, begeteth but weak, tender, and unprofitable Pigs. The befl time of their admifion is from the Calends of February unto the Vernal Equinox, for so it happeneth that they bring forth the young in the Summer time, for four moneths the goeth with young, and is good that the Pigs be farrowed before harveft, which you purpose to keep all the year for flore. After that you perceive that the Sows have conceived, then separate them from the Boars, left by the raging luft of their provoking, they be troubled and endangered to abortment. There be none that day, a Sow may bear young till the be seven year old, but I will not thrive about that whereof every poor Swineherd may give full fatisfaction. At a year old a Sow may do well, if he be covered by the Boar in the moneth of February. But if they begin not to bear till they be twenty moneths old, or two years, they will only bring forth the stronger, but also bear the longer time even to the feventh year, and at that time it is good to let them go to rivers, fens, or muddy places, for even as a Man is delighted in washing or bathing, fo doth Swine in filthy wallowing in the mire; therein is their reft, joy, and repofe. Albertus reporteth that in *some places of Germany* a Sow hath been found to bear young eighf years; and in other till they were fifteen years old; but after fifteen year it was never feen that a Sow brought forth young Pigs. If the Sow be fat, she is always the lefle prone to conceive with young, whether he be young or old. When firft of all they begin to seek the Boar, they leap upon other Swine, and in proclafs caft forth a certain purgation called Arqa, which is the fame in a Sow which *Hippomantes* is in a Mare, then they also leave their herd-fellows, which kinde of behavior or action, the Latin call by a peculiar Verb Subare, and that is applied to Harlots and wanton Women, by *Hora*;
We in English call it Boaring, because the never retheth to chew her desire to come to a Boar, and therefore when an old Woman lusteth after a man, being past lust by all natural possibility, she is call'd Anus subans. And the Bealt is so delighted with this pleasure of carnal Copulation, that many times the falletth asleep in that action, and if the male be young or duff, then will the female leap upon him and provoke him; yea in her rage she fetteth many times upon men and women, Fliny, especially if that they do wear any white Garments, or if their Apron and privy place be wetted and moistened with Vinegar. They have their proper voices and cries for this time of their Boarings, which the Boar or male utensil endareth prettily.

They are filled at one Copulation, and yet for their better safeguard, and to preserve them from abortion, it is good to suffer the Boar to cover her twice or thrice; and moreover, if the conceive not at the first, then may the safety be permitted three or four times together, and it is observed that except her ears hang down flagging, and carelessly, she is not filled but rejecteth the feed, but if her ears fall downward, and so hang all the time that the Boar is upon her, then is it a most certain token that she is filled, and hath conceived with young.

After four months (as we have said) the Sow farroweth her Pigs, that is to say, in the fifth month, as it were in the seventeenth week: For so is this beast enabled by nature to bear twice in the year, and yet to fuck her young ones two months together. And there is no clow-footed beast that beareth many at a time except the Sow, except in her age, for then the beginntoth lose her opus of purgation, and so many times miscarryeth, and many times bear but one. Yet this is marvelous that she beareth many, so the engendereth them perfect without blindness, lameness, or any such other diffirere, because as we have said before, that in some places you shall see Swine whole hoofed like a Horse, yet most commonly and naturally their feet are cloven, and therefore is the wonder accounted the greater of their manifold multiplication: and the reason thereof may arise from the multitude and great quantity of their food, for the humor cannot be so well avoided and dispersed in so little a body as Swine have, as in Mares and Cowes, and therefore that humour turned to multiply nature and natural kinde, and so it cometh to pass, that by overmuch humour turned into a natural feed, it breedeth much young, and for little humor it bringeth forth a few Pigs and thofe also are not only perfect, but also she is sufficiently furnished with milk to nourish them, till they be able to feed themselves. For as a fat ground or soil is to the plants that growth on it, even so is a fat Sow to a fruitful Sow, which the hath brought forth.

Their ordinary number which they bring forth and can nourish is twelve, or sixteen at the most. The number which a Sow beareth, and very rare it is to see sixteen brought up by one Sow. Howbeit it hath been seen that a Sow hath brought forth twenty, but far more often seven, eight, or ten. There is a story in Fufius of a Sow that brought forth thirty at a time, his words be thefe: The Sow of Anes Latium did bring forth thirty white Pigs at one time, wherefore the Latins were much troubled about the signification of this monstrous fairrow, at laft they received an answer that their City should be thirty years in building, and being so they called it Alba, in remembrance of the thirty white Pigs. And Fliny affirneth, that the images of those Pigs and the Sow their dam, were to be seen in his days in public places, and the body of the Dam or Sow preferred in Salt by the Priests of Alba, to be shewed to all such as desired to be certified of the truth of that story.

But to return to the number of young Pigs which are ordinary and without miracle bred in their dams belly, which I finde to be so many as the Sow hath dugs for, so many the may well nourish and give suck unto, and not more, and it needeth a special work of God which hath made this tame beast so fruitful, for the better recompence to man for her meat and cudtody. By the first farrow it may be gathered how fruitful the she will be, but the second and third do most commonly exceed the first, and the last in old age is inferior in number to the first.

The number of Pigs which are brought forth and can nourish is twelve, or sixteen at the most. The number which a Sow beareth, and very rare it is to see sixteen brought up by one Sow. Howbeit it hath been seen that a Sow hath brought forth twenty, but far more often seven, eight, or ten. There is a story in Fufius of a Sow that brought forth thirty at a time, his words be thefe: The Sow of Anes Latium did bring forth thirty white Pigs at one time, wherefore the Latins were much troubled about the signification of this monstrous fairrow, at laft they received an answer that their City should be thirty years in building, and being so they called it Alba, in remembrance of the thirty white Pigs. And Fliny affirneth, that the images of those Pigs and the Sow their dam, were to be seen in his days in public places, and the body of the Dam or Sow preferred in Salt by the Priests of Alba, to be shewed to all such as desired to be certified of the truth of that story.

But to return to the number of young Pigs which are ordinary and without miracle bred in their dams belly, which I finde to be so many as the Sow hath dugs for, so many the may well nourish and give suck unto, and not more, and it needeth a special work of God which hath made this tame beast so fruitful, for the better recompence to man for her meat and cudtody. By the first farrow it may be gathered how fruitful the she will be, but the second and third do most commonly exceed the first, and the last in old age is inferior in number to the first.
The History of Four-footed Beasts.

When the young one cometh forth of the dams belly wounded or imperfect, by reason of any harm therein received, (it is called Mutacereum) and many times Swine-gender Monsters, which cometh to pass ofter in the little beasts then in the great, because of the multitude of cels appointed for the receipt of the feed, by reason whereof, sometimes there are two heads to one body, sometimes two bodies and one head, sometime three legs, sometime two before and one behind, were the Pigs without ears, which were farrowed at that time that Dionysius the Tyrant went to war against Domitian, for all their parts was perfect but their ears, as it were to teach how insidiously against all good counsel, the Tyrant undertook that voyage, such are commonly found to be bred among them, also now and then of an unapproachable fmainess like Dwarfs, which cannot live, having no mouth nor ears, called by the Latinis Aparcelli. If a Sow great with Pig do eat abundantly of Acorns, it causeth her to call her farrow and to suffer abortion; and if the grow lat, then is the less fruitful in Milk.

Now for the choice of a Pig to keep for flore, it must be chosen from a lufby and strong dam bred in the Winter time, (as fome say) for fuch as are bred in the heat of Summer are of little value, because they prove tender, small, and overmoft, and yet alfo if they be bred in the cold Winter they are small, by reason of extreme cold, and their dames forfake them through want of milk: and more over because they through hunger pinch and bite their dugs, fo as they are very unprofitable to be nourifhed and preferred in the Winter time, rather they are fit to be killed and eaten young.

But this is to be obferved for reconciliation of both opinions, namely, that in hot Countries fix Hogs are preferred that be bred in the Winter, but in cold, fuch as are bred in March or April: within ten days after their farrowings they grow to have teeth, and the Sow ever offereth her foremoft Dug to the Pig, that cometh first out of her belly, and the residue take their fortune as it falleth, one to one, and another to another, for it leemeth the regardeth the firft by a natural instinct, not fo much to prefer it, as that by the example thereof the residue may be in vited to the like fucking by imitation, yet every one (as Teuton faith) keepeth him to his first choice. And if any of them be taken away from his Dug that is killed or fold, that dug prefently dryeth, and the milk currench backward, and fo until all be gone, one excepted and then it is nourifhed with no more then was ordained at the beginning for it. If the old Sow want milk at any time, the suppofe must be made by giving the young ones fried or parched corn, for raw corn or drink procureth loofenes; and it is bef for them to be fucked in the place where their Dam usually abideth.

For weaning them it is not good to let more then five or six fuck of her at one time, for although every one fuck but his own Dug, yet by the multitude, the milk is dryed up: After two months old they may fafely be defjoined from their Dam and weaned, fo as every year the Sow may breed eight months, and give fuck four: it is bef for them to feed afunder from their dams, till they have utterly been fotted to fuck. And thus much for the procreation and nourifhment of old and young Swine.

This beall lovethe fociety, and to live in herds or flocks together, and therefore the Ancients have invented Hog-keepers, whom they call Swine-herds, wherein there was wont to be confidered these instructions; firft be accustomed to the found of his horn, for by that he called them abroad out of their foldsto their feedings, for they never fuffered above twelve together at the trough or parcel of meat. It becometh a Swine-herd (faith Callimnnea) to be vigilant, diligent, industrious, and wife, for he muft carry in his head the state of all that he nourifheth, both old and young, barren and fruitful; and confider the time of their farrowings, whether they be near at hand, or far off, that fo none may be boil through the want of his obfervation; being farrowed, he muft confider and look upon them to fee which are fit for flore, and which are not, what are their natures and probabilities; how much milk their dam is able to afford them, and how many she is to bring up, especiollty to regard that every Sow bring up no more then her own Pigs; for Swine being out of the flye do mingle one with another, and lose their own young ones, and when the lyeth down to give them fuck, the lendeth her paps as well to ftrangers as to her own, and therefore heren muft the care and wit of the herdman appear, for if there be many, he muft shut up every Sow with her young; and if that cannot be, then with a little Pitch or Tar let him give feveral marks to the feveral farrows, that fo his memory may not be confounded. Another reme dy to avoid the confufion of young Pigs one another, is fo to frame the threshold of the flye, that the Pigs may not be able to go in and out; for the Sow can more easily go over, and so she may be caled of their company, and they safely included at home, and so thall no ftranger break into them; but every one in their own neft expect the return of their dam, which ought not to exceed the number of eight; for although the fecundity of Swine be great, yet it is better to kill off two or three, if their number be above eight, then to permit them to fuck their dam; for this multitude of fuckers do quickly draw away all nourifhment from the dam; and when they are but eight at the molt, regard muft be had that the Sow be well fed with ford Barly, or fuch like, left through a covetous pinching of the beall, learneth to overthrow and deftruction. Another point of a good Swineherd, is to fweep oftentimes the flye, for although fuch be the nature of the Beall, that it defileth all things, and will be wallowing in the mire, yet will he alo be very defirous of a clean lodging, and delight much in the fame; and when they be shut up, they muft not be enclosed like other bealls altogether, for one of them will

The office and first institution of Swine-herds.
Of the Swine.

throng and ly upon another, but there must be several porches and hatches to fever and dintingulsh
their lodgings, so as the great with Pig may lie in one place, and the other ready to be delivered by
themselves, free from all incursion and violence. These divisions or separations ought to be some 3,
or 4 foot high, so as they may not be able to leap over to one another, and not covered, to the in-
tent that every Swineherd both man and boy may freely look over to them, and tell them if any
chance to be miffing, or else help a poor Pig when it is overlaid by his dam.

Whenever the Swineherd clenfeth the fly, then let him call in land or some other drying thing
to it, that all the moisture and wetness may be drank up. The dam ought not to be permitted
for the first ten days to go forth of the stable, except to drink, and afterward let her go abroad
in some adjacent piture, not far off, that so by her often return she may the better give fick to
her young ones. When the little ones are a fortnight or three weeks old, they desire to follow
their parent, whereas they must be shut up from their mother, and feed alone in her absence, that
they may better endure it afterward when they shall be weaned. They must be fed in the Summer
time in the morning, before the heat be strong, and in the heat of the day led into some wetty or
shadowy place, that so they may be freed from extremity till the cool of the day return again, where-
in they must be suffered to feed. In the Winter time they are not to be led abroad till the frost
and ice be thawed and dissolved. Ten Boars are sufficient for an hundred Sows; and although some
keep five or six hundred in a herd, as we may read in Scripture of the great herds of Swan, into
which our Saviour Christ permitted the Devils to enter, yet is it not safe or wholesome to keep above
an hundred together, for a less flock or herd requireth less colt, charge, and attendance. There
is a speech of Tertullian Sows, tending to the commendation of the country or nourishing of Swan,
for thus he writhe: 

Agricultura ab initio fuit studium, non de prvnis scilicet maxime causarum, quod in
mognti quoque perisset. Qui enim erat non est communit, quis unus non fuit studium coli, quis fui
babi? 

quis non audierit parae suberat, quae novitiam? quae jacu, quae quidem? 

whereas the country or nourishing of Swan is not so great as it was

The females, therefore to gel them is in the old Moon, or as we say in the wane of the Moon, but Festial
prescribed, that an Ox and a Boar should be gelid in the second quarter, and first day there-
of, and Aristotle is of opinion that it skilfull not what age a Boar be when he is gelid, but it is
clear by the best experienced among these beasts, there are two times of geling them; one in the
Spring, and the other in the Autumn, and this is to be done after a double manner; First,
by making two incisions or wounds upon his ftones, out of which holes the stones are to be pressed
forth.

The second way is more perillous, yet more cleanly; for first of all at one wound or inci-
dition they take out one stone, then that being forth, with their knife they cut the small skin which
parteth the stones in the cor, and so press forth the second stone at the first wound, afterward
applying to it ordinary medicines, such as we will describe in the treatise of their diseases.

And the opinion of Varro is, that it is good to lib them at half a year old, or at a year old, or at
three or four year old, for their better fattering; but best at a year, and not under half a year. When
the stones are taken forth of an old Boar, suppose two, or three, or four year old, they are called by
the Latinus Palmas, because with them they polished and smooched garments.

The female also is gel'd or played, (although the often bore Pigs) whereof they open the side
(neer his loin) and take away from her Arios, and receptacles of the Boars feed, which being seen
up again, in short time is enclosed in fat; this they do by hanging them up by their fore-legs, and
first of all they which do it most commodiously, must cause them to fall two days before; and then
having cut it, they few up and close fast again the wound or incision, and this is done in the same place
of the female, that the stones are to be taken out in the male (as Arist. writeth) but rather it ap-
peareth by good examination and proof, that it is to be cut out on the right, against the bone
(called Or fascum.) 

And the only cause of this Sow-gelidng is, for their better growth and fat-
ing; which in some Countries they use, being forced thereunto by their penury and want of
food; but whereas is plenty of food, there they never know it: and the inventers hereof were the
Grecians, whose custom was to cut out the whole matrix. And thus much for libbing, gelidng,
and fplaying of Swan.

This beast is a moit unpure and unclean beast, and ravingen; and therefore we use (not improper-
lv) to call abacne and filthy men or women, by the name of Swine or Sows. They which have fore-
heads, eye-lids, lips, mouth, or neck, like Swine, are accounted footsíl, wicked, and wrathful: all their
lenses (their smelling excepted) are dull, because they have no Articles in their hearts, but have
thick blood; and some say, that the acuteness and ripeness of the soul, blandeth not in the
thickness of the blood, but in the cover and skin of the body, and those beasts which have

Y y 3 The nature of this beast

Adamsantium, F. Rex.
When certain Pirates in the Tyrrhena sea, had entred a Haven, and went on land, they came to a Swines flie, and drew out thereof divers Swine, and fo carried them on Shipboard, and looing their Anchers and tacklings, do depart and fail away. The Swineherds seeing the Pirates commit this robbery, and not being able to deliver and refte their Cattle, because they wanted both company and strength, suffered the Theeves in silence to fliep and carry away their Cattle; at laft, when they saw the Theeves rowing out of the Port, and lanching into the deep, then they lift up their voices, and with their accustomed cries or calls, called upon their Swine to come to their meat; as soon as the Swine heard the fame, they presently gat to the right file of the Veffel or Bark, and there flocking together, the fliep being unequally ballanced or loaded, overturned all into the Sea, and fo the Pirates were jufly drowned in reward of the theft, and the bole Swine swam fafely back again to their Malters and Keepers.

The nature of this Beast is to delight in the moft filthy and noifome places, for no other caufe (as I think) but because of their dull leners. Their voice is called Gruminitz grunting; So dide fus paccentius wunitia gruminitz; which is a terible voice to one that is not accustomed thereunto, (for even the Elephants are afraid thereof) especially when one of them is hurt or hanged falt, or is heft in his head. The patience of the refidue is as it were in commpcion condoling his mife, run to him and cry with him, and this voice is very common in Swine at all hands to cry, except he be carried with his head upwards towards heaven, and then (it is affirmed) he never cryth, the reafon whereof is given by Apoxnifian: because it is alway accustomed to look downward, and therefore when it is forced to look upwards it is suddenly appaled and afraid, held with admiration of the goodly face above him in the heavens, like one altonishd, holdeth his peace (fome fay that then the artery of his voice is prefled) and fo he cannot cry aloud. There is a fifth in the river Acholus which grunteth like a hog, whereof Juuentif Iiekaketh, faying: Et quam remigibus gruminitz Elephants porti. And this voice of Swine is by Caticus attributed to drunken men. The milk of Swine is very thick, and therefore cannot make what like a Sheeps, howbeit it suddenly coagulateth and congealeth together.

Among divers males or Boars when one of them is conqueror, the refidue give obedience and yeeld unto him, and the chief time of their fight or discord is in their luft, or other occasions of food, or strangenes, at which time it is not safe for any man to come near them, for fear of danger from both parties, and especially thofe which wear white garments. And Strabo reporteth in general of all the Belgian Swine, that they were fo fierce, strong, and wrathful, that it was as much danger to come near them as to angry Wolves. Nature hath made a great league betwixt Swine and Crocodiles, for there is no beast that may fo freely feed by the banks fides of Nile, as the Swinemay, without all hurt by the Crocodile. Other Serpents, especially the smaller Serpents, are oftimes devoured by Swine. Arifioth faith, that when many of them are together they fear not the Wolf, and yet they never devour any Wolf, but only with their fearing and gruntinge noise fear them away. When a Wolf geteth a Swine, he devoureth him, and before he can eat him draggeth him by the ears to fome water to cool his teeth in his fleth (which above measure burn in devouring his fleshe.) It hath been fen that a Lion was afraid of a Sow, for at the fetting up of his bristles he ran away.

It is reported that Swine will follow a man all the day long which hath eaten the brain of a Crow in his pottage: and Nydias affirmeth, that Dogs will run away from him that hath pulled off a tick from a Swines back. The people of Noffynauem did engender Man with Woman publicly like Swine; and Strabo writing against Women faith, that fome of them are derived from one beast, and fome from another, and namely a Woman defecnded of a Sow fitteth at home, and doth neither good nor harm: but Simondes writeth otherwife, and namely that a Woman born of a Sow fetteth at home fuffering all things to be impure, unclean, and out of order, without decking, drefling, or ornament, and fo fye growth fat in her unwafted garments. And there are many fictions of the transforming into Swine. Homer fignifieth that the companions of Ulyfser were all by Circe turned into Swine, which is interpreted in this manner, Circe to signifie unreasonable pleafure, Ulyfser to signifie the foul, and his companions the inferior affections thereof, and fo were the companions of Ulyfser turned into Swine by Circe. When unreasonable pleafures do overcome our affections and make us like Swine in following our appetites: and therefore it was the counfell of Soventic, that no man should at banquet eat more then sufficient, and thofe which could not abftain from them, should forbear their company that perfwaded them to eat when they were not hungry, and to drink when they were not thirsty, and therefore he fupposeth that it was faid in jeft that Circe turned men into Swine. When as Ulyfser by his owne abftinence and Mercury his counfell, was delivered and faved from that moft favage transformation, which caufed Herae thus to write;
And from this came the original proverb of Porcellus Aquanius for a tender and delicate person, used to to fuides, that all penury is death unto him. Sweet favours as we have shewed already, are very hurtful to Swine, especially the sweet oy of Marjoram. Whereupon came the proverb Nil cum amoratino suf; and Lucretius speaks hereof in this fort;

Deniq; amaranstin furitat sus, & timet omne Unguentum: nam fertigna sube acro venenost.

And for this caufe Tullius Cicero saith, Uti alabafrone puter ungenti plena; that is, a box of Alabaster full of ointments is displeasing to this Beast, for as the Scaredes or Horse fie foraketh sweet places to light and sit upon Horfe dung, even so doth Swine. There be many of the antients that have de. Callus, livered merrily Animus sus pro sale, that the Swines soul is in their body but in head of fat to keep the flesh from stinking, even as for no other purpose many among men seem to live and retain soul in body. They are very clamorous, and therefore are used for talking and pratling fellows, whereupon the Greek Poet Lucianus translated by Erafmus alludeth, when he faith in this manner, under Alla Mucelles, alia porce; is loquitur;

Sucula; bus, & capra mibi periere Menelles, & merces horum nomine poena tibi eft. Nee mibi cum Obyrada quicquam esf fuitae neguis, Nee fueris ullobus bus cito Thermopilis.

And to conclude, in Latin they say Sus Minervum. when an unlearned dunce goeth about to teach his better or a more learned man, then doth the Hog teach Pilules, or as we fay in English, the foul Sow teach the fair Lady to fpin.

There are in Swine many prefaces and foretokens of foul weather, as Swineherds have observed: as firft if they lie wallowing in the mire, or if they feed more greedily then they were accustomed, or gather together in their mouths, hay, furflew, or straw, as Aretus writeth; or if they leap and dance, or frisk in any unwonted fort: and for their copulation, in years that will prove moist, they will ever be boring, but in dryer years they are leffe lubidious.

The greatest harm that cometh by Swine is in rooting and turning up of the earth, and this they do in Corn fields, for which we have shewed that the Ophiurn made a law to beat out the teeth of such Swine: for this caufe Homer writeth that Ixion threatened Ulyfles, because his companions eat up all his corn, to knock out their teeth: yet sometimes the husbandmen admit them of purpose, both into their land before it be plowed, and alfo into their vineyards. It is faid that the Egyptians forbear to sacrifice them, because they tread in their Corn in their fields after it is swelt out of the earth, fo as the Birds cannot gather it up again, as we have shewed before. The Jews and the Egyptians accounted this Beast molt unclean. The Jews, not as the vain Gentiles imagined, because they worshipp’d it, for that it taught men to plow the earth, but for the Law of God. And the Egyptians hold it a profane thing, and therefore they had an antient law, that no Swineherd fhould come into their Temple, or that any Man fhould give him his Daughter in Marriage. It is very certain that they were wont to be used in facrifices. The faid Egyptians never Sacrificed them to the Moon and to Bacchus, and at other times it was unlawful, either to offer them, or to eat them: but it feemeth by many Authors, that their firft facrifices were of Swine, for we read of antient customs in Herodius, that at their marriage feaft they offered and Sacrificed a Swow to Venus, and at other times, especially in Harvest, they did fo to Ceres. The Latins do hold a Swine very grateful and facred to Jupiter, because as they believed that a Swow did firft of all lend her paps to him, and therefore all of them worship a Swow, and abtain from her flefh. Likewise in Myfia and Phoenicia, there were Temples of Jupiter, wherein it was forbidden to facrifice or kill Swine by a publick Law, like as it was amongst the Jews. When the Kings of Sparta were firft of all choft into that royal place, they were permitted to execute the Priests office, and to the intent that they might never want facrifices, there was a priviledge granted them to take a Pig of every Sow: and when they Sacrificed to Jupiter a Swine, it muft be after or at a Triumph: they were also Sacrifed to Neptune, because they were impetuous and ranging Beasts; and a Boar was holy to Mars, according to this saying of Pomponius in Aetiusana, Mars sibi sacrurum, & unquem redere, bidenta verre. And there was a custom among the Athenians, when a Man had slain an hundred enemies, he was permitted to offer up to Mars, some part of a Man at Looms, and afterward they grew out of liking of this vain custom, and in Head thereof Sacrificed a Barrow or gelded Hog, and when they houfed their army, they did it with Hogs, Sheep or Bulls, and nothing else, and they compassed it about three times with pomp and stately procession, and at last flew and offered them to Mars. They were wont to Sacrifice a Hog for a Man that had recovered his wits after he had been mad, and also they Sacrificed Swine to Silvanus, according to these Verfes;

Cedere Silvano porum quadrante lavi:

And again;

Tellurum porco Silvannae lalit pliament.
Their Pagan God Terminus, had an Ewe and a young Sow offered to him (as Ovid writeth) although by the laws of Names, all sacrifices of living things were forbidden unto him. To Ceres and Bacchus, we have swelled already how they were offered, and the reason of their sacrificing was, because they were hurtful to all green Corn and Vines.

Prima Ceres avidi gaviala est sanguine porci,
Ultima justa merita cede noscentis aetas,
Nam liberae non teneris latentia sucia,
Eruta setigera comparit ore suis.

And again in another place he writeth thus;

Prima putax bohia Sus menisfie morti,
Eve vit livers, frena, intercessit animi.

The time of their sacrificing to Ceres was in April, wherein the Priests with Lamps and Torches, and apparelled in white garments did first of all kill a female Swine, and then offer her; and sometime this was a Sow with a farrow, because thereby in a mystery they prayed for the fruitfulnes and fecundity of the earth; and for thefe and such like causes we read of titles put upon them, as Parce praeceps, for the Sow that was slain before the reaping, and Parce praed, for the Sow that was offered at a Funeral for the safety of all the family, wherein the dead man lived. They also sacrificed a barren Sow to Proserpine, because she never bore children, and to Juno in the Calends of every month: and thus much for their sacrificing.

Now we are come to the use of Swine and their several parts: first of all it is certain that there is no Beast lesse profitable being alive then a Hog, and yet at his latter end he payeth his Master for his keeping. Ceres said well, Sin quid habet praetor ofam, cui quidem non puressest, animam ipsum pro jace desampe effis Chrypsiou. A Hog hath in him besides his meat, and that therefore the soul thereof was given to it in feald of fat to keep it from finking: for indeed in Lions, Dogs, Bears, Horses, and Elephants, all their virtue lyeth in their minds, and their flesh is unprofitable and good for nothing, but the Swine hath no gifts at all in the minde, but in the body, the life thereof keeping the flesh and body from putrefaction. And there is no beast that God hath ordained for domestical provision of food and meat to man, except Hares and Conies, that is so fruitful as Swine are. God (as we have touched already) Levit. 11; Deut. 14, forbade his people of Israel to eat thereof, because it was an unclean Beast not chewing the cud; and furthermore the observance of Precisius is memorable, that whereas the Egyptians did worship with divine worship, both Oxen, Kine, and Sheep, and would not eat of their flesh or kill them in sacrifice, yet did eat, and kill, and sacrifice Swine.

The Jews were permitted and commanded to eat Oxen and Sheep, and abstinence from the flesh of Swine; thus manifesting how different his ways and thoughts are from the ways and thoughts of men. The Lord doth not this for policy, but to try the obedience of his people, placeeth therein one part of his worship, and therefore by his Prophets, Eze. 45. and 66. calleth the eating of Swines flesh abomination, and threatened them thereunto a certain unavoidable judgement and damnation. The woman and her seven lads which were apprehended by King Antiochus, and he tempted to eat Swines flesh which they refused to do (being against the law of their God) are remembered as most worthy Martyrs of his Church, that endured, cutting off their hands and feet, pulling out their tongue, and seething in a boiling Caldron with other exquisit torment; incident to such death, as is recorded by Jann. 2. Maccab. 6. We read that Heliodorus did abstinence from Swines flesh, because he was a Platonian, and they forbade him to eat it. The women of Bessaca in Africa, do never touch of Cowes flesh or Swines flesh.

The Arabian Scyrians never eat hereof, and Swine cannot live in their Countries. (Ctesistr and Aelianus affirme) that in India there are no Swine, either tame or wild, and that the Indians do as much forbear to eat of Swines flesh, in defection thereof, as they do of Mans flesh.

Now concerning the flesh of Swine, many opinions are held about the goodnes and evil thereof, yet Hippocrates writeth, that Porcine carnes prava sunt quom quiferint crudores & ambito, magis animo choleram generant, & turbationem faciunt, Soli carnes optime sunt omnium carnium; that is, The flesh of a Boar being raw or roasted, is worst of all other, because it engendereth Choler and wildly windy matter in the flomach; but the flesh of a Sow is the best of all flesh, with this proviso, that it neither exceed in fatnes, leannes, or age.

There is a merry and witty answer of a memorable Noble man to an old Gentlewoman (if not a Lady) who displeased Bacon at the Noble mans table, and said it was a curous, unpleasing meat. The Lord understanding a privity Emphasis in that speech against himself, (for his name was written with those Letters and syllables) answered her: you say truth, if the Bacon be a piece of an old Sow (as peradventure he seemed to be at that time.)

The bett opinion about the concocitive quality of this flesh is, that then it is best when it is in middle age, neither a Pig, nor an old Hog, for a Pig is over moist, like the Dam which is the most fat of all other earthy Beasts; and therefore cannot but engender much filage: and for this cause
caufe the fatterl be reprov'd for a good diet, for that it cannot digeft well through over much humidity.

And the old Swine are moft hard of Concoction, (yea though they be forchered or fngifled at the fire) becaufe thereby is increafed in their flefh much acroimony and sharpnes, which in the fomach of men turneth into Choler: for they bite all the veflles reaching to the fomach, making a derivation of all thofe ill humors into the belly and other parts.

I do not like their opinion, which think that it is better cold then hot, for fear of inflammation; this rule is good in the flefh of Goats (which are exceeding hot) but in Swine, where there is no predominancy but of moiflure, it is better to eat them hot then cold, even as hot Milk is more wholefome then cold. Hippocrates doth preffcribe the eating of Swines flefh in the ficknefs of the Spleen; and Celsus Aurelianus forbidde them the fame in the Paffie or Falling ficknefs.

Galen is of opinion that Caro porcina potentiffime nutrit; nourifheth moft strongly, and potently; whereof he giveth an inftance for a reafon taken from Combatants, or Wreftlers, if the day before they wretche or flipte, they feed on an equal quantity of any other flefh, they feel themfelves weak and feeble in comparison of that which is gathered from Swines flefh: and this (he faith) may be tried in Laborers, Mioners, Diggers, and Husbandmen; which retain their ftrength as well (if not better) by eating of Swines flefh or Bacon as any other meat: For as Beef in thicknes and folidity of fubfance to the eyes appearance, excelleth Pork or Bacon, fo Pork and Bacon excelleth and is preferred before Beef, for a clammy nourifhing humor. And this comparison betwixt Pork and Beef, Galen amplifheth farther in these words, Of Swines flefh, thofe are belt for men in their middle and ripe age, which are of Hogs of an answerable age, and to other which are but growing to a ripenes and perfection, Pigs, Sheares, and young growing Swine, are moft nourifhable. And on the contrary, young growing Oxen are moft nourifhable to men of perfect years and ftrength, becaufe an Ox is of a far more dry temperament then a Hog.

A Goat is lefle dry then an Ox, and yet compared to a Man or a Swine, it excelleth both of them; for there is a great reafemblance or fimilitude betwixt a Mans flefh and Swines flefh, which fome have proved in cafe, for they have eaten of both at one Table, and could finde no difference in one from the other: for fome evil Inn-keepers and Hoafs have so deceived men, which continued a great while, not deforyed or punifhed, until at laft the finger of a man was mixed therewith, and being found, the Authors received their reward. Swines flefh alfo is lefle excemtional then Pigs flefh, and therefore more nutritive, for the moifler that the flefh is, the sooner it is digerated, and the vertue of it avoided, and old Swine notwithstanding their primitive and natural moiflure, yet grow very dry, and their flefh is worth of all, becaufe in nature humidity helpeth the concocition thereon.

All Swines flefh being concocted engendereth many good humors, yet withal they contain a kind of glutinous humor, which stoppeth the liver and reins, efpecially in thofe which by nature are apt to this infirmity. And although fome are of opinion, that the wilde Boar is more nourifhable then the tame Swine, becaufe of his laborious courfe of life, and getting his prey; yet it appeareth that the tame Swine by their refty life, and easy gathering of their meats, are made more fit for nourifhment of man, for they are more moifl: and Swines flefh without convenient moiflure (which is many times wanting in wilde Boars) is poyfon to the fomach, and yet for a man that hath propounded to himself a thin extenuating diet, I would with him to forbear both the one and the other, except he ufe exercife, and then he may eat the ears, or the cheeks, or the feet, or the halter, if they be welled or drefled: provided they be not freth, but fauced or powdered: And it is no marvel that Swines flefh should fo well agree with ours, for it is apparent that they live in dirt, and love to muddie in the fame.

And if any man ask, how it commeth to paffe, that Swine which both feed and live fo filthily, should be fo nourifhable to the nature of man; fome make anfwer, that by reafon of their good conftitution of body, they turn ill nutriment to a good flefh: for as men which be of a found, perfect, and healthy disposition or temperature, are not hurt by a little evil meat, which is hard of digestion; even fo is it with well conftituted and tempered Swine, by continual feeding upon evil things, they grow not only to no harm, but alfo to a good etate, haufe nature in procefs of time draweth good out of evil: But if men which have moifl fomachs, do eat of Swines flefh, then do they suffer thereby great harm, for as water powered on wet ground increafeth the dirt; fo moiflness put upon a moifl fomach, increafeth more feeblenes: but if a man of a dry and moifl fomach do eat thereof, it is like rain falling into a dry ground, which begetteth and engendereth many wholesome fruits and hearts. And if a Swine be fatti with dried figs or nuts it is much more wholefome.

With Wine all Swines flefh is moft nourifhable, and therefore the Univerfity of Salerium, prefcribed that in their veftes to the King of England, and alfo they commended the loines and guts:

Ille pororum bona sunt, malo sunt reliquorum.

And Fiera depretieth the eating of Hogs-flefh in this manner:

Suntibus comos fit causa doméstica ore, Grataferat tuba mofa hyermis aprum.
And whereas *Hippocrates* commended Swines flesh for Champions and Combatants; it is certain, that *Bills* the Champion through eating of Swines flesh, fell to such a height of choleric, that he cast it upwards and downwards.

When the womb of a Woman is ulcerated, let her abstinence from all Swines flesh, especially the elder and the youngest. It is not good for any man to taint or eat this flesh in the Summer time, or any hot weather, for then only it is allowed when extreme froths have tempered it for mans stomach, and the stomach for it: the flesh of welle Swine is most of all hurtful to them that live at ease, without exercize, because that they are immoderately given to sleep. Some are of opinion that a few which is killed immediately after the Boar hath covered her, is not to wholesome as other: *Heliogabalus* observed this custom, to eat one day nothing but Pheasant Hens, another day, nothing but Pullen, and the third day nothing but Pork.

There was in antient time a dish of meat called *Trojanum*, the Trojan Hog, in imitation of the Trojan Horfe, for as that was stuffed within with many armed men, so was this with many several meats, and whole Beasts, as Lambs, Birds, Capons, and such like, to serve the appetites of the moist strange belly-gods, and Architects of gluttony: and therefore *Cicero* in his oration, wherein he perfwaded the Senators and people to the law *Fames*, reproveth this immoderate riot in banquets, *In opponendo mensis porcum Trojanum*: and indeed it wanted not effect, for they forbade both *Porcum Trojanam*, and *Callum Aprugnum*.

There was another Raven-monfter-dish (called *Pipes*) wherein were included many Beasts, Fowles, Eggges, and other things which were distributed whole to the guests: and no marvell, for this Beast was as great as a Hog, and yet gilded over with silver. And *Hippocrates*, in his Epistle to *Lyncus*, speaking of the banquet of *Caranus*, faith thus, *Aquatim es nobis etiam porcus dimidia parte diligenter affus fit*, *Et dimidia altera parte tanquam ex aqua molliter elixit*, *Mira etiam coquus industria tua paratur, ut qua parte jugulatus esset*, *Et cum modo variis deliciis refertus ejus vener non apparet*. There was brought to us a Hog, whereof the one half was well rofted, and the other half or side well sod, and this was so indifferently prepared by the Cook, that it did not appear where the Hog was flain or receiv'd his deadly wound, nor yet how his belly came to be stuffed with divers and sundry excellent and delicate things. The *Roman* had a fashion to divide and distribute a Hog, which appeareth in their *Veres of Martial*.

*Vobisvum*.

*Uli tibi faciete bona Saturnalia porcus*,
*Inter fumantem illice porcini apres.*

And of the eating of a fucking Pig, *Martial* also writeth in this manner;

*Latiti meropafum gigra mibi matris aliumnum*.
*Porcin, & Aetulo de fuis drues edat.*

I might add many other things concerning the eating and dressing of Swines flesh, both young and old, but I will passe it over, leaving that learning to every Cook, and Kitchin-bōy.

Concerning Bacon, that which is cold by the *Latius, Perna*, I might add many things, neither improper, nor impertinent, and I cannot tell whether it should be a fault to omit it in this place. The word *Perna* after *Varro*, feemeth to be derived from *Pede*, but in my opinion, it is more connoctant to reason, that it is derived from the Greek word *Perna*, which is the ribs and hips of the Hog hanged up and salted, called by *Martial Petajo*, and by *Plautus Ophthalmia*, *Horeum*, *Scembrium* and *Laridum*:

*Palladius*.

*Quanta pecos poscit venutes, quanto labes larido.*

The time of the making of Bacon, is in the Winter season, and all the cold weather, and of this *Martial* writeth very much in one place;

*Museum est, propria, claros ne differ amitos*.
*Nam mihi cum vetula sit petasone nihil.*

And again,

*Etpulbam dubio de petasone venas.*

—*Cretana mihi fiet, vel mappa licebit*.
*De memphis laitis, de petasone venari.*

*Strabo* in his time commended the Bacon of the Gauls, or of *France*, affirming that it was not inferior to the *African* or *Lycian*, an old City of Spain (called *Fempelin*) near *Aquitania*, was also famous for
Of the Swine.

527

for Bacon. They first of all killed their hogs, and then burned or scalded off all their hair, and after a little fation did flit them aflunder in the middle, laying them upon falt in some tub or deep trough, and there covering them all over with falt, with the skin uppermoft, and fo heap flipt upon flipt, till all be falted, and then againe they oftentimes the fame, that every part and side, might receive his falt, that is, after five daies, laying them undermoft which were uppermoft, and thofe uppermoft which were undermoft. Then after twelve daies fafting, they took all out of the tub or trough, rubbing off from it all the falt, and fo hanged it up two daies in the winde, and the third day they all to anoint it with oyl, and did hang it up two daies more in the wind; and afterward take it down again, and hang it or lay it up in the larder, where all the meat is preferred, still looking warily unto it, to prefervie it from Mee and Wormes: And thus much fhall iuftece at this time for the flefh of Hogs, both Pork and Bacon.

The milk of a Sow is fat and thick, very apt to congeal, and needeth not any runnet to turn it; it breeding little whay, and therefore it is not fit for the stomach, except to procure vomiting, and because it hath been often proved, that they which drink or eat Sow milk fall into Scors and Prophes, (which difeafe the Aflatts hate above all other) therefore the Egyptians added this to all the residue of their reafons, to condemn a Sow for an unclean and filthy beaffe. And this was peculiarly the faying of Manethon.

With the skins of Swine which the Grecians did call Phorine, they made fhoo-leather, but now a dayes by reafon of the tenderness and loofenas thereof, they use it not, but leave it to the Saddlers, and to them that cover Books, for which caufe it is much better then either Sheeple or Goate skins, for it hath a deeper grain, and doth not so easilie fall off. Out of the parings of their skins they make a kind of glue, which is preferred before Tauracolum, and which for fmalldime they call Chermolium. The fat of Swine is very precious to liquee fhooes and boots therewithall. The Amber that is in common use groweth rough, rude, impolifhed, and without clearneffe, but after that is fod in the greafe of a Sow that giveth suck, it getheth that nitour and fhining beauty, which we finde to be in it.

Some mix the blood of Hogs with thofe medicines that they caft into Waters to take fihes, and the Hunters in fome Countries where they would make Wolves and Foxes, do make a train with a Hog's liver fob, cut in pieces and anointed over with hone, and fo anointing their shoes with Swines greafe, draw after them a dead Cat, which will caufe the beaffe to follow after very fpeedily. The hairs of Swine are used by Cobbler and Shoemakers, and alfo with them every Boy knoweth how to make their Nofe bleed. The dung is very sharp, and yet it is juftly condemning by Columella for no use, no not to fatten the earth, and Vines alfo are burned therewithall, except they be diligently wafterd, or reft five years without furring.

In Primus time they thuded to enlarge and make their Lettice grow broad, and not clofe together, Thesphrafin, which they did by fitting a litte the flall, and thrusting gently into it some Hogs dung. But for trees there is more especial ufe of it, for it is used to ripen fruit and make the trees more plentiful. The Pomegranats and Almonds are sweeter hereby, and the Nuts eafily caufed to fall out of the fhell. Likewise, if Fennel be unfavorly by laying to the root thereof either Hogs dung, or Pigeons dung, it may be cured; and when any Apple tree is affected and razed with Worms, by taking of Swines dung, mixed and made loft like mortar with the urine of a man layed down into the root, it is recovered, and the Wormes driven away: and if there be any rents or ftripec visible upon trees, fo as they are endangered to be loft thereby, they are cured by applying unto the ftripeces and wounds this dung of Swine.

When the Apple trees are loofe, pour upon their roots the flate of Swine, and it fhall eitcbiff and settle them, and wherefore there are Swine kept, there it is not good to keep or lodge Hores, for their fhell, breath, and voice, is hateful to all magnanimous and perfect Spirited Hores. And thus much in this place concerning the ufe of the feveral parts of Swine, whereunto I may add our English experiments, that if Swine be fuffered to come into Orchards, and dig up and about the roots of the Apple trees, keeping the ground bare under them, and open with their noft, the benefit that will arise thereby to your increafe of fruit will be very ineflimable. And here to fave my felf of a labor about our English Hors, I will describe their ufe all out of Mr. Taffers hufbandy, in his owne words, as followeth: and firft of all for their breeding in the Spring of the year he wrieth in general;

Let Lent well kept offend not thee,  
For March and April breeders be.

And of September he wrieth thus:

To gather some maft it fhall stand thee upon,  
With fervants and children yet maft be all gone.  
Some lea amonge battes well your thy Fwine,  
For fears of a mishap keep Aoconnor fro kine.  
For roosting of flipture ring Hogs have need,  
Which being well ringed, the better doth feed.  
Though young with their elders will likly keep beft,  
Yet fcare not to ringe both great and the reft.

Take feldome thy Swine, while sucke time doth left,  
For divers misfortunes that happen too falt.  
Or if vou do fancy, whole care of the Hog,  
Give ear to ill neighbor, and ear to hit Dog.  
Keep hog I advise thee from medow and Carne,  
For out alowd crying, that ere he was borne.  
Such lowlefs fo haunting both often and long,  
If dog let him chewing he doth thee no wrong,

And
And again in October husbandry he writeth:

Though plenty of Acorns, the Porklings is fat,
Not taken in feaon may perish by that,
If falling or swellling get once in the throat,
Then left thy porking a Crown to a Great.

What ever thing is fat, is again if it fail,
Thou wert left the thing and the fameths withall.
The fatter, the better, to sell or to kill,
But not to continue, make proof if you will.

In November he writeth again:

Let Hog once fat, lose none of that;
When maff is gone, Hog falleth anon,
Still fat up some, till Shrovetide come,
Now Porks and fonce bears tucke in a houfe.

Thus far of our English husbandry about Swine. Now followeth their diseas in particular.

Of the diseases of Swine.

Emlock is the bane of Panthers, Swine, Wolves, and all other beafts that live upon devouring of flesh, for the Hunters mix it with flesh, and so spread or call the flesh so paylown abroad in bits or morlills to be devoured by them. The root of the white Chameleon mixed with fryed Barly flour. Water and oil is also payson to Swine. The black Ellebor worketh the same effect upon Hories, Oxen, and Swine, and therefore when the beafts do eat the white, they forbeare the black with all wearifomenefs. Likewise Henbane worketh many painful convulsions in their bellies; therefore when they perceive that they have eaten thereof, they run to the waters and gather Snails or Sea-crabs, by vertue whereof they escape death, and are again reforted to their health. The hearb Goofefoot is venemous to Swine, and alfo to Bees, and therefore they will never light upon it, or touch it. The black Night-shade is present deftuction unto them, and they abftain from Harts tongue, and the great bur, by fome certain infall of nature. If they be bitten by any Serpents, Sea-crots, or Snails, are the moft prent remedy that nature hath taught them. The Swine of Scythia by the relation of Pliny and Arifotle are not hurt with any payson except Scorpions, and therefore fo soon as ever they are flung by a Scorpion, they die if they drink. And thus much for the payson of Swine. Againit the cold (of which theea beafts ate moft important:) the best remedy is to make them warm flies, for if it be once taken, it will cleave fatter to them, then any good thing, and the nature of this beaft is, never to eat if once he feel himself sick, and therefore the diligent Maifer or keeper of Swine, must vigilant regard the beginnings of their diseas, which cannot be more evidently demonstrated, then by forbearing of their meat.

Of the Meafels.

The Meafels are called in Greek Μυνωρία, Chalaza; in Latin, Gransines; for that they are like hailstones spread in the flesh, and especially in the leaner part of a Hog, and this diseafe, as Arifotle writeth, is proper to this Beaff, for no other in the world is troubled therewith: for this cause the Grecians call a Meafily Hog, Chalaza, and it maketh their flesh very loofe and foft. The Germans call this diseafe Finnen, and Pfinnen; the Italians, Gr omn; the French, Sarfens, because the spots appear at the root of the tongue like white feds, and therefore it is ufal in the buying of Hogs in all Nations to pull out their tongue and look for the Meafels, for if there appear but one upon his tongue, it is certain that all the whole body is infected. And yet the Butchers do all affirm that the cleaneft hog of all, hath three of thefe, but they never hurt the swine or his flesh, and the Swine may be full of them, and yet none appear upon his tongue, but then his voice will be altered and not be was wont.

These abound moft of all in such Hogs as have flefthy legs and shoulders very moift, and if they be not over plentiful, they make the flesh the fweeter; but if they abound, it tafteth like fock-fiff or meat over-watered. If there be no appearance of thefe upon their tongue, then the chap-man or buyer pulleth off a brifle from the back, and if blood follow, it is certain that the beaft is infected, and alfo fuch cannot well ftand upon their hinder legs. Their call is very round. For remedy hereof divers days before their killing, they put into their waft or will some athes, especially of Hafel trees. But in France and Germany it is not lawful to fell fuch a Hog, and therefore the poor people do only eat them. Howbeit they cannot but engender evil humors and naughty bloud in the wheath.

The roots of the bramble called Ramme, beaten to powder and caff into the holes, where Swine use to bath themselves, do keep them clear from many of thefe diseases, and for this caufe alfo in antient time they gave them Horfe-fleff fodden, and Toads fodden in water, to drink the broth of them. The Bur pulled out of the earth without Iron, is good alfo for them, if it be cramped and put into milk, and so given them in their waft. They give their Hogs here in England red-lead, red-
Oker, and in some places, red loam or earth. And Pliny faith, that he or the which gathereth the aforefaid Burre, must say this charm:

Hec est herba Argemon
Quam Minerum repetit,
Sibua bu remedium
Qui de illa gaudeatur.

At this day there is great praise of Maiden-hair for the recovery of Swine, also holy Thistle, and the root of Gumbo and Harts-tongue.

Of Leanneffe or pining.

Sometimes the whole herd of Swine falleth into leanneffe, and so forlaken their meat, yea althouglh they be brought forth into the fields to feed, yet as if they were drunk or weary, they lie down and sleep all the day long. For cure whereof, they must be closely shut up into a warm place, and made to fast one whole day from meat and water, and then give them the roots of wild Cucumber beaten to powder, and mixed with water, let them drink it, and afterward give them Beans pulle, or any dry meat to eat, and lastly warm water to procure vomit, as in men, whereby their stomacks are emptied of all things both good and bad: And this remedy is prescribed against all uncertain diseaSES, the cause whereof cannot be discerned; and some in such cases do cut off the tops of the tails, or their ears, for there is no other use of letting these beasts blood but in their veins.

Of the Pestilence.

These beasts are also subject to the Pestilence, by reason of earth-quakes and sudden infections in the air, and in such affection the beast hath sometime certain bunches or swellings about the neck, then let them be separated, and give them to drink in water the roots of Daffadill:

Quattuor agros suisses annuale sise
As far, quod amitt, obtius tempesto pestis.

Some give them Night-shade of the wood, which hath great flacks like cherry twigs, the leaves to be eaten by them against all their hot diseases, and also burned snails, or Pepper-wort of the Garden, or Latuca xantva cut in pieces, sodden in water, and put into their meat.

Of the Ague.

In ancient time (Varro faith) that when a man bought a Hog, he covenanted with the seller, that it was free from sickness, from danger, that he might buy it lawfully, that it had no maungie or Ague.

The Signs of an Ague in this beast are these.

When they stop suddenly, standing still, and turning their heads about, fall down as it were by a Megrim, then you must diligently mark their heads which way they turn them, that you may let them blood on the contrary ear, and likewise under their tail, some two fingers from their buttocks, where you shall finde a large vein fitted for that purpose, which first of all we must beat with a rod or piece of wood, that by the often striking it may be made to swell, and afterwards open the said vein with a knife; the blood being taken away, their tail must be bound up with Oifer or Elm twigs, and then the Swine must be kept in the house a day or two, being fed with Barly meal, and receiving warm water to drink as much as they will.

Of the Cramp.

When Swines fall from a great heat into a sudden cold, which hapneth when in their travel they suddenly lie down through wearineffe, they fall to have the Cramp, by a painfull convulsion of their members, and the best remedy thereof, is for to drive them up and down, till they wax warm again, and as hot as they were before, and then let them be kept warm still, and cool at great leisure, as a horse doth by walking, otherwise they perish unrecoverably, like Calves which never live after they once have the Cramp.
The History of Four-footed Beasts.

of Lice.

They are many times so inflected and annoyed with Lice, that their skin is eaten and gnawed through thereby; for remedy whereof, some annoy them with a confection made of Cream, Butter, and a great deal of Salt: Others again annoy them, after they have washed them all over with the Lees of wine, and in England commonly the Country people use Staves-aker, red Oaker, and grease.

of the Lethargy.

By reason that they are much given to sleep in the Summer time, they fall into Lethargies, and die of the same: the remedy whereof is, to keep them from sleep, and to wake them whenever you finde them asleep.

of the Head-aches.

This diſeafe is called by the Grecians, Scotomia, and Kroara, and by Albertus, Frateris. Here, with all Swine are many times infected, and their ears fall down, their eyes are also dejecked, by reason of many cold humours gathered together in their heads, whereof they die in multitudes, as they do of the pellitence, and this sickneffe is fatal unto them, if they be not holpen within three or four daies. The remedy whereof (if there be any at all) is to hold Wine to their nostrils, first making them to smell thereof, and then rubbing it hard with it, and somne give them also the roots of white Thistles, cut small and beaten into their meat, but if it fall out that in this pain they lose one of their eyes, it is a sign that the beast will die by and by, as Pliny and Arifiole write.

of the Gargarism.

This diſeafe is called by the Latines, Ranculo, and by the Grecians, Branchos, which is a swelling about their chaps, joyned with Fever and Head-ach, spreading it self all over the throat, like as the Squinancy doth in a man, and many times it beggeteth that also in the Swine, which may be known by the often moving of their feet, and then they die within three daies, for the beast cannot eat being so affected, and the diſeafe creepeth by little and little to the Liver, which when it hath touched it, the beast dieth, because it purrithe and as it passeth. For remedy hereof, give unto the beast those things which a man receiveth against the Squinney, and also let him blood in the root of his tongue, (I mean in the vein under the tongue) bathing his throat with a great deal of hot water mixed with Brimftone and Salt.

This diſeafe in Hogs is not known from that which is called Struma, or the Kings evil at the first appearance, as Arifiole and Pliny write: the beginning of this diſeafe is in the Almonds, or kernels of the throat, and it is cauſed through the corruption of water which they drink; for the cure whereof, they let them bloud, as in the former diſeafe, and they give them the Yarrow with the broadleſt leaves. There is a Hearb called Herba impia, all hoary, and outwardly it looketh like Rosemary, some fay it is cauſed because no beast will touch it, this being beaten in pieces betwixt two tiles or stones, groweth marvellous hot, the juice thereof being mixed in milk and Wine, and so given unto the Swine to drink, cureth them of this diſeafe, and if they drink it before they be affected therewith, they never fall into it, and the like is attributed to the hearb Trinity, and Viola Matius, likewise the blew flowers of Violets are commendèd for this purpose by Dioscorides.

of the Kernels.

Here are little bunches rising in the throat, which are to be cured by letting bloud in the shoulder, and unto this diſeafe belongeth that which the Germans call Rangen, and the Italians, Eldor, which is not contagious, but very dangerous, for within two daies the beast doth die thereof, if it be not prevented: This evil groweth in the lower part or chap of the Swines mouth, where it doth not swell, but waxing white, hardeneth like a piece of horn, through pain whereof the beast cannot eat, for it is in the space betwixt the fore and the hinder teeth; the remedy is to open the Swines mouth as wide as one can, by thrusting into it a round bat, then thrust a sharp needle through the same fore, and lifting it up from the gum, they cut it off with a sharp knife; and this remedy helpeth many if it be taken in time: Some give unto them the roots of a kind of Gentian to drink, as a special medicine, which the Germans for that cauſe call Rangenerate; but the most sure way is the cutting it off: and like unto this there is such another growing in the upper chap of the mouth, and to be cured by the same remedy: the cauſe of both doth anfwer from eating of their meat over hot, and therefore the good Swineheard must labour to avoid that muffie; The muffie of this is described by Virgil:

Hinc canibus blandis rabies venit, & quasit ager
Tuffi ambula saepe, ac fauciibus adgit absint.
Of the Swine.

Of the pain in their Lungs.

For all manner of pain in their Lungs, which come by the most part for want of drink, are to have Lung-wort stamped and given them to drink in water, or else to have it tyed under their tongues two or three days together, or that which is most probable, because it is dangerous to take it inwardly, to make a hole in the ear, and to thrull it into the same, tying it fast for falling out; and the same vertue hath the white Hellebor. But the diseases of the Lungs are not very dangerous, and therefore the Butchers say, that you shall seldom finde a Swine with found Lungs or Livers; sometimes it falleth out that in the Lights of this Beath there will be apparent certain white spots as big as halfa Walnut, but without danger to the Beath, sometimes the Lights cleave to the ribs and fides of the Beath, for remdy whereof you must give them the fame medicines, that you give unto Oxen in the fame disease. Sometimes there appear certain blathers in the Liver of water, which are called water-gals; sometimes this is troubled with vomiting, and then it is good to give them in the morning, tyed peace mingled with duff of Ivory, and bruised Salt falling, before they go to their patures.

Of the diseases in the Spleen.

By reason that this is a devouring Beath, and through want of water, it is many times sick of the Spleen, for the cure whereof you must give them Prunes of Tamarisk preffed into water, to be drunk by them when they are a thirt: this disease cometh for the most part in the Summer, when they eat of sweet and green fruits, according to this verfe;

Strata jacent passim sua quaq: fab arbore poma.

The vertue of thefe Prunes of Tamarisk is also very profitable against the diseases of the Milt, and therefore it is to be given to Men as well as to Beasts, for if they do but drink out of pots and cups made out of the wood of the tree Tamarisk, they are easily cleared from all diseases of the Spleen; and therefore in some Countries of this great tree they make Hog troughes and mangers, for the safegard of their Beasts, and where they grow not great, they make pots and cups. And if a Hog do eat of this Tamarisk, but nine dayes together, at his death he fhall be found to be without a Spleen, (as Marcellus writeth.) When they become loose in their bellies, which happeneth to them in the Spring time by eating of green Herbs, they either fall to be lean, or else to die. When they cannot easily make water, by reafon of some floppage, or sharpfens of Urine, they may be eafed by giving unto them purge-feed. And thus much for the diseases of Swine. For confluon whereof I will add hereunto the length of a Swines life, according to Artifale and Pliny, if it be not cut of by ficknes or violent death, for in their dayes they observed that Swine did live ordinarily to fifteen years, and some of them to twenty: And thus much for the nature of Swine in general.

The medicines of the Hog.

The best remedy for the bitings of venomous Serpents is certainly believed to be this, to take Aetius. some little creatures, as Pigs, Cocks, Kids, or Lambs and eatt them in pieces, applying them whiles they are hot to the wound as soon as it is made, for they will not only expell away the poyfon, but also make the wound both whole and found. For the curing of Horses which are troubled with the inflammation of the Lungs; Take a fucking Pig and kill him neer unto the fick Horfe, that you may inflantly pour the blood thereof into his fawes, and it will prove a very quick and speedy remedy. The panche of a fucking Pig being taken out and mingled with the yolk which fliketh to the inner parts of the skin, and mollified bothe together, doth very much eale the pain of the teeth being poured into the ear, on which fide the grief falleth.

The liquor of Swines flesh being boiled, doth very much help againft the Bittrellis, the fame is also a very good antidote againft poyfon, and very much helpeith tho he which are troubled with the Gout. Cheefe made of Cowes milk being very old, fo that it can scarce be eaten for taffte, being in the liquor or decoction of Swines flesh which is old and falt, and afterwards throughly tempered, doth very much mollifie the flines of the joynts, being well applied thereunto.

The Indians use to wash the wounds of the Elephants which they have taken firft with hot water, afterwards if they fee them to be somewhat deep, they anointed them with Butter: then do they affwage the inflammation thereof, by rubbing of Swines flesh upon them, being hot and moist with the fresh bloud influming from the fame. For the healing of the wounds of Elephants, Butter is chiefly commended, for it doth easily expell the iron lyrage hid therein, but for the curing of the Ulcers, there is nothing comparable to the flesh of Swine. The bloud of Swine is moist, and not very hot, being in temper moist like unto mans bloud, therefore whosoever faith that the bloud of men is profitable for any diseases, he may firft approve the fame in Swines bloud: but if it shew not the fame, it may in a manner fhev the like action.
For although it be somewhat inferior unto man's blood, yet at the least it is like unto it; by knowledge whereof, we hope we shall bring by the use thereof, more full and ample profit unto men. For although it do not fully answer to our expectation, notwithstanding there is no such great need that we should prover men blood. For the encouraging of a feeble and dimmished Horfe, Luminatis reporteth, the flesh of Swine being hot, mingled in wine, and given in drink, to be exceeding good and profitable. There also addeth by Swine another excellent medicine against divers perilous diseases, which is this, to kill a young gelded Boar Pig, having red hairs, and being of a very good strength, receiving the fresh blood in a pot, and to stir it up and down a great while together with a flock made of red Juniper, casting out the clots of the blood, being gathered while it is flirring.

Then to call the scrapings of the same Juniper, and stir the berries of the Juniper in the same to the quantity of seven and twenty, but in the stirrings of the same, let the clots be full cast out. Afterwards mingle with the same these herbs following. Agrimony, Rue, Rheu, Scotch, Betony, Piumernel Succory, Parsely, of each a handful. But if the measure of the blood exceed three pints, put unto it two ounces of Treacle: but if it shall be bigger, for the quantity of the blood you shall diminish the measure of the Treacle. (But all things ought to be so prepared that they may be put to the blood coming hot from the Boar.) These being mixed all together, you must draw forth a dropping liquor, which you must dry in the sun, being diligently kept in a glasse-vessel for eight days together, which you must do once every year, for it will last twenty years. This medicine is manifestly known to be a great preservative against these diseases following, namely the Plague, impostumes in the head, fides, or ribs, as also all diseases whatsoever in the Lungs, the inflammation of the Milt, corrupt or putrified blood, the Ague, swellings in the body, shaking of the heart, the Dropifie, heat in the body above nature, evil humors, but the principal-left and chiefest vertue thereof is in curing all poisons, and such as are troubled with a noyisme or pestilent Fever.

Let him therefore who is troubled with any of the aforesaid diseases, drink every morning a spoonful, or four or five drops of the same liquor, and sweat upon the same, and it will in very short time perfectly cure him of his pain. Some also do use Almonds pounded or beaten in the blood against the Plague, the liquor being extracted forth by the force of fire. A young Pig being killed with a knife having his blood put upon that part of the body of any one which is troubled with warts being as yet hot come from him, will presently dry them, and being after washed, will quite expell them away. The blood of a Sow which hath once pigged being anointed upon women, cureth many diseases in them.

The brains of a Boar or Sow being anointed upon the fores or Carcuncles of the privy members, doth very effectually cure them, the same effect also hath the blood of a Hog. The dugs of a woman anointed round about with the blood of a Sow, will decrease leffe and leffe. A young Pig being cut in pieces, and the blood thereof anointed upon a Woman's dugs, will make them that they shall not encrease.

Concerning the grease of Swine, it is termed diversely of all the Authors, for the Greeks call it Steir Chalines, and Ocuungia, for the imitation of the Latin word Arsungia; but Marcellus also applyeth Arsungia to the fat of other creatures, which among the ancient Authors I do not finde: for in our time those which in Latin, do call that fat Arsungia, which increaseth more solid between the skin and the flesh, in a Hog, a Man, a Brock or Badger, a Dor-mouse, a Mountain-mouse, and such like.

The fat of Swine they commonly call Lard which growtheth betwixt the skin and the flesh, in expressing the virtues of this, we will first of all shew how it is to be applied to cures outwardly, and then how it is to be received inwardly; next unto Butter, it hath the chiefest commendations among the antients, and therefore they invented to keep it long, which they did by casting some salt among it, neither is the reason of the force of it obscure or uncertain, for as it feedeth upon many wholesome herbs which are medicinable, so doth it yield from them many vertuous operations; and besides the physicke of it, it was a custom for new married wives when they first of all entred into their husbands house, to anoint the parts thereof with Swines grease in token of their fruitfulnes while they were alive, and remainder of their good works when they should be dead.

The Apothecaries for preparation of certain Ointments, do geld a male fucking Pig, especially such a one as is red, and take from his reins or belly certain fat, which the Germans call Schafer, and the French, Qin, that is, Unguentum the husbandmen use Swines grease to anoint the axle trees of their Carts and carriages, and for want thereof they take purifiled Butter, and in some Countries the gum that runneth out of Pine trees, and Fir trees, with the scum of Butter mingled together: and this composition taketh away icabs and tetterers in Men:but it is to be remembered that this greaze must be fresh, and not salted, for of salt grease there is no use, but to skowre those things that are exulcated.

The antients deemed that this is the best Greaze which was taken from the reins of the Hog washed in rain water, the veins being pulled out of it, and afterwards boiled in a new earthen pot, and so preferred. The fat of Swine is not so hot and dry as the fat of other beastts, the chief use of it is to moilten, to fatten, to purge, and to fcurter, and herein it is most excellent when it hath been washed in Wine, for the fairest greaze so mixed with Wine, is profitable to anoint those
that have the Plurifie, and mingled with ashes and Pitch, eath inflamations, festuлаes, and tumors, and the fame virtue is ascribed to the fat of Foxes, except that their fat is hotter then the Swines, and leffe moist: likewise ashes of Vines mingled with talle grease of Hogs, cureth the wounds of Scorpions and Dogs, and with the spume of Nitre, it hath the fame virtue against the bitings of Dogs. It is used also against the French disease (called the French pox) for they say if the knees of a Man be anointed therewith, and he stand gaping over it, it will draw a filthy matter out of his stomach, and make him vomit.

By Serenus it is precribed, to be anointed upon the knees, against the stains of the Neck. Mingled with Quicksilver and Brimstone, it is sufficient against the itch and scabs. This Lard being fow with the fat, and applied to the body, doth mightily expell corruptions that cleave to the skin. The fat of Swine with Butter and Oyl of Roffes, is inftilled into the broken skins of the brain for the cure of them.

Likewise Bugloss plucked up by the root, and the roots cut off, and curiously washed, braten and pounded into a Ball, and mixed with Swines greafe, is good to be laid to any incurable wound. It is also profitable for the wounded Nerves of the body, beaten together with Wormes of the earth, according to thefe Verfes of Serenus:

---

Terra lumbros in hirta tritos,
Quam venus & tani fortis amarina uabet.

When bones are broke, if they be anointed with the fow greafe of Swine, and so bound up fat together, after they be well fat and closed, grow wonderful fat, fure and solid again: Serenus writeth thus of it;

Si cui forte lapis teneros violantes artis,
Necis adips vitulis, & trias chamaeoffon.

By the fat (the meaneth the fat of Swine) because preiently after he maketh mention of the dung of Swine to be good for the fame cure. Being mingled with Pitch, it tattereth all bunches and fellons. The hardnes of the brethts, Ruptures, Convulsions and Cramps, and with white Hellibor, it clofeth up cliffs and chinks in the flefh and maketh the hard skin to be foint again. It is very profitable against inflamations of Ulcers, especially the fat of the Boar Pig, mixed with liquid gum.

Women do alfo ufe the fat of a Sow that never bore Pig to cleare their skin, and to mix it with Pitch, and one third part of Afles greafe againft the scabs. The fame mingled with White Lead, and the spume of filver maketh the fears of the body to be of the fame colour with the refidue; and with Sulphur, it taketh away the fplot in the Nails, mingled with the powder of Acorns: if the greafe be falt, it fointneth the hardnes of the flefh. Rue mingled with Swines fowet or Buls greafe, taketh away fplot and freckles out of the face, and it is alfo profitable againft the Kings evil, being mixed with the powder of a Sea Oylter fhell, and being anointed in a Bath, it taketh away the itch and blifters. Featherfew and fow Swines greafe, is also precribed againft the Kings evil. This fame alone or with Snow, eath the pain of burnings in the flefh, and when there is an Ulcer, by reafon of the burning, mix it with tofted Barly, and the white of an Egge, according to thefe Verfes;

---

Combustis ignis,
Hordea vel fruges, atq. ost candida jungera,
Adit adips perca (mitra eft nem forma medea)
Funge etiandiuus as sit lora vulncre fuccu.
Quedv. recentis uti piscet, adnecis simplex
Matet, & en faeci gratis et medicamine cura.

Freshe greafe is very profitable for those members that are furbeted or riven of their skin, and likewise to anoint them that are weary with long journeys. The afhes of womens hair burned in a fhell, and mingled with the fat of Swine, are laid to eafe the pain of St. Antonies fire, and to fanch blood, and to cure Ring-worms.

The gall of a Swine, or of a Boar, and the liftles with the fat, fillfeth up the Kibes; and the flalls of Cabiges with the roots burned, and mingled with Swines greafe being applied to the fides, do cure the dayly pains thereof. And thus far of the ufe of this greafe for the bodies of men.

Now also it followeth in a word to touch the ufe thereof for the bodies of Beasts. When the horns of Oxen or Kine are broken, they take a little Lint, Salt, Vinegar, and Oyl, and lay them upon the broken horn, powring in the liquid, and binding the reft close on the outside, and this they renew three dayes togethe; the fourth day they take the like quantity of Swines greafe, and liquid Pitch, and with a smooth rind or bark of pine they bind it to close, and fo it is fattened again. When the hoof or ankles of an Ox are hurt with the plough fhare, then take hard Pitch, Swines greafe and Sulphur, roul them upall together in unwashed wool, and with hot burning Iron melt them upon the wound or horn.

Zz. 3
The History of Four-footed Beasts.

The ears of Dogs in the Summer time are exulcerated by flies, into which forc'd it is good to infill liquid Pitch sod with Swines greafe, and this medicine also is good to deliver Beasts from the ticks, for they fall off as many as touch it. When Lambs or Kids are troubled with the Sheep pox, some use to anoint them with Swines greafe and the rutt of Iron, that is two parts of Swines greafe, and one part of rutt, and so warm them together. Also for the scabs upon Horses' heels, that are called the scratcches, which come for the mokt part in the Winter time, they cure them in this manner: They take the fat of Swine, and melt it on the fire, and pour it into cold water, which afterwards they take it out and beat it well together, at last they mingle it with Brim- Stone beaten small, and so anoint the place therewith three days together, and the third day they own the scabs, and so continue anointing till it be cured.

When a Horse cannot hold his Neck right, it is good to anoint him with Oyl, Wine, Hony, and Hogs-greafe; the manner of some Leeches is, when they have made a fupputation by Oxen in burning, they fift of all wash it with hale Urine, and afterwards mingle an equal quantity of Pitch and Hogs greafe together, wherewithal they anoint and cure the fore.

Sometime the blood of Oxen falleth down into their feet, wherein it congealeth and breaketh forth into scabs, then muft the place fift of all be scraped with a knife, and the scabs cut away, afterwards with cloaths wet in Vinegar, Salt, and Oyl, moistened and pressed hard, and laft of all by an equal quantity of Hogs greafe, and Goats sweeter for both together, it will be cured by laying it unto it. And thus much for the remedies of Swines greafe towards Beasts. The hukes of Beans being beaten small to powder, and mixed with Swines greafe, is very profitable against the pain of the hips and the nerves.

Some Physicianstake the greafe of Swine, the fat of Geefe, the fwer of Bulls, and the Oefpus or swet of Sheep, and anoint therewithal Gowyf legs, but if the pain remove not, then do they add unto it Wax, Mirdle, Gum and Pitch, and some use it mixed with old Oyl, with the bone Sarco- physeis, Chicks-foyl better in Wine with Lime or athes. This Swines greafe beaten in water with Cumin, is preferibed by Simeon Letbi againft the Gowt. It remediateth the falling of the hair, and the pain in the heads of Women, mingled with one fourth part of gals, and the like virtue it hath with wilde Roifes, Linguulae and Hippomcrius with Nitre and Vinegar. When the corners of one's eyes are troubled with Worms, by anointing them with the fat of a Sow with Pig, beating them together both within and without, you shall draw all the Wormes out of his eyes.

When one hath pain in his ears whereby matter iflueth forth, let him beat the oldft Lard he can in a Morter, and rake the juice thereof in fine wool, then let him put that wool into his ear, making it to work through warm water, and then infuife a little more of the juice of that Lard, and to fhall he work a great cure in short time. And generally the fat of Hone, Hens, Swine, and Foxes, are prepared for all the pains in the ears.

If there arise any bunch in the neck or throat, feasthe Lard and Wine together, and fo by gargari- fhting that Liquor, it fhall be dispierfed, according to the Verfes of Serenus;

\[\text{Corvus geminus molucbuerunt styxine papes,} \\
\text{Istc longum puritir nervos medicina fictur.}\]

And it is no marvel that the vertue of this fhould go from the knees to the Nerves, feeing that Pliny affirneth, that from the anointing of the knees the favour goeth into the fomach: there is fo great affinity or operation of Rue upon the bones, that in antient time they were wont to cure burtnefts by anointing the Codis with wilde Rue and Swines greafe.

Also this Greafe with rutt of Iron, is good againft all the imperfections in the feat. Butter, Goofe greafe, and Hogs greafe, are indifferentely used for this infermity. Also this is used to keep Women from abortments that are subject thereunto, being applied like an eye falve. In the diseases of the Matrix, especially Ulcers, they fift of all dip Spunge or Wool in warm water, and so cleanse the places infected, and afterwards cure it with Rozen and Swines greafe mingled together, and of- ten using it in the day and night by way of Oyment; but if the exulceration be vehement, after the washing they put Hony unto the former confection, and some make a perfume with Goats Horn, Gals, Swine's greafe, and Gum of Cedars. And Fermerius faith, that Lard cut small and beat in a Morter of foyle like palle, in a Limbeck of Glaffe, rendereth a white water, which maketh the hair yellow, and also the face comely. If a man be poiuned with Helmock, he cannot avoid it better, then by drinking Salt, Wine, and freth Greafe. A decoction hereof is good against the poulon of Buarefris, and againftquickliver. The fetewe of a Sow fed with green Herbs, is profitable to them that are fick of a conumption of the Lungs, according to this Verfe of Serenus;

\[\text{Prociis. & vetris seki pliis fumpfa suffi.}\]

This may also be given them in Wine, either raw or decocted, or else in pis to be swallowed down whole if it be not salted, and the fift day after they precribe them to drink out of an Egge- shell Liquid Pitch, binding their fides, breast, and shoulder bones very hard. It is also used for an old Cough after it is decocted, the weight of a Goat being put into three cups of Wine with some Hony. It is given also to them that have the flux, especially old Lard, Hony, and Wine, being beaten together.
Of the Swine.

535
together till they be all as sticke as hoary, whereof the quantity of a Hasil-nut, is to be drunk out of Water. Also parcells of Swines greafe, Butter, and Honie, being put down into a Horse throat, cureth him of an old Cough; and finally a piece of this Greafe being old, moistened in old Wine, is profitable to a Horse that hath been overheated in his journey. When Calves be troubled with belly Wormes, take one part of Swines greafe, and mingle it with three parts of Hysof, afterwards thrust it down into the throats of the Calves, and it shall expell the Wormes.

When the tongue and chops wax black by a peculiar sickness of the mouth, which the Phyfians call Morbus Epidemius, it is most wholesome to rub the tongue with the inner side of the rines of Bacon, and so draw out an extreme heat: and it is said if a man be deeply infected, whole tongue is thus rubbed; the said Bacon being eaten by any Dog, will procure his death. The fat of Wolves and the marrow of Swine is good to anoint bleaf-eyes withal. By swallowing down the marrow of Swine, the appetite to carnal copulation is encreased.

The ashes or powder of Hogs briftles which are taken out of Plaisterers Pencils, wherewithal they rub wans, and mixed with Swines greafe, doth ease the pain of burnings, and also layeth the bleeding of wounds, and the falling down of the fest being first of all washed in Wine and dryed Pitch mingles therewithal. The powder of the cheek-bones of Swine, is a moft preuent remedy for broken bones, and alfo for ulcers in the legs and thins. The fat of a Boar is commended againft Serpents, and is alfo the liver of a Bore Pig when the Fibres are taken from it, if the weight of two pence be drunk in wine.

The brain of a Sow toasted at the fire, and laid to a Carbuncle. either difperfeth or emptieth it. Likewife the blood and brains of a Boar or a Sow, or Boar Pig being mixed with Honie, doth cure the Carbuncles in the yard, and the brains alone, openeth the gums of children, to let out their teeth, as Serden writeth;

Aet teneris cerebrum gingivis illin poro.

There are naturally in the head of a Hog two little bones that have holes in them, one in the right part, and another in the left. Now if it happen that a man finde these bones by chance, either one or both of them, let him lay them up safe; and whensoever he is troubled with the Head-ach, let him use them, hanging them about his neck by a filken thread, that is to fay, if the head aches on the right side, let him hang the right bone, and if on the left, the lefl bone: These things I report upon the credit of Marcofttus. Galen also writeth, that if the pole of the Swines ear be hanged about ones neck, it will preserve him from all Cough afterwards.

They were wont, as Doforides writeth, to feethe a Gudgen in a Swines belly, by the eating whereof, they flayed the falling down of the fest. If a man eat the lungs of a Boar, and a fow fadden and falling, they will prefervc him from drunkenness all that day; and likewife the faid lungs doth keep the foles of the feet from inflammation which are caufed by ftraithe fhoes. It alfo healeth the pufhes, clifts, and breaking of the skin, and kines of the feet, by laying to it a Boars gall, and a Swines lungs.

If a man drink the Liver of a Sow in Wine, it fayeth his life from the bittes of venemous Beasts. Also the liver of a Boar burned with Juniper-wood, cureth all the faults in the feetecr; and drunk in Wine without Salt after it is fod, fayeth the loofefees of the belly. The gall of Swine is not very vehement, for as the whole body is waterfif, fo alfo is that; neither is there any beaft herein com parable unto it, (except the wilde) and that is enemy to Ulcers, ripening the fore, fattering the evil humors, and refilling the bittes of venemous Beasts. Also the gall of Boars layed to bruited Articles, doth procure unto them wonderful eafe. One fhall take away an old fcurfe very eafily by the gall of a Sow, which fawrrow if it be mingled with the juice of the hearb Sicelamine, and there withal to rub the head well in a Bath. To keep hair from growing upon the browes when it is once plucked off; Take the gall and fat of a Boar, and put them into a smooth thick earthen pot, and of the sharpel Vinegar and oyf of Almonds four ounces a piece, pour that into it, and then binde the mouth of the pot clofe with a thick linen cloth, fo letting them stand seven dayes, afterwards open them again, and you fhall finde upon the top a certain fume like gold, wherewithal anoint thofe places, which you would have remain bald, after that you have beaten it together in a morter: likewife the gall of a Barrow Hog or Boar Pig, doth fatter Apollemes and banches in any part of the body. The gall of a Hog dried in an Oven, and laid upon a Carbuncle, as much as will cover it, it cleaveth fai to the fore, and draweth out the rooth and core thereof.

It is likewife good againft the Ulcers of the ears, except the Ulcer be of long continuance, and then it is good to use a sharper gall, such as is a Sheeps, an Oxes, a Bears or a Goats, they mingle herewithal sometimes oyf of Rofes; but for old wounds in the ears, it is good to take one part of bell Honie, and two parts of the sharpel Vinegar, and fo let them boil in the fire three walymes, afterwards let them fan off from the fire, until it leave fecting or boyling, and then put Nitre unto it, fo long till you know by the Vapour that the Nitre is fetted, then fette it again upon a gentle fire, fo as it boyleth not over, and layeth put into this the gall of a Boar, or of a Goat, and then fette it the third time, taking it from the fire, when it is lake-warm, infuflte it into the ears, and this gall must not be the gall of a Sow, except of such as never bare Pig. Also this gall being dried, doth
The History of Four-footed Beasts.

doth cure the Haemorrhoids and kibes. There are also certain flisters or clits in the hoofs of Horses, which are cured in one nights space, by applying unto them the gall of a Barrow hog, mingled with the yolkes of Eggs.

The blather of Swine will provoke urine, and of a Boar Pig fod, roasted or boyled, and so eaten and drunk, caufeth a man to contain his urine, which never could before. When the head of a Man is exuclerated and runneth, take the bladder of a Barrow-bog, with the Urine, and caft the same into the fat cut small, afterwards mingle it with Salt, that it may appear all white, then binde it up falt, and dig a hole in the Garden about a cubit deep, wherein bury and cover the said gall, and let it rest forty or fifty days in the earth, till the matter therein contained be purified, then take it out and melt it in a dith, and keep the ointment that arifeth of it. Then walfe the head all over with lye, unto the intent that it may not be offended through the Acromy thereof, mingle it with new wine or with water, and then when it is dry after such washing, anoint it with the said ointment, and fo will the noxious and unclean hairs fall every one off, and new pure ones arife in their place, and you muft be very carefulfull to keep the head from cold.

They were wont to give the flones of Swine against the Falling ticknes, but when they were first dryed, and afterwards beaten to powder, and given to the fick party in Swines milk, so he was commanded to abatian from wine many days before, and after he received it for many dayes together. In Satyrs they take the flones out of a young Hog when they geld him, and scour them at the fire fo long, till they may be crufted to pieces, and this they prefiere to be drunk in Wine against the Colick.

Some give the powder of Boars flones to men and women, to increafe copulation and conception. The Magicians or wife men of the East prefiere to drink for the incontinency of urine, the powder of a Boar Pig's flones out of sweet wine, and then to make water in a Dogs kennel, which while he is doing, to speak to himselfe the words; Ne ipse utram factam in foco cubile; but I will leave this superltition, as not worthy to be Englished. Some take the bladder of a Sow burned to powder, and drunk for this infirmity, and some a certain liquorish poyfon, which dropeth from the Navel of a Boar Pig, immediately after it is farrowed.

Bacon beaten together, and made like meal, is good against a continual Cough, or flayeth bleeding at the mouth. Bacon broath is also mingled with other medicines against the Gowe, and they make an emplaifer of Bacon to scatter gravelly matter in the bladder. The bones of Bacon about the hips are kept to cleene and rub teeth, and by burning of them, not only the loofe teeth in men are faltned, but also the wormses in the teeth of beaf's are killed. If a Horfe be troubled with the Glanders or any fluch liquid matter running out at his mouth and nose, then let the broath whereof in Bacon and Swines feet hath been fold, be mixed with hone, and fo strained afterwaerd, let it be beaten well together with Eggges, and so infalud into the left Noifril of the Horfe, Gagnarius prefierebath an Emplaifer to be made of Cheefe, and the feet of Swine against the shrinking up of the finewes.

The ankle bone of a Sow being burned untill it be white, and bruised and taken in drink, doth cure the swellings of the neck, and pains of long continuance. The ankle bone of a Sow burned and bruised, and given to drink only in Water, is a remedy against the Colick and stone. The ankle bone of a Sow doth drive away those swellings which arife in the stomack, and doth ease the pains of the head.

The ashes of the ankle bone of a Sow or Boar, doth cure Corns, clefts, or other riffs in the skin, and the hardnes of the skin that is in the botom of the feet. It is also shewed, that if the bone shall be hung about the neck of thofe that are troubled with quarrain agues, that then they shall be far better, but of what bone he speakeyth, it is uncertain, but as he remembreth it is the next bone before the fat of the ankle bone.

The bones that are taken from the hoofs of Swes, burned and beaten to powder, are very good to rub and cleene the teeth: Alfo the bones next to the ribs of Bacon, being burned, are very good to fatten the teeth. The bones that are taken from the hoofs of hogs, and burned to powder, are ufed to cleene the teeth, and it is very good alfo to fatten the teeth. The ashes which are made of a Harts horne, or of the hoof of a Hog, are very good to cleene or rub the teeth. The bones which are taken from the hoof of a hog burned and beaten to powder and sifted, and a little Spickard added thereto, doth make the teeth very white, by often rubbing them therewith. The ashes of the hoofs of a Boar or Sow, put in drink, doth flay the incontinency of Urine, and alfo the Bloudy flux. Take as much Mercurial foddon, as ones hand can hold, sod in two pintes of Water unto one pint, and drink the fame with Hony and Sale, and the powder of a Hogs hoof, and it shall loofe the belly.

The milk of a Sow drunk with sweet Wine, helpeith women in travell; and the famine being drunk alone reftoreth milk in Women's brefts; it is also good againft the Bloudy flux and Tiffick. The flones of Swine beaten to powder, and drunk in Swines milk, are good againft the Falling ticknes. The wife men were wont to prefiere the left foot or leg of a Camazlion to be bound unto the feet against the Gowe.

There are afo many ufe of the dung of Swine, and first of all it being mixed with Vinegar, is good againft the bitings of venemous beafts, and Alinn maketh an Empaiifer thereof, againft the bitings of a Crocodile. It is to be applyed fingle against the flinginge of Scorpions, and alfo the biting
Of the Swine.

...biring of any other reptile creature. If a Serpent bite an Ox or a Horse, or any other Four-footed Beast, take the talk of Nigella, and beat it into a pinte of old wine, so as all the juice may go out thereof, then infue it into the Nostrils of the Bealt, and lay Swines dung to the fore, so also it may be applied unto men, whereunto some do add Hony Amick, and the Urine of a man, and so it is to be applied warm, it being also warmed in a shell, and dryed to powder, mixed with Oyl, and layd to the body, eafeth outward pains. It it likewise profitable against burnings, itch, scabs, and blisters, and trembling of the body, according to thele Verfes of Serenus:

\[Sercorius ex porco cinereum confundito lymphi:\]
\[Sic pavidum corpus, dextra paflente fouert.\]

This is also commended against hard bunches in the body, hardnes of the skin, clifts and chinks in the fieth, freckles, lice, and nits, and also the breaking of the finews;

\[Stci forte lapis teneros violerit armus,\]
\[Non pudet uterum proterre produce porce.\]

It is also good to flay bleedings at the Nofe, if it be layed to the Nostrils warm, and to flay the bleedings of Beasts, if it be given them in Wine; the fame being mixed and covered with Hony, is annointed upon Horfes for the Quinie, or swellings of the throat. If the breasts of a Woman do swell after her delivery of childe, it is good to anoint them with water, and the dung of Hogs, also the powder thereof mixed with Oyl, is profitable for the secrecies of men and women. If a man have received any hurt by bruises, so as his bloud flayeth in his body, or suffer Convulsion of the Nerves through Cramps, those evils are cured by the dung of a Boar gathered in the Spring time, dryed and sod in Vinegar, and some of the later Phaffians prescrib it to be drunk in Water, and they say that Nero the Emperor was wont to use that medicine, when he would try the strength of his body, in a running Chariot: also the powder of the fame being drunk in Vinegar, is profitable for the Rupture and inward bruises, and warmd in Wine against all manner of fluxes and Tificks. For the pains of the Loins and all other things which need mollifying, rub them fift of all with Deers greatfe, and then sprinkle them with old Wine mixed with the powder of Swines dung.

The Urine of a Swine is also good againft all bunches and Apostemations being layed to in wool. 

The urine of a Boar Pig dryed in the fmoak, and drunk with Sweet Wine, the quantity of a Bean, is profitable against the Falling evil; against the whitenefs of the eyes, and the fione in the reins and bladder. And thus much of the Swine in general.

Of the Wilde B O A R.

T his Beast is termed by no other name then the common Swine among the Hebrews, namely, Chaiyr, as you may fee in Pial 80, where the Prophet speake of Chaiyr de fliou; that is, the Boar out of the wood. The Grecians call him Capros and Syagros, and Clunis; although fome take Clunis for a Boar of an exceeding great stature. Aristophane fayth, that there are fome of this kinde which
The History of Four-footed Beasts.

which are called Μοινα, which word by St. Cyril upon the Prophet Hosea is interpreted a wilde Affe, but I rather incline to their opinion which say, that Χλονις, Μοινα, and Χαυλιδουν are Poetical words for cruell Boars. Αριεθαλε is of opinion, these Boars being gelt when they are young, grow greater and more fierce, whereunto Homer also yeeldeth as he is thus tranflated:

\[\text{Nurtit exustum Sylvia borentibus aprum}
\]

But this is to be underwond of such Boars, as by accident geld themselves by rubbing upon any tree. The French call this Beall, Sanglier and Porc Sanglier; the Italian, Ginghiale and Ginghiare, and Porco: The Spaniards, Puerco Sybyrjata, and Puzco monter, and Σαλαδι; the Germans, Wild Schwarz; the Hyrtius, Veprez: and the Latinis, Αψερ, for Porco signifieth the tame Swine, and Αψερ the wilde. The reaoning of this Latin name Αψερ, is derived from Αψερ, because he liveth among the sharpe thorns and woods, but I rather think, that Αψερ is derived from Κατοις the greek word, or else Αψερ is from ιατρος, from fierce, and wilde, by changing one letter into another.

The Epithets of this Beall are many, both in Greek and Latin, such as these are; sharp, wilde, Arcadian, Atalantean, troublest, bloudy, toothered, hard, Ermanthian, cruel, outrageus, fierce, strong, gnathing, lightning, yellow, raging, Acorn-gatherer, quick, rough, rough-haired, horrible, Monstous Myson, Megacran, threatening, wood-wanderer, cruel, Seleucian, brittle better, foaming, strict, filthy, Terean, Thyran, fearful, wary-faced, treulent, devourer, violent, Umbrian, wound-maker, impetuous, mountain-liver, armed on both sides, and such like.

But of these Epithets there are only three, Ermysthean, Caldonian, and Myfian, which do offer unto us peculiar stories, according as we finde them in the Poets, which we will prefix by way of moral discourse before we enter into the natural story of this beall. First of all, Ermystheus was a hill of Arcadis, wherein was a wilde Boar, that continually did defend down and depopulate their Corn-fields; Hercules coming that way, and hearing of that mischief, did kill the said Boar, and carried him upon his back to Eurystheus, whereat Eurystheus was so much afraid, that he went and hid himself in a brazen vessell, whereof Virgill speaketh thus:

\[\text{Placrit silvam, & Lernam transrectit arcu.}\]

And of this Ermysthean Boar Martial speaketh;

\[\text{Quantus erat Caldon, aut Ermysthe taur.}\]

Of the Caldonian Boar there is this story in Homer; When Oenous the Prince of Aetolia sacrificed the first fruits of his Courtnery to the Gods, he forgot Diana, wherewithal she was very angry, and sent among the people a savage Boar, which destroyed both the Courtrey and Inhabitants: against whom the Caldonians and Plenomanus went forth in hunting, and first of all that wounded the wilde Beast was Melleager, the son of Oenous; for reward whereof, he received his head and his skin, which he beftowed on Atalanta a Virgin of Arcadia, with whom he was in love, and which did accompany him in hunting; wherewithal the sons of Thebass, which were the Ulces of Melleager, were greatly offended (for they were the brothers to his mother Althbe) those men lay in wait to destroy him, whereof when he was advertised, he killed some of them, and put the residue to flight. For which cause the Plenumani made war against the Caldonians: in the beginning of which war Melleager fell out with his Mother, because she did not help her Countrery. At last when the City was almost taken, by the persuasion of his wife Cleopatra, he went out to fight with his enemies, where in valiant manner he flew many of them, others he put to flight, who in chace running away, fell down uppon steep rocks and perihed. Then Althbe the mother of Melleager, began to rage against her son, and flung into the fire the torch which the Fates had given unto her to lengthen his days; so when she saw her son was dead, the repentted and flew her self, and afterwards was cast into the very self same burning fire with him. In the hunting of this Boar Attean the companion of Jaten to Colbeis was slain. This Boar is also called a Melogran and Ataliamon Boar, of whom Mertial writeth thus;

\[\text{Qui Diomedes metauendus Setiger agit}
\]

And again in another place;

\[\text{Latte mero posfam pigra mibi moris alumnam}
\]

It is said that this Boar had teeth of a cubit long, and the manner of his hunting was expressef in the pinnacle of the Temple of Tegea, for which caufe he is called the Tegean Boar. Upon the one side of the Boar against his middle, were painted Atalanta, Melleager, Thebass, Thalamon, Peleus, Polux, and Jebus the companion of all Hercules travails. Probus and Cometes, the sons of Thestines and brethren of
Of the Swine.

539

of Albes, on the other side of the Boar flood Ancus wounded, and Epechus sustaining his hunting spear; next unto him flour Castor and Amphirion, the son of Oeneum. After them Hippothus, the son of Cerion, Agamedes the son of Symphilus, and lastly Pyritis. The teeth of this Boar were taken away by Augustus after the time that he had overcome Anthony; which he hung up in the Temple of Bocchus, standing in the Gardens of the Emperor. And thus much for the Calidian Boar.

Now concerning the Myfian Boar, I finde this story recorded of him: When Adriasus the Phrygian, who was of the Kings blood, had unawares killed his brother, he fled to Saris, and after his exposition dwelt with Crefus. It happened at that time that there was a wide Boar came out of Olismus, and waited a great part of the Country of Myfia: the people oppressed with many loaves, and terrified with the presence of such a Beast, besought the King to send his own Son Antiyor with much company to hunt and kill the Boar. The King was afraid thereof, because in his dream he saw a vifion, his Son perishing by an iron spear; yet at last he was persuaded, and committed the garded of his body to Adriasus. When they came to the wide Beait, Adriasus bent his spear at the Boar, and while he call it to kill him, the son of Crefus came betwixt them, and so was slain with the spear, according to the dream of his Father. Adriasus seeing this misfortune (that his hands which should have defended the young Prince, had taken away his life) fell into extreme passion and sorrow for the same, and although the King knowing his innocence, forgave him the fact, yet he flew himself at the Funeral of Antiyor, and so was burned with him in the same fire. And thus much for the Myfian Boar.

Now we will proceed to the particular story of the wide Boar, and first of all of the Countries breeding Boars. The Spaniards say, that in the new found world, there are wide Boares much lefle than ours, which have tails so short, that one would think they had been cut off, they differ also in their feet, for their hinder feet are not cloven, but stand upon one claw, and their forefeet are cloven like common Swines. Their fleth also is more sweet and wholesome than common Swine's fleth, whereof Peter Martyr giveth reason in his Ocean Decades, because they feed under Palm trees, near the Sea-shore, and in Marshes.

Olaus Magnus writeth, that in divers places of Scandinavia, they hunt wide Boars which are twelve foot long. The wide Boars of India according to Pliny have teeth, which in their compass contain a Cubit, and besides their teeth growing out of their chaps, they have two horns on their head like Calves horns. In the Islands Moder, there are abundance of wide Boars, Likewise in Helevisia, and especially in those parts that joyn upon the Alpes, where they would much more abound, but that the Magistrates give liberty to every man to kill and destroy them. There are no Boars in Africa, except in Ethiopia, where their Boars have all horns, and of those it was that Lycaon the Countryman law in a publick spectacle at Rome;

Et nivos lepares, & omn fine cornibus apros.

that is, Hares white like Swine, and Boars that have horns. It is a wonderful thing that there are no Boars in Creet, and no leffe admirable that the Boars of Macedon are dum and have no voice; and thus much concerning the Countries of Boars.

Now concerning their Colour, it is observed, that wide Boars for the most part are of a black and brown colour, especially at the top of their hair, and somewhat yellow underneath, and yet Pausanias writeth, that he hath seen Boars all white; howbeit that is not ordinary. Their bloud is sharp and black like black wine, and such as will be thick, their eyes like to the eyes of wrathful beasts, as Wolves and Lyons. Their tusks are most admirable, for with them while they are alive, they cut like sharp knives, but when they are dead, they have loft that cutting property, the reason of it is in the heat of the tooth, for it is certainly affirmed by Hunters of wide Boars that when the Beait falleth first on the earth down before the Dogs and Hunters, if one pull off a bristle from his back, and lay it upon the tusk, the heat thereof will make it shrink up and turn together like a hot iron, and if Dogs do chance to touch them, they burn their hairs from their back, whereby the ardent and fiery nature of this Beait is manifest, as an everlasting monument of the work of God, and yet notwithstanding all their wrath they have no gall, (as Pliny writeth) their head and face are their strongest parts, and therefore upon them they receive the Hunters blowses as upon a bocket.

Their tears which they fend forth of their eyes are very sweet, and of all other things they cannot abide their own urine, for it is thought to be so hot that it burneth them, and they can never run away in flight till they have emptied their bellies thereof. The place of their abode is for the most part in the Marshes and Woods: for the Sesthians did hunt Hars and wide Boars in the Marshes, but Roes and wide Affes in the plain fields. Sometimes they hide themselves among Fern, which they have gathered together in the fields, and they dig holes and ditches for themselves, wherein they rest: And this is observed, that they love not so much to wallow in the mire, as the tame and domesticall Swine, although they be of a hot and fiery nature. Their voice is like the voice of common Swine, but the females is somewhat more thrill. They live for the most part solitary and alone, and not in beards as the other do, and feed upon such meats as the vulgar Swine. Toactus faith, that there is a kind of green Corn in Germany, which is armed with very sharp iilks and points at both ends like Barley, this the people do seethe and eat like pease.

Now forasmuch as wide Boars are destroyers of their Corn, they sow that grain near the Woods
The History of Four-footed Beasts.

woods sides where the Boars abide, whereby they defend and safeguard their better Corn. Bores do also eat the worms of the earth, which they dig out with their noses; and in Pomphilia and the mountains of Citha, they do eat Salamanders without hurt or danger to themselves, and yet if men chance to eat of their flesh which have so devoured them, they die afterwards through the poyson: whereby it manifestly appeareth, that there is danger in eating wilde Hogs flesh. Hemlock and Henbane is also poyson to Swine, which they never eat but unawares, and having eaten it, presently they lose their strength in their hinder parts, whereby they are fain to draw them after them, and in that manner they crawl to the water sides, where they gather together Smalls and Sea-crabs, by eating whereof they are restored to their former health. Ivy is also a medicine for the diseases of Boars, and old age maketh them altogether unfit to be preferred. Therefore in ancient time when they kept Boars in Parks, whereof Pulvinus Hirpinus was the first builder, Lucius Lucullus and Quintus Hortensius the immediate followers, I say they never kept Boars past four year old, because after that time they waxed lean and pined away.

Now concerning their generation or copulation to engender, it is certain that they do not couple often in the year, as the tame Swine, but only once, and that in the beginning of Winter, or the middle, so that they may bring forth in the Spring time of the year; and they choose the most unused, narrow, hollow, and steep places to couple in. The male abideth with the female thirty days together, and the female beareth her young ones, both for the number and the time answerable to the vulgar Swine. When the Boar is in copulation before-hand, while he worketh the Sow, he carrieth a mouth as white as any Horfe, which as in the Horfe it rileth through vehement hirring, so in the Boar it rileth through vehement heat and fervor. In the time of their lust they are very sharp, eager, and cruel, fighting with all males that come in their presence, and therefore they arm their bodies by bowling in the durt, and also by rubbing them against trees, that so they may be hard to withstand one another. This fight of Boars is thus described of Virgil:

Per situm tum Leas Aper, tum paffima Piggia,
Spiritus demetque labellum exuit Sue,
Et pedibus subitus terras, fricat aere cofas,
Altis hinc aq; ibique humeras ad vulnera durat.

The fight of Boars.

Being inflamed with venerable rage, he sall ethether upright the bristles of his neck, that you would take them to be the sharp fins of Dolphins; then chempeth he with his mouth, grathet and grafeth his teeth one against another, and breatheth forth his boylng spirit, not only at his eyes, but at his foaming white mouth, he defirgeth notthing but copulation, and if his female endure him quietly, then doth he satisfie his luft, and kill all his anger; but if the refue, then doth he either conftrain her against her will, or elle layeth her dead upon the earth. Sometimes they force a tame Sow, and then the Pigs so begotten are called Hibride, that is, by way of contumely, Baitards: And it is to be observed, that never any wilde beast being tamed, doth engender by copulation, except he be begotten young, only wilde Boars do quickly mingle with vulgar Swine. The female of this kinde hath no teeth standing out of her mouth like the male, except very short ones, and therefore the refidue are more like a faw then the teeth of a Boar, for it is a general rule;

Non identes exerti quibus ferrati.

Concerning the disposition of Boars in generall, it is brutish, stubborn, and yet courageous; wrathfull and furious, because their blood is full of fibres, and miniftrith unto them sudden matter of anger; neither are there any beafts so cloathed with hair as Lions and Boars; wherefore both of them are of like fierce and angry nature, yet we have shewed in the story of the Harr, how they were drawn from their meat and dens by the voice of Muffick. It is said, that they are not capable of any discipline or instruction, and yet Scatiger affirmeth, that he saw a Bore that belonged to the Lord of Salufment, of an exceeding great stature, tamed by his master, who at the founding of the horns, would come running like a Dog to hunting, and go abroad with his master among the Dogs, contending with the most swift in race to attain the prey.

They naturally defire to bury their own footsteps in wet miry places, that they may not be found out by the Hunters; and as the rage of the Boars is greatest in the time of their luft, fo is in the Sowes after their farrowing; and therefore it was an excellent speech of Cynareis unto Cyrus, that Swine when they see the Hunter, although they be many, yet run away with their Pigs; but if the Hunter follow one of the young ones, then doth the Dam turn again, and with all her force endeavour to destroy him that would deprive her of her young ones. Before the Boars do fight, they go and wett their teeth, but while they are in contention, if it happen that a Wolf cometh in fight, then they forfake their mutuall combat, and all of them joynt together to drive away the Wolf. The Beare dareth not to enter upon the wilde Boar, except behinde him, and unawares. Hefod faith, that Vulsan pictured upon the shield of Hercules, the images and shapes of many wilde beafts fighting one with another, neither of both yeelding to other, till both of them fell down dead, which caufe αλεθιον to make this Emblem of a Vulture standing by to fee their contention, and
and suffered them to kill one another without parting, whereby afterwards they enjoyed their dead carcases:

*Dom favis virent in mutua vulnera telis,*
*Unique leonerae, dente timendum aper,*
*Accurit vulse seditatum, et prandia captat,*
*Gloria victoris, prada future sua est.*

It is reported that Boars will swim single and alone like fishes, and some of them two together like Wolves, and many times in flocks and heards like Roes, for such is their ardent nature and desire of meat, that they fear not the highest Mountains, nor the deepest waters. Now concerning the fleth of wilde Boars, although we have spoken abundantly in the former discourse of Swine, yet must we add something in this place: For although generally the fleth of tame Swine is visous and cold, yet the fleth of the wilde is more temperate and nourishable, and of lighter conception and stronger nourishment. Therefore those which had a Timpany were preferred to eat Boars fleth and wilde Sowes, for it drieth, strengtheneth, and moveth; and men that are vexed with Saint Anthonies fire, are forbidden to eat all falt meats, and leavened bread, yet permitted to eat of Boars fleth. It is reported, that *Publius Strutius Radius,* was the very first among all the Romans that did set at his Table a whole Boar, most delicately dreFFed and stuffed with variety of divers comly dishes; which Boar by *Varro* is called *Aper Millionius,* that is, *Mille librarum,* of a thousand pound worth; against which intolerable gluttony and cott; *Vesalius* made these Verles;

---Quanta est guia quefli notor
Point Aperos, animal poper convivio natum.

*Apitius* in the beginning of his eighth book, prescribeth the manner how to dresse the fleth of wilde Boars, whereithall if any be delighted, let him read that book; for it is not my purpose in this Treatise, to blot any paper with any long instruction for Cooks and Belly-gods, neither were it any part of this natural History, nor yet agreeable to my calling or enterprise: and therefore I will only add this observation of *Cruithet,* that Boars fleth fline lax in powdering tubs, doth change both colour and taste, at that time of the year where in the living Boars doe rage upon their females: And thus much shall suffice to have spoken of Boars fleth.

Now in the next place we will proceed to talk concerning the hunting of Boars, which is not only a pastime for Lords and Princes, but also a necessary labour for meaner men; for as the harm that cometh by Boars is exceeding great, and so much the greater by how much he is poorer that doth fulfill it, so the utility to learn the means of destroying this beast is more cominducible, becaufe the common proverb is more true in this then in the vulgar Swine, that they never so good till they are dead.

It is reported of *Diocletian,* when he was Agent for the *Romans in France,* there came an old Woman called *Dryas* unto him, and reproved him for his covetousneffe, telling him that he was over-sparing, and parfimonious; to whom he anfwered in jeft, *When I am Emperor I will be more liberal:* *Dryas* replied unto him, *Noli jocare Diocletiam, nam imperator eri cum Aperum occidere.* That is, *Jelt not, O Diocletian:* for thou shalt be Emperor when thou haft killed Aper; (that was a Boar as he thought) and therefore he gave himself to the hunting of Boars, never sparing any time that was offered unto him, always expecting the event of that speech; whereof he was frustrated until he killed *Arius Aper,* the Governor of the Judgement Hall, and then afterwards being Emperor, he knew that the woman did not mean a Boar, but a man. Now therefore the hunting of Boars, and the manner of their taking is many ways, either by violence in chafe, or by policy in ditches and traps, or else by impoyoned baits. The best time of their hunting is in the middle of Winter, as some fay; but I think the Winter is the worst time, because then they are strongest, and seeing all Swine are impatient of heat, the Summer will quickly end their life, if then they be chafed. It behoveth therefore the Hunter of Boars to be very warie, and therefore the Ancients ordained that such a one should wear a rough garment of a brown colour, and likenfike that his Horfe should be of a yellow and fery colour, and that the Boar-spear fhould be frong and sharp, for this beast is armed with a very strong head and skin, and besides they cover themselves with dried durt as it were with a Coat of male to blunt the weapon, and therefore he runneth willingly either without dread or fear upon the Hunters. In which encounter if he receiveth not a deadly wound; he overthoweth his adversary, except he fall flat on the ground, for the Boars teeth cannot cut upward, but downward; therefore if the Hunter be a foot-man, he must feat himself neer some tree, and then alfo provide that if he misse the Boar, he may easily climb into the boughs, and fo fave himfelf; but if the Swine that is raised be a female, she will all to tear and bite the Hunter with her teeth if the get him within her clutches: wherefore, for the more speedy ending of the hunting, it is good to raffe the beast early in the morning, before he hath made water, for the burning of his bladder doth quickly make him weary.

But if the Boar have either made water before, or got liberty and reft in the chafe to eafe himself, then will his taking be very difficult and tedious, such is the nature of this courageous beast that he never ceafeth running till he be weary, and being wearie diffembleth the fame by

* Aa a  

fitting
firing upon his buttocks, and offereth combate to his Hunter, and yet he is not wont to strike a man, until he be wounded first by him. When the Boar is first raised out of the Wood, he snuffeth in the wind, lifting up his nose to smell what is with him, and what is against him.

The hunting Spear must be very sharp and broad, branching forth into certain forks or horns, so as by no means the Boar shall break through them upon the Hunter, and when he bendeth the same before the beast, he must stand with one leg before another like a Wrestler, holding his left hand upon the middle of the Spear to direct the same, and the right hand behind, to thrust it forward with violence, having his eye intent upon the beast, and if it be a Boar to wound him in the middle of his forehead between his eye-lids, or else upon the shoulder, for in both those places the wound is deadly; but if he chance to hit him on the cheek, the greatest harm that he doth him, is that he maketh him unfit to use his tusks: of this he must be very careful that if the Boar leap upon him, he like wise must give back and draw out his sword; and if he chance to be overturned, then to lie down in some hollow place where the Boar cannot come at him with his teeth.

Now concerning the instruction of Dogs, and the choice of such Hounds as are appointed for the hunting of Boars, you must note, that every Dog is not fit for the same, but great maitives, such as are used for the baiting of Bears. For the Boar first of all terrifieth the Dog with his voice, and if he be not ready to fight but to run away, then are the Hunters in worse case then at the beginning. Therefore they must be sure to have them well instructed before they give the onset, and be likewise at hand to encourage them. When they come first of all to the place wherein they conjecture the Boar is lodgd, if there be no appearance either by his footsteps, or by the wounds of his teeth upon the trees and boughs, then let them let loose one of the best Hounds, and calling about the Wood, follow with the residue whether the crie goeth.

The Dog preseth into the thickest bushes where commonly the Boar lodgeth, and when he hath found the beast he standeth still and bayeth, then must the Hunter come and take up that Dog, for the Boar will not stir very easily out of his lodging, and go and set up his nets and toys in all the by-places, whereby it is likely the beast will pale, and these must he hang to some trees, for polites in the earth will not suffice, always making the inside of them very light, that the beast may suspect no harm. The nets being thus set up, let him return again to his Dogs, loosing them all; and every Hunter arming himself with darts and a Boars Spear, to let the most skillfull follow the Dogs close to exhort them and set them on, the residue follow one after another a good distance, scattering themselves into sundry angles, for their better safeguard and end of their sport; for if they should come all together, the Boar might light upon them, and wound some of them, for upon whomsoever he falleth in his rage he hursteth them: furthermore when the Dogs begin to come neer to his lodging, then must they be set on more eagerly, and so heartned that they be no wayes appalled at the rasing of the Boar, for his manner is to make force at the foremost Dog that is neerest to him, so must he be followed in chase even unto the nets, but if the nets stand upon a hide-hill, or a steep rock, then when he is infared he will get out with no difficulty; but if it stand upon plain ground, the toys will hold him till the Hunters come, who must presently take care to wound him with darts and spears before they meddle with him, compelling him round about very warily, so that he nor they hurt any of the Dogs, and especially they must wound him in the face or shoulders, where the wounds are mortal, as I have said before; but if it happen that the beast geteth loose when he feeleth the blows, the Hunters must not start away, but the strongest of them to meet him with his spear, setting his body as we have formerly expressed, having an especial eye to the beasts head, which way so ever he windeth and turneth the same, for such is the nature of the Boar, sometimes he catcheth the spear out of the Hunters hands, or else recolleveth the force back again upon the imiter, for by both these means the Hunter is overcome and overthroweth: Wheneuer this hapneth, then is there but one means to save the Hunters life, which is this: another of his companions must come and charge the Boar, making as though he would wound him with his dart, but not casting it for fear of hurting the Hunter under his feet. When the Boar feeth this, he forfaketh the first man, and rufheth upon the second, who must look to defend himself with all dexterity, composing his body, and ordering his weapons, according to artificill Boar-hunting, and in the mean season the vanquished Hunter must arise again, taking firft hold upon his spear, and with all courage setting upon the adversary beast, to wound him either in the shoulders or in the head, for it is no credit to escape with life, except he kill and overcome the Boar.

When he feeleth himself thus wounded that he cannot live, if it were not for the crosses and forks upon the Boar-spear, he would presse in upon the vanquisher to take revenge for his death: For so great is the fervent wrath of this beast, that he spareth not to kill and wound, although he feel upon him the pangs of death: and what place soever he biteth either upon Dog or man, the heat of his teeth inflincketh a dangerous inflaming wound: and for this cause if he doth but touch the hair of Dogs, he burneth it off: but if it be a female that is rased, (for there is as great a rage in females as in males, though not so great power) then must the Hunter take heed he never fall to the ground, for as the male hursteth not but when a man flandeath or lieth high, so the female hursteth not but when a man falleth or lieth low: therefore if the Hunter chance to fall, he must raise himself with all speed, using no leffe dexterity and courage against the female, then he doth against the male.
Of the Swine.

There is also another manner of hunting wilde Swine, which is this. First of all they set up their netts in all passage, through which it is likely the beast will go, then do the men and Dogs with a gallant crie, filling the woods and fields, raise them out of their lodgings. In the mean season setting some valiant Hunters to keep the nets. When the beast perceiveth that he is hunted after, up he tarrett, looking about him like an evil spirit, where he may devour, but being terrified with the crie of men, and pursu'd by a multitude of greedy Dogs, forth he runneth in some of his usuall ways, carefully looking behind him, to avoid the train that followeth, until he fall fift enclosed into the Hunters nets, then cometh the keeper of the nets, and woundeth him with his Boar-spear, as I said before: but if it fortune that he fall out of the nets, or never cometh to them, then must they prosecute him, both men and Dogs, until they have wearied him, for such is the heat of his body, that he cannot long stand, and although he shall lodge himself in some Marith or Woods where the Hunters can have no use of their nets, yet must they not be afraid to approach unto him, and with such hunting instruments as they have, shew the magnitude and courage of their minde, by attaining their game by the strenth of hand, when they are deprived from the help of Art: And to conclude, the same devises, diligence, labour, prosecution, and observations, are to be used in the hunting of the Boar, which are prescribed for the hunting of the Hart. It feldom falleth out that the Pigs of wilde Swine are taken, for they run and hide themselves among the leaves, and in the Woods, feldom parting from their parents untill their death, and as we have said already, the dams fight for their young ones most irefully. For it is not with these as with the vulgar Swine, that they beat away their young ones from following them, but because they conceive but feldom, they suffer their Pigs to accompany them a whole year: And thus much for the violent and horible hunting of Boars. Now followeth the artificiall devises and policies which have been invented for the same purpose, whereby to take them without pursuit of Dogs: And firth of all, the same engines which we have precribed for taking of the Hart, are also in use for taking of the Boar, and that is to make a multitude of nets and lines in the way, and hug the nets with bushes and boughs, at the place where Boars make their abode, they low in some plain fields a kind of fatting corn which Hogs love, and about that field they make a high and strong hedge, of the boughs of trees in the one part, whereby of these they leave a great gap, yet not sloegether down to the ground. At the time of the year when the grain waxeth ripe, the Boars gather thereinto in great number: now right over against the said gap on the other side, there is another little low place of the hedge left over, which the Swine may easily leap. When the watch-man Hunter seeth the field full, he cometh alone and unarmed to the first gap, and therein he flaneth lewring and making a terrible noise to affright the Swine: now on the other side where the hedge is left low, there is also made a vast and deep ditch, the Hogs being terrifird with the presence and noise of the Hunter, and seeing him in the place of their entrance, run to and fro to seek another escape, and finding none, but that low place of the hedge before the ditch, over they preffe headlong as fast as they can, and so fall into the trench one upon another. Again, near Rome there be divers that watch in the woods, and in the night time when the Moon shineth, set up certain Iron instruments through which there glistereth fire, unto which the Boars and wilde Swine will approach, or at the leafwise fland still and gaze upon them, and in the mean season the Hunters which stand in secret come and kill them with their darts: and so to conclude, in Armenia, there are certain black venemous fitches, which the inhabitants take and mixe with meat and call them abroad where Boars and wilde Swine do haunt, by eating whereof as also Hemlock and Henbane, they are quickly poisoned, and die: And thus much we have shewed out of Xenophon and other authors, the severall ways of hunting and taking of wilde Swine.

Now forasmuch as the hunting thereof hath been often shewed to be dangerous both to men and Dogs, I will a little add some histories concerning the death of them, which have been killed by Boars. For if that cometh not to paffe which Martial writeth:

**Thumse glandes Aper populatur, & illic multa,**  
**Impiger Abole fana secunda feras,**  
**Quem menus intravice splendens supplice culter,**  
**Prada jaces sufrim invistis focis.**

I say, if the Boar be not killed by men, the Hunter is constrained many times to say with Lydia in the same Poet,

**Fulmine frumentis apri sum dente perpendicular.**

Aulus reports of one Leopoldus, that he loved the wife of Thrasyllus; now to the intent that he might possess her, he took her husband abroad with him to the hunting of a Boar, that under colour thereof he might kill him, and say the Boar flew him: Being abroad, the nets raised, and the Dogs loosed, there appeared unto them a Boar of a monstrous shape, wonderfull fat, with horrible hair, a skin fet with flaming bristles, rough upon the back, and his mouth continually foaming out a abundance of froath, and the found of his gnashing teeth ringing like the rating of armor, having fire-burning eyes, a despitful look, a violent force, and every way fervent, he flew the noblest Dogs which first set upon him, not slaying till they came to him, but he fought out for them, breaking their cheeks and

**Men that have perished by Boars in hunting.**
and legs asunder, even as a Dog will do some small bones; then he trod down the nets in disdain, patting by them that offered him the first encounter, and yet remembering his own vigor and strength, turning back again upon them, first overthrowing them, and grinding them betwixt his teeth like Apples, at length he meets with Toraslius, and first teareth his cloth from his back, and then likewise tore his body in pieces, and this man I remember in the first place to be killed by this monster-Boar, whether he was a beast or a man. Martial in his book of spectacles remembereth a story of Diana, who killing of a wilde Sow with Pig, the young ones leaped out of her belly, and this I thought good to remember here, although it be somewhat out of place;

Inter Casarte discrimina seu Diana,
   Finesset grandum cum levius bella fecum,
   Excultit partus misere de vincere materi.
   O Lucia feror, hoc peperisse fuit?

Ancrum the father of Appenor was killed by the Calidonian Boar, as we have said already. Carmon was slain by a Boar in the mountain Itonius. There was one Attus a Syrian, and another an Arcadian, and both these were slain by Boars, as Plutarch writeth in the life of Settorius. It is reported of one Attus a Phrygian, that as he kept his Sheep he did constantly sing fongs in commendation of the mother of the Gods, for which cause the loved him, honoured him, and often appeared unto him; whereupon Jupiter fell to be offended, and therefore sent a Boar to kill Attus. Rea after his death lamented him, and caused him to be buried honourably. The Phrygians in his remembrance did every day in the spring time lament and bewail him.

Adonis also, the Leman of Venus, is assigned of the Poets to be killed by a Boar: and yet Macrobius faith, that it is an allegory of the Sun and the Winter, for Adonis signifies the Sun, and the Boar the Winter: for as the Boar is a rough and sharp beast, living in moist, cold, and places covered with frost, and doth properly live upon winter fruits, as Acorns, so he is the fitter emblem for Winter, that is, a devourer of the Sun heat and warmth, both which fall away by death from all living creatures. When Teutras a King of Myra went to hunt in the mountain Toraslius, he started a huge great Boar, which he and his guard followed and hunted unto the Temple of Diana Orthosia, whereinto the Boar entred for sanctuary.

The poor beast seeing the Hunters at hand, cryed out with the voice of a man: Perce o res peculi Deo, O King spare Dionae Boar: But the king being nothing at all moved therewith, flew him in the Temple; which wickednesse the Goddes could not endure, and therefore first of all he restored the Boar to life, and afterwards afflicteth the King with madness, who was therefore driven into the Mountains, and there lived like a beast.

When Ly Jesse his mother knew hereof, she went to him into the Woods, and carried Gyrannus the Prophet, who instructed him to pacifie the Gods by a sacrifice of Oxen, which when it was performed, the King recovered again his right minde; and so his mother in remembrance thereof, built there a Chappell to Diana, and set thereupon the picture of a Boar in Gold, with a man mouth. There was also a cuftome in ancient times for champions and their fathers brethren and kindred to swear by a Boar cut in pieces. And thus much for the natural and morall story of the Boar, which I will conclude with those veres of Horace, describing the prodigious habitation of Boers in the waters, and Delphins in the Woods, as if one had changed with another;

Delphinum silvis appingit, floribus aprum,
Quo variare omitt temp prodigialiter mutat.

The Medicines of the wilde Swine.

There are declared a M. things concerning the remedies of Goats, but a larger and more ample power shall be shewn of a wilde beast of the same kind. Also the fame regard shall be had concerning the remedies of a tame Sow and a wilde Boar, yea, of all other tame and wilde beasts, that is, that the same or things like to either of them may be ended, differing only according to more or less, because the same parts of wilde beasts living, are lesse moist and cold then those that are tame. That which we repeat here concerning the common remedies of a Boar and Sow tamed, in fome of the parts of them, to wit, the blood, the brain, the cheek-bone, the lungs or lights, the liver, the gall, the ankle bone, the hoof, the dung, and urine, is not in the Sow repeated before.

The brains of a Boar taken with blood, is very much commended against the bitings of Serpents. Again, the brains and blood of a Boar, doth help those that fear the coming of Carbuncles. The lard and fat of a Boar being sodden and bound fast together, doth with a wonderfull celerity make firm those bones that are broken. The fat of a Boar mingled with Hony and Rozin, is very much commended against the bitings of Serpents.

The fat of a wilde Boar mingled with the fat of the lungs or lights, doth very much profit those which have their feet broken or bruised by any mischance. The fat of a Boar being mixed with Oyl of Roses, is very good for those that are troubled with blisters or pusseths, it being anointed thereupon. The brains of a Boar is very profitable for Carbuncles, and the pairs of a mans yard. The brains of a Boar being bruised very small in Hony, and put thereto, doth wonder-
Of the Swine.

The brains of a Boar fodder and drunk in wine, doth cear all the pains and griefs. There are more things spoken concerning the remedies of the brain in the medicines of the Sow. The ashes of the cheek-bone of a Boar doth cure those ulcers which do encrave bigger by little and little.

Alfo the fame thing doth make firm thofe bones that are broken. The lungs or lights of a Boar mixed with hony, and put upon the feet after the manner of a mollifying emplaiter, they fhall be freed from all exulcations. Dispoifides alfo doth commend the lungs or lights of Sowes, Lambs, and Bears. The liver of a Boar being new killed and fired by a fire, and beaten to powder, and fo being taken in wine, is an efpicall remedy againft the bitings of Serpents and Dogs. The liver of a Boar being old, and drunken in wine with Rue, is very much commended againft the bitings of Serpents. The Fibres of the liver of a Boar, and thofe efpicallly which are nearest to the entrance of the gall and liver, being taken in Vinaegar or rather wine, is much profitable against the bitings of Serpents.

The liver of a Boar is good to revive thofe whole spirits are drofly. The liver of a Boar doth much profit, being topped in the ears, for thofe that are troubled with Apollumies or any running foles therein. The liver of a Boar being new killed and drunken in wine is very effectuall against the loofenelfe of the belly. There are certain little bones in the liver of a Boar, as there is in a common or vulgar Sow, or at leaft wife like unto little bones, and they are alfo white, which being fodder and taken in wine, are very effectuall against the difeafe of the Stone. Thou fhalt read many more things concerning the remedies of the liver of a Boar in the medicines of the Sow. The gall of a Boar is very much commended for Wennes or swellings in the neck.

The gall of a Boar being mangled with Rooff and Wax, doth cure thofe ulcers which do encrave bigger and bigger. The gall of a Boar, and Lambs milk, being mangled together, and dropped in the ears, is very profitable for all pains therein. The body of a man being anointed with the gall of a Boar, doth thire him up to eternal copulation. The gall of a Boar being mangled with fewet, and applied upon every joynt of the body, doth immediately cure all pains of the Gout. We have declared alfo many things in the medicines of the Sow, concerning the remedies of the gall of a Boar. The bones of a Boar being eaten is very good against the Falling fickneffe, or the bones of a Boar being taken in Mares milk or water, is alfo very effectuall against the fame difeafe. The hoofs of a Boar being burned to ashes, and sprinkled upon drink, and fo taken, doth very much help thofe that cannot eafily make water.

The hooves of a Boar being burned and beaten to powder, and given in drink, is very effectual againft the stopping of urine. The hooves of a Boar or Sow being burned, and given to drink in wine, is very much commended for thofe that cannot hold their urine in their flEEP. The dung of a Sow (which liveth in the Woods) being dried and drunk in water and wine, doth take the voiding of blood, and doth efpecially old pains of the fides: And again being taken in Vinegar, it doth take all ruptures and convulsions, and alfo being mangled with the fyrup of Rofes, it doth remedy or help thofe places which are out of joynt.

The dung of a Boar being new made, and bor, is a speciall remedy against the flux of blood which suffeth forth of the Nofe. The dung of a Boar being mingled in wine, and applied after the form of an emplaiter, doth presently draw away and make found any thing which cleaveth to the body. It being alfo brined and fodder with hony, and afterwards kneaded like Dough, and doth applied to the joynts, doth eafe all pains that arifie therein.

An emplaiter made of the dung of a Boar, is very profitable against all venemous bitings, for it draweth forth the poison. All other ulcers are filled up and cleaned with the dung of a Boar, except thofe which arife in the thighs. The dung of a Boar dried and beaten to powder, and sprinkled upon drink, doth cure all pains of the fides. Again, it being dried and beaten to powder, and administered in wine, doth not only cure the pain in the Spleen, but alfo the pain in the hudneys. The dung of a Boar being burned to the ashes, and given to drink in wine, doth eafe all pains in the knees and legs. The dung of a Boar new made and anointed upon thofe places that are out of joynt, is very profitable for them. The dung of a field-boar mixed with brimstone, and taken in wine, and strained Pitch, is very commendable for pains in the hips. The dung of a Boar being mingled with wine, and afterwards strained, and given to drink, about the measure of two little cupples at a time, doth speedily help thofe which are troubled with the Sciatica.

Alfo being fodder in Vinegar and Hony, doth mitigate all pains that rife in the feet or ankles. The dung of a Boar burned to ashes, and sprinkled upon wineLuke-warm, and fo given to drink, doth help all thofe that are troubled with the bloody-fix. The eft of the remedies which concern the dung of a Boar, thou fhalt find in the medicines of the Sow. The urine of a Boar mingled with Hony and water, and fo taken, is a speciall remedy for thofe that are troubled with the Falling fickneffe.

Again, the urine of a Boar being taken in sweet Vinegar, doth drive out thofe things which are dryed in the bladder. The urine of a Boar being kept in a glaffe, doth cure all diseases and pains in the ears, but it is efpicallly profitable for thofe which cannot hear. The urine of a Boar being kept in a glaffe, and made Luke-warm, and dropped into the ears, is a speciall remedy for all Apollumies that are therein. The urine of a Boar which is kept long, is far more profitable, if fo be that it be kept a vessel of glaffe. Again, the urine of a Boar being dryed in fmoak, and moifened with Hony, and fo powered into the ears, doth cure the deafneffe of the ears.
The History of Four-footed Beasts.

The urine of a Boar, and Oyl of Cypresse, each of them being equally mingled, and made lukewarm, is also good for the same disease.

The urine of a wilde Boar also is of the same force and vertue. The bladder of a wilde Boar doth stay the incontinency of the urine, if it be eaten, roasted, or boiled. The blater of a Goat being burned to powder, and given to drink in water and wine, is very good and profitable for those which cannot make water easily. The urine of a Boar being drunken, doth help those that are troubled with the stone in the bladder, but it is more effectual if it be first of all mingled with the dung. The Bladder of a Boar moistened with the urine, and hung up till the waterish humor cometh forth, and then boiled and given to those which are truculent with the Strangury, is very profitable and good for them.

The Bladder of a Boar being dried and given in drink, is very profitable for those which are troubled with pains in the bladder and wringings of the guts. The urine of a tame Boar hung up in the smoak in the bladder of a Sow, and mixed with drink, is very profitable for those that are troubled with the Strangury. The urine of a Boar, or at least wise the bladder being given in drink, hath cured those which have been troubled with the Hydrophyse as some do say. The urine of a Boar being taken in drink, is very good for those that are troubled with the Stone.

Now forasmuch also as Hunters are hurt by some, I thought it good to let down what remedies is fit for them. Therefore the wounds made of them are dangerous, because they are not only deep, but also large and great, and it is also impossible to bring them to a glutination with medicines, for the lips of the wounds which is made by contusion, are cut off and burned. They use a mutual gnashing and biting of their teeth together, as it were against a whetstone, to take revenge upon those which pursue and follow them. Therefore they cause a certain scab to grow upon the lips of the wound, wherefore it is meet to use a suppurative and not a glutinatious manner of cure in them. It is meet to use in running and moist ulcers, not hot things, but cold, both in Winter and Summer. For it is an easie matter for a Boar to hurt a Horse in the insides of his knee, in the time of his hunting, which doth breed to a waterish ulcer, and there doth also follow a swelling. To this cold things are to be applied, and it is to be cured by anointing it with a medicine which is called Diadochalcum, or the head of a Dog, being burned about the tongue, and beaten into powder, and so to be applied after the manner of a Cataplasm. And thus much concerning the medicines of the Boar.

Of the TATUS, or Guiana Beast.

This is a four-footed strange Beast, which Helvetius faith, he found in Turfania, among the Mountains and Apothecaries. It is brought for the most part out of the new-found world, and not of Guinea, and therefore may be fairly conveyed into these parts, because it is naturally covered with a hard shell, divided and interlined like the fins of fishes, outwardly seeming buckled to the back like Coast-armour, within which the beast draweth up his body, as a Hedge-hog doth within his prickled skin; and therefore I take it to be a Brasillian Hedge-hog. It is not much greater then a little Pig, and by the snout, ears, legs, and feet thereof, it seemeth to be of that kind, saving that the snout is a little broader, and shorter than a Pig, and the tail very long like a Lizards or Rats, and the same covered all over with a crust or shell. The gaping of the mouth is wider then a Swine; and one of these being brought into France, did live upon the eating of seeds, and fruits of the Gardens, but it appeareth by that picture, or rather the skin stuffed, which Adrianus Marcellus the Apothecary
Of the Tiger.

The word Tigris is an Armenian word, which signifies both a swift Arrow, and a great River, and it should seem that the name of the River Tigris was therefore so called, because of the swiftness thereof; and it seemeth to be derived from the Hebrew word Gir and Grier, which signifies a Dart. [165] Munster also in his Dictionary of three languages, doth interpret Tigris for a Tiger. In the 4. of Job the word Lātik by the Septuagints is translated Μύρμηλαος, and by S. Jerom, Tigris. The Jews call the same beast Pharadez, which the Greeks call Tigris; and all the people of Europe, to whom this beast is a stranger, call it after the Greek name, as the Italians, Tigre and Tigris, the French Un Tigre, and the Germans Tigrilier.

Now concerning the name of the River Tigris, which because it joineth in affinity with this beast, Tigru.
beast, it is necessary that I should say something in this place, because that we finde in holy Scripture that it is one of the four Rivers which runneth through Paradise, which according to Josephus, maketh many compasses and windings in the world, and at last faileth into the Red sea; and they further say, that there is no River of the world that runneth so swiftly as this: And therefore Tigre is vocatur, id est Sagaris, quod jactatur vel flagitium velociitate aquae: That is, it is called a Tiger, a Dare, or Arrow, because it runneth as fast as an Arrow flyeth; and for this cause we finde in Thucydides, that a River in Sicilia was called Actis, that is, Spiculum, a Dare.

Some of the Poets do derive the name of the River Tigre from this Tiger the wilde beast, whereupon these Histories are told. They say, that when Bacchus was distraffed, and put out of his ways by Juno, as he wandered to and fro in the world, he came to the River Sylax (which was the first name of this water) and being there deifiour to pass over, but found no means to accomplish it, Jupiter in commemoration of his elate did fend unto him a Tiger, who did willingly take him upon his back, and carry him over; Afterward Bacchus called that swift River by the name of that swift beast, Tiger. Others do report the tale thus. When Dionysius fell in love with the Nymph Alcmena, whom by no means either by promises, interteats or rewards he could allure unto him, at last he turned himself into a Tiger, and so oppreffing the Nymph through fear, did carry her over that River, and there begot upon her his son Medus, who when he came to age, remembering the fact of his father and mother, called the name of the River Tigre, because of his Fathers transformation. But to leave this matter as not worth the flanding upon, whether the River was called after the name of the beast, or the beast after the name of the River, or rather both of them after the name of the dart or swift Arrow, we will proceed to the natural flory of the Tigre, commending that to the Readers judgement which is effential to this flory, containing in it necessaey learning, and garnished with all probability.

First of all therefor, Tigers like Lyons are bred in the East, South, and hot Countries, because their generation defirith abundance of heat, such as are in India, and near the Red sea, and the people called Afrage, or Beftung, which dwell beyond the River Ganges, are much troubled and annoyed with Tigers. Likewise the Praftants, the Hyracians, and the Armenians. Apollinius with his companions travelling betwixt Hyphen and Ganges, saw many Tigers. In Berigeza and Debinabades, which is beyond the Mediterraneas Region of the East, there are abundance of Tigres, and all other wilde beasts, as Arriamus wrieth. In Hispanicola, Cimbe, and Guanafa, Peter Martyr faith, by the relation of a Spaniard inhabiting there, that there are many Lyons and Tigers.

Countries breeding Tigres.

Quantity of Tigres.

The several parts.

It was needes to speak of their crooked claws, their sharp teeth, and divided feet, their long tail, agility of body, and wildenes of nature which getheth all their food by hunting. It hath been fallify believed, that all Tigers be females, and that there are no males among them, and that they engender in copulation with the winde; whereupon Camerarius made this witty riddle in his rhetorical exercises:

A fluvis idem, fluvis vel dictur ex me,
Junctis, sum vento, vento velociter ipsi,
Et mihi dat ventus natus, nee quærra maritis.

Oppianus.

It were needless to speake of their crooked claws, their sharp teeth, and divided feet, their long tail, agility of body, and wildenes of nature which getheth all their food by hunting. It hath been fallify believed, that all Tigers be females, and that there are no males among them, and that they engender in copulation with the winde; whereupon Camerarius made this witty riddle in his rhetorical exercises:

The Epithets.

The Epithets of these beasts are these: Armenia Tigres, sharp, Gangeticam, Hyracian, fierce, cruel,
cruel, and wicked, untamed, spotted, divers coloured, ftraked, bitter, ravenous, African, greedy, Ca-
frian, Carcian, Caucasian, Indian, Parthian, Marfian, straight-footed, mad, illefe, fearful, strong,
foaming, and violent, with many fuch others, as are eafe to be found in every Author. The voice
of this beast is called Ranking, according to this verfe:

Tigrides indomite rancant, reginanc; Leones.

Now because that they are Strangers in Europe, as we have faid already, never breeding in that part
of the world, and as feldom seen, we muft be contained to make but a fhort ftorie of it, becaufe
there are not many divers things concerning the nature of it, and in the Physick none at all. For
Their food, the manner of their food, they prey upon all the greateft beafls, and feldom upon the smaller, as
Oxen, Harts, and Sheep, but Hares and Conies they let alone.

It is reported by Plutarch, of a tame Tiger that was brought up with a Kid, the faid Kid was kil-
led and laid before him to eat, but he refufed it two days together, and the third day oppreffed
with extremity of hunger, by her ranking and crying voice the made fitnes to her Keeper for other meat,who caft unto her a cat,which presently it pulled in pieces and devoured it. The like ftorie unto
this we have fhevik already in the Panther. Generfly the nature of this beast, is according to the
Epithites of it, fharp, untamed, cruel, and ravenous, never fo tamed, but fometines they re-
turn to their former natures; yet the Indians do every year give unto their King named Ti-
gers and Panthers, and fo it commeth to pafs, that fometines the Tiger kiffeth his Keeper as Seneca
writeth.

In the time of their luft they are very raging and furious, according to thefe Verfes of Virgil:

Per fylum tum Seum aper, tum preffima Tigre,
Hic male cum Libye flos erratur in agris.

They ingender as Lions do, and therefore I marvel how the fable firft came up, that they were all
females & had no males among them, and that the females conceived with young by the Weft wind.
We have fhewn already in the ftorie of the Dogs, that the Indian Dog is engendered of a Tiger and
a Dog, and fo also the Hircanian Dogs: Whereby it is apparent, that they do not only conceive among
themselves, but also in a mingled race. The male is feldom taken, becaufe at the fight of
a man he runneth away, and leaveth the female alone with her young ones, for he hath no care
of the whelps, and for this occafion I think that the fables firft came up that there were no males
among the Tigers. The female bringeth forth many at once like a Bitch, which the nourifheth in
her den very carefully, loving them, and defending them like a Lioness from the Hunters, whereby
she is many times enfnaired and taken. It is reported by Plutarch, that when they hear the found of
Bels and Timbrels, they grow into fuch a rage and madness, that they tear their own flefh from
their backs.

For the taking of Tigers, the Indians near the River Ganges have a certain herb growing like Bu-
glofs, which they take and prefs the jucey out of it, this they preferve befide them, and in ftil
fent calm nights, they pour the fame down at the mouth of the Tigers den, by vertue whereof it
is faid the Tigers are continually encaflod, not daring to come out over it through fome fecret oppo-
fition in nature, but fmalt and dye, howling in their caves through intolerable hunger. So great is
the fwiiftnefs of this beast, as we have fhewn already, that fome have dreamed it was conceived by
the wind. For as the fwiifteft Horses, and namely the Horses of Darfium, are likewife fabled to be
begotten by the Northern winde, fo the Tigers by the Weft winde.

They are never taken but in defence of their young ones, neither is there any beafl
that liveth upon preying fo fwiift as they: Solam Tigrim Indus infaflerabilem effe dicitur, quantum fugi-
endi celeritate, quae ventos square dicitur, & confpeditu ausfugit. Only the Tiger, the Indians fay can
never be conquered, becaufe when he is hunted he runneth away out of fight as falt as the winde. For
this caufe they diligently fearch out the caves and dens of the Tigers where their young ones are
lodged, and then upon fome fwiift Horses they take and carry them away: when the female Tiger
returnd and fheweth her den empty, in rage fhe followeth after them by the foot, whom fhe quick-
ly overtaketh, by reafon of her celerity.

The Hunter feeing her at hand, cafteth down one of her Whelps: the defireful angry beafl knowing
that he can carry but one at once, firft taketh up that in her mouth, without letting upon the
Hunter, contented with that one, returneth with it to her lodging; having laid it up safe, back again
she returned like the wind, to purifie the Hunter for the refidue, who muft likewife fit her down ano-
ther, if he have not got into his fhip, for except the hunter be near the water fide, and have a fhip rea-
dy, the will fetch them all from him, one by one, or else it will coft him his life: therefore en-
terprife is undertaken in vain upon the fwiifteft Horses in the world, except the waters come be-
twixt the Hunter and the Tiger: And the manner of this beafl is, when the feeth that her young
ones are fhipped away, and she for ever deprived of seeing or having them again, the makeith fo
great lamentation upon the Sea fhore howling, braying and ranchorke, that many times the dyeth in
the fame place, but if the recover all her young ones again from the Hunters, the departeth with un-
speakable joy, without taking any revenge for their offered injury.

For
For this occasion, the Hunters do devise certain round spheres of glass, wherein they picture their young ones very apparent to be seen by the dam, one of these they call down before her at her approach, the looking upon it, is deluded, and thinketh that her young ones are inclosed therein, and the rather; because through the roundness thereof it is apt to ravel and stir at every touch, this the drivelth along backwards to her den, and there breaketh it with her feet & nails; and so feeth the that is deceived, returneth back again after the Hunters for her true Whelps; whereof they in the season are safely harbored in some house, or else gone on some shipboard. It is reported by Johannes Leditus a Spaniard, this excellent story of a male and female Tiger. In the Island Darline, standing in the Occidental Ocean of the New-found World, some eight days sail from Hispaniæ, it fell out (faith he) in the year of our Lord 1514, that the said Island was annoyed with two Tigers, a male and a female, for half a year together, so that there was no night free, but they left some of their cattel, either a Horse, or an Ox, or a Cow, or a Mare, or a Hog, and Swine, and in the time that their young ones did suck, it was not safe for men to go abroad in the daytime, much less in the night; but they devoured, if they did not first of all meet with another beast: At length the Countrie thus oppressed, necessity constrained them to devise a remedy, and to try some means to mitigate their calamities, wherefore they sought out all the ways and paths of the Tigers to and from their dens, so that they might take vengeance upon the ravens for the loss of so much blood: At the last they found a common beaten way, this they cut affunder and digged deep into a large dungeon; having made the dungeon, they flrewed upon the top of it little ficks and leaves, so covering it to dissemble that which was underneath, then came the heedles Tigers that way, and fell down into the ditch upon such sharp Iron flakes, and pointed instruments as they had there set, with his roaring he filled all the places thereabout, and the Mountain founded with the echo of his roaring voice.

The people came upon him, and calling great and huge stones upon his back killed him, but first of all, he broke into a thousand pieces, both the stones, Weapons, and Spears, that were cast against him; and so great was his fury, that when he was half dead, and the blood run out of his body, he terrified the islanders by beholding and looking upon him. The male Tiger being thus killed, they followed the footsteps into the Mountains where the female was lodged, and there in her absence took two of her young ones, yet afterward changing their minds, carried them back again, putting upon them two brazen collars and chains, and making them fast in the female den, so that when they had forced till they were greater, they might be with pleasure and safety conveyed into Spain. At last when the time appointed was come that they should be taken forth to be sent away, the people went to the den, wherein they found neither young nor old, but their collars faftened in the same place that they had left them, whereby it was conceived that the envious mother had killed and torn her young ones in pieces, rather then they should fall into the hands of the hunters; so that this beauteous love of hers, ended in horrible cruelty, and for this occasion is it that Meles thus speaketh in Ovid;

Hoc ego f patiar, summe de Tigride natam, 
Tum ferrum & foquas gisære in corde widæs.

And for this cause it was fainied, not without singular wit by the Poets, that such persons as fatifie the fulness of their wrath in extremity of revenge, are transformed into Tigers. The same Poet compareth the wrath of Perseus standing between two advantages unto a Tiger betwixt two presys or herds of cattel, being in doubt whether of them to devour, in this manner;

Tigris ut auditis diversa vale durum, 
Extimulata fame, mugitibus armamentum, 
Nefcit utra patium ruas, & Vere ardet utros;
Sic dubius Perseus dextra lavave feraru.

In ancient times these Tigers were dedicated to Bacchus, as all spotted beasts were, and that the said Tigers did draw his Charriot whilest he did hold the rains; and therefore Ovid saith thus;

Bacchus in currum quem summum tesserat uir, 
Tigrius adjunctis auræ lata datat.

And Horace in this manner;

Hae te merente Bacche pater tua
Vexere Tigres inciditij jugum collt trabantem.

Tigers, notwithstanding their great mindes and untamable wildenes, have been taken, and brought in publike spectacle by men, and the first of all that ever brought them to Rome, was Augustus, when Quintus Tabore, and Fabius Maximus were Consuls, at the dedication of the Theater of Marcelius; the which Tigers were sent unto him out of India, for presents (as Dio writeth.) Afterwards Claudius presented four to the people; and lastly Helagogalus causeth his chariots to be drawn with Tigers, whereunto Martial alluded when he said;
Of the **UNICORN**.

**W**e are now come to the history of a Beast, whereof divers people in every age of the world have made great question, because of the rare vertues thereof; therefore it behoveth us to use some diligence in comparing together the several testimonies that are spoken of this beast, for the better satisfaction of such as are now alive, and clearing of the point for them that shall be born hereafter, whether there be a Unicorn; for that is the main question to be resolved.

Now the vertues of the horn, of which we will make a particular discoursse by itself, have been the occasion of this question, and that which doth give the most evident testimony unto all men that have ever seen it or used it, hath bred all the controversy; and if there had not been divulged in it any extraordinary powers and vertues, we should as easily believe that there was a Unicorn in the world, as we do believe there is an Elephant although not bred in Europe. To begin therefore with this discoursse, by the Unicorn we do understand a peculiar beast, which hath naturally but one horn, and that a very rich one, that groweth out of the middle of the forehead, for we have shewed in other parts of the history, that there are divers beasts, that have but one horn, and namely some Oxen in India have but one horn, and some have three, and whole hoofs. Likewise the Bulls of **Aonia**, are said to have whole hoofs and one horn, growing out of the middle of their fore-heads.

Likewise in the City *Zella* of **Ethiopia**, there are Kine of a purple colour, as Ludovicus Ramaeus writeth, which have but one horn growing out of their heads, and that turneth up towards their backs. Caesar was of opinion that the Elk had but one horn, but we have shewed the contrary. It is said that Persiotes had a Ram with one horn, but that was bred by way of prodigy, and not naturally. Simon Sebti writeth, that the Musk-cat hath also one horn growing out of the fore-head, but we have shewed already that no man is of that opinion befide himself. Elinas writeth, that there be Birds in **Ethiopia** having one horn on their fore-heads, and therefore are called *Unicorns*: and Albertus faith, there is a fish called *Monoceros*, and hath also one horn. Now our discoursse of the Unicorn is of none of these beasts, for there is not any vertue attributed to their horns, and
and therefore the vulgar sort of Infidels people which scarcely believe any herb but such as they see in their own Gardens, or any beast but such as is in their own flocks, or any knowledge but such as is bred in their own brains, or any birds which are not hatched in their own nests, have never made question of thefe, but of the true Unicorn, whereof there were more proofs in the world, because of the noblenefs of his horn, they have ever been in doubt: by which diftraction it appereath unto me that there is some secret enemy in the inward degenerate nature of man, which continually blindeth the eyes of God his people, from beholding and believing the greatnes of God his works.

But to the purpofe, that there is such a beast, the Scripture it felf witneffeth, for David thus speakeith in the 52. Psalm: Et erigetur cornu meum tangamus Monoceros. That is, my horn fhall be lifted up like the horn of a Unicorn; whereupon all Divines that ever wrote, have not only collected that there is a Unicorn, but also affirm the fimilitude to be between the Kingdom of David and the horn of the Unicorn, that as the horn of the Unicorn is wholefome to all beasts and creatures, fo fhould the Kingdom of David be in the generation of Chrift: And we do think that Da- vid would compare the vertue of his Kingdom, and the powerful redemption of the world unto a thing that is not, or is uncertain or fantafical, God forbid that ever any man fhould do diffigure the holy Ghofl. For this caufe alfo we read in Suidas, that good men which worship God and follow his laws are compared to Unicorns, whose greater parts as their whole bodies are unprofitable and unaatable, yet their horn maketh them excellent: io in good men, although their liefthy parts be good for nothing, and fall down to the earth, yet their grace and piety exalthe their fouls to the heavens.

We have shewed already in the f Rory of the Rhinocerot, that Reem in Hebrew signifies a Unicorn, although Musfer be of another opinion, yet the Septuagint in the tranflation of Deut. 33. do tranflate it a Unicorn, for the Rhinocerot hath not one horn, but two. Rabbi Solomon, Da- vid Kimbi, and Sandius do always take Reem and Karas for a Unicorn, and they derive Reem from Rom, which signifies Altitudinem, height, because the horn of the Unicorn is lifted up on high. Hereunto the Arabians agree, which call it Barkron; and the Perfians, Bark; the Chaldeans, Rema- ns. In the 39. of Job, the Lord speaketh in this manner to Job: Nonquid acquisit Monoceros ut fer- viat tibi, aut ut moweret juncta prefpe tua? Nonquid ligabii Monoceratam fune pro falco faciendo, aut complanabit gibus bullium potf te? That is to fay, will the Unicorn reft and serve thee, or tarry befide thy catches? Canst thou binde the Unicorn with a halter to thy plough to make furrows, or will he make plain the clots of the Valleys? Likewise in the prophets of Efa. the 34. chap. and in many other places of Scripture, whereby God himfelf must needs be traduced, if there be no Unicorn in the world.

Besides the Arabians, as And Belus, writeth, call this bear Alcherceden, and fay that it hath one horn in the fore-head which is good againft pyrons. The Grecians call it Monokerat, from whence Pliny and all the ancient Grammarians do call it Monoceros, yet the divines both elder and later do name it by a more learned proper Latin word Unicorns. The Italiani, Alcorno, Unicorno, Licono, Lecorno; the French, Licorne; the Spaniards, Unicornos; the Germans, Einhorn; and the Ilyrians, Gedornozec. And thus much for the name. All our European Authors which write of beasts, do make of the Unicorn divers kinds, especially Pliny, Lucius Secundus, Varro, Plinius Venetus, Eneas Sylvius, Abaton Magnus, out of whose words we muft gather the bell description that we can of the Unicorn. The Arabic Indians (faith Pliny,) are manie certain wildbeaft which is very curf, unaatable, having one horn, which in the head refemblith a Hart, in the feet an Ele-phant, in the tail a Boar, and in the residue of the body a Horse; the horn of his faith, is about two cubits long, and the voice like the lowing of an Ox, somewhat more shrill, and they deny that this beast is ever taken alive. Elhans writeth hereof in this manner, there are (faith he) certain Mountains in the midit of India, unto the which the paffage is very difficult, whereare are abundance of wildbeaft, and among other Unicorns, which the Indians call Carucarum, who in their ripe age are as big as a Horfe, and their mane and hairs are yellow, excelling in the celerity of their feet and bodies, having feet cleven cloke like an Elephants, the tail of a Boar, and one black horn growing out betwixt their eye-brows, not smooth, but rough all over with wrinkles, and the fame groweth to a mofl sharp point, these things (faith Elhans,) by comparing of whose words with Pliny, it is apperant they decribe in these words but one and the same beaft, and fo also doth Philby; where- by I gather, that it is no other beaft then the wild Afs, or at the leaft the wild Afs somewhat neareft to the Unicorn of all others, for they agree in these things; first, in that both of them have one horn in the middle of the fore-head; secondly, in that both of them are bred in India; thirdly, in that they are both about the bignef of a Horfe; fourthly, in their celerity and solitary life; fifthy and laftly, in their exceeding strength and unaatable natures; but herein they differ both in their feet and colours, for the feet of the wilde Afs are whole and not cleven like the Unicorns, and their colour white in their body, and purple on their head; and Elhans faith, that the horn also differeth in colour from the Unicorns, for the middle of it is only black, the root of it white, and the top of it purple, which Bellowius doth interpret, that the superficies or upper face of the horn is all purple, the inner part white, and the inward part or middle black; but of this Indian wilde Afs we have spoken already, and therefore I will add nothing in this place but the words of Philo- stratus in the life of Apollonius, who writeth in this manner:

There
There are many wilde Asses which are taken in the Fens, near the River Hipphais, in whose forehead there is one horn, wherewith they fight like Bulls, and the Indians of that horn make pots, affirming that whosoever dranketh in one of those pots, shall never take diseaue that day, and if they be wounded, shall feel no pain, or falsely pafs through the fire without burning, nor yet be poufioned in their drink, and therefore such cups are only in the possession of their Kings, neither is it lawful for any man except the King, to hunt that Beall, and therefore they say that Apollinius looked up on one of those Bealls, and considered his nature with singular admiration.

Now there was one Damus in his company, who asked him whether he did believe that the vulgar report of the unicorn's horns were true or no, Apollinius made this answer: "Adhucce si bujas regione immanitatem regione effe intelleges, qui enim minl aut alteri culquem poallum ilia sese potes dare, nemo verissime eiusmodi pugnet, sed ad cromulum ilios bibere, nemo enim ut puto illum colomnababor qui in tali poallum etiam inebriabit. That is to say, I would believe that report, if I found in this Country a King that were immortal and could never dye, for if a man would give me such a cup, or any other man, do not you think that I would believe he drank in the same cup? and who should blame a man if he drank in such a cup till he were drunk? for it were lawful to use that horn unto fertilising: whereby we may gather the minde of that wise man concerning the Asses horn, and the Unicorns; namely, that they may give one some eafe against accidental diseases, although they cannot prolong a mans life the space of one day: these things said he. There be Bealls (faith Arifiole) as the Oryx and Indian Afs, which are armed with one horn, and the cloven footed Oryx is no other then the whole footed As, for in the middle of their fore-head they have one horn, by which both sides of their head are armed, Corn mediumiasi iter commane utrig. extremos fit. Because the middle is equally distant from both the extremes; and the hoof of this Beall may well be faid to be cloven and whole, becaufe the horn is of the substance of the hoof, and the hoof of the substance of the horn, and therefore the horn is whole, and the hoof cloven; for the cleaving either of the horn or of the hoof cometh through the defect of nature, and therefore God hath given to Horfes and Asses whole hoofs, because there is greatest use of their legs, but unto Unicorns a whole and entire horn, that as the eafe of men is procured by the helpes of Horfes, fo the health of them is procured by the horn of the Unicorn. Thefe things (faith Arifiole.) And Strabo also writeth, that there are Horses in India, which have Harts heads, with one horn, of which horn their Princes make cups, out of which they drink their drink against poyzon: and therefore by this which hath been said it appeareth unto me, that either the Indian Afs is a Unicorn, or differeth from it only in colour; and the objection of the hoofs is answered by Arifiole. Unto this dircourse I will add the travails of Ludovici Koman, wherein he saw two Unicorns at Melba in Arabia, where Mahomet Temple and Sepulcher is. There are preferred (faith he) within the walls and Cloysters of that Temple two Unicorns, which by way of miracle they bring forth to the people, and truly not without caufe, for the fight is worthy admiration.

Now their description is on this sort: One of them and the elder was about the nature of a Colt of two years and a half old, having a horn growing out of his fore-head of two cubits length, and the other was much lefs, for it was but a year old, and like a Colt of that age, whole horn was some two fpan long, or the like lengths. The colour of the horn was like a Wefled coloured Horfe, the head like the head of a Harte, the neck not long, and the mane growing all on one side. The legs flender and lean, like the legs of a Hinde, the hoofs of the fore-feet were cloven like a Goats feet, and the hinder-legs are all hairy and fhaggy with the outide; the Bealls although they were wide, yet by Art or superflition, they seemed to be tempered with no great wildenes; it was faid that the King of Ethipia, did fend them to the Sultan of Mecca, with whom he is contrained to observe perpetual amity. Now these Unicorns are of another kinde, then the Unicorns of Piny and Albus, because their Unicorn hath a whole hoof, and this cloven, but this objection was answered before: and although Piny and Arifiole do acknowledge no other Unicorn then the Oryx, whose horn is black, as hard as Iron, and sharp at the point, yet it is clear that there is another Unicorn besides that.

Now Paulus Venalbus faith, that in the Kingdom of Baffman, which is subj ect to the great Cham, that there are Unicorns somewhat leffer then Elephants, having hair like Oxen, heads like Boars, feet like Elephants, one horn in the middle of their fore-heads, and a sharp thorny tongue, whereby they deftrouy both man and Beall: and besides he addeth, that they muddle in the dirt like Swine. Now if it were not for the horn in the middle of the fore-head, I would take this Beall for a Rhinocerot, but because the horn of the Rhinocerot growth out of the nose, I deem this to be a second kinde of Unicorn; for there is no man that shall read this story, but will think that the learned Author had reason to discern between the eyes and the fore-head, and therefore there can be no exception taken to my observation.

Nicolaus Venalbus an Earl faith, that in Majmon or Seriis, that is, the Mountains betwixt India and Cathay, (as Arifiole Sylvius wrote) there is a certain Beall having a Swines head, an Oxen tail, the body of an Elephant (whom it doth not only equal in stature, but also it liveth in continual variance with them) and one horn in the fore-head: now this if the Reader shall think it different from the former, I do make the third kinde of the Unicorn; and I trull that there is no wise man that will be offended at it: for as we have fowed already in many stories, that many Bealls have not only their divisions, but sub-divisions, into sub-alternal kindes, as many Dogs, many Deer, many.
many Horsest, many Mice, many Panthers, and such like, why should there not also be many Unicorns? And if the Reader be not pleased with this, let him either shew me better reason, (which I know he shall never be able to do) or else be silent, left the uttering of his dislike, bewray envy and ignorance.

Now although the parts of the Unicorn be in some measure described, and also their Countries, namely, India and Ethiopia, yet for as much as all is not said as may be said, I will add the residue in this place: And first of all there are two Kingdoms in India, one called Nymt, and the other Lambror or Lambri; both there are flourished with Unicorns: And Alfinus Cadamannus in his fifty Chapter of his Book of Navigation, writeth that there is a certain Region of the New-found World, wherein are found live Unicorns; and toward the East, and South, under the Equinoctial there is a living creature (with one horn which is coocked, and not great) having the head of a Dragon, and a beard upon his chin, his neck long, and stretched out like a Serpent, the residue of his body like to a Harts, faying that his feet, colour, and mouth are like a Lions: and this also (if not a fable or rather a Monfer) may be a fourth kind of Unicorn; and concerning the horns of Unicorns, now we must perform our promfe, which is to relate the true history of them, as it is found in the best Writers. This therefore growing out of the fore-head betwixt the eye-lids is neither light nor hollow, nor yet smooth like other horns, but hard as Iron, rough as any file, revolvo in many plights, sharper than any dart, straight and not crooked, and every where black except at the point.

There are two of thefe at Venice in the Treasury of S. Mark's Church, as Brusfevius writeth, one at Argentament, which is wreathed about with divers Spires. There are also two in the Treasury of the King of Polonia, all of them as long as a man in his stature. In the year 1520. there was found the horn of a Unicorn in the River Arula, near Briga in Helvetia, the upper face or outside whereof was a dark yellow, it was two cubits in length, but had upon it no plights or wreathings. It was very odoriferous (especially when any part of it was set on fire) fo that it smelled like musk: asfoon as it was found, it was carried to a Nunnery called Campus tagus, but afterwards by the Governor of Helvetia it was recovered back again, because it was found within his territory. Now the vertues of this horn are already recited before, and yet I will for the better justifying of that which I have said concerning the Unicorns horn, add the testimony of our learned men which did write thereof to Gelfuer, whose letters according as I finde them recorded in his work, fo I have here inferred and tranlated word for word. And first of all the anwer of Nicolai Gerbelin unto his Epife, concerning the Unicorns horn at Argentamentum, is this which followeth, for, faith he, The horn which thofe Noblemen have in the secrets of the great Temple, I have often seen and handled with my hands; It is of the length of a tall man, if fo be that you shall thereunto add the point thereof: for there was a certain evil disposed perfon among them, who had learn'd (I know not of whom) that the point or top of the fame horn would be a prefent remedy both against all poyfon, and alfo against the Plague or Pestilence: Wherefore that sacrilegious thief pluck'd off the higher part or top from the residue, being in length three or four fingers.

For which wicked offence, both he himself was call'd out of that company, and not any ever afterwards of that family might be receiv'd into this society by an Ordinance gravely and maturely raifed. This pulling off the top brought a notable deformity to that mofl fpentand gift. The whole horn from that which ticketh to the fore-head of this beaft, even unto the top of the horn is altogether firm or fold, not gaping with chops, chinks or crevices, with a little greater thickness than a tile is usually among us. For I have of times combin'd almost the whole horn in my right hand. From the root unto the point it is even as wax candles are rowled together most elegantly fevered and raifed up in little lines.

The weight of this horn is of so great a massinefs, that a man would hardly believe it, and it hath been often wonder'd at, that a beaft of fo little a figure could bear fo heavy and weighty a burden. I could never smell any sweetnefs at all therein. The colour thereof is like unto old Ivory, in the midst betwixt white and yellow. But you shall never have a better pattern of this, then where it is fold in little pieces or fragments by the Oylmen. For the colour of our horn is life unto them. But by whom this was given unto that fame Temple I am altogether ignorant.

Another certain friend of mine, being a man worthy to be believed, declar'd unto me, that he saw at Paris with the Chancellour, being Lord of Fruis, a piece of a Unicorns horn, to the quantity of a cubic, wreathed in tops or spires, about the thickness of an indifferent Flaffe (the compafs thereof extending to the quantity of fix fingers) being within and without of a muddy colour, with a solid substance, the fragments whereof would boil in the Wine, although they were never burned, having very little or no smell at all therein.

When Johnes Ferreri of Piemont had read thefe things, he wrote unto me, that in the Temple of Denis, near unto Paris, there was a Unicorns horn fix foot long, wherein all thofe things which are written by Gerbelin in our Chronicles were verifi'd, both the weight and the colour: but that in biginefs it exceeded the horn at the City of Argentorate, being also hollow almost a foot from that part which ticketh unto the fore-head of the Beaf, this he saw himself in the Temple of S. Denis, and handled the horn with his hands as long as he would. I hear that in the former year (which was from the year of our Lord 1553.) when Vereilla was overthrow'd by the French, there was brought from that treafure unto the King of France, a very great Unicorns horn, the price
price whereof was valued at fourcore thousand Duckets. Paulus Pisonius describeth an Unicorn in this manner: That he is a Beast, in shape much like a young Horse, of a dully colour, with a maned neck, a hairy beard, and a fore-head armed with a horn of the quantity of two cubits, being separated with pale tops or spires, which is reported by the smoothness and ivory whiteness thereof, to have the wonderful power of diffolving and speedy expelling of all venom or poyson whatsoever.

For his being put into the water, driveth away the poyson; he may drink without harm, if any venomous Beast shall drink therein before him. This cannot be taken from the Beast being alive, forasmuch as he cannot posibly be taken by any deceit: yet it is usually seen that the horn is found in the Desiers, as it happeneth in Harts, who cast off their old horn through the inconveniences of old age, which they leave unto the Hunters, Nature renewing another unto them.

The horn of this Beast being put upon the Table of Kings, and set amongst their junkets and banquets, doth bewray the venom if there be any such therein, by a certain sweat which cometh over it. Concerning these horns, there were two feen, which were two cubits in length, of the thickness of a mans arm, the first at Venice, which the Senate afterwards sent for a gift unto Solyman the Turkishe Emperour: the other being almost of the same quantity, and placed in a silver pillar, with a short or cutted point, which Clement the Pope or Bishop of Rome, being come unto Marsfelt, brought unto France the King for an excellent gift. Furthermore concerning the virtue of such a gift, I will not speak more of this Beast, than that which divulged fame doth perwade the believers.

Peter Bellinum writeth, that he knew the tooth of some certain Beast in time past, fold for the horn of a Unicorn, (what Beast may be signified by this speech I know not, neither any of the French men which do live amongst us) and so a small piece of the fame being adulterated, fold sometimes for 300. Duckets. But if the horn shall be true and not counterfeit, it doth notwithstanding seem to be of that creature which the Ancients called by the name of a Unicorn, especially Athenar, who only ascribeth to the same this wonderful force against poyson and most grievous diseases, for he maketh not this horn white, as ours doth feem, but outwardly red, inwardly white, and in the midst or secrecte part only black.

But it cannot be denied, that this our Unicorns horn was taken from some living wilde Beast. For there are found in Europe, to the number of twenty of these horns pure, and so many broken; two of which are shewn in the treasury of Saint Marks Church at Venice, (I heard that the other was of late sent unto the Emperor of the Turks for a gift by the Venetians) both of them about the length of six cubits: the one part which is lowell being thicker, and the other thinner, that which is thicker, exceedeth not the thickness of three inches jutf, which is also attributed unto the horn of the Indian Afs, but the other notes of the fame are wanting.

I do also know, that which the King of England poiffeth to be wreathed in spires, even as that accounted in the Church of S.Dennis, then which they suppose none greater in the world, and I never saw any thing in any creatures more worthy praise, then this horn. The substance is made by nature, not Art, wherein all the marks are found which the true horn requireth. And forsoomuch as it is somewhat hollow (as the measure of a foot which goeth out of the head, and the bone growing from the same isocomprehended) I conjecture that it never falleth, as neither the horns of a Musk-cat, a wilde Goat, and an Ibex do: but the horns of these beasts do yearly fall off, namely, the Buck, the Hart, Field-goat, and Cemelopard. It is of so great a length, that the tallest man can scarcely touch the top thereof, for doth fully equal seven great feet: It weighteth thirteen pounds with their affize, being only weight by the guests of the hand, it feemeth much heavier. The figure doth plainly signify a wax candle, (being folded and wreathed within it self) being far more thicker from one part, and making it self by little and little lefs towards the point, the thickest part thereof cannot be fuit within one hand, it is the compass of five fingers, by the circumference, if it be measured with a thread, it is three fingers and a span.

That part which is next unto the head hath no sharpens, the other are of a polished smoothnes. The plein of the spire are smooth and not deep, being for the most part like unto the wreathing turnings of Snails, or the revolutions or windings of Wood-bine about any Wood. But they proceed from the right hand toward the left, from the beginning of the horn, even unto the very end. The colour is not altogether white, being a long time somewhat obturated. But by the weight it is an easie thing to conjecture, that this Beast which can bear so great burden in his head, in the quantity of his body can be little lefs then a great Ox.

There are found oftentimes in Polonia certain horns which some men gues to be of the Unicorns, by a double argument. First, because they are found several, never by twain which as yet is heard, although sometimes they may be found with the skull and bones of the rest of the body: furthermore, because their strength or vertue is approved against great and most grievous diseas: concerning which thing Antonius Schnobergerus, a Physitian of great learning amongst the Sarmatians, and an excellent observer of nature, writ unto me some five year past, to see some of these horns, having lent them by the labour of my very good friend Jacobinus Rheticus, a most excellent Physitian in Sarmatia, and incommensurable in the Mathematicks Arts in this age.

The first of these horns (faith he) I saw being of the length of my fathom, with a dusky or darkish colour: the point thereof being exceeding sharp and smooth. The compass about 15 1/2, the
The root of the horn did exceed fix fpoons. The outside was plain, with no turnings of spires: the substance eafily to be crumbled, the figure crooked, the colour exceeding white within, which if it be drunk in Wine, doth draw over it felf a dark colour. Eight such divifions were joyned to the fame, as you fhall fee in the greater part which I fend, but that part is not of the horn, but either the entrance of the pala, or fome other things as I confider.

This horn was found under the earth, (not deeper then a foot, in a solitary and high place, as between two hills, through which a River runneth) by Countréy-men that were digging to lay the foundation of a house. But the horn was fitten with an Ax, and ferved into very small pieces: but that noble and excellent man James Erifke (in whose field the horn was found, being divifion from Cratogia two miles) by all diligence he could, left that the small pieces fhould be cut abroad, took deliberate heed, that they fhould be taken out of the earth. From the root to the top it was all round and smooth, but touching it with ones tongue, it cleafeth fuffice unto it, the tooth was as big as a man could grippe in his hand; being in the upper or outward part bony or hollow within, white in the middle, and outward somewhat red as the polifh.

But this horn was found all the Beaff, as by the greatness of his bones might eafily be perceived, being bigger in quantitу then a Horfe. It is moft certain that it was a four-footed Beaff, by the bones of the shoulders, thighs and ribs. But if this horn were the tooth of an Elephant, as fome do fuppofe, you would marvail why two (which I have heard) were never found together. But the teeth or rather horns of Elephants are never fo crooked that they might come almoft to half a circle as they did. The strength of this horn a penny weight thereof being put in Wine or water of Barage, health old Fevers, as alfo tertian or quarten Agues of three years continuance, and cureth many difeafes in mens bodies, as affwaging the pain of the belly, and making of thofe to vomit, who can by no means eafe their flomachs. Hitherto they have been divifions concerning one of fhew horns which I faw. The other was like unto this, but lefs pure; for the colour was outwardly moft black, inwardly moft white, being found in the River. The third, and fourth moft hard, fo that a man would think it were by the touching thereof stone or iron, being solid even unto the point, for I have not feen them wholly, but the part of one, to the length of a cubit; of the other, to the length of half a cubit, with a dark colour, being almoft of the fame thicknefs as the two former: But forasmuch as the two former have no rifts or chinks in them, thefe have by their longititude, being like herbs bending or wreathing in their falkes.

There was another found in a certain field, fo much appearing out of the earth, that the rude or Countréy fort did think it to be some pile or stake. Many alfo are cured and freed from fhaking Fevers by the medicinal force of thefe, the caufe whereof I fuppofe to be this, becaufe the former are foter, for as much as one of them will ly in the water for fo long a time, but the other under the earth being feare well hid. I afterwards saw a fifth like unto the firft, none of them being fraught or direft up, but alfo crooked, fome almoft unto a half circle: Hichtero Schonbergerus, who alfo addeth this: That there are more of thefe to be found in Polonia, and therefore for the moft part to be contenmned.

There are moreover found in Helvetia fome of thefe horns: one in the River Aula against the Town of Bruges, the other in the laft year, in the River of Bifte, but it was broken, even as the third with that famous Earl of the Cymbrians, William Warner in a Tower near unto the City Rattawth, who gave unto Gaffer a good piece thereof; who found another piece as he was a fishing at Bifte in the River. And it is no great marvel that they are found there, where through length of time they are broken into fmall pieces, and carried by the force of the waters into divers places.

But it is moft diligently to be observed, whether they are found in the earth, alfo to be known whether that great horn be of this Beaff, which hangs alone in the great Temple at Argentor (hanged by the pillar, for it hath hanged there many years before, as now it appeareth, for that doth plainely feem the fame magnitude, thicknefs, and figure which Schonbergerus hath described in his own horn, that we have allowed before for wilde Oxen. The Ancients have attributed fingular horns to the Unicorn, whom fome have calld by other names as it is faid: and furthermore to the Oryx (a wilde Beaff unknown in our age except I be receiv'd), which Aristilus and Pliny ca// a Unicorn, Alceus a Quadricorn. Oppianus doth not exprpref it, but he feemeth to make it a two horned Beaff. Simon Sithi doth alfo write, that the Musk-cat or Goat which brings forth Musk, hath one horn: Certain later writers (as Staliger reporteth) fay, that there is a certain Ox in Ethiopia which hath one horn coming out in the midft of his fore-head, greater then the length of a foot, boding upwards, the point being wreathed overfhand, and they have red hair, whereby we gather that the horn of all Unicorns is not pure. But the reafon why these horns are more found in Polonia, then in any other place, I cannot well guess, whether from thence we fhall fuppofe them to be of certain Beafts, which at this day abide in the Woods of Sarmentia; in times past, there were many more, which have lived both in greater and larger Woods, neither were they killed with fo often hunting; some whereof it is moft like have come to great age, as appeareth by their great and flately horns, which things we leave to be confidered of others. I fuppofe that the Apothecaries never have the true horn of a Unicorn, but that some do call a kind of false adulterated Horn, other the fragments of this great and unknown horn, of which we have spoken, and not only of the horn, but alfo of the bones of the head; fome of which are fo affected by longitnd of time, that you may take a three-fold fublance in them, although it be broken by a certain diftance, one being for the moft part white and pale, the other white and foter, the third fomy and molt white.

I hear
The natural properties of Unicorns.

The taking of Unicorns.

Concerning the horns of the Unicorn, I have sufficiently already written, as the Antients have delivered in their remedies: but in this place I will handle the remedies which late Writers have attributed thereunto, as also our own observations of the same. I remember that in times past, I saw a piece of this horn of the weight of nine inches, with a certain Merchant in the market, being black and plain, and not wreathed in circles or turnings, but at that time I did not so much observe it. Now amongst our Apothecaries I do not only finde small or little fragments out of which there flowed (as they say) some certain marrow, which are rounder, whiter, and softer.

But both the same colour, as also the substance being put too much, and eaten, if it be easily crummed, and not full as other horns, doth signifie the same not to be good or perfect, but counterfeited and corrupted: as perhaps the horn of some other beast burnt in the fire, some certain sweet odors being thereunto added, and also imbrued in some delicious or aromatical perfume; peradventure also Bay by this means, first burned, and afterward quenched or put out with certain sweet finelling liquors. There is great care to be had, that it be taken new, and while it smelleth sweet.

B b b 3.
sweet, not either abolished by age, nor the vertue thereof diminished by often or frequent cups. For rich men do usually cut little pieces of this horn in their drinking cups, either for the prevent- or curing of some certain disease. There are also some which incline it in gold or silver, and so caft it in their drink, as though the force thereof could remain many years, notwithstanding the continual soaking in Wine.

But that which is so used and drunk in Wine doth bring upon it a certain dark or obscure colour, the whiteness which before remained upon the same being quite lost, expelled and utterly abolished. Most men for the remedies arising from the same, command to use the horn simply by itself: Others prefer the narrow therein. It being caft in Wine doth boil, which some men either through ignorance or deceit, impute to be a sign of the true horn, when as contrarily any other horns being burnt, do in water or wine cause bubbles to arise. There are some wicked pertrons which do make a mingle mangle thereof, as I saw amongst the Venetians, (being as I hear made, compounded with lime and fope) or peradventure with earth or some stone: (which things are wont to make bubbles arise) and afterward sell it for the Unicorns horn.

Wherefore it shall be more to late to buy it out of the whole horn if it may be done, or of greater crums, and which may well describe the figure of a horn; then small fragments where you may receive less deceit. A certain Apothecary which was at Nooremberg, in a lately mart Town amostng the German, declared the way unto me how to deface the colour of an adulterate Unicorns horn, being made by some with Ivory, either macerated or boiled with certain medicines (by Set-foil as I suppose, and other things) by which means having scraped it, I found within the true substance to be Ivory. Antonius Brasavolas writeth, that all men for the most part do fell a certain stone for Unicorns horn: which truly I deny not to be done, who have no certainty therein my self: notwithstanding also it may to come pas, that a very hard and solid horn, about the point of a sword especially (which part is preferred to inferior, as also in Harts horns) to which either stones or iron may yield, such as Authors attribute to the Rhinoceros. And other Unicorns may bear the shape of a stone before it fell. For if Orphee concerning Harts horns rightly doubted, whether the same or stones were of greater strength: I think it more to be doubted in the kindes of Unicorns, for the horns of Harts are not only solid (as Aristotle supposed) but also the horns of Unicorns, as here I have said.

The horn of an Unicorn is at this day used, although age or longinquitie of time hath quite abol-lished it from the nature of a horn. There are some which mingle the Rhinoceros with the Unicorn, for that which is named the Rhinoceros horn, is at this day in Physical use, of which notwithstanding the Authors have declared no effectual force. Some fay that the Unicorns horn doth sweat, having any poyson coming over it, which is false, it doth perhaps sometimes sweat, even as some solid, hard, and light substance, (as also stones and glas) some external vapour being about them, but this doth nothing appertain to poyson.

It is in like manner reported, that a kinde of fone called the Serpents tongue doth sweat having poyson come over it. I have heard and read in a certain book written with ones hands, that the true horn of a Unicorn is to be proved in this manner. To give to two Pigeons poyson (red Arnick or Orpin) the one which drinketh a little of the true Unicorns horn will be healed, the other will die, I do leave this manner of trial unto rich men. For the price of that which is true, is reported at this day to be of no les value then gold. Some do fell the weight thereof for a florin, or eight pence: some for a crown, or twelve pence. But the marrow thereof is certainly of a greater price, then that which is of harder substance. Some likewise do fell a dram thereof, for two pence half penny, so great is the diversity thereof. For experience of the Unicorns horns to know whether it be right or not: put filk upon a burning coal, and upon the filk the aforefaid horn, and if so be that it be true the filk will not be a whit consumed.

The horns of Unicorns especially which is brought from new Islands, being beaten and drunk in water, doth wonderfully help against poyson : as of late experience doth manifest unto us, a man, who having taken poyson & beginning to swell was preferred by this remedy. I my self have heard of a man worthy to be believed, that having eaten a poysoned cherry, and perceiving his belly to cure himself, by the marrow of this horn being drunk in Wine, in very short space.

The same is also praised at this day for the curing of the Failing leeknes, and affirmed by Elianus, who called this disease curved. The ancient Writers did attribute the force of healing to cups made of this horn, Wine being drunk out of them: but because we cannot have cups, we drink the substance of the horn, either by it self or with other medicines. I happily sometime made this Sugar of the horn, as they call it, mingling with the fame Amber, Ivory dust, leaves of gold, coral, & certain other things, the horn being included in filk, and beaten in the decoction of Raisins and Cinnamon, I call them in water, the reit of the reason of healing in the same time not being negletued. It is moreover commended of Physitians of our time against the pestilent fever , (as Alexius Mundelius writeth) against the bitings of ravenous Dogs, and the strokes or poysonfome thing of other creatures: and privately in rich mens houses against the belly or maw worms; to conclude, it is given against all poyson whatsoever, as also against many most grievous diseases. The King of the Indians drinking out of a cup made of an Indian Unicorns horn, and being asked wharefore he did it, whether it were for the love of drunkennese, made answer, that by that drink drunkennese was both expelled and reforted, and worier things cured, meaning that it clean abolish all poyson whatsoever. The horn of a Unicorn, doth heal that deteatable disease in men called S. Johns evil, otherwise the curved
curved disease. The horn of an Unicorn being beaten and boiled in Wine, hath a wonderful effect in making the teeth white or clear, the mouth being well cleansed therewith. And thus much shall suffice for the medicines and virtues arising from the Unicorn.

Of the URE-OX.

This beast is called by the Latines, Urus; by the Germans, Aurox, and Urox, and Græco vene in; by the Lituanians, Taur; the Sybians, Bubri; and these beafts were not known to the Grecians, (as Pliny writeth) of whom Senecha writeth in this manner;

 Tibi dant variæ pellora Tigres,
 Tibi villesi terga bisontes,
 Latifam feri cornibus urii.

And Virgil also maketh mention of them in his Georgics, writing of the culture or tilling of Vines.

 Texenda sapere etiam & pecunio teneendum : Sileostres uris asidue, capitaes sequaces
  Præcipue cum frons testra, imprudentes, laborum, Illudtis. —
  Cui super indulgus hymene, solvens potentem.

These wild beasts or Ure-oxes are wilde Oxen, differing from all other kindes, already rehearsed in the story of Oxen, Bugles, Bifons, or any other, although some have unskilfully taken them for Bifons, and Sir Thomas Elton in his Dictionary, doth English Urus a Bugle; but beside him no body, that I know, and for this cause he is reprehended by other. Now although there be nothing in this beast but ordinary, yet seeing it is a creature so well known, we have left reason to omit his shape and colour, lest we should unjustly be condemned of negligence and carelessness.

In outward proportion of the body it differeth little from the Bull, It is very thick, and his back somewhat bunched up, and his length from the head to the tail is short, no ways answerable to the proportion of his stature and sides: the horns (as some say) are but short, yet black, broad, and thick, his eyes red, a broad mouth, and a great broad head, his temples hairy, a beard upon his chin, but short, and the colour thereof black, his other parts, as namely in the face, sides, legs, and tail, of a reddish colour.

These are in the wood Hercynia, in the Pyrney Mountains, and in Mazovia, near Lituania. Places of their abode. They are calld' Uro of Oxen, that is the Mountains, because their savage wildenes is so great, that they seldom defend from those safeguards. They far excel Bulls, and other wilde Oxen, coming nearer to the quantity or stature of Elephants, then to the Bull. In resemblance a man would think them to be compounded of a Mule and a Hart, for their outward resemblance so seem. It is said they could never be taken by men; although they were taken when they were young.
The History of Four-footed Beasts.

Countries of their breed.

Their nature.

Use of their parts.

Histories of other wild Oxen.
Of the Urs.

Theursus writeth, that betwixt Florida and Palma, in the new found World, there are very many strange shaped beasts, and among other a kinde of wilde Bull, whose horns are a foot long, but on his back he hath a tumour or bunch like a Camel, and is therefore called Bos Camelus, his hair all over his body is very long, but especially under his chin, and his colour like a yellow Mule, and this beast is a continual enemy to a Horse. Like unto these are the tame Solinus Oxen, and some other in Asia, who carry packes upon the bunches of their backs, and also bend their knees like Camels.

Of the Lybian Oxen.

There is so great an innumerable number of Lybian Oxen, of so great swiftnesse and celerity, that the Hunters are many times deceived in hunting them, and so do certainly chance or fall upon other wilde beastes for the same they rased, and he in the mean while doth hide himself in a place of brambles and briars, keeping himself there safe, while other wilde beastes doth appear like unto them, and so do deceive the eyes of the Hunters: therefore if any man do begin to follow after either of them, it will be but labour lost, for he is not able to comprehend or attain them with a Horse, except he may take them being wearied by longevity of time. But if any Hunters shall finde a young Calf, spare the life thereof, and shall not presently kill it, he shall reap a double profit by it: and first it doth bring profit to it self, and doth induce or lead his Dam into captivity. For after that the Hunter hath bound the Calf with a rope, the being inflamed by the love or affection which the beareth to her Calf, returneth back again unto it, coveting with an ardent desire to loose and take away her Calf out of the bond or halter, therefore the thralleth in her horn that he may loosen the cord, and pluck her young one away, whereby the is kept fast bound with her Calf, her horns being intangled in the rope. Then cometh the Hunter and killeth her, and taketh forth her liver, and also cutteth off her dugs or udder, and doth likewise pluck off her skin, and leaveth her flesh for the Birds and wilde Beasts to feed upon. There is another kinde of Ox in Lybia, whose horns do bend downward, and for that cause they are fain to feed going backwards. Of the fayings of Herodotus and Solinus, I have spoken before. Pliny doth write, that they are called Oxen going backward, because the broadnesse of their horns doth cover their eye-fight, so that it flanathan them in no use to go forward, but is very commodious to go backward. There is an Ox which liveth in the Woods of Africa, which doth resemble a domestical Ox, yet lesse in stature, of a brown or ruffer colour, and also most swift of foot. This beast is found in the deferts, or in the Marches or limits of the deferts. Their flesh is also of a perfect or absolute savour and taste, good for the nourishment of men.

Of the Indian wilde Oxen.

The horns of the Oxen of the Garamantes do grow downwards toward the earth, and therefore when they feed they bow the hinder part of the neck, (as Solinus writeth) and as we have spoken before in the diversities of wilde Oxen. The Woods also in India are filled with wilde Oxen. In the Province of India where the Gymnos inhabit, are great multitudes of Oxen which live in the Forests or Woods. In these Kingdoms which are upon the borders or confines of India, (in the midst of the day) there are many wilde and great Oxen which live in the Woods. These are Mountains in the utmost Regions of India, which are very hard to come unto, where they sly live those beastes wilde, which are among us domesticall and tame, as Sheep, Goats, Oxen, and so forth. The great King of India doth elect or choose a day every year for the runnings and combats of men, and also fightings of Beasts, who setting their horns one against another, do fight irefully with admirable rage, until they overcome their adversaries. They do also labour, and strive with all their nerves and finewes, even as if they were Champions, or fought for some great reward, or should get honour by their battell.

Wilde Bulls, tame Rams, Aifes with one horn, Hyenes, and lastly Elephants, as if they were capable of reason, they wound them among themselves, and the one doth oftentimes overcome and kill the other, and sometimes fall down together being both wounded. I have also recited before in another place of the intractability of Oxen, those Indian Oxen which are said to be most swift in their joyns in running to and fro, when they are at combate, because there we had not distinguished whether these were wilde Oxen or not: but it doth appear in this place, that they are wholly taken for wilde Oxen: and the thing it self doth manifest that domesticall Oxen are not so swift nor so strong.

The Oxen in India have altogether whole hooves, and also but one horn. Ethiopia also doth Pliny breed Indian Oxen, that is to say, Oxen that are like to those of India, for some have but one horn, and other some three. Solinus faith, that there are found in India some Oxen which have but one horn, and otherwise which have three horns, with whole hooves and not cloven. The Indian Oxen are said to be as high as a Camel, and their horn four foot broad. Ptolomæus doth report, that he saw a horn of an Indian Ox which did hold in the breadth of it thirty gallons.

There
The History of Four-footed Beasts.

There are also Oxen which are bred in India which in greatnesse are no bigger then a Buck, or Goat, they do run yoaked together very swift, nor do end their race with Jelie speed then the Goat-land Horses, and I did not take them to be Oxen living in the Woods, for our Rangifer and Oxen which live in the Woods, are the swiftest of all beasts in this kinde, and most apt to combats and runnings, and they may partly be called Oxen having one horn, and partly Oxen having three horns: neither are they found in Scandinavia, but also in other Regions and Dominions of Asia, as we believe that Indian Oxen are of the same kinde. Selinus doth not rightly call those Indian Oxen, which Aristotles callth Eebiptec, as I have declared above in the story of the Eebipte Oxen, for their horns are moveable. Ctesias doth write, that there are sprung up among the same beafts, that beast which is called Mynstecors: which is manifested by Aristotles in his History of Four-footed beafts. Persians also and others have not conidered this error. Among the Areobantia there are Oxen which live in the Woods, which do differ from those that are bred in the City, as much as wilde Swine from tame. Their colour is black, bending a little downwards, and their horns broad and upright. There is a City in India called Areobantia, taking the name from the River Areobantia, which doth flow out of Canacial, what those beafts are which do bend their horns upward, I have declared in the story of the Bifon; for as there may be spoken something concerning the difference of the Plants of the Woods, so also concerning the beafts that are bred in the City, and those that are bred in the Woods.

Of the WEASEL.

There are divers kindes of Weaftel, but in this place we do intreat of the leaft kinde, whose form and shape we have also here let down. It is likewise properly named of the Latines, WEASEL, a Weasel, for to we were wont plainly to name those which were common and domesticall, and to addie names to those which are more feldome seen, or live in the Woods for differenceake.

The word Chold in Levit. 11. is tranflated a Weafel of all Interpreters. The Rabbinis do call them Choldab, and commonly Mufela, as David Kimbi writeth. The Chaftalas do tranflate it Cholda, the Arabians Calcab, the Persians Gurba, and Hieron. Mufela. Oach is an Hebrew word, whereupon it was once called Obim, plurally in Ifai. 13. Babylon submersor, or implentis domus corum Obim, Munfierius cercopithecos verit. That is to say, Babylon fhall be overthrowed, and their bowes fhall be fied with Obim, that is, Weafels, but Munfierius doth call them Munkeys. David Kimbi, and the Maifter of Talmaid, do call it Nemilab, that is, like to a Cat, but commonly they call it a Marten, or Wirum, and Furon. The Authors of the Concordances of the Hebrewes, do interpret Kopb, Circopithecum, or Capbam, and Calcab, that is to say, Mufela, a Weafel, as the Hebrews do think. The Chold hath tranlated a Marten Obija. Simmabius also hath left or forfaken the Hebrew word. Aquila doth tranflate it Typhonis, that is, a Whifne-winde, Hieronymus doth tranlate it Draco, that is, a Dragon.

Roid is truly intrepted to be a kind of Lizard, or a Chamelion; in Levitices II. We also reade in Albertus, Mif, and Hyrcan, two barbarous words) for a Weafel, which he himfelf doth not underland: but I have difcерned or taken this signification out of the words of Aristotles: for Albertus doth moft unlearnedly expound Hicrum a Hare, being deceived, because both the living beafts do often times remove their young ones from one place to another in their mouths. Pethlis doth feem to be according to Aristotles, no other thing then Gale, that is to say, a Weafill. For Fryton (faith he) it hath wit like a Fox, that is to say, in fettling upon Hens or Chickins, and the other fhape and form of it is Kafiz, that is to fay, Mif, a Ferret. Namiflasa also is even to this day called a Weafel among the Greceens. Ibanusfe is also called a Weafel, Ibanwes is a little four-footed beaft. balas doth dofe feem to fignifie a Weafel, by a feigned word proceeding from the French or Italiens, which do call altio Beletam, Babotam pro Mufela, for a Weafel, but some of the later Greceens do abuse it, in terming it a Cat, as I have spoken before in the History of the Cat.

Theorem Casa in Aristotles doth interpret it sometimes a Weafel, and other sometimes a Cat; neither can I sufficiently gather wherefore he doth change it, feeling that the Greceens call Catam for a Cat Aethrum, and the Latines Felum. Some fay, that Mufela for a Weafel hath been interpreted
or declared of late days, being only led (if I be not deceived) with the affinity of the German word, for the German do call Musfela a Wifel. The Grecians do usually take to this day Musfela for a Weasel, as I have read in the Oration of Suidas. A Weasel is called in Italy Donuia, or Balbutla. It is apparent by the words of Avice, that Donuia, and otherwife Donuia is barbarously used pro Mift. Scops. la for a Weasel: Albertus and Niphon do write Donuia for a Weasel, by the which word, the later Writers do very obscurely understand Donuia for a Weasel, which is of the kinde of Goats living in the Woods. Donuia or Donuia is a small and weak beast, (as Itharus writeth) speaking of those that are wilde, and will not come to hand. When it doth bring forth young, it doth presently devour the Seconds or those that come after birth, before they touch the earth, and yet it is a prey Albertus, it self to other Four-footed beastes. You may also seem to take a little Dear, or a kinde of young Goat, or a Weasel, for that kinde of beast which doth devour her Seconds: But we read that neither of these do it.

The Lizard is said to devour her first litter which the litterer in her old age We also call Domestickl Weasels, Furms. A Weasel is called in France, Belote, or Belette, and Albetae. Some as I do hear, which do inhabit about the Towns of Meta, do call them Bacul. Carolus Figuli doth interpret a Weasel in French, Trousierum, or Marteuel, of which I have shewed before that there are two kindes, and also that there are Weasels living in the woods. In Spaine also they are called Comaveria. The people of Rhetia which speake Latin, do keep the Latin name. The Germans do call them Wiel or Wifelse. Georgius Agricola faith, that it is called a Weasel by reason of the noise that it maketh. Otherwise dwelling in Helvetia, do call it Herron, and some do call it by a corrupt word Hanuim, but those ought only to be named so which are altogether white, and are found in Winter time. But here in England it is called a Weasel, and some do write it Wease, or Weasal: But the white Weasel is called Mynver, by the transplantation of the letters of the French word, it is called Herminne, and among the Iberians, Kolcama.

Some do think at this day, that the beast whose shape and form we have given for a Weasel, is the Shrew-mouse, but not rightly, for their only reason is, that the bitings of it doth poyson and harm almoft in like manner. Albertus also doth write, that the Sea Weasel is called the field-Shrew, which is utterly false and untrue: For the Shrew is called among the Grecians, Mygale, male or female. They do now also commonly call Ecbemnon the Indian Mouse, and otherwise the fallow Deer: But Donuia, or Donuia, is of the Italians and some later barbarous Writers, altogether called a common Weasel, and not Ecbemnon, which is a peculiar beast to the Egyptians.

Now the reason of the Latin name Musfela, Carolus Figuli is of opinion, that it is derived of My Niphon, and Stelis, two Greek words, because it devoureth Mice, and both the Germans and the English derive their word Stiel, or Stelis, to rob or flitch, from the Greek word Stelis; so that it is so called, because this Weasel is a pill, and secret, stealing, and devouring beast. Caecilis faith, that Musfela is gaeulorius Mys. This beast is also called by Arfisile, Habeniuin, and it is said, that it hurteth Moles or blinde Mice.

The Epithets hereof are, fearfull, in-creeper, and swift, and beside these I finde not any matteriall, or worthy to be rehearsed. Now concerning their outward proportion, it is as we have here described, a long and thin body, but the colour thereof varieth; for some of them are brown, and branded, some black, and some clean white, which have been shewed already to be the Egyptians for in some places of Germany, Hibisilia, and the Alpes, the Weasels in the Winter become all white. But forasmuch as there are two kindes of Weasels, one vulgar and domesticket, living in houses and Cities, and the other wilde, living in the Woods and Mountains: we finde alfo that they differ in colour, neither of both being conflant in the same: for the domesticall Weasel is upon the back, and side fandy, red, and sometyme yellowish, and alwayes white on the throat, yes, sometymes as Geor. Agricola writeth, they are all white, whereas no man ought to wonder, seeing the Hares of Helvetia do in the Winter time turn white: And of these white Weasels or Ermine there are abundance in the Northern parts of Europe, where their Summers are short, and their Winters long: And these white Weasels differ nothing from the common vulgar Weasels of other colours, except that their hair flck faster to their backs; and it is observed, that in Allia the Noblewomen are apparelled with these skins; And there is a Wood in Scandinavia (called Lamiuscules) which is of fourscore mile long, wherein are abundance of white Weasels: And the Kingstents among the Tartarians are paid to be covered all over with the skins of Lyons without, and the walls to be hung with the Ermin or white Weasels within; and although the price of these skins be very dear among them (for sometimes so many as are used in one Garment will cost two thousand Crowns) yet do the people earnestly seek after them, accounting it no small honour, to wear so much wealth upon their backs.

Now the reason why these beasts came to be called Armines, is from Arnilla a chain, because they did wear them in fringes about their garments like chains; and although that some of the Alpine Mice be all white, and likewise the Pontique Moue, yet there must be a difference observed betwixt these Weasels which are properly called Armines, and those Mice which are so called, only by way of resemblance, as we have shewed already in their Stories. And of the Pontique Moue, I may add thus much more, that they live in the Winter time in hollow trees, wherein they become as white as snow all over, except their tails, and are in quantity like Squirrels, but in the end of May they turn somewhat red, because that they give themselves to copulation and generation of young ones, when they lay aside their whiteneffe, and live many days together in carnall copulation,
The History of Four-footed Beasts.

Of the Lemmar.

There are certain little four-footed beasts called Lemmar, or Lemmus, which in tempestuous and rainy weather, do seem to fall down from the clouds, and it was never yet found, whether their beginning arose first from heaven or earth, but this is certain that as soon as ever they have fallen to the ground, some of them have been opened, and in their bowels have been found green herbs, and therefore I marvel why ever it should be believed that these beasts are bred of some feculent matter in the clouds; but if any man ask me from whence then have they their beginning, I answer from the earth, even as Locusts and Caterpillers, who are said in holy Scripture to be carried to and fro with the winds, and so these beasts being delitute of natural food in their places of generation, do advance themselves into the wind, and so are carried into other strange and unknown Countreys, where they fall like Locusts upon every green thing, living until they have devoured all, but when once they taste of new grown herbs, they perish and die, by means whereof they encrease great pestilence and corruption, but the Arminns or Arminns do eat and devour them.

Now the Skins of these beasts are exceeding delicate having in them divers colours, and therefore the people flea them off from their bodies, and sell them by thirty or forty in bundles, for great price; but of these skins I have said enough, both here and elsewhere. The wide Weasels differ not from the vulgar domestical Weasel, their foreteeth are short and not long like a Moufe, the face broad, their genital part like a Foxes, their tail short, their legs and claws short, strong and sharp; and it is reported by Strabo, that the Weasels of Mauritania are as big as Cats, but their gaping and opening of their mouth much longer, and wider. There is an Island called Dordceles, on the one side whereof (as Pliny writeth) there are Weasels, and through the middle there is a way over which they never passe, and on the other side there are not only not any bred, but also if they be brought into it, they die and perish, and so likewise it is reported of Besta.

They make themselves caves and holes in the earth, rocks, and walls, wherein they lodge, into the which they frame two passages or doors, one into the South, the other into the North, (resembling herein the Squirrels) that so they may be free from the wind, on which side forever it bloweth, sometimes they get into stacks of Hay and straw, and there they lodge: those Weasels which live near houfes sleep not much, for they have been seen abroad all the Winter time, not only the vulgar but the Arminns; neither are they unthankfull unto the Countrey men in whole houfes they lodge, for they kill, eat, and devour all manner of Mice, Rats, and Moles; for because of their long, slender bodies, they are apt to creep into the holes of the earth, and narrow passages, fetching their prey from those places whither Cats cannot come; therefore in Helvetia the Countrey men nourish them more then Cats, because they destroy more vermin then Cats. The harm they do is to Hens, Chickens, and Eggs, and yet some fay they eat the Eggs and let the Hens alone: they are likewise enemies to Glee, and devour their Eggs; and Artemus writeth, that when they come unto dead men, they will pull out their eyes in such manner as they do Eggs, and therefore such Carkases are to be watched against them. Amyntas writeth, that the Shrew-moufe is conceived betwixt a Moufe and a Weasel, which opinion is not only ridiculous, but impossible, for how is it likely that a Moufe will engender with that beast which lyeth in wait to destroy her? It is also said, that a Weasel fighteth with those Serpents that hunt after Mice, for no other caufe, but to gain the prey from him.

There is nothing in this beast more strange, than their conception and generation, for they do not engender nor couple in their hinder parts, like other four-footed beasts, but at their ears, and bring forth their young ones at their mouth, and for this caufe Africitas writeth, the Jews were forbidden to eat them, for this their action was an emblem of folly, and of foolish men, which can keep no secrets, but utter all that they bear (thus faith he) But we that are Christians knew other reasons why the Jews were forbid to eat them. The Egyptians make of it another sign, for they say, that their copulation at the ear, and generation at the mouth, are emblems of speech which is first taught to the ear, and then uttered by the tongue: there be other again that hold this to be a fable: And Pope Clement writeth, that they conceive at the mouth, and bring forth at the ear. Many fay, it is true of the Weasel of the Sef, but not of the Weasel of the earth, which is therefore called Collitara, and this they would confirm by another fable of Medusa, whose head after it was cut off, it is said to bring forth Chrysaor and Pegasus; some do allledge for this opinion, that the Crows and the Dis do conceive at their mouths: but this is certain, that they have places of conception underneath their tails like other four-footed beasts, and therefore how it should come to passe, that their young ones should come forth at their mouths, I cannot easily learn. It may be that the opinion thereof first arose from the sight of some old one carrying her young in her mouth, for the young ones are very small like Mice, and therefore it is likely that they receive them to and fro, as Cats do their young ones, for they are in continual fear, lest they should be taken and destroyed by men, or by some other enemy beast.

The dung of Weasels doth smell many times like musk, the reason whereof we have shewed you in another place, all of them in general have a most rank and filthy favour. It is a raving and destroying beast; and although the body of it be very small, yet is the wit and understanding of it very
very great, for with singular art and subtility it compasseth his prey, whereupon there lyeth this history of Galanthis the maid of Alcmena, as Periuss observeth out of Ovid. When Alcmena was in long travel and child-beirth, it is said that the maid perceiveth she was hindered by Lucina, carefully obtained not only the knowledge of the caufe by Lucina, but also the remedy; whereupon she eafed her Lady, (like a true and faithful servant) of many pains. Lucina seeing that she was beguiled by Galanthis, and that her crafty wit had over-reached a Goddeffe, she turned her into a Weafel, for her punishment, that as she had finned by revealing of the counfell of the Goddess, fo she should be punished to bring forth all her young ones at her mouth, as Weafels do; and for this occafion, the Domethcall Weafel like a Maid doth continually live in houses, and her colour yellowish like the hair of Galanthis; thus fay they of metamorphosing and transforming.

Other fome fay, that when Alcmena was in travail of Hercules, having induced long torments, she was delivered by the weight of a Weafel which came in her prefence, and therefore the Urban Greats do religiously worship a Weafel, for they fay, that as it was nourfhit by Hercules the Goddeffe, fo it did nourfhit Hercules; but herein they take Gale for Galanthis aforefaid, that is, a Weafel, for Alcmenas maid. And feeing we have begun to talk of transformations, I will addle another thing out of Stobius, not impertinent to this common place, for he writeth in the difpofe of women, that the diuerfity of their diijpositions perfwadeth him that some of them are derived from one beaff, and fome from another: and namely thofe which come of Weafels, are a mirifible, fullen, and forrowfull kinde of women, to whom nothing is pleasing, delightfull, or acceptable, but having no minde to the pleafure of Venus, loathing her husband, hurtheth her neighbours, robbeth her elf, and devoureth confecrated and hallowed things, even after the manner of Weafels, which will take a booty from the Altar: Thus faith he, which I believe to bee true in the comparifon, but not in the generation or tranfmutation of women from Weafels.

I do marvail how it came to paffe, that a Weafel was called, an unhappy, unfortunat, and un-lucky beaff among Hunters, for they held opinion here in England, that if they meet with a Weafel in the morning, they fhall not speed well that day; therefore the Greats lay Galeft in, and Alcmenas excllent Emblem, whereby he infinuateth that it is not good to have a Weafel run upon ones left hand, and therefore advifeth a man to give over his enterprize after fuch an Omen. Now although I would have no wife man to f tand in fear of fuch a superfition concife, yet I will subscribe his verfe, more for variety and elegancy, then for truth:

\[\text{ Auspiciis res copia melius cedere nec sit:} \]
\[\text{ Puleci que jant omne facta, juvat.} \]
\[\text{ Donum agis, Melita tibi faccurret, omittae:} \]
\[\text{ Signa melius facis bisfis praevit gerit.} \]

It fhould seem that the beginning of this opinion did come from the punishment of a certain General of the Corintians Navy, who being perjured in breaking his faith to that Stare, came running away from them; and they fay, that afterwards he could never flepp, but that he dreamed Weafels came and tore his fleshe from his body: At laft through anguish and grief of mindes, he flew himfelf. These things are reported by Hecatides, which whether they be true or false, are but a filly and fender foundation to build upon them a Propheticall opinion, or preface future evils; and fo I will leave the morall part of the Weafel, and return again to the natural. They have knowledge like Mice and Rats, to run out of houfes before their downfall. They live in ha- tred with the Serpent that hunteth Mice, for by eating of Rues they drive them out of houfes wherein they inhabit; and this is a wonderfull work of God, that this filly beaff fhould have the knowledge of the vertue of that herb, and not only arm her felf with it. because it is hateful to Ser- pents, and they in no wif in nature able to abide it, but alfo by it to refore to life again her young ones after they are dead.

There is a pofoon in Weafels which defroyeth the Cockatrice, for when the Weafel findeth the Cockatries hole or den, the layeth her pofoon in the mouth thereof, whereby two contrary na-tures meet and fight, and the leffer overcometh the greater, and this is affirmed both by Pliny and Salinus; wherefore all manner of Cattle do fear Weafels. They hunt all manner of bodies, pulling out their throat as a Wolf doth a Sheeps. They will play with Hares till they have wearyed them, and then defroy them; they are in perpetuall enmity with Swine, Rieves, Crowes, and Cats, for although Cats sometimes let upon them, yet they cannot overcome them. In many places of Italy they are nourifhed tame, as for Ferrets are used to fetch Conies out of the earth, fo are Weafels by tying a string about their neck, to fetch young Pigeons out of Dove-cotes, and birds out of their nets. If the powder of a Weafel be given unto a Cock, Chickens, or Pigeons, it is fad, they fhall never be aNNoyed by Weafels.

Likewise if the brain of a Weafel be mingled with a renet in Cheefes, it keepeth them from being touched with mice or corrupted with age. The fleshe of a Weafel is not used for meat, but dried and preferved for medicines. The powder thereof mixed with water, driven away Mice, by callinge the gall of Stellus in a houfe where Weafels are gathered together, and then by Oyl of bitter Almonds, or falt Ammonia this may be killed, but if one of their tails be cut off, all the refidue do forake the houfe. And thus much shall suffice concerning the History of Weafels, now followeth the medicines arifing out of their bodies.

---

The signification of a Weafel's occurrence.
The History of Four-footed Beasts.

The Medicines arising from the Weasel.

A Weasel being applied unto those which are troubled with Agues or Quartern Fevers, doth in short time cure them. It doth also being mingled with other things make a wonderfull pleasant mollifying medicine for those which are troubled with the gout, or any other infirmity in the joynts, and eateth those which have a continual ache in the head, leaving a certain matter on the top thereof, and stroaking it from the forehead to the hinder part of the head.

For the curing also of the gout, this is an excellent remedy. To take a little young whelp alive, well fatted, and a living VVeasel in nine pints of Oyl, and unto the same two or three pounds of Butter, and to boil them together, until the beasts be made lank or lither, and then to put your hands or feet a whole day in hot Oyl well strained. Avicenna attributeth certain things to VVeasels' flesh only, which the clashcall Authors rather ascribe to the powder of VVeasels which are thefe: to be applied to the gout, being drunk in wine against the Falling sicknese, and the head-ache, but it is accounted an effectual remedy against the bitings of Scorpions.

The flesh of a VVeasel being taken is a very good and effectual preservative against all poysions. The fame being taken in meat, the head and feet only call away, both help those which are troubled with wens or bunches in the flesh, being first annointed with the blood of the same beast. The blood of a VVeasel is very well applied to broken or exulcerated fores in the flesh. The fame vertue hath the whole body of a Weasel, boiled in wine, being in the manner of a plater placed thereunto. For the expelling of the gout take a dead Weasel, and boil it in Oyl, until it be made liuid, then strain forth the Oyl, and mingle it with wax, fathioning the fame in the form of a plater, and this being in good order applied, will in very short time expell it quite away.

A house Weasel is wont to be burned for divers remedies, and to be embowelled with salt, and dried in a shade. But there are some late writers which affirm, that a Weasel is better being dried or burned for the said disese, then used in the aforefaid manner, some also which are more foolifh, think it best, being only salted, but it is more proper, being used in the first manner.

The bodies of creatures which are dry by nature being dryed by the sprinkling of salt upon them, are unmeet for food, for a certain man going about to salt a Hare, made it like unto a dryed VVeasel. Some have written that the flesh of a Hedge-hog dried, doth very much profit those which are troubled with an outward or inward leprome: which if it can effect, it will more strongly have a drying force or power: even as the flesh of a VVeasel being dryed, and drunk in wine, expelleth poifon. A vulgar VVeasel being kept very old, and drunk in wine, to the quantity of two drams, is accounted a preuent remedy against the venom or flings of Serpents.

A young VVeasel being prepared, as is before faid, that is to say embowelled with salt, is of good force against all ill medicines. A VVeasel used in the fame manner doth presently cure the bites of Serpents. A VVeasel being burnt and dryed, especially the belly thereof, is accounted an excellent remedy against the bites of any other wilde beast. Some small part of the belly of a young VVeasel, to the quantity of two drams being bucket with Corander, and drunk in wine, is given to those that are bitten by Serpents, and is curable for them. The flesh of a VVeasel being burnt, mingled with Rue and wine, and so drunk, is very medicable for the curing of the bites of all creatures. The young whelps of VVeasels being imbowed with salt, is very profitable for the healing of the deadly flings or bitings of the Spider called Phalangium.

The whole of a Weasel doth cure the venemous bitings of the Shrew. The flesh of a Weasel being dryed, doth strongly drye and separate, by both which forces those are healed which are troubled with the Falling sicknese having drunk it in wine. This vertue is also attributed unto the blood of a Weasel. A Weasel being dryed and drunk in wine, doth heal those that are troubled with the Palfie or flaking of the joynts. Concerning the powder of Weasels, there are many things read: But Galen writeth, that he never burned this creature, that he might try the excellency thereof. The blood and powder of a Weasel are very profitable, being anointed on those whole bodies are vext with the leprome, according to the laying of Serenus in these verses;

---

Serenus.

Elephanti

Marbo adversus et ridet de cortice succus;
Muffelave evi vel fujus sanguis ab illo.

The powder of a Weasel being mingled with the blood of a young Swallow doth heal the Quinzie or Squinzie, the inflamation of the jaways, as also those which are grievd with the strangury, being either taken in bread or in drink. The fame is also very effectual for the expelling of wens or bunches in the body, and healeth those which are troubled with the Falling sicknese, being dayly taken in drink. The same diseases are both healed by this medicine, to burn a living Weasel altogether in an earthen pot, and to mingle with the powder thereof Hony, Turpentine, and Butter, of each a sufficient quantity, and in the manner of an Ointment, to apply it unto the bodies of the grieved partie. The blood of a Swallow and a Weasel are commended by some to be very congruent and agreeable, but Pliny, Avicenna, and the rest of the antient writers commend the blood of a Weasel only to be very medicinable for these diseases following; namely, the Falling sicknese, the Foul evil, and the head-ache.
Of the Weasel.

The powder of a Weasel being mingled in water, and given to one that is mad or frenzy to drink, Pliny, is reported by some to be very good and profitable for him, if so be that they can compel the frantic person to perceive it. The powder of a Weasel is very effectual for the expelling or taking away of the pin and web in the eyes. There is a speedy remedy for the driving away of rheum in the head, and the Cataract swelling by rheum in the jaws, which is this. To take a Weasel upon a Thursday in the old Moon, and put him alive in an unburned pot, that in the Boyling he may be torn, and dried into powder, which powder being gathered together and well tempered with Honey, to give it to the diseased person every day in a spoon falling, to the quantity of three drams, and it will in short space wonderfully eafe him.

A Weasel being burnt, and the powder thereof wrapped in some fear-cloth which is anointed over with the Oyl of Flower-deluces, doth help and heal all fores or impostumes proceeding from the head to the ears, being applied thereunto. A VVæsef being beaten to powder, mingled with wax, and in the manner of a fear-cloth applied unto the shoulders, doth expell all pains, aches, or griefs therein whatsoever; it doth also purge or cleanse fores very effectually, according to these Veres of Sennus following:

*Obiects sc. ponc locos nova vulnera carpant,\* *Hormentum mensa curaritur fronte ruborum.*
*Et si jam vetei succedit follia morbo,*
*Mafculti inerne immisit, purgabitur uleum,*
*Sanguine cum viciue, quem bov gestauerit ante.*

A VVæsef being burned in an earthen pot, is very medicinable for the curing of the gout. The powder thereof being mingled with Vinegar, and in that manner thereunto applied. The dust of a living VVæsef burnt, mingled with wax Rose-water, and anointed with a feather upon gouty legs, cureth the same disease. The brain of a VVæsef being kept very long, and thoroughly dried, afterwards mingled with Vinegar, and so drunk, doth very effectually cure the falling fickness.

The brains of a Camel mingled with the brains of a VVæsef, being both well dried, and drunk in Vinegar, speedily helpeth those which are troubled with the disease called the Foul evil. If a horse shall fall into a fuddain disease (being for the most part termed dangerous) which our Countrymen call Reecb, concerning which I have spoken in the Horse, he is cured by some Horse-couriers by a small quantity of a VVæsef's skin, being about the bigginne of a forefayd golden Crown) which is given to him inwardly, whether in a potion by some horn, or cut small and mingled with chaffe, I know not. Some do give to the Horfes troubled with the aforefoaid disease the tail of a white VVæsef being half black, and half white, cut exceeding small in their chaffe or provender. If a Serpent or any other venemous creature shall fling or bite an Oxe, let the wounded place be strowed or smoothed with the skin of a VVæsef, and it shall in short time be perfectly cured. The same they do in a manner command to be done to Horfes which are so flung or bitten, rubbing the wound with a Weasel skin untill it wax hot, ministring in the mean time some certain Antidote within the Horfes body. There are some also which are of opinion that the skin being in the fayd manner applied, is of no efficay, but that the whole beast being cut and applied while it is hot, will rather profit, which both in a Shrew, as also in many other creatures is manifest.

The blood of a Weasel being anointed upon any impostume arising behinde the ear, doth instantly causeth the swelling to cease, or being broken, doth speedily heal the sore. The same also being anointed upon any impostumes in the head either whole or broken, doth very effectually cure them. The blood of a Weasel being anointed upon wevs or bunches of flevel in any part of the body doth instantly expel them. The same doit also help those which are troubled with the Falling sicknesse: which disease is also cured by the whole body of a VVæsef either burnt or embowed with salt. The head and feet of a VVæsef being caft away, and the body taken in any kinde of drink, doth perfectly heal those which are troubled with that peltiferous disease called S. Jobus evil. The blood of the fame beast is an excellent remedy for the expelling of the foul evil. The blood of a Weasel being anointed upon broken or excuterated bunches in the flevel, doth not only mitigate the pain, but also heal the wounds. The blood of a Weasel being anointed upon the jawes, doth heal all pains or fores therein whatsoever. The powder and blood of a Weasel being both mingled together, and anointed upon the body of any leprous man, doth in short time drive away all scabs or surces thereon. The blood of a VVæsef being anointed with a Plantain upon the legs or feet of any one that is troubled with the gout, doth very speedily mitigate or allwise the pain thereof. The same being anointed upon the veswes or sinewes which are thrum together, doth easilly mollifie them again, and loosen the grievous pain either in the joynts or articles. The liver of a VVæsef mingled with his own brains, being both well dried, and taken in any kinde of drink, doth very much profit those which are troubled with the disease called S. Jobus evil. The liver of a VVæsef, being thoroughly dried, and afterwards taken in water to drink, doth heal the disease called the Foul evil, taking hold of fenes and munde together: but there mult great care be had that this medicine be ministered unto the sick party, even when the disease is coming on him. The gall of a Hare being mingled with the liver of a VVæsef to the quantity of three drams, one dram of Oyl of Beavers stones, four drams of Myrrhe, with one dram of Vinegar, and
and drunk in hony, or baftard wine, doth heal those which are troubled with a dizziness or certain swimming in the head. The liver of a Weasel is reported to be very good and medicinable for the curing of the Lethargy, and DropFre evil. The liver of a Weasel being bound to the left foot of a woman, doth altogether hinder her from conception. The gall of a Weasel is a very excellent and effectual remedy against the venom or poison of Asps, being taken in any kind of drink. The yard of a Weasel, Hart, or Doe, being dried, and beaten to powder, and taken in wine, or any other drink, is an excellent medicine for the curing of the bites or stings of Serpents. The yard of a Weasel or Ferret, is commended for a very excellent remedy against the strangury, or distempe called the Colicke and stone. The ftones of a male Weasel, or the secret parts of a female Weasel, is reported by fome to be very medicinable for the curing of the Falling sickness. The ftones of a Weasel being bound unto any part of a woman while theis is in travail of childe birth, doth altogether hinder her from delivery. By the left ftone of a Weasel being bound in a piece of a Mules hide, there is a certain medicine made, which being drunk by any woman not being with child, caufeth barrenneffe, as also by women being with childle, hard and grievous pain in delivery. The efficacy or force in them, have the ftones of a Weasel being cut off in the change of the Moon, and he suffered to go away alive, being tied upon any part of a woman in the hide of a Mule. The heel of a living Weasel being taken away and bound unto a woman, doth make her that the shall not conceive fo long as the shall fo bear it. The powder of a Dogs head dried, being put into any broken or exulcerated fores, doth eat away all the corruption or dead flfle encruling therein. The fame vertue hath the powder of Weafels dung, being ufed in the faid manner.

The dung of Mice or of a Weasel, being anointed upon the head, is an excellent remedy for the falling off of the hair on the head, or any other part of mans body, and doth also cure the difafe called by fome the Foxes evil. The biting of a Weasel is reported by fome to be very venemous, and in his ravingen or madneffe not to be leffe hurtfull then the bitings of mad Dogs. For Weafels and Foxes are very often mad. But arnolbis is of a contrary opinion, and affirmeth that the Weasel doth more hurt by his biting, then by any venom he can put forth. Others also do affirm, that there is venom in Weafels for this caufe, that in all kinde of Weafels when they are angry, the force of their fmmel is fo rank and strong. The beft way to drive away Mice, is by scattering the powder of Weafels or Cats dung up and down, the favour whereof of Mice cannot abide, but the fame being made into some certain kinde of bread will smell more strongly. That the bites of a Weasel are venemous and deadly, there is an example written by Arifides, of a certain man who being bitten by a Weasel, and ready to die, gave a great figh, and fayd, that if he had died by a Lyon or Panther, it would never have grieved him, but to die by the biting of fuch an ignoble beatt, it grieved him worse then his death. The biting of a Weasel doth bring very quick and grievous pain, which is only known by the colour, being dusky or blewith: and it is cured by Onions and Garlick, either applied outward, or taken in drink, fo that the party drink sweet wine thereon. Unripe Figs alfo mingled with the flour of the grain called Orobs, doth much profit the fame. Treacle in like manner being applied in the manner of a plaifter, speedily cureth them. Garlick being mingled with Fig-tree leaves and Cinnamon, and so beaten together, are very well applied to the faid bites. It cometh also to passe, that sometimes the Weasel biteth some Cattell, which prefently killeth them, except there be some infall remedie. The remedy for this is it, to rub the wounded place with a piece of a Weafels skin well dryed untill it waxe hot, and in the mean time give the beft Treacle to drink in the manner of an antidote. The Weasel ufually biteth Cowes dugs, which when they are fwnollen if they be rubbed with a Weafels skin they are instantly healed.

Of the WOLF.

The several names.

A Wolf is called in Hebrew Zeb, as it is faid in Gen. 49. and among the Chaldeans, Detha and Deo, among the Arabians Dih. The female is called Zebab a the-Wolf; and the malucine Zebim, but in Ezech. 22. it is called Zebabib, that is to fay, a Wolf. Aljebba (Heith. And. Bohum.) is a common name for all Four-footed beasts which do feet on men, killing and tearing them in pieces, devouring...
devouring them with their teeth and claws, as a Lyon, a Wolf, a Tiger, and such like, whereon they are said to have the behaviour of Arizona, that is, wilde beasts which are fierce and cruel. From hence happily cometh it, that not only Albertus, but also some ignorant Writers do attribute unto a Wolf many things of which Aristotle hath uttered concerning a Lyon.

Oppianus among the other kinde of Wolves hath demonstrated one which is bred in Glicicia. And also hee doth write, that it is called in the mountains of Laurus and Amyntus, Chryson, that is to say, Aurum, but I conjecture in those places it was called after the language of the Hebrews or Syrians which do call Sabab, or Schab aurum, and Seb Lupum for a Wolf, or Dabab, or Debab for Aurum: They also do call Deb or Debba for a Wolf. Dib (other the wife Dib) is an Arabian or Syrian word: Also the translation of this word in the book of medicines is divers, as Adib, Adip, Aladip, and Aldip: but I have preferred the last translation, which also Befutunis doth use. Adip Alambat doth signify a mad or furious Wolf. The Wolf which Oppianus doth call Aurum, as I have said even now, doth feem to agree to this kinde, both by signification of the name Aurum, and also by the nature, because it doth go under a Dog close to the earth, to etch the heat of the Summer, which Oppianus doth write, doth seek his food out of hollow places, as a Hyena or Dabb doth out of graves where the dead men are buried. The golden coloured Wolf is also more rough and hairy than the residue, even as the Hyena is said to be rough and maned. And also these Wolves necks in India are maned, but it differeth according to the nation and colour where there are any Wolves at all.

Lycaon a Wolf among the Grecians, and Lupus, and Lycaon, and Lycos, among some of the Arabic Writers, is borrowed from them, as Mulfer hath noted in his Lexicon of three languages. In Italy it is called Lupo. In French Loup, in Spain Lobo, in England Wolf. In Libya, Lobo, as it were by a transposition of the letters of the Greek word. Now because both men, women, cities, places, mountains, villages, and many artificial instruments have their names from the Latin and Greek words of this beast, it is not vain or idle to touch both them and the derivation of them, before we proceed to the natural history of this beast. Lupus as some say in Latin is Quafer, or Lupiter or earth, because it refembles a Lyon in his feet, and therefore Lycos or earthe, wrote, that nothing liveth that it preseth or treadeth upon in wrath. Other derive it from Lycus, the light, because in the twilight of the evening or morning it devoureth his prey, avoiding both extreme light, as the noon day, and also extreme darkness as the night. The Grecians do also call them Nydernis canes, dogs of the night. Lupus and lupula were the names of noble devouring Harlots, and from thenceforth cometh Lupanar for the Swees. It is doubtfull whether the nurse of Romulus and Remus were a Harlot, or she-wolf, I rather think it was a Harlot then a Wolf that nurfed those children. For we read of the wife of Eosulus, which was called Larentia, after she had played the whore with certain Shepherds was called Lupa. In all Nations there are some mens names derived from Wolves, therefore we read of Lupus a Roman Poet, Lupus Servatus a Priest or Elder, of Lupus de Oliveto a Spanish Monk, of Fulbus Lupinus a Roman, and the German have Vulf, Vulpe, Hard, Wulfgang.

The Grecians have Lycembe, of whom it is reported he had a daughter called Nebole, which he promised in marriage to Archibocus the Poet, yet afterwards he repented and would not perform his promife, for which caufe the Poet wrote against him many bitter Verfes, and therefore Lycembe when he came to knowledge of them, dyed for grief. Lycaon was a common name among the Grecians for many men, as Lycos Gnaios an excellent maker of edged tools. Lycoen the brother of Nefer another, the son of Priamus Ilian by Agbabie: But the famous and notorious among all, was Lycaon, the King of Arcadia, the son of Titarn and the earth, whose Daughter Calife was deflowed by Jupiter, and by Tana turned into a Bear, whom afterwards Tana pitying, placed for a sign in heaven, and of whom Virgil made this Verse:

Pleides, Hyadus, claramque Lycaonis Arljin.

There was another Lycaon the son of Pelasgus, which built the City Lycaon, in the Mountain Lycus, this man called Jupiter Lycaon, upon a time sacriificed an Infant upon his Altar, after which sacrifice he was presently turned into a Wolf. There was another Lycaon after him, who did likewise sacrifice another childe, and it was said, that he remained ten years a Wolf, and afterwards became a man again: whereof the reason was given that during the time he remained a beast, he never tasted of mans flesh, but if he had tasted thereof he should have remained a beast for ever. I might add hereunto Lycoethon, Lycoethes, Lyceinimnus, Lyctinus, Lycomedes, Lyconus, Lycus, and of womens names, Lyra, Lyce, Lycofar, Lycofaris, Lycias, and many such others, besides the names of people, as Ipria, of Mountains and places, as Lyabetus, Lyceus, Lycrea, Lyconnia, Lyconus, Lycoethon School. Of floods and Rivers, as Lyceus, Lycomes. Of Plants, as Wolfbane, Lupum fulcidarium, Lupinus, Lycreuthus, Lycofarus, Lycofaris, Lycofaris, and many such others, whereof I have only defined to give the Reader a taffe, following the same method that we have observed in other beasts. And thus much shall suffice to have spoken of the names of this beast.

The Countries breeding Wolves, are for the most part those that follow. The inhabitants of Crete were wont to say, that there was neither Wolves, Bears, nor Vipers could be bred in their Countrieys illand, because Jupiter was born there; yet there is in a City called Lycaon, (so named for the breeding multitude of Wolves that were abiding therein.) It is likewise affirmed of Sardina, and Olympus, Wolves.

Cec 3 a
The History of Four-footed Beasts.

a Mountain of Macedon, that there come no Wolves in them. The Wolves of Egypt are less than the Wolves of Greece, for they exceed not the quantity of Foxes. Africa likewise breedeth small Wolves, they abound in Arabia, Sxenia, Ethiopia, and the Earl-domes of Tyrol in Muscovia, especially that part that boundeth upon Livonia. The Wolves of Saxonia, by reason of extremity of cold in those parts, are blinde and lose their eyes: There are no Wolves bred in Lombardy beyond the Alps, and if any chance to come into that Country, prently they ring their Bells, and arm themselves against them, never giving over till they have killed him, or drove him out of the Country. In Norway there are three kides of Wolves, and in Scandinavia the Wolves fight with Elks. It is reported that there are Wolves in Italy, who when they look upon a man, cause him to be silent that he cannot speak. The French men call those Wolves which have eaten of the flesh of men Escobares. Among the Crotontes in Meotis, and divers other parts of the world, Wolves do abound: there are some few in France, but none at all in England, except such as are kept in the Tower of London, to be seen by the Prince and people, brought out of other Countries, where there fell out a rare accident, namely, a Maffive Dog was limed to a Bhe-Wolf, and the thereby conceived, and brought forth fix or seven young Whelps, which was in the year of our Lord 1605, and thereabouts.

There are divers kides of Wolves in the world, whereof Oppiarus in his dedication to Shepherds, maketh mention of five, the first is a twife Wolf, and runneth fast, called therefore Tuntas, that is, Sagittarius, a shootor. The second kide is called Harpager, and these are the greatest ravencers, to whom our Saviour Chrift in the Gospel compareth fale Prophets, when he faith, Take heed of false Prophets which come unto you in Sheep's clothing, but are inwardly Lyco Harpagers, ravening Wolves; and these excell in this kide. The third kide is called Lupus ursus a golden Wolf, by reason of his colour, then they make mention of two other kides, (called Acmon) and one of them peculiarly Illimit.

The first, which is twife, hath a greater head then other Wolves, and likewise greater legs fitten to run, white spots on the belly, round members, his colour betwixt red and yellow, he is very bold, howleth fearfully, having fiery-flaming eyes, and continually wagging his head. The second kide hath a greater and larger body then this, being twifer then all other; betimes in the morning he being very hungry, goeth abroad to hunt his prey, the fides and tail are of a sliver colour, he inhabith in the Mountains, except in the Winter time, wherein he defendeth to the gates of Cities or Towns, and boldly without fear killeth both Goats and Sheep, yet by theft and secretly.

The third kide inhabith the white Rocks of Taurus and Silicia, or the on the tops of the hill Armenia, and such other sharp and inaccessible places, being worthily for beauty preferred before the others, because of his golden resplendent hairs: and therefore My Author faith, Non Lupus seu Lupparum fere. That he is not a Wolf, but some wilde beast excelling a Wolf. He is exceeding strong, especially being able with his mouth and teeth to bite a funder not only bones, but Brafle and Iron: He feareth the Dog far, and heat of Summer, rejoicing more in cold then in warm weather, therefore in the Dog years he hideth himself in some pit or gaping of the earth, until that Sunny heat be abated. The fourth and fith kides are called by one common name Acmon, now Actaeon signifieth an Eagle, or else an Instrumet with a short neck, and it may be that these are so called in resemblance of the ravening Eagle, or else because their bodies are like to that instrumet, for they have short necks, broad shoulders, rough legs and feet, and small fowets, and little eyes: herein they differ one kide from the other, because that one of them hath a back of a sliver colour, and a white belly, and the lower part of the feet black, and this is Ilitus canes, a gray Kite-wolf; the other is black, having affer body, his hair flanding continually upright, and liveth by hunting of Hares. Now generally all Authors do make some two, some three, some four, and some five kinds of Wolves, all which is needless for me to protest, and therefore I will content my self with the only naming of such differences as are observed in them, and already expreffed, except the Tuntas and the fea-Wolf, of whom there shall be something said particularly in the end of this History. Olani Magni written, in his History of the Northern Regions, that in the Mountains called Doffiri, which do divide the Kingdoms of Sweita and Norwy, there are great flocks or heards of Wolves of white colour, whereof some wander in the Mountains, and others are in the vales. They feed upon little, small, and weak creatures, but there are also wilde common Wolves, who begin to destroy their herds of Cattell, and flocks of Sheep, against whom the people of the Country do ordain generall huntings, taking more care to destroy the young ones then the old, that so the breeders and hope of continuance may be taken away. And some also do keep of the Whelps alive, flutting of them up close and taming them, especially females, who afterwards engender with Dogs, whole Whelps are the most excellent keepers of flocks, and the most enemies to Wolves of all other.

There be some have thought that Dogs and Wolves are one kide; namely, that vulgar Dogs are tame Wolves, and ravening Wolves are wilde Dogs. But Scaliger hath learnedly confuted this opinion, shewing that they are two diftinck kides, not joyned together in nature, nor in any natural action, except by contraint: for he faith, that there are divers wild Dogs that are not Wolves, and so have continued for many years in a hill called Mountfelon, altogether refrufing the Society and service of men, yea, sometimes killing and eating them; and they have neither the face, nor the voyce, nor the nature, nor the conditions of Wolves, for in their greatest extremity of Hunger, they never set upon flocks of Sheep: so that it is unreasonable to affirm, that Wolves are wilde Dogs, although it much needs be confessed, that in outward proportion they are very like unto them. Some
Some have thought that Wolfs cannot bark, but that is false (as Albertus wrote) upon his own knowledge, the voice of Wolfs is called *Vulatus*, howling, according to their voices;

Aft *Lupus fulvus, silvat* agrestis apes,
And again:

Pur meltem fingere *Lupis ululatibus urbes.*

It should seem that the word *Vulatus*, which the Germans translate *Heulen*; the French, *Hurlet*; and we in English, howling, is derived either from imitation of the beast's voice; or from a night whooping Bird called *Vulca*, I will not contend, but leave the Reader to either of both, for it may be that it cometh from the Greek word *Olia* xei:n, which signifies to mourn and howl after a lamentable manner, and so indeed Wolfs do never howl, but when they are oppressed with famine: and thus I leave the discourse of their voice with the Annotation of *Servius: Vulatae Canum* & *Furiam.* To howl is the voice of Dogs and Furies. Although there be great difference of colors in Wolfs, as already I have shewed, yet most commonly they are gray and hoary; that is, white mixed with other colors, and therefore the *Greritis* in imitation thereof, do call the very-light which is between day and night, as it were participating of black and white *Lycaon,* W.; -light, because the upper side of the Wolfs hair is brown, and the neather part white. It is said, that the flaggis hair of a Wolf is full of vermin and worms, and it may well be, for it hath been proved, that the skin of a Sheep which was killed by a Wolf breedeth worms.

The brains of a Wolf do decrease and increase with the Moon, and their eyes are yellow, black, and very bright, sending forth beams like fire, and carrying in them apparent tokens of wrath and malice; and for this cause it is said, they see better in the night then in the day, being herein unlike unto men, that see better in the day then in the night, for reason giveth light to their eyes, and appetite to beasts, and therefore of ancient time the Wolf was dedicated to the Sun, for the quickness of his seeing sense, and because he feeth far. And such as is the quickness of his sense in seeing, such also it is in smelling, for it is reported, that in time of hunger by the benefit of the wind, he smelleth his prey a mile and a half or two miles off; for their teeth they are called *Canis mutrates,* that is sawed, yet they are smooth, sharp, and unequal, and therefore bite deep, as we have shewed already, for this cause the sharpest bits of Horfes are called *Lupata.*

All beasts that are devourers of flesh do open their mouths wide, that they may bite more strongly, and especially the Wolf. The neck of a Wolf standeth on a straight bone that cannot well bend, therefore like the Hyena, when he would look backwards he must turn round about, the same neck is short, which argueth a treacherous nature. It is said that if the heart of a Wolf be kept dry, it rendreth a most fragrant or sweet smelling savour. The liver of a Wolf is like to a Horfes hoof, and in the bladder there is called a certain stone called *Syrira,* being in colour like Saffron or Hony, yet inwardly contains certain weak finning flars: this is not the stone called *Syrira,* *Indicus,* which is defined for the vertice of it against the stone in the bladder. The fore-feet have five distinct toes, and the hinder-feet but four, because the fore-feet ferve in stead of hands, in Lions, Dogs, Wolfs, and Panthers. We have spoken already of their celerity in running; and therefore they are not compared to Lions which go foot by foot, but unto the swiftest Dogs. It is said they will swim, and go into the water two by two, every one hanging upon another's tail which they take in their mouths, and therefore they are compared to the days of the year, which do successe follow one another, being therefore called *Lucubra.* For by this succive swimming they are better strengthened against impiety of the floods, and not loft in the waters by any over-flowing waves or billows. Great is the voracity of this beast, for they are so infaatile that they devour hair and bones with the flesh which they eat, for which cause they render it whole again in their ejectments, and therefore they never grow fat. It was well said of a leated man: *Lupus vorat potius quam comedit carnem, & potius mutat po门槛.* That is, A Wolf is said rather to rain then to eat his meat. When they are hungry they rage much, and although they be nourished tame, yet can they not abide any man to look upon them while they eat; when they are once satisfied, they endure hunger a great time, for their bellies standeth out, their tongue swollen, their mouth is flapped, for when they have drove away their hunger with abundance of meat, they are unto men and beasts as meek as Lambs, till they be hungry again, neither are they moved to rapine, though they go through a flock of sheep; but in short time after, their bellies and tongue are calling for more meat, and then faith mine Author: *In antiquum figuram redit, iterumque Lupus exufit.* That is, They return to their former conditions, and become as ravening as before. Neither ought this to seem strange unto any man, for the like things are formerly reported of the Lion; and it is said that Wolfs are most dangerous to be met with all towards the evening, because of their fasting all the day before, and for this is alluded the saying of holy Scripture where the Prophet makes mention of *Lups Vesperini,* but we have shewed already in the story of the Hyena, what those signify.

It is said that Wolfs do also eat a kind of earth called *Argilla,* which they do not for hunger, but to make their bellies weigh heavy, to the intent, that when they set upon an Horfe, an Ox, a Hart, an Elk, or some such strong beast, they may weigh the heavier, and hang fast at their throats till they have pilled them down; for by vertue of that tenacious earth, their teeth are sharpened, and the weight of their bodies encreased; but when they have killed the beast that they
they set upon, before they touch any part of his flesh, by a kind of natural vomit, they disgorge themselves, and empty their bellies of the earth, as unprofitable food.

The remainder of their meat they always cover in the earth; and if there be many of them in hunting together, they equally divide the prey among them all, and sometimes it is said, that they howl and call their fellows to that feast which are absent, if their prey be plentiful. Now this they have common with Lions, in their greatest extremity of hunger, that when they have election of a man and a beast, they forsake the man and take the beast. Some are of opinion, that when they are old, they grow weary of their lives, and that therefore they come unto Cities and Villages, offering themselves to be killed by men, but this thing by the relation of Niphus is a very false; for he professed that he saw an old Wolf come into a Village, and set upon a Virgin to destroy and eat her, yet he was so old that he had scarce any teeth in his head, but by good hap company being at hand, the Maid was saved, and the Wolf was killed.

Now those Wolves that are most sluggish and leaft given to hunting, are most ready to venture upon men, because they love not to take much pains in getting their living: This Wolf is called Vinietes, but the inordinate hunting Wolf Kunepjænia. It is reported that a Wolf will never venture upon a living man, except he have formerly tasted of the flesh of a dead man, but of these things I have no certainty, but rather do believe the contrary; that like as Tyrants in an evil griev'd elate, do pick quarrels again every man that is rich for the spoil of their goods, accounting them their enemies, so well and often they have deserv'd at their hands: In like manner, Wolves in the time of their hunger fall upon all creatures that come in the way, whether they be men or beasts, without partiality, to fill their bellies, and that especially in the winter time, wherein they are not afraid to come to Houles and Cities.

They devour Dogs when they get them alone, and Elks in the Kingdom of Norway, but for Dogs it hath been seen, that they have lived in a kinde of society and fellowship with Wolves, but it was to steal and devour in the night time, like as Theeves do cover their malice and secret grudies one to other, when they are going about to rob true men. Wolves are enemies to Aiffs, Bulls, and Foxes, for they feed upon their fleeth, and there is no beast that they take more easily than an Aif, killing him without all danger, as we have showed already in the story of an Ais.

They also devour Goats and Swine of all sorts, except Boars, who do not easily yield unto Wolves. It is said a Sow hath resifted a Wolf, and that when he fought with her, he is forced to use his greatest craft and subtlety, leapiong to and from her with his beast activity, left the sow should lay her teeth upon him, and so at one time deceive him of his prey, and deprive him of his life. It is reported of one that saw a Wolf in a Wood, in take his mouth a piece of Timber of some thirty or forty pound weight, and what he did practis'd to leap over the trunk of a tree that lay upon the earth; at length when he, priz'd his own ability and dexterity in leaping with that weight in his mouth, he did make his cave and lodged behind that tree; at last it fortunate there came a wilde Sow to seek for meat along by that tree, with divers of her Pigs following her, of different age, some a year old, some half a year, and some leis. When he saw them near him, he suddenly set upon one of them, which he conjectur'd was about the weight of wood which he carried in his mouth, and when he had taken him, whilst the old Sow came to deliver her Pig at his first crying, he suddenly leaped over the tree with the Pig in his mouth, and so was the poor Sow beguiled of her young one, for she could not leap after him, and yet might stand and fee the Wolf to eat the Pig which he had taken from her. It is also said, that when they will deceive Goats, they come unto them with the green leaves and small boughs of Oysters in their mouths, wherewithal they know Goats are delighted, that fo they may draw them therewith, as to a bait to devour them.

Their manner is when they fall upon a Goat or a Hog, or some such other Beast of small stature, not to kill them, but to lead them by the ear with all the speed they can drive them to their fellow Wolves, and if the beast be stubborn and will not run with him, then he beareth his hinder-parts with his tail, in the mean time holding his ear fast in his mouth, whereby he causeth the poor Beast to run as fast as fatter then himself unto the place of his own execution, where he findeth a crew of ravishing Wolves to entertain him, who at his first appearance feize upon him, and like Devils tear him in pieces in a moment, leaving nothing un eaten but only his bowels.

But if it be a Swine that is so gotten, then it is said, that they lead him to the waters, and there kill him, for if they eat him not out of cold water, their teeth doth burn with an intolerable heat. The Harts when they have loft their horns do lie in secret, feeding by night for fear of the Wolves, until their horns do grow again, which are their chiefest defence. The least kind of Wolves we have shewed already, do live upon the hunting of Hares, and generally all of them are enemies to sheep, for the foolish sleep in the day time is easily beguiled by the Wolves who at the flight of the Sheep maketh an extraordinary noise with his foot, whereby he caustheth the foolish Sheep unto him, for standing amazed at the noise he falleth into his mouth and is devoured: but when the Wolf in the night time cometh unto a fold of Sheep, he first of all compafseth it round about, watching both the Shepheard and the Dog, whether they be asleep or awake, for if they be present and like to resist, then he departeth without doing any harm, but if they be absent or asleep, then lootheth he no opportunity, but entereth into the fold, and falleth a killing, never giving over till he have destroyed all, except he be hindered by the approach of one or other; for his manner is not to eat any till he have killed all, not because he feareth the over-livers will tell tales, but for that his
his infaftable minde thinketh he can never be satisfied, and then when all are slain he falleth to eat one of them.

Now although there be great difference between him and a Bull both in strength and stature, yet is he not afraid to adventure combat, truing in his policy more then his vigor, for when he fetteth upon a Bull, he cometh not upon the front for fear of his horns, nor yet behind him for fear of his heels, but fritt of all standeth aloof from him, with his glaring eyes, daring and provoking the Bull, making often proffers, to come near unto him, yet wife enough to keep aloof till he lype his advantage, and then he leapteth suddenly upon the back of the Bull at the one side, and being fo accent'd, taketh such hold that he killeth the Beast before he loozen his teeth. For it is also worth the observation, how he draweth unto him a Calf that wandereth from the dam, for by singular treachery he taketh him by the nofe, first drawing him forward, and then the poor Beast striveth and draweth backward, and thus they struggles together, one pulling one way, and the other another, till at laft the Wolf perceiving advantage, and seeing when the Calf pulleth heavy, suddenly he leppt his hold, whereby the poor Beast falleth back upon his buttocks, and so down right upon his back; then flyeth the Wolf to his belly which is then his upper part, and easily teareth out his bowels, so satisfying his hunger-greedy appetite: But if they chance to fee a Beaver in the water, or in the marsh, encombed with mire, they come round about him, flopping up all the paffages where he should come out, baying at him, and threatening him, so as the poor defireful Ox plungeth himself many times over head and ears, or at the least wife they fo vex him in the mire, that they never fuffer him to come out alive. At laft when they perceiue him to be dead and clean without life, they pull at him, it is not xible to observe their singular subtlety to draw him out of the mire, whereby they may eat him; for one of them goeth in, and taketh the Beast by the tail, who do-0709.4049038,6-1-1.9865669teth him with all the powers he can, for wit without strength may better kill a live Beast, then remove a dead one out of the mire: therefore he looketh behind him and calleth for more help: then presently another of the Wolves taketh that first Wolves tail in his mouth, and a third Wolf the fects, a fourth the thirds, a fifth the fourths, and fo forward, encreaing their strength, until they have pulled the Beast out into the dry land: whereby you may fee, how they torment and stretch their own bodies, biting their tails mutually, pinching and straining every joxent until they have compassed their defire, and that no man shoul think it strange for a Wolf to kill an Ox; it is reported that Danaus did build a Temple to Apollo at Argos, in the very fame place where he saw a Wolf destroy an Ox, because he received instruction thereby, that he should be King of Greece. Wolves are also enemies to the Buffes, and this is no marvel, feeing that it is confidently reported by Plineus, that in time of great famine when they get no meat, they destroy another one; for when they meet together, each one bemoaning himfelf to other, as were by confent they run round in a circle, and that Wolf which is fritt giddy, being not able to fland, falleth down to the ground, and is devoured by the residue, for they tear him in pieces, before they can arife again.

Pliny affirmeth that there be Wolves in Italy, whose sight is hurtful to men, for when a man feeth the harne of one of them, though he have never fo much defire to cry out, yet he hath no power: but the mean- ing of this is, as we find in other Writers, that if a Wolf fritt fee a man, the man is filent, and cannot fpeak, but if the man fee the Wolf, the Wolf is filent and cannot cry, otherwife the tale is fabulous and superflitious, and thereupon came the proverb Luips in fabula eft, to significare silence. Now although these things are reported by Pliny, Puerilus, Vincentius, and Ambrofius, yet I rather believe them to be fabulous then true, howbeit Albertus writeth, that when a man is in fuch extremity if he have power to loofe his cloak or garment from his back, he shall recover his voyce again. And Sextus faith, that in cafe one of thefe Wolves do fee a man first, if he have about him the tip of a Wolves tail he shall not need to fear any harm. There be a number of fuch like tales concerning Wolves and other creatures, (as that of Pythagoras) A Beaver making water upon the urine of a Wolf, shall never conceive with young. All dometicaul four-footed Beasts, which fee the eye of a Wolf in the hand of a man, will presently fear and run away.

If the tail of a Wolf be hung in the crach of Oxen, they can never eat their meat. If a Horse tread upon the foot-reps of a Wolf which is under a Horfe-man or Rider, he breakeh in pieces, or else standeth amazed. If a Wolf treadeth in the foot-reps of a Horfe which draweth a Waggion, he cleaveth fad the rode, as if he were frozen.

If a Mare with Foal tread upon the foot-reps of a Wolf, the ewe faleth her Foal, and therefore the Egyptians when they signify abornment, do picture a Mare fading upon a Wolfes foot. Thefe and fuch other things are reported, but I cannot tell how true) as supernatural accidents in Woves. The Wolf also outwighte to overcome the Leopard, and followeth him from place to place, but forasmuch as they dare not adventure upon him fingle, or hand to hand, they gather multitudes, and fo devoure them. When Woves fet upon wilde Bears, although they be at variance among themfelves, yet they give over their mutual combats, and joyn together against the Wolf their common adverary. For these occasions a Wolf hath evermore been accounted a molt fierce and wilde Beast, as may further appear by this History following. When Eurifines and Porus intended to marry the Daughter of some Grecian, that fo they might joyn themselves in perpetual league and amity by affinity, they went to Delphi to ask counsel of Apollo in what place they should meet with their wives. Apollo gave them answer, that when they should meet with an extreme wilde Beast, as they went into Lacedemonia, and yet the fame Beast appear meek and gentle unto them, there they should
should take their wives. When they came into the land of the Cleottomi, they met with a Wolf carrying a Lamb in his mouth, whereupon they conceived that the meaning of Apollo was, that when they met with a Lamb in that Country, they might very happily and successeively take them wives, and so they did, for they married with the daughters of Theophanes Cleonymus, a very honest man of that Country. It is reported of Milo Costoni, that a valiant strong man, how upon a feaide rending a tree in fonder in the woods, one of his arms was taken in the closing of the tree, and he had not strength enough to loofe it again, but remained there inclofed in most horrible tormentes, until a Woff came and devoured him.

The like story unto this, is that which Elymaus reporteth of Gelon the Syracusan, a Schollar, unto whom there came a Wolf as he sat in the School writing on his Tables, and took the writing tables out of his hand. The Schoolmafer being inagared herewith, and knowing himselfe to be a valiant man, took hold of the fame tables in the Woffes mouth, and the Wolf drewe the Mafter and Scholars in hope of recovery of the tables out of the School into a plain field, where suddenly he devoured the Schoolmafer and a hundred Scholars, sparing none but Gelon, whose tables were a bait for that prey, for he was not only not slain, but preferred by the Wolf, to the fingular admiration of all the world; whereby it was collected, that that accident did not happen naturally, but by the over-ruling hand of God: Now for these occasions, as also because that the wood and skin of beafts killed by Wolves are good for nothing, (although the flefh of Sheep is more fweeter) are unprofitable and good for nothing.

Men have been forced to invent and finde out many devises for the destroying of Woffs, for necessity hath taught men much learning, and it had been a shameful mistery to induce the tyrannie of fuch spoiling beafts, without labouring for refiitance and revenge: for this caufe they propounded also a reward to fuch as killed WVoIfs, for by the law of Draco, he that killed a young VVolf received a talent, and that killed an old Woff received two talents.

Solen prefcribed that he that brought a VVolfalive, should receive five pieces of money, and he that brought one dead, should receive two. Apollo himself was called Lycodentis, a VVolf-killer, because he taught the people how to put away VVols. Homer calleth Apollo Ilaysenes, for that it was laid immediately after he was born of his mother Latona, he was changed into the shape of a VVolf, and so nourished; and for this caufe there was the Image of a VVolf set up at Delphos before him.

Others fay, that the reafon of that Image was, because that when the Temple of Delphos was robbed, and the treaure thereof hid in the ground, while diligent inquisition was made after the thieves, there came a VVolf and brought them to the place where the golden vefelts were covered in the earth, which he pulled out with her feet. And some fay that a VVolf did kill the sacrile- ger, as he lay asleep on the mountain Parnaffus, having all the treaure about him, and that every day he came down to the gates of Delphos howling, until some of the Citizens followed her into the Mountain, where she flew them the thiefe and the treaure both together. But I lift not to follow or f tand upon thefe fables. The true caufe why Apollo was called a VVolf-killer was, for that he was feigned to be a Shepheard or Herdman, and therefore in love of his Cattle to whom VVols were enemies, he did not only kill them while he was alive, but also they were offered unto him in sacrifice, for VVols were facred to Apollo, Jupiter, and Mars; and therefore we read of Apollo Lytius, or Lytus, to whom there were many Temples builded, and of Jupiter Lytus, the sacrifices of him called Lytian, and games by the fame name. There were other holly-days call'd Lyteralia, wherein barren women did chaffe themselves naked, because they bare no children, hoping thereby to gain the fruitfulnes of the womb, whereof Ovid speakeyth thus:

Excipit favcunde patienter verbere dextra:
Jam facer optatum nonem babebit avi.

Property and some other writers seem to be of the minde that those were firft insti.tuted by Fabius Lupercus, as appeareth by these verfes:

Verbera pellitum seto fannovebat arator,
Unde licens Fabium facra Lupercum habebat.

And Junoal thus:

Nec prodest agili palmas praebere Lupero.

Now concerning the manner of taking of VVols the Ancients have invented many devises and pins, and firft of all an Iron toall which they finall fatten in the earth with Iron pins, upon which pins they feave a ring, being in compafs about the bignefs of a VVolf head, in the midft whereof they lay a piece of fteth, and cover the Toil, fo that nothing is feen but the fteth, when the Woff comeeth and taketh hold of the fteth, feeling it fteel, pulling hard, he pulleth up the ring, which bringeth the whole Toil on his neck, and sharp pins. This is the firft manner that Crescentiensis repeateh of taking VVols, and he fay there are other devises to enfaire their feet, which the Reader cannot underftand, except he faw them with his eyes.

The Italians call the nets wherein VVols are taken, Tagliola, Harpaio, Lo Rampino, and Lycino, the French, Hausfeld, and Blondus affiirmeth, that the shepheards of Italy make a certain gin with a net, wherein
wherein that part of the VWolf is taken which is first put into it. Now the manner of taking VVolis in ditches and pits is divers, first of all they dig a deep ditch, so as the VWolf being taken, may not get out of it, upon this pit they lay a hurdle, and within upon the pillar they fix a live Goole or Lamb, when the VWolf windeth his prey or booby, he cometh upon the trench, and seeing it at a little hole which is left open on purpose to catch the VWolf into the deep ditch; and some use to lay upon it a weak hurdle, such as will not bear up either a man or a beast, that so when the VWolf cometh upon it, it may break, and he fall down; but the belt devise in my opinion that ever was invented in this kind, is that the perch and hurdle may be so made, and the baft so fet, that when one VWolf is fallen down it may rise again of its own accord, and stand as it did before to entrap another; and great care must be had, that these kind of ditches may be made in solid and strong earth, or if the place afford not that opportunity, then must the inside be lined with boards, to the intent that the baft by bearing and digging with his feet make no evation.

The Latians use to raise up to a Tree a certain engine like a Moule-trap, but much greater, through which there is a cord where they hang a baft of flesh or pullove, or some such thing which the VWolf loveth; when he cometh unto it, he suddenly snatcheth at it, and so pullbeth the trap upon his own pate. The Lyowabians, Myssam, and Tribalians, Inhabitants of Asia, were wont to carry short weapons to kill VVolis, and they used also the strongests Dogs, who by the encouragement of the Hunters would tear the VVolis in pieces, for there is hardly any Dog so courageous, as to adventure upon a VWolf at single hand.

The Dogs have therefore certain collars made unto them of leather stuff full of sharp Iron nails, to the intent that their necks may be safe guarded from the VVolis biting. Now Nouns faith, that all hunting of VVolis with Dogs is in vain, except there be also set up certain great nets made of strong cords, stretched out and standing as a tiffle, as may be immoveably tauned to the bodies of trees, or strong pillars in the earth, and in divers places of these nets they must set round about to cover them, to the end the VVolis destroy them not; and at either end of the net must be made a little thred with bougets to cover a man, wherein the hunter must lodge with his Spear, ready to pierce through the VWolf when he perceiveth him in the net, for if the VWolf be not instantly wounded, he will deliver himself and escape, and then also he must be followed with the cry of Men and Dogs, that he may not return back again into his den, and the Hunters observe this order in hunting of a VWolf, and driving him to their nets.

When they are far from their nests, they hunt them but gently, and let them go at leisure, but when they are cloer and nearer unto them, they follow them with all speed and violence, for by that means many are intrapped and suddenly killed; and these are those hunting observations which I finde to be recorded in Authors for the taking of VVolis. And this is the nature of this baft, that he feareth no kind of weapon except a stone, for if a stone be cast at him, he presently falleth down to avoid the stroke, for it is said that in that place of his body where he is wounded by a stone, there are bred certain worms which do kill and destroy him; and therefore the Egyptians when they do decipher a man that feareth an eminent danger, they picture a VWolf and a stone; as Oros writeth.

VVolis do likewise fear fire even as Lions do, and therefore they which travel in woods and secret places by night, wherein there is any fulfion of meeting of VVolis, they carry with them a couple of flints, wherewith they strike fire, in the approach of the ravenous beast, which to daunteth his eyes, and daunteth his courage, that he runneth away fearfully. It is said that VVolis are afraid of the noise of swords or iron fruck together; and it may well be, for there is a true story of a man travelling near Baffil, with a bell in his hand, who when he saw that the throwing stones at the VWolf which followed him would nothing availe, and by chance fell down, in the mean time a bell which he carried about him did give a sound, at which found the VWolf being affrighted ran away; which when he perceived, he founded the bell aloud, and so drove away the wilde ravening beast. As the Lion is afraid of a white Cock and a Moule, so is the VWolf of a Sea-crab or thramp. It is said that the pipe of Pibocarin did repreh the violence of VVolis when they set upon him, for he had the same unfuckenly, and indiñññnly, at the noise whereof the raging VWolf ran away; and for he had been believed, that the voyce of a singing man or woman worketh the same effect. Herod takes the last so much of himself, that by singing he drove away a VWolf, as in these versets;

Nanse; me siles Lupus in Sabina,
Dum mean canto Latagias, et ultra
Terminus curas vulgaris erat,
Fugit inermem.

Quae pertinuum nec; militaris
Dumia in lati alti ejgentia,
Nei Juba telius generat Leonam
Arida matue.

If at any time a VWolf follow a man afar off, as it were treacherousely to set upon him suddenly and destroy him, let him but set up a flick or flasses, or some such other knowledgable mark, in the middle space betwixt him and the VWolf, and it will scare him away; for the fulphonned baft fear eth such a man, and thinketh that he carryeth about him some engin or trap to take away his life: and therefore also it is said, that if a traveller do draw after him a long rod or pole, or a bundle of flicks and cions, a VWolf will never set upon him, wolthily murthering some deferred policy to overthrow and catch him. Eophiopis writeth, that if a man do anoint himself with the fat or fewet
fewet taken out of the reins of a Lion, it will drive away from him all kind of Wolfs. There be some that take WVolfes by poisonous, for they poyfon certain pieces of meat, and cast them abroad, whereof when the Wolfs do eat, they die immediately. There were certain Countrymen which brought the skins of Wolfs into the City of Rome, and carried them up and down the streets publi
cally to be seen, affirming that they had killed those Wolfs with the powder of a certain herb call'd Cariwm Vartus, and that therewithal also they would kill Rats and Mice. Pauflanias faith, that there was a Temple of Apollo Lyceum, at Siccia, and that on a time the Inhabitants were so annoyed with Wolfs, that they could receive no commodity by their flocks, wherupon Apollo taking pity of them, told them that there was in their Temple a certain piece of dry wood, commanding them to pull off the rinde of that bark of wood, and beating it to powder, to mingle it with convenient meat for WVolfes, and so cast it abroad in the fields.

The people did as they were commanded by the Oracle, and thereby destroyed all the WVolfes; but what kind of wood this was, neither Pauflanias nor any of the Priests of Siccia could declare. In one part of the world the Ewe-tree, and certain fragments of Juniper. The Spindle-tree, and Rododaphne do yeeld poyfon unto WVolfes mixed in their drink, and besides them we know no trees that are venemous, and yet plants innumerable, especially WVolf-bane. And the occasion why there are so many poyfonful herbs then trees, is in the juice or liquor whereby they are nourished, for where the juice is wholesome and well tempered, there it increaseth into a great tree, but where it is imperfect and venemous, there it never groweth tall, nor bringeth forth any great floe.

There are certain little Fishes called by the Grecians, Lycoi, and by the Latinists, Blennius, which we may call English WVolf-Fishes, and these the Hunters use to take Wolfs in this manner: when they have taken a great many of them alive, they put them into some tub or great mortar, and there kill them by bruizing them to pieces, afterwards they make a fire of coals in the Mountains where the WVolfes haunt, putting into the same some of these fishes mixed with bloud and pieces of Mutton, and so leaving it, to have the favours thereof carried every way with the wind, they go and hide themselves: whilest that in the mean time the WVolfes enraged with the favour of this fire, seek to and fro to finde it, because of the smell, the fire before they come is quenched or goeth out naturally, and the WVolfes by the smok thereof, especially by taking of the fleth, bloud and fish naturally there they finde, do fall into a drowsie dead sleep, which when the Hunters do perceive, they come upon them and cut their throats. The Aenemius do poyson them with black fishe, and some do take a cat, pulling off her skin, taking out the bowels, they put into her belly the powder of Frogs, this Cat is boyed a little upon coals, and by a man drawn up and down in the Mountains where WVolfes do haunt; now if the WVolfes do chance to meet with the train of this Cat, they instantly follow after her, ingred without all fear of man to attain it, therefore he which draweth the Cat, is accompanied with another Hunter armed with a Gun, Pistol, or Crofs-bow, that at the appearance of the WVolf, and before his approach to the train, he may destroy and kill him.

I will not discourse of WVolf bane, commonly called Antidum in Latin, wherewithall both men and beasts are intoxicat'd, and especially WVolfes, but referring the Reader to the long discourse of Conrastin Gesner, in his History of the WVolf, I will only remember in this place an Epigram of Auffonius wherein he pleasantly relatach a flory of an adulterated woman, defining to make away her jealous husband, and that with speed and vehemency, gave him a drink of WVolf-bane and Quick-silver mingled together, either of both fingle he poyson, but compounded are a purgation, the Epigram is this that followeth:

Toxica zeloto dedit uxor marito.
Nec satia ad mortem credidit esse datum,
Miseruit argenti lelatia pandere vivi,
Cogeret ut celarem via geminata ocrem,
Drodat hie quis, factum dixit venenum;

| Antidum sumet, qui sociata bibet. |
| Ergo inter sejus moxia pocula constant. |
| Cepha lelatia maxa satirfera. |
| Praetum & oculos abo psinter receffum. |
| Lubrica dejectum qua uita non cibis. |

Concerning the enemies of Wolfs, there is no doubt, but that such a ravening beast hath few friends, for except in the time of copulation wherein they mingle sometimetime with Dogs, and sometime with Leopards, and sometimetime with other beasts, all beasts both great and small do avoid their society and fellowship, for it cannot be safe for strangers to live with them in any league or amity, seeing in their extremity they devour one another: for this caufe, in some of the inferior beasts their hatred lasteth after death, as many Authors have observed; for if a Sheep be hanged up with a Wolves skin, the wool falles th off from it; and if an infringement be fringed with string made of both these beasts, the one will give no found in the presence of the other; but of this matter we have spoken in the story of the sheepe, shewing the opinion of the bell learned, concerning the truth thereof. The Ravens are in perpetuum enmity with Wolfs, and the antipathy of their natures is so violent, that it is reported by Ploes and Elium, that if a Raven eat of the carcasse of a beast which the Wolf hath killed, or formerly tafted of, the presently dyeth.

There are certain wild Onions called Kelle, and some fay the Sea-Onion, because the root hath the similitude of an Onion, of all other things this is hateful to a Wolf, and therefore the Arabi

us fay, that by treading on it his leg falleseth into a cramp, whereby his whole body many times endureth
endureth inefurable torments, for the Cramp increaseth into Convulsions; for which cause it is
worthy to be observed how unpeakable the Lord is in all his works, for whereas the VVolf is an
enemy to the Fox and the Turtle, he hath given secret inflict and knowledge both to this Bealt
and Fowl, of the virtuous operation of this herb against the ravening VVolf; for in their absence
from their fells, they leave this Onion in the mouth thereof, as a sure guard to keep their young
ones from the VVolf.

There are certain Eagles in Tataria which are tamed, who do of their own accord being fet
on by men adventure upon VVolves, and to vex them with their talons, that a man with no la-
bour or difficulty may kill the beast, and for this caufe the VVolves greatly fear them and avoid
them; and thereupon came the common proverb, 
Lupus fugit aquilam: And thus much shall suffice

to have spoken in general concerning the taking.

Now we will proceed to the other parts of their History, and firft of all of their carnal copula-
tion. They engender in the fame manner as Dogs and Sea-calves do, and therefore in the middle
of their copulation they cleave together against their will, It is observed that they begin to engen-
der immediately after Christmas, and this rage of their luft lafteth but twelve days, whereupon
there was wont to go a fabulous tale or reafon, that the caufe why all of them conceived in the
twelve days after Christmas was, for that Latona so many days together wandered in the shape
of a the VVolf in the Mountains Hyperborei, for fear of Juno, in which likenefs she was brought to
Del 

but this fable is confuted by Plutarch, rehearsing the words of Antipater in his Book of Beasts,
for he faith when the Oaks that bear Acorns do begin to caft their flowers or blossomes, then the
VVolves by eating thereof do open their wombs, for where there is no plenty of Acorns, there
the young ones dye in the damis belly, and therefore fuch Countries where there is no flore of
Acorns, are freed from VVolves; and this he faith is the true caufe why they conceive but once a
year, and that in the twelve days of Christmas, for thohe Oaks flower but once a year, namely,
in the Spring time, at which fession the VVolves bring forth their young ones. For the time that
they go with young, and the number of whelps, they agree with Dogs, that is, they bear their young
nine weeks, and bring forth many blinde whelps at a time, according to the manner of thoheit
that have many claws on their feet. Their legs are without Articles, and therefore they are not able
to go at the time of their littering, and there is a vulgar opinion, that the VVolf doth never in all
her life bring forth above nine at a time, whereas of the luft which the bringeth forth in her old age is
a Dog, through weaknes and infirmity; but the Ebations among whom VVolves do abound, do af-
firm constantly, that in the beginning of May, they bring their young out of their dens, and lead
them to the water, sometimes feven, and sometimes nine, every year encreasing their number; fo
that the firft year the littereth one whelp, the second year two, the third year three, and so ober-
veth the fame proportion unto nine, after which time the growthen barren and never beareth more :
and it is faid when the bringeth her young ones to the water, the oberveth their drinking very
diligently, for if any of them lap water like a Dog, him the recepteth as unworthy of her parentage,
but thole which fuck their water like a Swine, or bite at it like a Bear, them the taketh to her,
and nouriseth very carefully.

VVe have faid already that VVolves do engender not only among themselves, but among other
beasts, and fuch are to be underftood of them which bear their young an equal proportion of
time, as of Dogs and VVolves cometh the Lupus Canarius, or Panther, and the Crocuta. Of the Hyxn
and the Wolf come the Thoes, of whom we shall speake in their due place in the end of this story, and
the VVolf it self feemeth to be componded of a Wolf and a Fox.

Concerning the natural disposition of this Bealt we have already spoken in part, and now we will
adde that which doth remain; and firft of all their Epithets which are attributed unto them among
several Authors are moft clear demonstrations of their disposition; as fowre, wilde, Apalhen, Sharp,
fierce, bold, greedy, whoar, fieth-eater, wary, swift, bloody, blood-lovers, degenerate, hard, glu-
ton, hungry, Cattle-eater, famishing, furious, yellow, faihing, ungenteel, unharmonious,
and unlawful, Cattle-hunter, teeth-grafer, infatiable, treacherer, martial, lowerful, mountain, nightly,
robber, Itrate, ravener, mad, fiatcher, cruel, pack-bearer, blood-fucker, foamer, proud, fearing,
ullen, terrible, vehement, hollwing, and fuch other like belonging to the male Wolf. Now unto
the female there are fome peculiar ones also, as inhumane, ungenteel, martial, obfcur, rank, ravener,
fanded, Romanian, greacie, terrible, and Volfian: and the ravening defire of this Wolf doth not only
appear in the Proverbs of holy Scripture already repeate, as where Chrift compareth the Hereticks
to Wolves, but also from hand instruments and ficknesses, for a little hand-faw is called of the La-
tines and Germans Lupus, a Wolf; because of the inequality of the teeth, wherewithal a man fhear-
eth afunder violently any piece of wood, bones, or fuch like thing.

There is a disease called a Wolf, because it comufeth and eateth up the flefh in the body next the
farts, and much every day be fed with frefh meat, as Lambs, Pigeons, and fuch other things wherein
is blood, or else it comufeth all the flefh of the body, leaving not fo much as the skin to cover the
bones. Also the galls on a mans feet which cometh by Horse-riding, are by the Ancients called Lupis,
and by Martial, Ficus, whereof he made this divifion:

Stragula succinii venator surn veredt,
Nom salet a nudu surgere ficum equo.

D d d There
There be also instruments called Lupi, and Harpagos, or Harpagones, wherewithall Ankers are looed in the Sea, or any thing taken out of the deep. There is a certain territory in Ireland, (whereof Mr. Camden writeth) that the Inhabitants which live till they be past fifty year old, are foolishly reported to be turned into Wolves: the true cause whereof he conjectureth to be because for the most part they are vexed with the disease called Lycanthropia, which is a kind of melancholy causing the persons so affected, about the moneth of February to forfake their own dwelling or houses, and to run out into the Woods, or near the graves and sepulchres of men, howling and barking like Dogs and Wolves. The true signes of this disease are thus described by Morcellus: those that he which are thus affected, have their faces pale, their eyes dry and hollow, looking drollily, and cannot weep. Their tongue as if it were all scabbd, being very rough, neither can they spit, and they are very thirsty, having many ulcers breaking out of their bodies, especially on their legs: this disease some call Lycam, and men opprèfse thereof with Lycanth, because that there was one Lycam as it is signified by the Poets, who for his wickednes or sacrificing of a childe, was by Jupiter turned into a Wolf, being utterly distracted of humane understanding, and that which Poets speak of him, may very well agree with melancholy, for thus writeth Ovid:

*Territus ipsi fuit, neglectus, frena raris
Exulatus, fustratus, loqui constiter.*

And this is most strange, that men thus diseased should desire the graves of the dead. Like unto this is another disease, called by Bellumst, *Lamionem Leominium,* which is faith he, Consulst rationes cum fælio malis, noxias & iriandias: *A Leone dilittium videtur malum, quod ex denti aliquos bovinus Lindet,* & *Leomin infatis in eos venit:* that is, the Lion-devil disease is a confusion of reason, joined with wrathful, and impious facts; and it seemeth to be named of Lions, because that such as are opprèfse therewith, do rage against men, and wound them like Lions.

There is a pretty Apology of a league that was made betwixt the Wolves and the Sheep, whereupon came the name *Lycophiset,* my Author rehearseth it thus: *Lupis et agnis salutis aliquando fuit, datis stringit, obfidiens, Lupi fuis catulis, ovus Canum obturatum dederet. Qui est ovibus ac pasien-tibus Lupi matris defiderio ululantes educunt, tum Lupi irruentes fident fadus, feluum clamantium, ovos; Canum presfito definitas lamiunt, that is to say, There was a peace made betwixt the Wolves and the Sheepe, either side giving hostages to other, the Wolves gave their young whelps, and the Sheep gave the Shepherds Dogs to the VVolves. Now when the young VVolves were among the flock of Wolves, they howled for their dams, which when the old VVolves heard, they came rushing in upon the Sheep, crying out that they had broken the league, and therefore they destroyed the Sheep in the abience of the Dogs that should keep them: whereby is notably signified the simplicity of innocent men, and the impiety of the wicked, for whatsoever bonds of truce and peace are made with them, they ever respect their own advantage, taking any small occasion; like VVolves at the crying of their young ones, without all offence of the innocent and harmless, to break through the brazen walls of truce, peace, and amity, for the execution of their bloody and ungodly designs.

VVolves are truly said to be fierce and treacherous, and not generous and bold, and noble like Lions. They especially rage in the time of their hunger, and then they kill not so much as will suffice, but all the flock before them; but being satisfied, as we have said already, they seem rather Lambs then VVolves. The male is always as careful of the young ones as the female, for while she suckleth her young ones, he bringeth meat unto her in the den, and when that they are greatly confined both to fly away, they carry their young ones along with them. Great is their malice toward them that hurt them, as Nephtis faith, he cried one day when he was a hunting near Rome, for his Dog was fighting with a VVolf, and he comming in with the multitude of Hunters, alighted from his Horfe, and drew his sword, and gave the VVolf a wound. The VVolf feeling the stroke of the sword forfook the Dog and turned upon the man, making all force at him he could to bite him, but he professed he escapeth with singular danger, more by the help of his fellow hunters, then by his own valour; wherefore he concludeth, that as VVolves are enemies to all, so they take special revenge of them that harm them, as we have said before of Lions. Some say that when many of them have obtained a spoil, they do equally divide it among them all. I am sure the like is reported betwixt the old Lion and the young, but whether it be true in VVolves I cannot tell, but rather think the contrary, because they are inatiabte and never think they have enough. And Alberius faith, they do not communicate their prey like Lions, but when they have fed sufficiently, they hide the reftidue in the ground till they hunger again.

When they fell upon horned beasts, they invade them behinde, and on their backs; when they set upon Sheep, they choose a dark cloudy day or time, that so they may escape more freely; and to the intent that their treadings should not be heard, they lick the bottom or foles of their feet, for by that means they make no noise among the dry leaves; and if going along they chance to break a stick, and to confift their minds make a noise, then pretently they bite their foot, as if it were guilty of that offence: For the most part they fell upon such Cattle as have no Keepers, and raven in secret. If they come unto a flock of Sheep where there are Dogs, they first of all consider whether they be able to make their party good, for if they see they cannot match the Dogs, they depart away although they have begun the spoil, but if they perceive their forces to be
be equal or superior, then they divide themselves into three ranks, one company of them killeth Sheep, a second company fighteth with the Dogs, and the third fighteth with the men. When they are in danger to be taken by the hunters, they bite off the tip of their tails, and therefore the Egyptians, when they would describe a man delivered out of extremity and danger, do picture a Wolf lacking that part of his tail. To conclude, when they are in peril they are extremely fearful, affrighted, and afraid, especially when they are unavoidably included in the feem harmless, and then argue the beneficence of the men, which is full, cowardly, and treacherous, daring do nothing but for the belly, and not then neither, but upon a singular advantage, and for the manifesting hercelf, I will express these two stories following, as they were related to Gefner by Michael Hers, and Iugius Gubcrus. It happened (faith the first) that a certain Wolf constrained by famine, came unto a village near Milan in Italy, and there entred into a certain house, wherein sat the good wife and her children, the poor woman being terrified herewith, and not knowing what the did, ran out of the house, pulling the dore to after her, and so running the Wolf in among her children, at last her husband returned home, unto whom she related the accident, and how she had shut up the Wolf; the man being more afraid then was cause, left the Wolf had devoured some of his children, entered hastily in a dores, longing to fave and deliver his poor Infants, whom the fearful mother had left with the Wolf, when he came in he found all well, for the Wolf was in wofe cafe, altomithed, amazed, daunted, and flanding like a flock without fene, not able to run away, but as it were offering himfelf to be devour'd: And this is the first history. The fecond is like unto this, but more admirable, for the great Uncle of Gubcrus, being marvelously addicted to the hunting of wide beasts, had in his land divers ditches and trenches cut up with other pits and caves wrought very artificially for the safe keeping of fuch beasts as should fall into them. Now it hapned that upon one Sabbath day at night there fell into one of those pits three creatures of divers disposition, and adverse inclination, none of them being able to get out thereof: the first was a neighbors wife of his a poor woman, which going to the field to gather Bees and Rapes for her meat the day following, it fortuned that the fell down by a mishance into the said pit, wherein she was fain to lodge all night (you must think with great anguish, sorrow, and perilous danger to her felf) beside that which her husband and family conceived at home, but she had not carri'd long in the said pit ere a Fox was likewise taken and fell down upon her, now began her grief to be encreated, fearing left the wide bell should bite and wound her, having no means to escape from him, nor no man to help and relieve her, although the cried as loud as ever the could; wherewithal being wearied, necessity made her to be patient, being a little comforted to fee the Fox as much afraid of her, as she was of him, and yet she thought the night full long, willing for the break of the day, when men fir abroad to their labours, hoping that some or other would hear her moan, and deliver her from the society of fuch a Chamber-fellow: while thus fhe thought, striving betwixt hope, fear, and grief, lo what befel her more woefully then before, for suddenly a Wolf was taken and fell down upon her, then the loft her hope, and in lamentable manner thinking of husband and children, how little they conceived of her extremity, resolved to forsake the world, and commended her foul to God, making no other reckoning but that her disfreasted lean limbs should now be a supper and breakfast to the Wolf, wishing that she might but fee her husband, and kifs her children before the loft her life by that savage execution; but all her wishes could not prevail, nor clear her heart from fear and expectation of an unavoidable death: while thus the mused, the saw the Wolf lie down, the fitting in the one corner, and the Fox refting in another, and the Wolf appealed as much as either of both, fo the woman had no harm but an ill nights lodging, with the fear whereof she was almost out of her wits. Early in the morning came his great Uncle the Hunter to look upon his trenches and pits what was taken, and coming unto that pit, he found a treble prey; a Woman, a Wolf, and a Fox: whereat he was greatly amazed, and stepped a little backward, at the firft fight the woman feeing him cryed out, calling him by his name, and praying his aid: he knowing her by her voyce, prettily leaped down into the pit, (for he was a valiant man) and with his weapon firlew the Wolf, and then the Fox, and so delivered the woman from the fear of them, yet there was forced to leave her till he went and fetched a ladder, for she was not able to come forth as he was; then having brought the ladder, he went down again into the pit, and brought her forth upon his shoulders, in that manner delivering her safe to her husband and family. Now these two stories do plainly set forth, that a Wolf daren't do nothing while he is in fear himself.

It hath been a question whether Wolves can be tamed or no, some fay that they are always wide and can never be tamed. [Albert] writeth, that being taken wheals, they are tamed and will play like Dogs, yet he faith, they never forget their hatred againft the Hunter and the desire of Lambs or other beasts which are devour'd by Wolves, whenever he goeth abroad. And [Stumpfius] writeth, that even when they are tamed, they are angry with their Masters that look upon them while they eat their meat.

[Strabo] writeth a fable of two Woods among the ancient Veneti, one of them dedicated to Juno, and the other to Diana, and he would make the world believe, that therein the Wolves lived peaceably and gently with the Harts, and did come to the hands of men like familiar tame Dogs, suffering themselves to be found which is full, cowardly, and treacherous, daring do nothing but for the belly, and not then neither, but upon a singular advantage, and for the manifesting hercelf, I will express these two stories following, as they were related to Gefner by Michael Hers, and Iugius Gubcrus. It happened (faith the first) that a certain Wolf constrained by famine, came unto a village near Milan in Italy, and there entred into a certain house, wherein sat the good wife and her children, the poor woman being terrified herewith, and not knowing what the did, ran out of the house, pulling the dore to after her, and so running the Wolf in among her children, at last her husband returned home, unto whom she related the accident, and how she had shut up the Wolf; the man being more afraid then was cause, left the Wolf had devoured some of his children, entered hastily in a dores, longing to fave and deliver his poor Infants, whom the fearful mother had left with the Wolf, when he came in he found all well, for the Wolf was in wofe cafe, altomithed, amazed, daunted, and flanding like a flock without fene, not able to run away, but as it were offering himfelf to be devour'd: And this is the first history. The fecond is like unto this, but more admirable, for the great Uncle of Gubcrus, being marvelously addicted to the hunting of wide beasts, had in his land divers ditches and trenches cut up with other pits and caves wrought very artificially for the safe keeping of fuch beasts as should fall into them. Now it hapned that upon one Sabbath day at night there fell into one of those pits three creatures of divers disposition, and adverse inclination, none of them being able to get out thereof: the first was a neighbors wife of his a poor woman, which going to the field to gather Bees and Rapes for her meat the day following, it fortuned that the fell down by a mishance into the said pit, wherein she was fain to lodge all night (you must think with great anguish, sorrow, and perilous danger to her felf) beside that which her husband and family conceived at home, but she had not carri'd long in the said pit ere a Fox was likewise taken and fell down upon her, now began her grief to be encreated, fearing left the wide bell should bite and wound her, having no means to escape from him, nor no man to help and relieve her, although the cried as loud as ever the could; wherewithal being wearied, necessity made her to be patient, being a little comforted to fee the Fox as much afraid of her, as she was of him, and yet she thought the night full long, willing for the break of the day, when men fir abroad to their labours, hoping that some or other would hear her moan, and deliver her from the society of fuch a Chamber-fellow: while thus she thought, striving betwixt hope, fear, and grief, lo what befel her more woefully then before, for suddenly a Wolf was taken and fell down upon her, then the loft her hope, and in lamentable manner thinking of husband and children, how little they conceived of her extremity, resolved to forsake the world, and commended her soul to God, making no other reckoning but that her disfreasted lean limbs should now be a supper and breakfast to the Wolf, wishing that she might but see her husband, and kiss her children before the lost her life by that savage execution; but all her wishes could not prevail, nor clear her heart from fear and expectation of an unavoidable death: while thus she mused, she saw the Wolf lie down, the sitting in the one corner, and the Fox resting in another, and the Wolf appealed as much as either of both, so the woman had no harm but an ill nights lodging, with the fear whereof she was almost out of her wits. Early in the morning came his great Uncle the Hunter to look upon his trenches and pits what was taken, and coming unto that pit, he found a treble prey; a Woman, a Wolf, and a Fox: whereat he was greatly amazed, and stepped a little backward, at the first sight the woman seeing him cryed out, calling him by his name, and praying his aid: he knowing her by her voyce, prettily leaped down into the pit, (for he was a valiant man) and with his weapon firlew the Wolf, and then the Fox, and so delivered the woman from the fear of them, yet there was forced to leave her till he went and fetched a ladder, for she was not able to come forth as he was; then having brought the ladder, he went down again into the pit, and brought her forth upon his shoulders, in that manner delivering her safe to her husband and family. Now these two stories do plainly set forth, that a Wolf daren't do nothing while he is in fear himself.
The History of Four-footed Beasts.

Although nothing hath hitherto been brought to light concerning the Sea-wolf of the ancient writers, that I know, yet his form is notable to be observed; and you may judge whether you will call him a Thief or a Sea monster, much differing from the Wolf's, as that he feedeth to challenge a particular description or treatise. It is also a Four-footed beast that liveth both on sea and land, satisfying his hunger on the most part upon fishes; it hath been seen upon the British Ocean-thoar, and it doth resemble the Wolf that liveth on the land, that it is not unaeedevedly called among the common people a Wolf.

It doth live also a long time being tamed, it hath a dangerous head, and very many hairs growing on both sides of his eyes to shadow them, his nostrils and teeth are like unto a Dogs, and strong hairs growing about his mouth; also small bristles growing upright upon his back: and adorned and marked on every side with black distinct spots, a long tail, thick and hairy, all the other parts being like to a Wolves, as you may easily see by this expressed Picture: and unto this belongeth the story of the Wolves last before expressed, which live upon fishes, and divide them familiarly with men.
Of the THOES.

T

Here are two kinds of Thoes, as there are of Panthers, differing only in magnitude or greatness. But the lesser Thoes is like unto the lesser Panther, a Lycopanther, and the Lycaon Canatus engendered between a VVolf and a Dog are all one four-footed beast. The Thoes also are a kind of VVolf. And again there is a kind of VVolf which Alisflat doth call Cabaces, but Aisicon doth write, that it ought to be called Beruet, in the Perifian tongue. And again in another place, where he doth write, that the Lion and the Thoes are utter enemies, and Albertus doth translate it, that a VVolf doth fight with the four-footed beat Tabor, which is a corrupted word, Tabor, for Tabor, as Cabace for Thoes, and this some men think to be the Lyx. Thoes is called in Hebrew, Tabas; Alisflat is a four-footed beat like to a Wolf. Adictaeb is also a kind of Woff, but I do not know whether these names belong only to the Thoes, or to any other kind of Wolf. Selium doth call Thoes Ethiopian Wolves, and a little before he said that Lycaon was an Ethiopian Wolf, maimed on the neck, and so divers coloured that a man would think there were no colors wanting in them.

The people of Sybia likewise say, that the Buff doth change his colors, neither is there any other beat covered with hair, except the Lycaon among the Indians, (as Pliny also writeth) and besides this there is no mention made of the Lycaon among all the ancient writers. Lycaons are called Dogs, in the story of the diversities of Dogs. The lesser kind of Thoes are the beat, for some make two kinds of Thoes, and some three, and these like birds, and other four-footed beat, change their color, both in Winter and Summer, so that sometime they appear bare, and again at other times all over, that is bare in the Summer, and rough in the Winter, but it doth plainly seem that there is no more kind of Thoes but one, which the things that come after doth prove and make manifest. Nearbe faith, that thoese Tigers are not true Tigers, which are commonly called Tigers, but changeable Thoes (as if that every Thoes were not changeable) and greater then the other Thoes.

They have no renown which take the Lycops Caninus for a Thoes, which we have already shewed to be a Lyx; for the Rhetians which speak Itallian &c. the Savages do to this day call him Cervario, and for the Armenian Woff the Ciacius, and the Lycaon Canatus we have already shewed, that it is a Panther, and therefore it is needles to fland any longer upon those names in this place. We will therefore take it for confessed, that the Thoes is a beat engendered between a Woff and a Fox, whereas some are greater and some are smaller, and there are found about the Mountain Pangem, Citum, Olymp, Mytis, Pindus, and Nys, beyond Syria, resembling for the most part a Hyanza, having a longer body, and a straighter tail than a Woff, and although it be not so high of stature, yet it is as nimble and as strong as is the Woff, and it seemeth that the very name Thoes is taken from the celerity and swiftness in running and leaping, for it getteth his living by the quickness of his feet. In the outward face it much resembles a Woff his Father, but in spots and length of his body it resembles a Panther his Mother; they couple in generation like Dogs, bringing forth two or four at a time, like Wolves, which are blinde, and their feet cloven into many toes.

They are enemies to Lions, and therefore they do not live in the same place where Lions are, not only because they live upon the same victuals and food, but also because they are a more pitiful creature then they, especially to man, for if they see the face of a man at any time, they run unto him and do him all such reverence as their brutish nature can demonstrate.

And further Pliny and Selium write, that if they see a man oppossed by any other beat, they run and fight for him, although it be with the Lion, not sparing to offer their own lives, and to spend their dearest blood in the defence of the king, who by secret instinct of nature they understand to be ordained of God, the King and chieft of all worldly creatures: therefore Gratus called this kind, femifem, Thoes de fanguine prolem, and of their taming and fighting with Lions, he speaketh:

---Thoes commissus Leones
Ei subire aula, & parvis donscope laceria.

They live for the most part upon Harts, whom they take in the swiftness of their course, flye they bite and suck their blood, then suffering them to run away to some Mountains, thither they follow them and take them the second time, not destroying them all at once, but by distance of time, whereby the Harts blood groweth sweeter unto them, and they have the better appetite thereunto to destroy them. The Lycopanthers, and also the beat Pathyon, whereof Albertus speaketh, I do take to be two several distinct beats from the Thoes, although the quantity and stature agree, and I fee no cause if there be any flesh beat in the world, but that we may truly say they are a lesser kind of Panthers. And this shall suffice to have said of these beats, which are deemed to be of the kind of Wolves, wherein we have endeavored to say so much of the general and special as we could collect out of any good Authors; and thus we will shut up the story of the Wolf with a short remembrance of his medicinal vertues.

---The Medicines of a Wolf.

A Wolf being foddain alive until the bones do only remain, is very much commended for the pains of the Gout, or a live Wolf steeped in Oyl and covered with Wax, is also good for the same disease.

D d 3
The skin of a Wolf being tasted of those which are bit of a mad or ravenous Dog, doth preserve them from the fear or hazard of falling into water. The skin of a Wolf is very profitable for those which are troubled with the wind colick, if it be bound fast about the belly: and also if the person so affected doth sit upon the said skin, it will much avail him. If any labouring or travelling man doth wear the skin of a Wolf about his feet, his shoes shall never pain or trouble him. The skin of a Wolf being new plucked off from him, and especially when it hath the natural heat in it and rowled about the member where the cramp is, is very effectual against it.

The blood of a Wolf being mixed with Oyl, is very profitable against the deafness of the ears. The dung and blood of a Wolf is much commended, for those that are troubled with the Colick and Stone.

The blood of a Buck, Fox, or Wolf being warm, and so taken in drink, is of much force against the disease of the stone. He who doth eat the skin of a Wolf well tempered and fodder, will keep him from all evil dreams, and cause him to take his rest quietly. The flesh of a Wolf being fodder, and taken in meat, doth help those that are Lunatick. The flesh of a Wolf being eaten is good for procreation of children. You may read more things in the chapter going before, concerning remedies of the flesh of a Wolf taken in meat. The fat of a Wolf is no less efficable, then the flesh.

The fat of a Wolf doth very much profit, being anointed upon those whose jynots are broken. Some of the later writers were wont to mix the fat of the Wolf, with other Ointments for the disease of the Goat. Some also do mingle it with other Ointments, for the Plltie. It doth often also the Uvula, being anointed thereon. The fame also being rubbed upon the eyes, is very profitable for the beards or bloud-shot of the eyes. The head also of a Wolf is very good for those that are very troubled with sleep upon being laid under their pillow. The head of a Wolf being burned into ashes, is a special remedy for the leathness of teeth. The right eye of a Wolf being killed, and bound to the body, doth drive away all Agues and Fever. The eye of a Wolf being rubbed upon the eye, doth dimmit all diseases that rife in the fight of the eye, and it doth also take away all marks or prints being made with hot Irons. The right eye of a Wolf also is profitable for those that are troubled with Birchtes on the right side of the belly; and the left eye of a Wolf for pains on the left side. The right eye of a Wolf is very good against the bitings of Dogs. Also the eye of a Wolf is much commended for those that are Lunatick by the bitings of Dogs.

The teeth of a Wolf being rubbed upon the gums of young Infants, doth open them, whereby the teeth may the easier come forth. Again, the gums of children are loosen'd with the tooth of a Dog, being gently rubbed thereon, but they are sooner brought forth with the teeth of a Wolf. Some men do commend the tongue of a Wolf to be eaten of those that are troubled with the Falling-ficknes. The artery which springeth in the throat of a Wolf being taken in drink, is a most certain cure against the Squinsie. The throat of a Wolf taken in drink, is very much commended for those that are troubled with the Falling-ficknes. The lungs or lights of a Wolf being fodder and dried, and mingled with Pepper, and so taken in milk is very profitable for those that are puffed up or swollen in the belly.

The heart of a Wolf being burned and beaten to powder, and so taken in drink, doth help those that are sick of the Falling-ficknes. Take one ounce of the gum of an Oak, and half an ounce of the gum of a Pear-tree, and two drams of the powder made of the top of a Hart-bone, and one dram of the heart of a Wolf, all which being mingled together, and made into medicine, is always used for the cure of all ulcers: but it will be more effectual if thou dost add thereto the hinder-part of the skull of a man beaten to powder. The Liver of a Wolf is of no use vertue then the Lungs or Lights, which I have manifested in the medicines of the Fox. The Liver of a Wolf helpeth or profitteth those that are sick of the Falling-ficknes. The Liver of a Wolf being washed in the belt white wine, and so taken, is very good for those diseases that arise in the Liver. The Liver of a Wolf mixed in the medicine made of Liver-wort, is very much commended for the diseases in the Liver. Galen also doth say, that he hath holpen those which have been diseased in the Liver, only using the medicine made of Liverwort, and he faith, if he did apply any other medicine thereto, he did little or nothing at all profit him.

The Liver of a Wolf is very profitable for those that are troubled with the furce in the mouth. The Liver or lappes of a Wolf is much used for those that are troubled with diseases in the Liver, but you must dry it and afterwards beat it to powder, and so give the party so affected one dram of it in sweet wine. The Liver lappes of a Wolf faith Maresellis, being dried and beaten to powder, and a little part of it mingled in like portions with the powder made of Fengeek, of Lupines, Woodworm, and of the herb called Herba Menthe, and so mingled that it may be about the quantity of a cup full, and so given that day which he is not troubled with the Fever, but if he shall be troubled with it, let him take it in water for the space of three days, and after he hath drunk it, let him lie for the space of half an hour with his arms spread abroad: and afterwards let him walk very often, but eat very seldom, and let him be sure he keep himself for the space of those three days well ordered, and from drinking any cold drink, or eating any salt or sweet thing, and within a little space after he shall be freed from that disease. The Liver lappes of a YWolf being wrapped in bay-leaves, and so set to dry at the Sun or at the fire, and being dryed, beat it to powder in a Mortar, first taking away the leaves very warily, which being powdered, you must keep it in a clean vessel, and when you give it to drink, you must add thereto two leaves of Spoonwort, with ten grains of Pepper beaten very small, and as much clarified Honey as is needful, and also made hot with a hot burning Iron, and mingled very diligently in a Mortar, which being so warmed, you must give him to drink sitting right
right up in his bed, that after he hath taken the potion, he may lie down on his right side for the space of an hour, drawing his knees together, and after that he hath done so, let him walk up and down for the space of an hour, and this will likewise cure him of the same disease.

Avicen doth set down a medicine concerning the cure of the hardness of the Liver, which is, Take Opium, Henbane, Oyl made of Beavers bones, Myrrhe, Saffron, Spicknard, Agrimony, the Liver of a Wolf, and the right horn of a Goat burned, of each equal parts, and make thereof a medicine. The Liver of a Wolf being made in the form of a dry Electuary and given as a Lozeng, doth also very much profit against the diseases of the Liver.

Gugger a Philosopher doth affirm, that the Liver of all living beasts doth very much profit against all pains of the Liver. The Liver of a Wolf being thoroughly dried and drunk in sweet Wine, doth mitigate all griefs or pains of the Liver. The Liver of the same beast to the quantity of a penny, taken in a pinte of sweet Wine, is very medicinaile for the curing of all pains in the Liver whatsoever. The Liver of a Wolf being taken in hot wine, doth perfectly cure the cough. If an intolerable cough doth vex any man, let him take of the Liver of a Wolf, either dried or burnt, as much as he shall think convenient, and therewith let him mangle wine, honey, and warm water, and afterward drink the same falling every day, to the quantity of four Spoonfuls, and he shall in short space be cured of the same.

The laps or fillets of a Wolves Liver, being applied unto the side, doth perfectly heal any itch or pricking aching therein. The Liver of a Wolf being taken in sweet wine, doth heal those which are troubled with a Tisick. The Liver of a Wolf being first boiled in water, afterwards dried, beaten and mingled with some certain potion, doth insanely heal the grief and inflammation of the stomach. The powder of a Wolves Liver mingled with white wine, and drunk in the morning for some certain days together, doth cure the Dropkie. The Liver of a Wolf taken either in meat or drink, doth aflwage the pains of the fecret parts. Two Spoonfuls of the powder of a Wolves Liver being given in drink, doth cure all pains or fores of the mouth. The gall of a Wolf being bound unto the navel of any man, doth loosen the belly.

The gall of a Wolf, being taken in wine, doth heal all pains in the fundament. The entrails of a Wolf, being washed in the best white wine, blown upon, dried in an Oven, pounded into dust, afterwards roweld in Wormwood, is a good and effectual remedy against the Colick and Stone. If some part of the yard of a Wolf being baked in an oven, be eaten by any, either man or woman, it insanely stirreth them up to luft. Concerning the genital of a Wolf I have spoken before in the medicines of the Fox: but antiquity, as Play laith, doth teach that the genital of beasts which are bony, as Wolves, Foxes, Ferrets, and Weeals, are brought to an especial remedy for many diseases. If any man take the right f hone of a Wolf, being bloody, steep it in Oyl, and give it unto any woman to apply it unto their secret parts, being wrapped in wool, it insanely caueth her to forfaie all carnal copulation, yea although she be a common strumpet. The same being taken in some certain perfumes, doth help those which are troubled with the soul evil.

The eyes being anointed with the excrements of a VVolf, are insanely freed from all covers or spreading skin therein. The powder of the same VVolf being mingled with the sweetest Honie as can possibly be had, and in like manner rubbed or spread upon the eyes, doth expel all dizzining from them. The time of a VVolf long rubbed until it be very light, being mingled with Honey, by the unction thereof, causeth the fitch or scurfe growing about the eyes to avoid away, and reforreth them to an exceeding cleaninesse. The powder of a VVolvs head being rubbed upon the teeth, doth make fast and confirm the loofenesse thereof, & it is most certain that in the excrements of the same beasts, there are certain bones found, which being bound unto the teeth, have the same force and efficacy.

The dung of a VVolf or Dog being beaten into small powder, mingled with Honey and anointed upon the throat, doth cure the Quinsie or Squinsie as also all other fores in the throat whatsoever. The time of a VVolf being given to those which are troubled with the Colick to drink, doth easily cure them, but this dung is more effectual if it have never touched ground, which is very hard to come by, but it is found by this means. The nature of the VVolf both in making his water, as also in voiding his excrements is like unto a Doggs, for while he voideth his water he holdeth up his hinder-leg, and voideth his excrements in some high or sleepy place far from the earth, by which means it faileth down upon bushes, shrubs, elder-trees, or some other herbs growing in those places, by which means it is found never touching the earth. There is furthermore found in the time of VVolvs certain bones of beasts which they have devoured, which for as much as they could not be ground or chewed, so also can they not be concocted, which being beaten and bruised small, are by some commendable to be excellent given in drink for the ease of the Colick, but if the grieved person shall be some fine or delicate person which cannot endure to gross a medicine, then mingle it with Salt, Pepper, or some fuch like thing, but it is most often given in sweet wine, so there be but a small quantity thereof drunk at one time.

But this dung which the Graecians call Lagatons, and is to be applied to the groin of the diseased person, ought to be hanged in a band made of wooll, but not of any wooll: But it would be more effectual if it were made of the wooll of that Sheep which was slain by a VVolf. But if the same cannot be got, then it is fit that there be two bands, one which may be bound about the groin, and another which may be bound upon the dung to keep it from falling.

There are also some which call a small quantity of the same dung to the bigness of a Bean in a little pot, setting the same to any one which is troubled with the said disease, and it healeth them (which in
The History of Four-footed Beasts.

in a manner seemeth incredible) in very short time. The dung of a Wolf boiled in small white wine, and afterwards taken in drink, is very profitable for those which are troubled with the colick: and it is also reported that if the same dung be covered with the skin of the same beast, and hung upon the thigh of any one which hath the colick being bound with a thread made of the wool of a Sheep's skin, a Wolf, it will instantly cure the said diseas.

The time of a Wolf, so that it be not found upon the earth, but upon some trees, Brambles, or Bulrushes, being kept, and when there shall be need bound unto the arm of him that shall be troubled with the Colick, or to his neck being included in a bone, or in Copper, and hung with the thread wherein with filk-women weave, doth wonderfully and most speedily cure him, so there be great care had, that in the mean time there be a little of the same dung given to the grieved party to drink, not knowing what it is. The dung of a Wolf being taken, and the bones therein beaten into powder, mingle therewith cold water, giving it to any one to drink which is troubled with the Stone, and it will instantly cure him.

The dung of a Wolf beaten into the smallest powder then strained and given unto any in his face which is troubled therewith to the quantity of half a spoonfull in hot water, is a very effectual and approved cure for the Stone. The bones which are found in Wolves, being bound unto the arm of any one which is troubled with the Colick, having never touched the ground, do with great speed and celerity cure him. The pattern bone of a Hare found in the dung of a Wolf, being bound unto any part of the body of him which is troubled with the colick, doth very effectually cure him. The dung of a Wolf with the hairs of a white Afe, taken by any woman in a certain perfume, maketh her apt for conception.

The teeth of a Wolf are unequal, wherefore their bitings are very dangerous. A ravenous Wolf by his biting bringeth the same danger, as a ravenous Dog, they also are cured by the same medicines, as we have declared at large in the story of the Dog. The wounds which come by the teeth or nails of a Wolf are very dangerous, for the fifth which pierceth through all clouts or spunges which are laid upon them: But they are cured by no other means then the bitings of Dogs: Aristotele writeth these things concerning the bitings of a Lion, and not of a Wolf.

Johannes Vitus the Hungariam declared that there were certain men in Hungary bitten by a mad Wolf, and that they were as it seemed perfectly cured: But before forty days expired they all died by a most bitter and painful disease, small pieces of flesh excreting through their urine in the form of Dogs, with an exceeding pain or torment. It is also reported of a certain Countryman, who when he had drunk a Wolf with his Club, and the Wolf had so torn his face with his nails, that he pulled off the skin, he was in short time healed that there appeared no sign of any harm, but in short time after he began to be sick, and to howl like unto a Dog, and so perished: by which it was conjectured that that Wolf was mad. An Ox being bitten by a mad Wolf or Dog is cured by Garlic, being beaten and rubbed upon the wound: The Wolf himself is also healed of any wound by old salt flesh applied unto the same. Two drams of Gentian being drunk in wine, is an excellent cure for the bites of a mad Dog and raving Wolves, as also of all beasts tearing with their teeth or nails. The bites of Wolves being marked in the bodies of any Catell, are burned or seared with a hot Iron, left that the biting be assuredly hurtfull, may draw unto it self corruption. And thus much shall suffice concerning the medicines of the Wolf.

Of the ZEBEL, commonly called a SABEL.

Among all the kinds of Weasels, Squirrels, Wood-mice, wilde Mice, or other little beasts of the world, there is none comparable to this Zebel, commonly called in Latine Zebelius, and Zebela, from whence the Germans call it Zabel, the Illyrians and Polonians, Sobel and Sobolt, the Italians, Sef, and Sabinet: The skins hereof are called Zebeline, and Zebelin, and sometimes Zibeline. Its bred in Maloia, and the Northern parts of the World, among the Lapons, but no where more plentiful then in Tartarie, Siberia, and Sarmatia, and it is therefore called by some Mus Sybisnes, the Sybian Moufe. The French men because of the similitude it hath with a Martin, do call it by a compound name, Marty Zebelinus. It liveth for the most part in the Woods, being leffer then a Martin everay way, and hath also shorter legs: They run up and down upon trees like Squirrels, easily falling their claws in the boughs; when they leap, their tail ferveth them instead of a cross Beam to direct them. They bite mof scurily, for their teeth are as sharp as Razors, and there is no beast in the World of their quantity so angry and terrible as they: their flesh is unprofitable and good for nothing. The only price and estimation of this beast is for the skin, which farre excelgeth all the skins of the World, either Ermins, Martins, or Foines, differing herein from the Martins, because their hair is thinner, and if you stroke them from the head to the tail, or on the contrary from the tail to the head, they do lie every way smooth, whereas the Martins do only fall smooth from the head to the tail.

These are more subject to Worms then other skins, except they be continually worn, or laid up with bunches of Wormwood: but above all other things the laying of them open one day togethe in the Sun or air, doth him more harm then a whole years wearing, for the beast itself liveth evermore in shadowy places, forbearing the sun except he be hunted, and catcheth small birds in secret. In the furthest part of Lituania they have little or no money, and therefore the Merchants which traffique thither do exchange their wares for Zebel or Sabel skins; those are the best which have
Of the Sivet-cat.

have most white and yellow hairs mingled in them, and the Garments of Princes are only fringed and lined with these Sabel skins, and honourable Matrons, ancient Noble men and their Wives do likewise use two or three of these to wear about their necks; for it is certain that a garment of these skins is much dearer than cloth of Gold, and I have heard and also read, that there have been two thousand Ducks payed for so many as were put in one Cloak.

It is a very libidinous and lustful beast, and at that time lanketh very rankfully, wherefore it mingleth itself with Martins of all sorts that it meeteth. And thus much shall suffice to have described of this little beast. Now there are divers other which seem to be of this kind, of which, though I have not much to say, yet rather then they should be omitted, I will express their bare names, that so I may give occasion to all our Country-men that shall travel into other Nations, to make enquiry after them, that to at their return, if they have any confidence of publique good, they may get themselves eternal fame and names, by communicating publiquely their own knowledge, experience, and learning, which they have gained in thefe, or other Four-footed beasts.

Of the NOERTS.

This beast is of the quantity of a Wesel, and by the Germans called Noerzt, and Nertz, from which word the Latines have their Noerza for this beast. It liveth (as Georgius Agricola writeth) in the Woods, betwixt Sowes and Vifula, the colour of the hairs which is short and smooth, is for the most part like an Otter. Their skins are fold at Franceford by forty in a heap or bundle, they are long, and more red then the Ferrets, every bundle most commonly is fold for fix and twenty Nobles. Some think that this is the Latex, spoken of before, because it geteth his living in the waters.

Of the VARMEL.

This beast is called by the Latines Vormelia, by the Germans Wormiein, it is lefse then a Ferrer, the belly whereof is black, all the residue of the skin full of white, pale, red, and yellow spots, which adorneth it in admirable manner, very comely and excellent to be looked upon, the tail not past half a hand breadth long, the tip whereof is black, but the hairs of the residue mixed with white and a th colour together.

There is another beast which for the variety of the colours, which are apparent in his skin, he is called a Salamander, not that which liveth in the fire, but one like unto it, having a gentle hair, differing all over into black and yellow spots, and these because of our ignorance we reckon among our outlandish Wesels.

In India there is a little beast called Oburewa, having a very precious skin, and this (as Cardan writeth) hath a bag under the belly, wherein it suffereth his young ones to go in and out, as before we have said of the simiaa, or Foxe-Ape.

There is another little beast in Hungaria, called Ureken, which dwelleth in holes of the earth as Coney do, the outward proportion whereof is like a Wesel, but it is much thinner and longer, the colour of the back is red, and all the residue of the body Moufe colour. Now although I do not read any special use of the skin of this beast, yet I thought it good to name it in this place, because it is reported that the breathing thereof upon the face of man is venemous and poyfonfull, for when Souldiers sleep in their tents upon the earth, they come many times and look in their faces, and poyfon them: And thus much for the Zebel, and the severall kinds of this little beast.

Of the ZIBETH, or SIVET-CAT.

This beast description that is of this beast in all the World, that I could ever finde, was taken by Doctor Gay, and thus tens as it is here figured to Doctor Gifmer with these words following. There came to my sight (faith Doctor Gay) a Zibeth or Sivet very lately, which was brought out of Africa, the picture and shape whereof in every point I caufed to be taken, which is this prefixed, so that one Egge is not more like another, then this is to the said Sivet or Zibet. It is greater then any
any Cat, and lefser then a Texus, having a sharp face like a Martin, a short, round, blunt ear, which was black withouht, but pale within, and on the brims a blewsky-coloured eye, a foot and leg black, and more broad or open then a Cats: Likewise a black claw, neither so crooked, nor so hid in the foot as it is in a Cat, but their teeth are more fearefull and horrible. It is all spotted over the body, but the nose thereof is black, the neither part of the upper chap pale, and the middle part black, and from thence to the top of the head it is of the colour of a Badger. The lower chap was all black, and the briflies of the upper chap were white, growing forth of a pale skin, and a little above the eye there were two other white ones growing forth of a black skin.

The throat thereof was black, and a little above the eye there arife three black lines or ftrakes, whereof the firft or uppermoft defcendeth down right to the throat, the second defcendeth compaffe in and out to the middle of the neck, and the third down to the shoulder, and then a little beneath that place on the contrary, arife two other black lines like circles afcending in the compaffe of the shoulder to the back bone: and all the residue of the body is dillinguifh'd and parted into many colours, having divers and fundry fpots fcarted abruptly throughout the whole circuit, whereof fome are continued and joyned together. For that which is upon the back is continued from the shoulder, and the second and third arifing in that part, are broken and divided, the fourth and all the residue are in like fort difcontinued and separated one from the other, fo that their position ruruneth all in length.

The firft part of his tail to the middle is spotted, and all the refidue black. The hair both on the face, legs, and feet, is foft, and very gentle to be handled, falling down, but in all other parts of the body, it is harfh, deep, and ftanding upright: the fpots doth both afcend and defend, the tongue hereof was smooth and not rugged, and under the tail was the paffage for the excrements after the fflation in other beftes, and a little beneath the fame was the receptacle or bag containing the Sivet, and a little space after that the privy part of the male which was hid or fhethed in the body. The beafl being moved to anger, uttereth a voyce like to the voyce of an angry Cat, withall doubling the letter R.R. but being not angry the voyce is like a young Cats although lower.

This Zibeth was in length from the head to the tail, one foot, three palms, and one Roman fingers breadth, but the breadth thereof under the belly, was one foot, two palms, and three Roman fingers. It was a gentle and tractable Creature, and was fold for eight pounds of English money, which was in French twenty four Crowns, or in Florens forty and eight. These things are faid by Doftor Cau. Now unto this Geffer addeth, that he received fuch another Picture from one Johannes Bentmannus, which he took by another of these Cats in the possession of the Duke of Savoy, and he faid that it was bought by him for seventy Taters (every Tater being worth in our English money eight pence half penny) in the year of the Lord, 1545. This beafl is a very clean beafl, I mean, a hater of filthineffe: and therefore the place wherein it lyeth muft be swept every day, and the Veoffel clean wash'd. The Sivet or liquor diliftilled out of the Cod, muft be taken away every second or third day, or else the beafl doth rub it forth of his own accord upon fome poftle in his kennel, if he be tamed or inflected. This Sivet is an Excrement not growing in the secret part only, but in a peculiar receptacle by it felf, increaing every day the weight of a groat; the colour whereof at the beginning is like Butter, but afterwards it growtheth more fad and brown: one ounce of it if it be pure and not foppifhed, is fold for eight Crowns at the leaff. There be Impoffors, which do adulterate it with an Oxes gall, Styrrax, and Hony. This is of a strange favour, and preferred before Musk by many degrees, yet it fmelleth worse if it be held hard to the nose: It is faid that the liquor running out, doth go back again if any Veoffel be put to receive it, except it be a Silver Spoon or Porringr.

Les Affer faith, thefe Beafles are wilde, untamable, and live upon flesh, but the European Merchants buy of the young ones and nourifh them tame, with Bran, Milk, hard Egges, and other things, and that fo they convey them into Europe out of Africk, emptying their Codswice or thrice a day in the hot Countreys: and that this Sivet is nothing elfe but the sweat of the beafl under the feds, fore-legs, neck, and tail. There were divers of thefe Zibeths tamed among other. It is reported of a Conful of the Florentine Merchants at Alexandria, that had one of thefe tame, that it would play with a man, and bite his nose, ears, cheeks, or lips fo gently that it fhould not be felt, therefor whereof was given, because it was at the firft nourifhed with the milk of a Woman. Cardinall Galleatus had three of thefe at Rome, which he kept for their Sivet: And Obio Duke of Brunodia, had also one which he nourifhed with Sugar. They are bred in Ethiopia and India, about the City Vegus and Tanafari. Their Sivet is not faavoury till it be wash'd and cleaned. It is faid to be very excellent againft the frrangulations of the wombe; and it is good againft the Colick: It hath also vertue to purge the wombes of women, to purge the brain, and is applied to many other diseases and infirmitie.
THE HISTORY OF SERPENTS. OR, The second Book of living Creatures:

WHEREIN IS CONTAINED Their Divine, Natural, and Moral descriptions, with their lively Figures, Names, Conditions, Kindes, and Natures of all venomous BEASTS: with their several Poylons and Antidotes; their deep hatred to Mankinde, and the wonderful work of God in their Creation, and Destruction.

By Edward Topsell.

London, Printed by E. Cotes, 1658.
The History of Servants: A Selection of Popular English Short Stories.
To the Reader.

Entle and pious Reader, although it be needless for me to write any more of the publishing of this Treatise of Venemous Beasts, yet for your better satisfaction and direction, briefly take this which followeth.

After the publishing of the former book of Four-footed Beasts, I understood of two things much misliked therein, wherein I also my self received a just offence. First, the manifold escapes in the Press, which turned and sometimes over-turned the sense in many places, (especially in the Latine) which fault as it may in part concern me, so yet it toucheth another more deeply, yet are both of us excusable: He in wanting the true knowledge of the Latine Tongue, and I, because of my employment in my Pastorall charge, and both of us together, because we were not so thoroughly estated, as to maintain a sufficient Scholar to attend only upon the Press. Wherefore, in this second Book, we have removed away that blot, and used a more accurate diligence, and I trust there is no escape committed perverting the sense, and not very many altering the letters.

The second exception taken against the former Treatise, was the not Englishing or translating of the Latine Verses, which thing I purposed to have done, if I had not been overhaltened in the business; for it had been to the work an Ornament, and to the History a more ample declaration: This fault I have now amended in the setting forth of this second Book of Living Creatures. All therefore that can be laid for your direction, I could with the History more compleat for the manifestation of the most blessed Trinities glory, whose works are here declared; and for the better revelation of the severall natures of every Serpent. I may fail in the expressing of some particular, yet I suppose that I have omitted no one thing in their narration, which might be warranted by good authority or experience. And therefore, although I cannot say that I have said all that can be written of these living Creatures, yet I dare say I have wrote more then ever was before me written in any Language.
Now therefore ask the Creatures (after God) and they will tell you: For, saith S. Austin, Interrogatio creaturarum profunda est consideratio ipsarum: responso earum, attestatio ipsarum de Deo, quoniam omnia clamant, Deus nos fecit. The asking of the Creatures is a deep and profound consideration of their several natures: their answer is, their attestation or testimony of God, because all of them cry out, The Lord hath made us. Wherefore, seeing it is most true, incognita non desiderantur, things unknown are not desired, to the intent that all true English Christians may hereafter more affectionately long after and desire, both the mysticall vision of God in this World, and also his perfect sight in the World to come, I have (for my part) out of that weak ability wherewith I am endued, made known unto them in their own mother Tongue, the wonderfull works of God; for the admiring of Gods praise in the Creatures, standeth not in a confused ignorance, not knowing the beginnings and reason of every thing, but rather in a curious and artificiall invesigation of their greatest secrets.

Therefore, let all living men consider every part of divine widsom in all his works; for if it be high, he thereby terrifieth the proud; by the truth he feedeth the great ones; by his affability he nourisfeth the little ones. And so I will conclude my Preface with the words of the three Children: O all ye works of the Lord, praise him and magnifie him for ever.

Edward Topsell.
A GENERAL TREATISE
OF
SERPENTS,
DIVINE, MORAL, and NATURAL.

Of the Creation and first Beginning of SERPENTS.

Here is no Man that can justly take exception that this History of Serpents beginneth at their Creation: for seeing our purpose is, to set forth the works of GOD, by which as by a clear glass, he endeavoureth to disperse and distribute the knowledge of his Majesty, Omnipotency, Wisdom and Goodness, to the whole race of Mankinde, it seemeth most proper that the first stone of this building, laid in the foundation be fetched from the Creation: and the rather, because some Naturalists (especially amongst the ancient Heathen) have taken the Original of these venomous Beasts, to be of the earth, without all respect of Divine and Primary Creation. And hereunto some Heretics, as the Manichees, and Marcionites, have also subscribed, though not directly, for they account the Creation of these venomous and all hurtful Beasts an unworthy work for the good GOD, because they could never see any good use of such creatures in the World.

Yet we know the blessed Trinity created the whole frame of this visible World by it self, and for good, reasonable, and necessary causes, framed both the beneficial and hurtful Creatures, either for a Physical or Metaphysical end. Therefore it is most certain, that if we consider the outward parts of these Creatures attended with life, no man nor nature could begin and make them, but the first Efficence or Fountain of life: and if we can be brought to acknowledge a difference between our shallow capacity, and the deep wisdom of God, it may neceffarily follow by an unavoidable sequel, that their uses and ends were good, although in the barrenness of our understanding, we cannot conceive or learn them. But I purpose not to follow these things Philosophically by arguments, but rather Divinely by evident demonstration of the things themselves. And first of all, it appeareth, Gen. 1:24, that God brought out of the earth all creeping things after their kindes: And left that any man should doubt, that under the general name of creeping things, Serpents, and other venomous Beasts, were not intelligibly enough expressed; it is added Chap. 3,1 That the Serpent was more subtile then all the Beasts of the field which God had made. The Prophet David also, Psal. 148,7 among other things which are exhorted by the Prophet to praise their Creator, there are named Dragons, which are the greatest kindes of Serpents. Unto this also alluded S James, ch.3,7, saying: That the whole nature of Beasts, and of Birds, of creeping things and things in the Sea is tame by the nature of Man: for man, which is next unto God, hath authority and power, to rule over all his works, and therefore over Serpents.

And herein it is fit to shew, what wonders men have wrought upon Serpents, taming and destroying them rather like Worms and Beasts, no ways enemies to mankind, but friendly, and endowed with sociable respect, or else as weaklings commanded by a superior power. Such an one was Aysr a notable Inchanner, who by touching any Serpent brought it into a deadly sleep: according to these verses;

\[
\begin{align*}
\text{Nec non Serpentes dito examinare veneno},
\text{Debus Aysr: taflique graves sepire obeydres.}
\end{align*}
\]

In English thus;

The cunning Aysr, Serpent fierce, of poysen did disem,
And Water-fraikes to deadly sleep, by touching he did charm.
Of Serpents in General.

Aelius Gadamesius, in his description of the new World, telleth an excellent history of a Ligurian young man, being among the Negroes travelling in Africa, whereby he endeavoureth to prove, how ordinary and familiar it is to them, to take and charm Serpents, according to the verfe of the Poet:

Frigidus
In pratis cantando rumpitur anguis.

That is, the cold earth-snake in Midsum green,
By singling, broke in pieces may be seen.

The young man being in Africa, among the Negroes, and lodged in the house of a Nephew to the Prince of Budanel, when he was taking himself to his rest, suddenly awaked by the hearing the unwanted noise of the hissings of innumerable forts of Serpents; whereas he then wondered, and being in some terror, he heard his Hoft (the Prince Nephew) to make himself ready to go out of the doores, (for he had called up his servants to saddle his Camels:) the young man demanded of him the cause, why he would go out of doores now so late in the dark night? To whom he answered, I am to go a little way, but I will return again very speedily: and so he went, and with a charm quited the Serpents, and drove them all away, returning again with greater speed then the Ligurian young man his guests expected. And when he had returned, he asked his guests if he did not hear the immediate hissings of the Serpents? and he answered, that he had heard them to his great terror: Then the Prince Nephew (who was called Bishop) replied, saying; they were Serpents which had befet the house, and would have destroyed all their Cattle and Herds, except he had gone forth to drive them away by a charm, which was very common and ordinary in those parts, wherein were abundance of very hurtful Serpents.

The Ligurian young man hearing him say, marvailed above measure, and said, that this thing was so rare and miraculous, that scarcely Christians would believe it. The Negro thought it as strange that the young man should be ignorant hereof, and therefore told him, that their Prince could work more strange things by a charm which he had, and that this and such like were small, vulgar, and not to be accounted miraculous. For when he is to use any strong poyson upon preuent necessity, to put any man to death, he putteth some venom upon a sword, or other piece of Armor, and then making a large round circle, by his charm compelleth many Serpents to come within that circle, he himselfe standing amongst them, and observing the most venomous of them all so assembled, which he thinketh to contain the strongest poyson, killeth him, and causeth the residue to depart away presently; then out the dead Serpent he taketh away the poyson, and mixeth it with the feed of a certain vulgar tree, and therewithal anointeth his dart, arrow, or swords point, whereby is caused present death, if it give the body of a man but a very small wound, even to the breaking of the skin, or drawing of the bloud. And the said Negro did earnestly persuade the young man to see an experiment hereof, promising to shew all as he had related, but the Ligurian being more willing to hear such things told, then bold to attempt the trial, told him, that he was not willing to fee any such experiment. And by this it appeareth, that all the Negroes are addicted to Incantations, which never have any approbation from GOD, except against Serpents, which I cannot very easily be brought to believe.

And seeing I have entered into this passage of Charming, being (no doubt) an invention of Man, and therefore argueth his power to tame these venomous Beasts, according to the former sayings of Saint James, although I condemn such courses utterly, yet it is lawful to proteste the fame, seeing the holy Ghost, Psalm 58. ver. 4. 5. affirmeth a practife against Serpents, a dexterity and ripinenes in that practife, and yet an impossibility to affect any good, except the voice of the Charmer come to the ear of the Adder: For thus he writeth; Their poyson is like the poyson of a Serpent-like a deaf Adder that flippeth his ear, 5. Which heareth not with the voice of the Inancher, though he be most expert in cunning. Upon which words Saint Augustine, Saint Jerom, and Capituliter writing, say; that when the Charmer cometh to Inchant or Charm, then theylay one of their ears to the earth so close, as it may not receive the sound, and their other ear they close with their tail. I will therefore yet add somewhat more of this taming of Serpent.

I have heard a Gentleman of singular learning, and once my worshipfull good friend, and daily encourager unto all good labours, report divers times very credibly, upon his own knowledge and eye-sight, that being at Padua in Italy, he saw a certain Quack-salver, or Mountebank upon a stage, pull a Viper out of a box, and suffered the said Viper to bite his foot, to the great admiration of all the beholders, receiving thereby no danger at all. Afterward he put off his doublet and shirt, and showed upon his right arm a very great unwonted blew vein, standing in the common course of nature; and he said, that he was of the lineage of Saint Paul, and so were all other that had such veins, and that therefore (by special vertue to that Family given from above) no Viper nor Serpent could ever annoy or poyson them: but withall, the fellow drank a certain compound water, or antidote, for fear of the world, and so at one time vented both his superflicious hypocrisie, and also much of his Antidote to his great advantage.

But I have since that time also read, in Matthew his Commentaries upon the sixth Book of Disputation, that there were wont to be many such Juglers in Italy, carrying in their botomes living Serpents, of whose fraudulent Impostures he speaketh in this fort. They take Serpents in the Winter
Of Serpents in General.
Winter time, when they grow dead and flife through cold, & yet for their better defence against their venomous biting, they defend themselves by a certain experimental unguent, known to be practiced in this sport, made of the Oyl preffed out of wilde Radish, the roots of Dragonwort, the juice of Daffodil, the brain of a Hare, the leaves of Sabine, spixts of Bay, and some other few things thereunto added. Asfoon as they have taken them, they instantly all to ftep upon their heads, for by reafon of a secret antipathy in Nature, they grow very dull thereby, and lay aside the force and rage of venom; for the fettle of a Man, is of a clean contrary operation to their poifon. And when afterward they make oftentation hereof in the Market, or publique Stage, they fuffer them to bite their own flesh: but firft of all, they offer them a piece of hard ftefth, whereupon they bite to clean their teeth from all fpawn and fpume of venom, or else sometime pull forth the little bags of poifon, which inhere in their chaps, and under their tongues, fo as they are never more replete or filled again: And by this deceit they deceive the world where ever they come, giving forth that they are of the linage of Saint Paul, who cast a Viper off from his hands, as we read in the holy Scriture.

It was an invention of ancient time among the wife Magitians, to make a pipe of the skins of Cats legs, and therewithall to drive away Serpents; by which it appeareth, that the soveraignity of Man over Serpents, was given by GOD at the beginning, and was not lost, but continued after the fall of man, (although the hand that should rule be much weaker) and practiced by the most barbarous of the world, necelcity of the defence forcing a violence and hatred, betwixt the Serpent and the Womans feed. For this cause we read of the feven daughters of Atlas, whereof one was called Hyge, whose daily exercise was hunting of venomous Beasts, and from her the Hyge had her denomination. And for a conclusion of this Argument, I will add to this one story more out of Ethiopia. When Thonus the King of Egypt had received of Menelion, Helen to be safely kept, whiles he travelled through Ethiopia, it hapened that the King fell in love with her beauty, & oftentimes endeavour'd by violence to ravifie her; then, it is also faid, that Helen, to turn away the Kings unlawful luft, open'd all the matter to Phedyamma the wife of Thonus, who impatiently fearing her own elfate, left that in time to come, fair Helen should deprive her of her husbands love, banifhed her into the land of Pharos, which was full of all manner of Serpents, and yet taking pity on her for her simplicity, gave her a certain herb, whereby the drove away all Serpents. For (it is faid) when the Serpents and venomous Beasts do but smell the fame herb, they infantly hide their heads in the earth. Helen coming into that Island plante the fame there, and was therefore called by the Inhabitants after her own name Helenium, which the skilful Herborifls at this day affirm to grow in Pharos.

Unto this discourse of the taming of Serpents, I may add yet more strange things, if any thing be strange in the nature of this world. And thofe are some Histories of the familiarity of Men, Women and Serpents. Alexander was thought to be begotten of a Serpent, for it is faid, that on a time there was found a great Serpent upon his Mother Olympia as she was fleeping; and some fay (for the honour both of the Mother and the Son) that this Serpent was Jupiter, turned into the likeness of a Serpent, as we read he changed himself into many other shapes. And the like story unto this, is allledged of Scipio Africaius his mother, who long time remained barren without the fruit of the womb, infomuch as P. Scipio her husband utterly defpair'd of posterity. It hapned one day, as she was in her bed, her husband being abfent, there came a great Snake and lay beside her, even in the presence of the fervants and family, who being mightily afftomfled thereat, cryed out with loud voyces for fear, whereat the woman awoke, and the Snake fled away invisibly. P. Scipo hearing this report at his return home, went to the Wizards to understand the lecret or significatio of this prodige: who making a facrifice, gave anfwere that it betoken'd prodigie, or birth of children, and thereupon followed the birth of Scipio Africaius.

We read alfo in Plutarch of certain Serpents, lovers of young Virgins, who after they were taken and infinared, fhou'd all manner of fuitful, vitiouf, and amorous geftures of uncleannefs and carnality; and by name, there was one that was in love with one Eufba a Virgin, who did accouml to come unto her in the night time, fliding gently all over her body never harming her, but as one glad of fuch acquaintance, tarry'd with her in that dalliance till the morning, and then would depart away of his own accord: the which thing being made manifest unto the Guardians and Tutors of the Virgin, they removed her unto another Town. The Serpent muffing his love, fough her up and down three or foure days, and at laft met her by chance, and then he fatified her not as he was wont, with fawning, and gentle fliding, but fiercely affaulted her with grievous countenance, flying to her hands, and binding them with the fpire of his body faft to her sides, did softly with his tail beat upon her backe parts. Whereby was collected, fome token of his chafement unto her, who had wrong'd fuch a Lover with her wilful abfence and disappointment.

It is alfo reported by Eutamon, that Egemon in his verses, writeth of one Athis a Thesilian, who feeding his Oxen in the fpife, near the Fountain Helenium, there fell in love with him a Serpent of exceeding bignefs and quantity, and the fame would come unto him, and foftly lick his face and golden hair, without doing him any manner of hurt at all. Thence, and fuch like things do evidently prove, that Serpents are not only involuntary tamed by Men, but alfo willingly keep quarter with them, yielding to the firft Ordinance of the Creator, that made them subjécts and vassals to men. And thus much shall fuffice to have spoken in this place, concerning the firft creation of Serpents.
of the natural Generation of SERPENTS, and their several Originals.

IT being thus cleared, that Serpents were at the beginning created by GOD, and are ruled by men, as now followeth, that we should in the next place talk of the matter of their beginning, and the means of their continuance ever since their Creation.

First therefore it is most plain in Genesis, that the Earth (by the virtue of the Word of GOD) did produce all Creeping things, and among them Serpents: but since that time, they have engendered both naturally, and also prodigiously.

As concerning their constitution, it is held to be most cold, above all other living Creatures: Pliny, and therefore Pliny writeth, that they have neither heat, nor blood, nor sweat. Hereunto subscribeth Galen, both Galen and Pausiy. Avicen seemeth to affirm the contrary, Mercurialis decideth this controversie, and proveth that Serpents are extremely cold, and their bodies outwardly moist. First, because those which are slung and poysoned by Serpents, are oppressed with an unnatural cold, which overcometh natural heat, and disturbs all their parts, vexing them intolerably. Secondly, there can be assigned no other reason why these Creatures hide themselves four months in the year, but only their natural cold, making them so tender, as they are altogether unfit to endure any external frigidity. Thirdly, if a man take a Snake or a Serpent into his handling in the midst of Summer, and warmeth part of the year, yet shall he perceive that they are cold in a palpable manner being alive, which is not a quality compatible to any other creature. Fourthly, seeing that blood is the proper and native heat of all heat in natural living bodies, Serpents having a very small quantity of blood, must also have a smaller proportion of heat: and therefore it followeth unavoidably, that the eminency of their temperament is cold in the highest degree, above all other living Creatures. And that their bodies be outwardly moist, it appeareth (faith Isidore) by this, that when they slide along upon the Earth, (which way forever they go) they leave behind them in their train or path a flimy humour.

By this therefore it is confirmed, that they are of the Earth and of the Water, as afterward we shall shew in the description of their kindes. But yet there are prodigious beginnings of Serpents, Plutarch, whereof some seem to be true, and other to be fabulous. The first sort are those which Pliny affirmeth to be engendered of the marrow in the back-bone of a man, and that indifferently, out of the dead bodies of good and evil men. Yet some more modell, thinking it unreasonable, that the remains of a good meek man, should beget or be turned into so barbarous, venomous, and cruel a nature; rather taking it for granted, that peace and quietness is the reward of such perfons, attribute these beginnings or alterations to the bodies of wicked men, as a just deferred punishment of their former evils, that the revolusions of their bodies should after death turn into Serpents, whom they resembled being alive in the venomous fraud of their spirits. Of this Ovid speakseth.

Sunt que ex omn. clausis putrefactis a Spina fepulchra,
Mutari credent hominum angue medallis.

Which may be thus Englished,

Some think the putrid back bone in the grave rack'd,
Or narrow chang'd, the shape of Snakes to take.

In Egypt, as Frogs and Mce are engendered by showres of rain, so also are Serpents: And Avicen Macrobius, faith, that the longest hairs of women are easily turned into Serpents. Nicander dreameth, that all Callus Rho. venomous Beasts are engendered of the blood of the Titans or Giants. Aemulus, of the blood of Pliny. Typhon. Aplinam Rhodium, of the drops of blood which do distil from Gorgons. Virgilus Sitch, that being laid in a hollow place, subject to receive moisture, engendereth Serpents, Of the Gorgons drops, Ovid writeth thus;

Cumque super Lybicas vitubr penderet arenas,
Gorgonei capiti gatata cecidere cruente,
Quas hunc exception, varias animaeus in angues,
Unde frequent illa est infestaque terra culbris.

Which may thus be Englished;

And as he over flow
The Lybick sands, the drops of blood that from the head did fall
Of Gorgon being new cut off, upon the ground did fall,
Which taking them, and as it were conceiving them without,
Engender'd fiery Snakes and Worms: by means whereof that Cime
Did swarm with Serpents ever since, to this same present time.

But most strange of all other, are the succeeding Narrations. For it is reported that when L. Scipio, and C. Norbus were Conuls, that the Mother of Clusium in Herturia, brought forth a living Serpent in head of a childe, and the said Serpent by the command of the Wizards was cast into a River, nevertheless it would not drown, but swummed against the stream. And Pliny faith, that at the beginning of the Marjek war, there was a mid-servant that brought forth another Serpent. And

Fausina
Of Serpents in General.

Caesius Tacitus writeth, that when Tirsa found Serpents in carnal copulation in Cilicia, he slew a female, who prefently after death was turned into a Woman, then alfo he flew a male, who likewife being dead, was in the fame place and manner turned into a Man. When Cadmus was was fent by his Father, to feek out his fifter Europa that was ravifhed by Jupiter, with ftraight charge not to return back again except he could finde her, having fpent much time in feeking her to no purpofe, becaufe he could not finde her, and not daring to go back again to his father; he was warned by the Oracle that he fhould go into Boreas to build a City. Coming thither, he fent his companions to the fountain of Mars that was in the Countrie to fetch water, where a great Serpent came and killed them; at alfo Cadmus not finding their return, went likewise to the fame Fountain, where he found all his men flain, and the Serpent approaching to affail him but he quickly killed it. Afterward he was admonifhed by Pallus, to fwear the teeth of the fame Serpent upon the ground, which he performed, and then out of thofe teeth (faith Ouid) arrove a multitude of Armed men, who inftantly fell to fight one with the other, in fuch cruel and bloudy manner, that at the left there were but five of them alleft alive, which five (by the will of Pallus) were prefervd to be the Fathers of

His form exposiio peregrina anguis arenis
Ov. paras. & paras fablanis sive capitis
Lambis, & hymmeria inbaita ducitere cultum:

In English thus;
No foner on the faur coaf now caft a land they were,
But that cruel' natur'd Snake did ftraight upon them fly,
And licking on his ruffled hair, the which was dropping dry,
Did gape to fpy upon thofe lips that had been wont to fong
The heavenly hymns. But Phoebus ftraight preventing that fame thing,
Disjoint the Serpent of his bars, and turns him into fton;
With gaping chops, &c.

So Caesius Tacitus writeth, that when Tirsa found Serpents when he was with childe of Commodus and Antonius, and one of thefe Serpents feemed more fierce then the other, which proved allegorically true: for afterward Commodus was fo voluptuous and tyrannous, that he feemed like a Serpent to be born for nothing, but for the deftruction of mankind.

In the year of our Lord 1551, there was a little Latin Book printed at Vienna, wherein was contain'd this History following. In this Summer (faith the Book) about S. Margaries day, there happened molt rare and admirable accidents: for near a Village called Zieba, by the River Throfe in Hungary, there were many Serpents and Liffards bred in the bodies of men, very like to fuch as are bred in the earth, whereupon they fell into exquitite torments: and there dyed of that calamity, about three thousand, and some of the bodies being laid against the Sun gaping, the Serpents came forth of their mouths, and suddenly entred into their bellies again. Amongst other, there was a certain Nobleman's daughter which dyed of that malady, and when she was dif-.fected or ripped, there were found in her body two great Serpents. These things feem to be miraculous, and above the order of Nature: yet credible, becaufe in our experience in England, there have been Worms like Serpents found in the bodies of men, whereof fome have been ejected the parties being alive, and other when as the parties were dead. But that thefe beginnings of Serpents being unnatural, are Divine and fent from God as scourges, it may appear by another notable History, recorded in the aforesaid Book, both in the fame year, and in the fame Countrie.

There was (faith mine Author) found in a mower or ryck of Corn, almost as many Snakes, Adders, and other Serpents, as there were heafs, fo as no one heafl could be removed, but there prefently appeared a heap of ugly and fierce Serpents. The Countrу-men determined to fet fire upon the Barn, and fo attempted to do, but in vain, for the flame would take no fire, although they labored with all their wit and policy to burn them up. At laft, there appeared unto them at the top of the heap a huge great Serpent, which lifting up his head fpake with mans voice to the Countrу-men, faying: If with fuch ferventry you defire, for you fhall not be able to accomplish our burning, we were not bred by Nature, neither came we hither of our own accord, but were fent by God to take vengeance on the firl of men. And thus much for the true and natural beginnings of Serpents.

Now we read in read in holy Scripture, that the rod of Moses was turned into a Serpent by divine miracle, whereby he was affured of the power that God would give him to deliver his people Israel out of Egypt, which land abounding with Serpents, both natural bred in the earth, and moral, fuch are crafty and politick Princes and people: yet Moses fhou'd take them as he did his Serpent by the tail, and caufe them to bend unto him like as it were a wand, or elfe fome other little walking faffe: and also that his power fhould be unrefiftible, becaufe his Serpent devourous others The Magitians or Sorcerers, (as Janne and Jambes) refilited him, and alfo turned their rods into Serpents. But Moses did it by true piety, they by diabolical delusions, as falf Christians many times work miracles by outward signes of true piety, and therefore Moses rod overcame the Sorcerers Serpents, becaufe the end of fraud and falsehood is, to be overcome by truth and piety.

From this changing of rods into Serpents, came the feveral metamorphofing of sundry other things into Serpents alfo, as that tale of Osfebow head, after he was torn in pieces by the Thracian wo- men; and the fame thrown into a River, was taken up in Lemnos. The Poet defcribeth it thus;

| His form exposiio peregrina anguis arenis | Tandem Phoebus adsit: morafsque inferre param et
| Ov. paras. et paras fablanis sive capitis | Arcet, et in Lapidem rutilus Serpentis aperas
| Lambis, et hymmeros inbitant divellere cultum: | Congelat, et patibus ut erant indurat biaus. |

In English thus;
No foner on the faur coaf now caft a land they were,
But that cruel' natur'd Snake did ftraight upon them fly,
And licking on his ruffled hair, the which was dropping dry,
Did gape to fpy upon thofe lips that had been wont to fong
The heavenly hymns. But Phoebus ftraight preventing that fame thing,
Disjoint the Serpent of his bars, and turns him into fton;
With gaping chops, &c.
and so of the people of Thebes. And to Aesop's faiweather; that with the help of men bred of Serpent's teeth, came Japhon to obtain the Golden Fleece. They feign also, that Aesopus, when he ftove with Hercules about Desienia, turned himself into divers shapes, and laft of all into a Serpent, or as fome fay, into a River. So likewise Cadmus aforefai, being overcome with the sight and fenfe of his own miseries, and the great calamities that fell to his Daughters and Nephews, forsook Thebes, and came into Libya, where it is faid, that he earnestly defired of the Gods to be turned into a Serpent, because a Serpent was the first original of all his extremities. Antipater faiweather Jupiter to be turned into a Serpent; and Medusa refuling the love of Neptune, is also faiweather by Ovid to be turned into a Serpent, when he writhe:}

*writeth, that the myrtle rod was not lawful to be brought into the Temple of Jove, and that a Vine branch was extended over the head of her fign: and whereas it was not lawful to name Wine, they brought it into her Temple under the name of milk, and that therein continually lived harmless Serpents. The reafon of all this was, because that her own Father Fama fell in love with her, whom the refiiled with all modelly, although thef were beaten with a Myrtle rod, and made to drink Wine; but at laft the beaftly father was transformed into a Serpent, and then he opprefling her with the fpires of his winding body, ravifhed her againft her minde. These and fuch like stories and Fabies are extant about the beginnings of Serpents; all which, the Reader may confider, to lift up his minde to the carnall and ardent meditation of that power that of Iones can make men, of Rocks, water, of water, Wine, and of small Rods great Serpents. Then thus having expreffed the Original of Serpents in their Creation, it followeth now to fing Pity, the refidue of this Chapter about their generation. It is a general rule that all Beasts wanting feet, have long bodies, perform their work of carnal copulation by a mutual embracing one of the other, as Lampeys and Serpents: And it is certain, that two Serpents in this action feem to be one body and two heads, for they are fo indivifibly united and conjointed together, and the frame of their body is altogether unapt for any other manner of copulation. When they are in this action on they fend forth a rank favour offenfive to the fenfe of them that do perceive it: And although like unto many fihes, they want ftones, yet have they two open passages wherein lyeth their generative feed, and which being filled provoketh them to their venerable luft; the feed it felf being like a milky humor: and when the female is under the male, the hath alfo her passages to receive the feed, as it were into the cells of her womb, and there it is framed into an Egge, which the hideth in the earth an hundred in a cluftcr, about the quantity of a Birds egg, or a great bead, such as are used sometime by women.

And this is general for all Serpents, except Vipers, who lay no Eggs, but hatch in their wombs their young ones, as we fhall fhew at large in their particular history. The Serpent having laid her Egge firfteth upon them to hatch them at feveral times, and in a year they are perfected into young ones. But concerning the suppoftered copulation of Serpents and Lampeys, I will not meddle in this place, referring that difcourfe to the History of Fihes, and now only it fufficeth in this place to name it, as a feigned invention; although Saint Ambrofe and other ancient Writers have believed the fame, yet Areneus, and of late days P. Jovin, have learnedly and sufficiently declared by unanswerable arguments the clean contrary. The Serpents love their Egges moft tenderly, and do every one of them know their own, even among the confufed heaps of the multitude, and no lefs is their love to their young ones, whom for their safeguarfe, sometime they receive into their mouths, and fuffer them to run into their bellies: And thus much for the generation of Serpents.

Of the Names of Serpents, and their several parts of Anatomy.

By Serpents we understand in this difcourfe all venomous Beasts, whether creeping without legs, as Adders and Snakes, or with legs, as Crocodiles and Lizards, or more neerly compleate bodies, as Toads, Spiders, and Bees; following herein the warrant of the beft ancient Latins, as namely Cornelius Celsus, Pliny and Apuleius, do call Lice Serpents, in that their relation of the death of THESEUS, who was the Preceptor of Pythagoras, of whom it is faid, Serpentisus perisse, to have perifhed by Serpents, when on the contrary it is manifef ted he was killed by Lice. *Hifole and Golen define a Serpent to be animal funginum pudendum orbatum or orbatum, that is, a bloody Beaf without feet, yet laying egges; and fo properly is a Serpent to be understood.

The
Of Serpents in General.

The Hebrews call a Serpent Nacabij. Daron and Cheveia by the Chaldees: so allo Talmínim and Sheckphorn, by the Hebrews; as Rabbi Solomon, Munifter and Fagninus write. The Grecians, Opbidi and Opus, although this word do allo signify a Viper in particular, even as the Latin, Serpens, or Serpula do, sometime a Snake, and sometime an Adder. The Arabians, Hali, and Hadace, for all manner of Serpents. And Telub, or Tenvia, or Agefim for Serpents of the Wood, likewise Apatius and Atlas. The Germans, Einjebian, which word seemeth to be derived from Angii, by an usual figure, and after the German fashion, prepending Scb. The French call it Un serpent; the Italias, Serpe & Serpente: and Mundanus faith, that Seræa and Serzone, are general words for all manner of Serpents in Italy, which strike with their teeth. The Spaniards call them Serpe: the Grecians call the young ones in the Dan's belly, Embria; and the Latines, Catilæ. And thus much for the names in general, which in holy Scripture is Englished a Creeping thing.

Now it followeth, that I should fet down a particular description of all the outward parts of Serpents; and first of all, their colour is for the most part like the place of their habitation, or abode, I mean like the Earth, wherein they live, and therefore I have seen them black, living in dung; some yellow, living in sandy rocks; and some of other colour, as green, living in trees and fields; but generally they have spots on their sides and belly, like the scales of fish, which are both white, black, green, yellow, brown, and of other colours allo, of which Ovid writeth:

---

Longo caput extulis ante
Ceratulum Serpent, borrendaque fìbula mift.
That is,
The greenish Serpent extend her head from den so steep,
And fearful hissing did send forth from throat so deep.

The frame of their bodies do not much vary in any, except in the feet and length, so that with a reservation of them, we may express their universal Anatomy in one view; for almost all of them are of the fame proportion that is seen in Lizards, if the feet be excepted, and they made to have longer bodies. For they are inclosed in a kind of shell or crusty skin, having their upper parts on their back, and their nearer parts on the belly like a Lizard, but they want flones, and have such manner of places for copulation as fishes have, their place of conception being long and cloven. All their bowels, by reason of the length and narrowness of their bodies, are allo long and narrow, and hard to be discerned, because of the dissimilitude of their figures and shapes. Their artery is long, and their throat longer then that: the ground or root of the artery is near the mouth, so as a man would judge it to be under the tongue, so as it seemeth to hang out above the tongue, especially when the tongue is contracted and drawn backward. The head long like a Fishes, and flat; never much bigger then the body, except in monstrous and great shaped Serpents, as the Boas. Yea, Arisjolite makesh mention of a Serpent that had two heads; and Arisjolus, of a Serpent in the Piney Mountains, thin by a foudier, that had three heads, in whole belly were found two fons of the said foudier devoured by him, and the back-bone thereof was as great as a man's skull, or a Rams head. And thus an one we read in our English story was found in England, in the year 1349. And the 23 year of Edward, the third, there was a Serpent found in Oxfordshire, near Clippinganour, that had two heads and facing like women, one being shapèd after the new attiré of that time, and another after the manner of the old attiré, and it had great wings, after the manner of a Bat.

The tongue of a Serpent is peculiar, for besides the length and narrowness thereof, it is allo cloven at the tip, being divided as it were with very little or small nails points. It is allo thin, long, and black of colour, volatile; neither is there any beast that moveth the tongue so speedily: wherefore some have thought, that a Serpent hath three tongues, but in vain, as Isidorum fetheweth, for they deceive by their nimblenes thereof. Their ventricile is large, like their maw, and like unto a Dogs, allo thin, and uniform at the end. The heart is very small, and cleaveth to the end of their artery, but yet it is long, and fetheweth like the reins of a Man: wherefore sometimes it may be seen to bend the tip or lap thereof to the breast-ward. After this followeth the lights, but far separate from it, being simple, full of fibres, and open holes like pipes, and very long: the liver long and simple; the milk small and round as in Lizards. The gall is for the maw part as in fishes, but in Water-fishes it is joyned to the Liver: in other Serpents to the stomach or maw. All their teeth fand out of their mouth, and they have thirty ribs, even as there were among the Hebrews and Egyptians thirty days to every moneth.

Arisfolie faith, that as their eyes be small, so allo they have the fame good hap that befalleth young Swallows, for if by chance they fratch or rend out their eyes, then is it said they have other grow up naturally in their places; in like manner their tails being cut off, grow again. And generally Serpents have their heart in the throat, the gall in the belly or stomach, and their ftons near their tail: their egges are long and foft, and in their teeth they carry poyson of defence and annonyance, for which cause they defire above all other things to fave their heads. Their fight is but dull and dim, and they can hardly look at one fide, or backward, because their eyes are placed in their temples, and not in their fore-head, and therefore they hear better then they see. They have eye-lids, for generally no creatures have eye-lids, except those which have hair in the other parts of their bodies; four-footed beasts in the upper cheek, fowl in the neather, or Lizards which
have eggs, or Serpents which have loit backs. They have also certain passages of breathing in their nostrils, but yet they are not so plain that they can be termed nostrils, but breathing places. Their ears are like to finny Fishes, namely small passages, or hollow places in the back parts of their head, by which they hear.

Their teeth are like Sawes, or the teeth of Combes joyned one within the other, that so they might not be worn out by grinding or grating together; and yet they bend inward, to the end that they may the better hold their meat in their mouths, being without all other external help for that purpose; for even those Serpents which have feet, yet can they not apply them to their chaps. In the upper chaps they have two longer then all the residue, on either side one, bored thorough with a little hole like the sting of a Scorpion, by which they utter their poyfon. Yet there be some good Authors that affirm, that this poyfon is nothing else but their gall, which is forced to the mouth by certain veins under the ridge or back-bone. Some again say, that they have but one long tooth, and that a crooked one, which turneth upward by often biting, which sometime fall-eth off, and then groweth again, of which kind those are, which men carry up and down tame in their boxoms.

Although they be great raveners, yet is their throat but long and narrow, for help whereof, when they have gotten a bootie, they erect themselves upon their tails, and sware down their meat the more easily. They cannot be said properly to have any neck, yet something they have, which in proportion answereth that part. They have tails like all other creatures, except Men and Apes, and some say that their poyfon is contained in their tails, and is from thence conveyed into little bladders in their mouths, therefore the Mountebanks or Juglers, break that bladder, that they may keep them without poyfon, but within the space of twenty four hours they are recollected, and grow anew again.

Their bodies are covered over with a certain skin like a thin bark, and upon Serpents it supplyeth the place that scales and hair do upon Beasts and Fishes; for indeed, it is a pure skin, and in molt things they are like to Fishes, except that they have lights, and Fishes have none: the reason is, they live on the earth, and the Fishes in the sea, and therefore have fins and gills instead thereof. The little Serpents have all their bones like thorns, but the greater, which stand in need of greater strength, have solid bones for their firmitude and better constitution. It is questionable whether they have any milt or no, and some say they have at the time of their laying of eggs, and not otherwise. Their place of conception or secret, is large, and flaneth far out, beginning beneath, and a rising up to the back-bone double; that is, having one skin or enclozure on either side, with a double passage, wherein the eggs are engendered, which are not laid one by one, but by heaps or clusters together. They have no bladder to contain urine, like to all other Creatures which have feathers, scales or rindle-speckled skins, except the Tortoises: the reason is, because of the exiguity and smallness of the asfumed humour, and also all the humour acquired, is conumed into a loose and evaporate flesh. And to conclude this Anatomy, I will add a short description on which Gregorius Mezer a Physitian wrote to Gesner, 1558. by his own dissection as followeth, sayring.

As I lay at rest in a green field, there came unto me a great Serpent hisling, and holding up her neck, which I sud duty with a piece of wood amazed at a stroak, and so flew without peril to my self. Afterward, dicking her faft to a pale, I drew off her skin, which was very falt and sharp, and I found betwixt the skin and the flesh, a certain little thin skin, defending all upon the body with the outward skin, and this was somewhat fat. And when I came unto the place of excrements I found it like a Finnes, but there iffued forth certain fithf, farre exceeding in thinkeing favour the excrements of a man. After I had thus pulled off the skin, it was easie for me to look into the inward parts, which I found to answer the inward Anatomy of fishes and Fowls in some parts, and in other things, there appeared a proper disposition to the Serpent it self. For the Artery Trachea was about three or four fingers long, turned about with little round circles, and so defended to the lights, unto which the heart and the bladder containing the gall, did adhere or cleave falt. Then the liver was long, like the Fith Lucius, and so a white caule or fatene covered both the liver and stomach, which was half a span long: The guts began at the chaps, and so defended down to the place of excrements, as we see they do in Fishes.

Beneath the liver were the guts, upon either side defended a certain nervy or hard vein, unto which the eggs did cleave: which were covered with such little skins as Hens eggs are before they be layd, but yet they were distinguished in fcat or place, because of their multitude; for upon either side I found two and thirty eggs. The tongue of the Serpent was cloven, and very sharp, but there appeared not any poyfon therein. And so it is evident, that in the vein Trachea, heart and lights, it agreeeth with Birds; in the liver, guts and caule, it refembleth a Fith, but in the place of the gall, and disposition of the eggs, it differeth from both. And thus farre Mezer, with whose words I will conclude this Chapter of Serpents Anatomy.
Of the quantity of Serpents, and their abode, food, and other accidents.

So great is the quantity of Serpents, and their long during age increafeth them to fo great a figure, that I am almost afraid to relate the fame, left some fulpicious and envious minded persons, should utterly condemn it for fabulous; but yet when I consider not only the plentiful testimonies of worthy and undoubted Antiquaries, and all the evidence of all ages, (not excepting this where-in we live) wherein are and have been flowed publiquely many Serpents, and Serpents skins, I receive warrant sufficient to express what they have oberved, and affured answer for all future objections, of ignorant, incredulous, and unexperienced Ages. Wherefore as the life of Serpents is long, fo is the time of their growth; and as their kinds be many, (as we shall manifest in the succeeding discourse) fo in their multitude, some grow much greater and bigger than other.

Gellius writeth, that when the Romans were in the Carthaginian war, and Attius Reginus the Conful had pitched his Tents near unto the River Bragrae, there was a Serpent of monstrous quantity, which had been lodged within the compass of the Tents, and therefore did caufe to the whole Army exceeding great calamity, until by calling of stones with lings, and many other devises, they opprefled andlew that Serpent, and afterward flewed off the skin and laid it to Rome, which was in length one hundred and twenty feet. And although this seem to a beft of unmatchable figure, yet Poffidionius a Christian Writer, relateth a story of another which was much greater, for he writeth, that he saw a Serpent dead, of the length of an acre of Land, and all the residue both of head and body, were anfwerable in proportion, for the bulk of his body was fo great, and lay fo high, that two Horfemen could not lee one to the other being at his two fides, and the wideness of his mouth was fo great, that he could receive at one time within the compass thereof, a Horfe and a man on his back both together: The scales of his coat or skin, being every one like a lare buckler or target. So that now there is no fuch caufe to wonder at the Serpent which is faid to be killed by S. George, which was as is reported fo great, that eight Oxen were but strength enough to draw him out of the City Silena.

There is a River called Rhymedon near the Coafts of Byzantium, wherein are Snakes of exceeding monstrous quantity, for when through heat they are forced to take the water, for their safegard against the Sun, and birds come flying over the pool, suddenly they raife their heads and upper parts out thereof, and swallow them up. The Serpents of Megalana, are faid by Pausanias to be thirty cubits long, and all their other parts anfwerable. But the greateft in the world are found in India, for there they grow to fuch a quantity, that they swallow up whole Bulls and great Stags. Wherefore I do not marvel that Ptom the King of India, sent to Augufus Cefar very huge Vipers, a Serpent of ten cubits long, a Tortoise of three cubits, and a Partridge greater than a Vulture. For Alexander in his Navigation upon the Red-fea, faith; that he faw Serpents forty cubits long, and all their other parts and members of the fame quantity.

Among the Scythes, the Serpents come by great swarms upon their flocks of Sheep and cattell, and some they eat up all, others they kill and fuck out the blood, and some part they carry away. But if ever there were any thing beyond credit, it is the relation of Vitateren, in his twelfth Book of the New-found Lands, wherein he writeth, that there are Serpents of a mile long, which at one certain time of the year come abroad out of their holes and dens of habitation, and deftroy both the Heards and Hend-men if they find them. Much more favourable are the Serpents of a Spinit Island, who do no harm to any living thing, although they have huge bodies, and great strength to accomplish their desires.

In the Kingdom of Sarbos, their Serpents are fo great that they devour whole Beasts, as Goats, and fuch like, without breaking any one of their bones. In Calcbute, they are as great as their greatest Swine, and not much unlike them, except in their head, which doth far exceed a Swines. And because the King of that Countrey hath made a Law, that no man kill a Serpent under pain of death, they are as great in number as they are in quantity: for fo great is his error, that he deemeit as lawful to kill a Man as a Serpent.

All kinds of Serpents are referred to their place of habitation, which is either the earth, or the waters of the earth; and the Serpents of the earth are more in number then the Serpents of the water, except the Serpents of the Sea: And yet it is thought by the moft learned Rafflinis, that the Serpents of the Sea are fifties in the likeneffe of Dragons. Now the places of Serpents abode being thus generally capitulated, we must enter into a farther narration of their habitations, and regions of their native breeding. In the firft place, India nourifheth many and divers forts of Serpents, especially in the Kingdom of Sefelum, and Alcander the Emperor, found among other Beasts, fundry kinds of Serpents in a long Defert, which is on the North-fide of India. But all the Nations of the World may give place to Asia for multitude and variety, for there they gather together on heaps, and lie in compafs like round hills, visibly apparent to the eyes of them that behold them a far off. The like is faid of all Africa, for in Numidia, every year there are many men, women and children destroyed by Serpents. The Island Phaen, is also (by the testimony of the Egyptians) filled with Serpents: The Coafts of Elymais are annoied by Serpents; and the Calipsines are so annoied by Serpents which come swimming in the floods, that men cannot fail that ways but in the Winter.
Of Serpents in General.

Winter time. For from the beginning of the Spring, or equinoctial, they seem (for their number) to approach ravening, like Troops and Armies. There are certain Islands called Oblivion and Elysium, named after Ophir, a serpent, for the multitude bred therein: And there are Serpents in Candy, Ephesus, and all hot Countries; for this privilege hath God in nature given to the colder Countries, that they be less annoyed with Serpents, and their Serpents also less nocent and hurtful: and therefore the Serpents of Europe are tewer in number, letter in quantity, and more refoluble for their weaknesses and strength.

There were a people in Campania called Ofici, because of the multitude of Serpents bred among them: Likewise there are great stores in Lombardy and Ferrara. And whereas we have said, that the most nocent and harmful Serpents are bred in the hottest Regions, where they engender more speedily, and also grow into greater proportions, yet it is not to be understood of any special property appertaining to them alone, for I read in Olaius Magnus his description of the Northern Regions, or Serpents of as great quantity as in any other place of the world; but yet their poison is not half so venomous and hurtful, as in the hotter Regions, especially the African Serpents.

In Bohus near Lomva, there are great stores of great Serpents also, so that the Heerd-men are at continual war and contention with them for defence of their flock: Likewise in the Mountains of Helvetia and Savoy, whereof there are many wonders reported in the World, which I will not stand upon to relate in this place. We read also, that some places have been inhabited, and disepeoled by Serpents, such were the people of Sophisa, called Nouri, who before the war of Darius, were contrived to forishe their soil, because they were annoyed, not only with home-born Serpents, but also with many other which came from other parts: and so the Country remaineth desolate to this present day, the ancient Inhabitants being all removed to dwell among the Budamni. The City Amyca in Italy (as M Varro writeth) was destroyed also by Serpents. And there be certain places of the world, where have received their denomination from Serpents, besides the Ophi-ule near Crete.

The Island Tenos, was called Hydraea and Ophiolus, to were Cremnus, Eolus, and the Expladis. The Mountains Maecrennii, Ebaus, and the long Islands Ophiods in the Arabian coast, which after it had remained along time deferr, was purged and cleared from Serpents by the Kings of Egypt. Nicostas also calleth Cyprus, Ophiolus. And in Panianias, we read of a place named Ophius Phale, the Serpents head. The like might be said of Rivers, as of Crates, called also Ophlies, and Ophis in Pontus, which divideth Ander Celcbis, and the Countrey Thibemina. Ebusus nourisheth no Serpents, and the Earth thereof hath in it a secret verte to drive away Serpents, wherefore it is much desired of all men to carry about them, for that it hath been often proved, that never any venomous beast durst adventure upon any man possetted thereof. The like is said of Ireland, as our own Chronicles do plentifully declare, and therefore I will spare to enter into any narration thereof.

To come therefore to the more particular abode of Serpents, especially of such as are known to us, we must leave off the talk and nomination of Kingdoms, and defend to dens, holes, caves, dungeons, Sleep-throw, valleys, rocks hollow-walls and trees, woods, green pallures, hedges, and such like places, where to make their most abode: And now and then in their Northern parts of the world (and yet seldom) they drive down into the bottom or roots of trees, especially such as are green all the Winter time: For they finde in them a greater heat or warmth, than in other things, where leaves fall off and decay in the cold weather, except in the roots of Birch and by reason of their multitude gathered together at the root of this tree, it falleth out that their breath heateth the fame, and so preserveth the leaves from falling off: Wherefore in ancient time, the ignorant multitude, seeing a Birch tree with green leaves in the Winter, did call it our Ladies Tree or a holy tree, attributing that greenness to mystery, not knowing the former reason, or secret in Nature. Solomon reporteth of such a like Wood in a part of Africa, where in all the Winter time, the leaves of all the trees abide green, the caufe is as before recited, for that the Serpents living at the roots of the trees in the earth, doe heat them with their breath. Neither ought any man to wonder that they should so friendly live together, especially in the Winter and cold time, seeing that by experience in England, we know that for warmth they will creep into bed-thraw, and about the legs of men in their sleep; as may appear by this succeeding discouer, of a true history done in England, in the house of a worshipful Gentleman, upon a servant of his, whom I could name if it were needful. He had a servant that grew very lame and feeble in his legs, and thinking that he could never be warm in his bed, did multiply his clothes, and covered himself more and more, but all in vain, till at length he was not able to go about, neither could any skill of Physician or Chirurgeon finde out the caufe.

It hapned on a day as his Master leaned at his Parlour window, he saw a great Snake to glide along the house side, and to creep into the chamber of this lame man, then lying in bed (as I remember,) for he lay in a low chamber, directly against the Parlour window aforesaid. The Gentleman defirous to fee the issue, and what the Snake would do in the chamber, followed, and looked into the chamber by the window; where he espied the Snake to glide up into the bed-thraw, by some way open in the bottom of the bed, which was of old boards. Strageway his heart riling thereat, be called two or three of his servants, and told them what he had seen, bidding them go take their Rapiers and kill the said Snake. The serving men came first and removed the lame man (as I remember) and then the one of them turned up the bed, and the other two the thraw, ther-
Of Serpents in General.

matter standing without at the hole, whereunto the said Snake had entered into the chamber. The bed was no sooner turned up, and the Rapiere thrust into the straw, but there issued forth five or six great Snakes that were lodged therein: Then the serving-men bellying themselves, soon dispatched them, and call them out of doors dead. Afterward, the lame Mans legs recovered, and became as strong as ever they were: whereby did evidently appear, the coldness of these Snakes or Serpents, which came close to his legs every night, did do bennum them as he could not go. And thus for heat they pierce into the holes of chimneys, yea into the tops of hills and houfes, much more into the botomms and roots of trees.

When they perceive that Winter approacheath, they finde out their resting places, wherein they lie half dead four months together, until the Spring sun again communicating her heat to all Creatures reviveth, and as it were raifeith them up from death to life During which time of cold Winter, as Seneca writeth, Tuto tridedi pefiftera Serpentes potefi, non defunt tunc illi venena, fed torpens: They may be safely handled, without fear of harm, not because they want poiyon at that time, but because they are drouzy, and deadly almonieth. But there is a question, whether when they be in this secretie or drouziness, they awake not to, or else their feep be unto them in liead of food. Olami Magnus affirmeth of the Northern Serpents, that they eat not at all, but are nourisshed with sleep. Cardan faith, that they take some little food, as appeareth by those which are carried up and down in boxes to be seen, and are fed with bran or cheafil. But this may be answered, that Serpents in boxes, are not so cold as those in Woods and Deferts: and therefore seeing cold keepeth them from eating, the external heat of the box-houfe, or humane body which beareth them about, may be a caufe, that incloued Serpents feed in Winter as well as in Summer, and yet the Serpents which live in the fields eat nothing at all, during the time of their Chor or Eisium, that is, their lying hid.

Greewius that learned man proponeth this question, Si Serpentes calidi sunt, quid fit ut integros tres aut quatuor menses, id est tuto ilio tempore quo deltesent, absque cibo vivant? If (faith be) Serpents be hot, how cometh it to pass that they can live three or four moneths without all food, that is, all the time of their lying secret? He maketh (in my opinion) a sufficient anfwer to this question, which for me shall conclude the caufe, saying: Doth it not fall out with Serpents as it doth with some women, who being full of humor, and thicke phlegmatick matter, have but a little and weak natural heat, (yet proportionable to the said humor) do live a great time by reason thereof without food or nourishment? And for this caufe, all the hoasts of Philosophers do define, that Serpents do also abstain from eating a long feaon. For Nature hath clothed them with a more folid skin, and lined them with a more thick and fubflantial flefh, to the intent that their natural heat should not easily vanife away and decay in their bodies, but remain therein permanent, for the feeding and preferving of life. When they feep, they seem to feep with open eyes, which is elegantly described by Philes in thefe Greek verfes:

Oly<ref>kt<ref>ude kai<ref> dokei palin blepein Ophi</ref> te kai <ref> povn</ref> kai thumus pleies leon Epipetata gar ke oblamys ton ummaton

Allum tinas Chitones hapaladrous. Phorarontos autis os deiptra, taks-360.

Which may be Englished thus;

How can the Flare, the Serpent, and the Lion bold,
Both feep, and lie together at one time?
Within their ey-lids, a soft skin their figh doth fold,
Steddling their apples, as glass doth weaken beds.

The food of Serpents that is permitted them by God, is the dust of the earth, as may appear by that firft and juft sentence, which GOD himfelf gave upon them, for reducing our firft Parents, Adam and Eve, Gen. 3. 14. Because thou haft done this thing, thou art occurreth above all the Beasts of the field, for thou haft eaten uncleanly, and eat dust all the days of thy life. And again, Efra 65. 25. Duff fhall be meat to the Serpent. And left that we should think that this curse hath not taken hold upon the Serpent, we may finde the expreff præfcript hereof, Mech. 7. 17. where it is laid of Gods enemies, that they fhall eat the dust like the Serpent. Yet Aristotle affirmeth truly, that Serpents are Omnivorous, that is, devourers of flefh, fift, herbes, or any other things; howbeit, herein they parte their kinde, or else the curfe of God reacheth not to any other kinde then to that alone which deceived our firft Parents.

We have shewed already, how they eat and devour men, women and children, Oxen, Sheep, and Goats, but whatsoever they eat, they retain nothing but the moisture of it, and the refidue they eject whole and undigeffed. Whatsoever is offered them, that they take, either a bird, or a small chicken, or an egge having it, they take hold but of one end, as of the head of a chick, or small end of an egge, and fo fett it directly before them; then do they gather themselves together in as fhort a compass as may be, that fo their bodies which feem long and small, being extended, may appear great and wide, reduced into a fhort and compacfed frame. And furely hereby they open and make wider their paffage and swallow for then they suddenly goble in the beaf or meat before them, without any great ado; and having kept it in their body till it be dryed from all moifteur, they call it out again as they swallowed it up, at another ordinary place. But for birds and chickens, they thrave with them till they have gotten off their feathers, or else, if they swallow them whole, they eject the feathers as they do egge-shells.
Of Serpents in General.

The Serpents of the North do in the Summer time eat the flesh of birds, and herbs, and after the eating of them, they taste of a little water, or milk if they can attain it, or else Wine. For this cause they will suck the udders of Kine, or Goats, or Sheep, as hath been seen in England. Yet is their appetite to drink but small, as is all other creatures, whole livers are jugous, and loit like luppen; and fo are all beasts and creatures which lay eggs. Above all kinds of drink they love Wine, and therefor they be drunk, wherefore in Italy they let pottles of Wine to entrap Vipers: for if once they smell the Wine, they enter the vessel gladly and speedily, and the Wine or Milk whereof they drink, is poiyoned by them. But in those places of Africk where it never raineth, they eat a knede of black moist worm, which hath many legs, as is laid by Theophrastus. And to conclude, their meat and drink is so small, that it is received for truth, NabuLum vernenatam petit famme vel fin, that no venomous beall persiflet by hunger or thirst.

The voyce of Serpents is called Sibilan, a hissing, and their voyce differeth from all other Beasts hissing, in the length thereof: for the hilling of a Tortoise is shorter and more abrupt. Of this hilling voyce speakseth Lucan, saying;

qua sibilat anguis, qua sibilat anguis.

In English thus;

Gnashing and bowing, is the voyce of wilde Beasts,
Long hissing in Snakes and Serpents doth rest.

Among other things notable in a Serpent, this is one, because it calleteth off his old age every year, whereof the Grecians tell this fabulous reason. Once Man-kinde strowe earnestly with the Gods by supplication for a perpetual youth, that they might never wax old: and obtaining their desire, they laid the same to be carrie upon an Afs. The filly Beant waxing sore athirit in his travall, at last came unto a water, and thereof endeavoured earnestly to drink: but the keeper of the same water being a Serpent, denied leave to the Afs to drink thereof, except he would grant him his carriage, which was Perpetual youth: The poor Afs ready to perisht for thirst, easly condefcended thereunto. Whereupon the Serpent changeth her age for youth, and Men their youth for old age; and the Afs for his punishment, is more tormentt with thirst then any other Beall.

But to leave fables, and to come more neer the mark, the Latins call the casting off their skin, Anguis senectus, Serpens Serpens, & vernatio; the Grecians, Ophoer derma, Suphar, Leberis & Gene, the Arabians, Gene & Geula, & Fdeulatib.; the Italians, Spoglia delle Serpi: and the Spaniards, Pelle de la calbra. About this Snakes skin there is great difference among Authors, some affirming it to be the very skin. Other, that it is nothing but a knede of hard Leprosite, grown upon them during the Winter time while they lie hid. Some again say, that they call it twice a year, first in the Spring, and then secondly in the Autumn. But by conference of all together it appeareth, that while the Serpents lie hid, by reason of their drought now in the beginning of the Spring when they come first abroad, they rub off this skin by sliding betwixt two stones, or underneath some root of a tree, or else betwixt some boughs or small trees, beginning at the head, and so continuing to the tail. And within four and twenty hours, that which was raw and bald, beginneth to have another skin upon it; and so as a young childe or beall cometh out of the Secondine both a Serpent come out of the skin.

As concerning their eye-fights, they naturally do take the juycie of Fennel, which they eat, and by that recover their seeing again: and if it happen that they cannot finde sufficient, they rub their dim eyes thereupon. And if it happen that any of his scales be bruised, or fall senseles, then do they rub themselves upon the thorns of Juniper. And whereas it is thought that they call their skins again in Autumn, that is to be attributed either to Vipers alone, which call their skins twice a year, or else to those which are long before they call, and so it falleth off in Harvest or Autumn the first time, which by reason of the unseasonable fisht, is thought to be a second coast. And this have I my selfe often found here in England in the Summer time. The casting off this skin is thus elegantly described by Tibullus:

Crudeler Divi! Serpentes novas exsultan.
Forma non aulan. una dedere morum.
Anguis excisit una cum pelle renibus.
Cur non anguis conditione famus?

Which may thus be Englished;

O cruel Gods, sib Serpent change their yearly age,
And Fates delay not to refine their form,
Sib Serpents with tender skin excuss'd their years enlarge,
Why unto worser hap is Mankind bred?
Of the inward disposition of Serpents, and of their concord and discord with other Creatures.

It is ever to our woe to be remembered, that which the Lord himself hath left recorded in Genesis, that, The Serpent was more subtle than all the beasts which God had made. By which is expressed the natural disposition of this beast above other to subtility and policy: For I cannot approve the saying of them, who think that the Devil at the beginning might as well have used the tongue of an Ass or a Dog to have deceived Man, as well as a Serpents; but fully that old Serpent knew very well, (better then all they which speak the contrary) that he could not have so fit a subject in all the World, as the shape, wit, and cunning of a Serpent. And that this came not into the Serpent at that time when the Devil framed his tongue to speak, may appear by the precept of our Saviour Christ, where he faith; Be wise as Serpents, be innocent as Doves. For if there had not been naturally, some extraordinary faculty of understanding in this beast, as there is of meekness in a Dove, his wifdome would never have sent us to a Serpent perplexed with a Devil, but rather to some other ingenious Beast, whereof there were great store in the World. And therefore I conclude, that subtilty and prudence came not to the Serpent as speaking into Balaams Ass, but rather by nature or creation.

And yet concerning this last sentence of our most blessed Saviour, I cannot but express the words of Teizter, who writeth thus upon it, Serpate capita vfaera, quemadmodum Serpent qui insidit petiti subtilitas, atque indutus habet ad mortem, omnimodae capitis abscondit, sic ventur a tyrannis & implis cruciati, caput servata mibi, iadem vrstram, & ne Drun negetui usque ad ipiam mortem. That is, it is as much as if our Saviour Christ should say; Even as when a Serpent is set upon and broken, by all the means the can the lideth her head, and exposeth all her other parts to blows, referring that found; so you, when you are perplexed by Tyrants, preferve your head, that is, your faith, and deny not your God to death. And this thing is affirmed by all Writers, both divine and humane, which have ever touched this point, that above all the parts of the body the Serpent preferveh his. For Pliny faith, that if his body be cut off but two fingers length to the Serpent as speaking into Basilamis Ass, but rather by nature or creation.

Paulus Fagius writing upon Genesis, faith: It is the opinion of some Hebrews, that the Serpent at the beginning did go upright, and was indulged with all the affections of men: but this Jewish stable is not worthy to be confuted, beacause humane affection cannot proceed but from a reasonable soul, which to ascribe to the Serpent, were blasphemous and absurd. Besides, that then the soul might die, and that God had created such a soul, otherwise than by breathing into the body the breath of life.

Serpents have many Epithets given unto them, as illiberal, peridious, treacherous, venomous, poysonful, llinging, implacable, furious, savage, merciless, devourer, and such like: And indeed the holy Writers, by a Serpent do understand implacable fury: For they are inmitissimum animi genus, a molt ungentle and barbarous kind of all creatures, as may appear by the rage of a little Snake, one of the least of Serpents kinde: for when he perceiveth that he is hurt or wounded, he never ceaseth calling out his poyson, until he have done harm, or die for madness.

Two things I finde to be notable in Serpents, the first is proper to their kinde, the second is common to them with Swine, Rats, and Mice. Firſt, they are above meatiure kinde, not only to their young ones, but also to their Eggs. For Pindarconf æt fastly sweareth, that at Letorum he saw a Serpents Egge taken and cast into a hot furnace, and when it began to fry in the same, whether by natural instinct, or by smell thereof, the old Serpent came, and would have run into the fire to fetch it out, but that he and other strangers hindered her by killing her. And fo likewise, if in a Wood one of them be set on fire, all the Serpents that are within the favour thereof, or within the hearing of the hissing, will instantly gather unto it, even as beasts when they hear one another roar. And fo great is their love one toward another, (as Pliny and Teizter write) that it was a vulgar saying, Serpentum moriatur non petit Serpentes, one Serpent will not bite another. And Juvenal writeth; 

Sed jam Serpentum major concordia—
Scribit, quam hominum inter se.

That is to say; 
Better do Serpents with Serpents accord,
Then Man with Man, who should be their Lord.

I cannot conceal a most memorable History as ever was any in the World: of a fight betwixt the Serpents of the Land and the Water. This History is taken out of a Book of Schiitbergen, a Bavarian, who knew the same (as he writeth) while he was a captive in Turkys, his words are these. In the Kingdom called Genecke there is a City called Sampson, about which while I was prisoner with Balazeta King of Turkys, there pitched or arrived an innumerable company of Land and Water Serpents, compassing the said City a mile about. The Land-serpents came out of the woods of Trienick, which are great and many, and the water Serpents came out of the bordering Sea. 

Thefe
Of Serpents in General.

There were nine days together assembling in that place, and for fear of them there was not any that durst go out of the City, although it was not observed that they hurt any man, or living creature thereabouts. Wherefore the Prince also commanded, that no man should trouble them, or do them any harm, wisely judging, that such an accident came not but by Divine miracle, and that also to signify some remarkable event. Upon the tenth day these two valiant Troops join'd battel early in the morning before the Sun-rising, so continuing in fight until the Sun-set, at which time the Prince with some Horse-men, went out of the City to see the battel, and it appeared to him and his associates, that the Water Serpents gave place to the Land Serpents. So the Prince and his company returned into the City again, and the next day went forth again, but found not a Serpent alive, for there were slain above eight thousand: all which he caused presently to be covered with earth in ditches, and afterward declared the whole matter to Baculata by Letters after he had gotten that City, whereas the great Turk rejoiced, for he thereby interpreted happiness to himself.

But I have been too long in this first and proper affection of Serpents, namely, their mutual concord; and this example of the Land and Water Serpents, doth not break the common promised rule, because it is to be understood of Serpents that live in the same element. The second property is to preface Petilence, rottenness of air, famine, floods, and ruin of those places wherein they are commorant, and have their abiding: so do they know to chufe a good air, and fore-know fertility of fruits, earth-quoakes and great tempeilts. When Helius was destroyed, five days before, the Serpents, Snakes, Rats, Mice, and Weasels, departed all out of there, being wiser then Men, that misdeeming no harm, although they law and wondered at these removals, yet flood it out to their own utter ruine, overthrow and destruction.

of the friendship and enmity which Serpents keep with other Creatures.

Ev'ry since the Devil entered into the Serpent, it became hateful to all, or the most part of the beasts of the field, for that it may as truly be verified of the Serpent as it was of Eja, that the hands of all Men and Beasts are against him, (except very few) for they are strangers to all, and finde very few or no friends. Yet it is reported, that the Serpent and the Fox will live peaceably together in one cave or lodging. There is a story, not unpleasant, of a Man that found a Serpent enclofed betwixt two stones, and at the inready of the Serpent, he loofed him out of danger, and did him no harm. The Serpent being releas'd and free from death, in stead of other recompence for so good a turn, told the Man that he had been therein a long time inclofed, and was very hungry, and therefore was forced (again his will) to make the best of his fortune, and therefore must needs eat the Man, and bad him prepare himself for death. The Man afftomed at this motion, replied to the Serpent, that he hoped he would not deal so with him, having delivered him from death, now to put his deliverer to death: and said moreover, that he would not be the Judge of his own cafe, but refer the fame to the next they found: and the Serpent also yielded to that judgement, being assured that no creature would quit the Man, let he should caft his own life into peril. Forth then they went and met with an Afs, to whom the Man told the difference betwixt him and the Serpent, how kindly he sav'd the Serpents life, and how unkindly he again would take away his life. And then the Serpent bade the Afs consider what judgement he gave, and for whom he spake. The Afs adjudged it lawful for the Serpent to kill the Man. Lo now, said the Serpent, make you ready, for the matter is judged against you, and withall, began to make force at him with mouth and fling. But the Man faid, that he would not take this Afses deree for reafonable, and therefore prayed the Serpent to tarry yet a little longer, and try once more the next Befft they met withall; and the Serpent thinking himself sure of the booty, yeilded thereunto. Then forth they paffed again, and shortly after met with a Fox, to whom the Man related his cafe, and the benefit he had done to the Serpent: The Serpent again confeded he releas'd him, but withall, denied his cafe to be as the Man had faid, fo delerperate, but only he entrapped himfelf the better to compafs a booty. The Fox having heard them both, (defirous to end the matter for the Mans benefit) would needs go with them both to the place where the Serpent was inclofed, and fo all parties conflented. And when the Fox came thither, he bade the Serpent go into the same place again, that fo he might the better judge of the whole matter. The Serpent went in again betwixt the stones; and was fo incloed as he was before, for he could not flir neither backward nor forward. Then the Fox asked the Man if this were the Serpents cafe, from which he had delivered him? The Man answered yes, in all points. Then he bade the Serpent come out again, as he faid he could, without the help of the Man. But the Serpent called the Man to help him again. Nay, faid the Fox, I found you two at variance, because of your discharge from this place, and seeing now you are as you were before, and the Man as he was before your enlargement, my sentence is, that when you come forth of that place you are in, then fhall you eat the Man: and if he will let you forth again, I will never put him. By this fable is shewed, that Foxes love not Serpents so well as they love Men, and yet they never love Men, but they are afraid, fupicious, and willing to forfake their familiarity.
Some say there is a kind of love between Serpents and Cats, whereof I finde this story in *Penzettus.* There were certain Monks, who all of them fell sick upon a sudden, and the Physicians could not tell how or whence this sickness came, except from some secret poison. At last, one of the servants of the Abbey, faw the Cat which was daily fed at the Monks table, to play with a Serpent; and thereby it was conjectured, that the Serpent having in his sport lost or left some poison upon the Cats skin, the Monks by stroking of the Cat were infected therewith. And the cause why the Cat was not harmed thereby, was for that the received the poison from the fport, and not from the anger of the Serpent.

And this thing surely is not so marvellous, seeing that little Mice and Rats do also play with Serpents, and herein Politicians play the Serpents, who hold correspondence and peace both with the Cat and the Mouse: that is, with two sworn and natural enemies together. The like peace and league they are also said to keep with Eeles, as may more plainly appear by this following History, of a certain Monk called *Rudolphus a Will Monachus Carpathis.*

There was (as this Monk affirmed) one of his fellow Monks, which did often tell him, that being a little boy, and using to sport himself by the water side, he hapned to catch an Eele, which he attempted (for his own pleasure) to carry to another water; and by the way as he went, he paffed through a Wood, at which time when he was within the Wood, the Eele began to hiss and cry mainly, at the hearing whereof, there gathered together very many Serpents round about him, incomphch that he was afraid, and let down his basket halfffd and ran away; afterward he came again and sought for his basket, but he found not the Eele therein, wherefore it was suppos’d, that the Serpents delivered the same Eele out of the basket, by some sleight of nature: the only doubt is, whether Eeles do his or not, seeing they are fishes, and *Omnes pisces muri,* all fishes are mute or dumb. But for answer to this objection, it is most certain that Eeles have a voice, as alll know which use fishing in the night: for I my self, have not only heard such a voice in the night time in Rivers, and other waters where Eeles abounded, but have had it confirmed by divers other, of greater pratiﬁce and experience in fishing. The reason whereof, may be their manner of generation; for they engender not by spawn as other fishes, but by the flame of the earth or water, and differ not from Serpents in their external form, except in their colour, and therefore may be said to partake with Fishes and Serpents in both their natures: that is, having a voice like a Serpent, and a substance like a Fish. Such is their confederacy with living Creatures, and with no more that I ever read or heard of.

But moreover, it is said that they love some Plants or Herbs above measure, as the Fennel and Ivy; and for this later, both *Pline* and *Tusser* do not without great cause wonder, that ever there was any honour ascribed or given to the Ivy, seeing that Serpents (the most unreconcilable enemies of man-kinde) delight so much therein. But herein the Devil blinded their reason, as he did the modest women, that worshipped *Priapus,* or the *Taurus,* which at this day worship the Devil, to the end that he should do them no harm. Thus much I can only say of the friends and lovers of Serpents, by the multitude whereof we may conjecture, how among other parts of the curse of God upon them, they are held accursed both by man and Beall.

Now then it followeth, that we enter into a more particular description, or rather a relation of that hatred which is between them and other creatures, and first I will begin with their arch enemy, I mean Man-kinde. For when GOD at the beginning did pronounce his sentence against the Serpent, for deceiving our first Parents, among other things he said, *I will set enmity between thee and the Woman,* between thy seed and the Woman’s seed. Whereby he did signify that perpetual war, and unappeasable discord, which should be for ever (by his own appointment) between them. And the truth hereof is to be seen at this day, by a kind of secret insinuunt, and natural motion, a man abhorreth the sight of a Serpent, and a Serpent the sight of a man. And as by the tongue of the Serpent, was wrought mans confusion, so by the sritte of a mans tongue, is wrought a Serpent’s affrontment. For indeed such is the Ordinance of God, that Men and Serpents should ever annoy and vex each other. And this *Erasmus* faith shall continue, as long as *meminerimus illius insanificati pomi,* we shall remember that unfortunate Apple.

*Isaurus* faith, that Serpents are afraid of a man naked, but will leap upon, and devour a man clothed. Which thing is also affirmed by *Olaus Magnus,* for he faith, that when he was a boy he often triey that, when he was naked, he found little or no resistence in Serpents, and did safely without all danger combat with them hand to hand. I my self also in my younger time, when I was about ten or twelve years old, used many times in the Spring and Summer time, to wash my self with other my Colleagues, in certain fish-ponds, wherein I have seen and met with divers Water-snakes without all harm; and I did never in my life, hear of any harm they did to any of my fellows being naked, neither did I ever see any of them run away so fast on the land, as they did fly from US in the water; and yet not the Water-snakes les hurtful then the Land-adders. And this was well known to many.

About the beginning or Fountain Springs of *Euphrates,* it is said, that there are certain Serpents which know strangers from the people of the Country, wherefore they do no harm to the natural born Country-men, but with strangers, and men of other Countrys they fight with might and main. And along the banks of *Euphrates in Syria,* they also do the like; saying that if they chance to be trode upon by any of the people of those parts, they bite (like as a Dog doth) without any great harm; but if any other, fortunier or stranger annoy them, they also repay him with malice,
for they bite him, and intolerably vex him. wherefore the Countrey-men nourish them, and do them no harm. Such as these are also found in Tyritius, but they are very little ones, and are thought to be engendered of the earth.

The first manifestation in nature, of Mans discord with Serpents, is their venom: for as in a Serpent there is a venom which poiyfoneth a Man: so in a Man, there is the venom of his fpirit which poiyfoneth a Serpent. For it the falling fprit of a Man fall into the jaws of a Serpent, he certainly dyeth thereof. And of this, thus writeth the Poet Lucretius:

Est utique ut Serpens, kominis qui tecta jactus
Disperrit, ac fefte mandando conjicit ipse.

In English thus:

At Serpent dyeth when fpritle of Man be fiplet,
Gnawing his teeth to eat himfelf he wasteth.

The cause of this, the Philosophers (which knew nothing of Adams fall, or the forbidden Apple) do allign to be the contrariety betwixt the living fouls or spirits of thefe Creatures: for the Serpents life is cold and dry, and the Humane life hot and moist, wherefore either of both abhorreth one the other: and the Serpent leaheth as far from a Mens fpritile, as it would do out of a veffel of scalding water.

Agatharchides writeth, that there was a King in Africa called Pylus, whose Sepulchre was preferred in the greater Syrtes. From this King there were certain people named Pylusians, in whole bodies there was a certain inbred and natural power to kill, or at the leaft to affonith Serpents, Spiders, Toads, and fuch like, and lay them for dead, even by the favour or smell of them. And the manner of these men, to try the chaftity of their Wives, was to take their children newly born, and to call them unto direful Serpents: for if they were of the right line, and lawfully begotten, then did the Serpents die before them, but if they were adulterous, and the children of Strangers, the Serpents would eat and devour them. Pliny affirmeth, that even in his days there were some of those people alive among the Najamant, who destroyed many of them, and did poifeth their places; yet some running from death, escaped. Generally, fuch people were called Manis and Pylis, for the Manis were a people of Italy, defcended of Circum (as is faid) in whom there was a vertue to cure all the flinging of Serpents, by touching the wounded places. Such faith Gratus Pergamenum, are in Helepbren, about the River Parus. And some are of opinion, that at the beginning they were Opbiogenes, born or bred of Serpents; or that some great Nobleman, father of that Countrey, was of a Serpent made man. And Varro fayth, that in his time there were some few men alive, in whose fpritile was found that vertue, to refift and cure the fpoynom of venoumous Beasts.

But having named Opbiogenes, or Anguina, that is, Men bred of Serpents or Snakes, I fee no caufe why it should be judged, that thofe which cure Serpents poiyfon, fhould be fo misjudged; for to cure poiyfon, is not the work of poiyfon, but of an Autodite, or contrary power to poiyfon: and therefore curers and refifters of poiyfon, are without all learning called Opbiogenes, that is, Serpents brood: but rather, that term belongeth more juftly to thoce people, whose nature is fociable with Serpents, and Serpents agree with them, as they would do with their own kinde. Such an one was Exagen the Embaffador of Rome, who at the commandement of the Consuls, (for their experience) was caft naked into a veffel or tun of Snakes, who did him no harm, but ticked him with their tongues, and fo with great miracle, he was let forth again untouched; and yet there is no more reaon to fay, that this man, was born of the linage of Serpents, becaufe thofe Men-enemies did not hurt him, then it was to fay, that Daniel was born of Lions, becaufe that the Lions did not harm him. Or that Ramus and Renus were born of the kindred of Wolves, becaufe the Wolf did nourith them. We do read of many people in the World, which were furnamed of Serpents, all which may as well be deemed to be defcended of fuch creatures, becaufe of their name, as well as the other, who were by GOD for their innocency preferred from death.

Ephus was called Colubraxis, and the people thereof Ophiusse, and in Arabia we read of the Ophiades, both which are derived from Serpents called in Greek, Ophis Esothathis also relateth a fiory of a man called Ophis, which I omit to speak of the Ophis and others: yet thus much I muftneeds fay, that commonly fuch names have been given to Serpents, for fome caufe or accident, either fignifiedly or truly derived from Serpents. So we read of Ophys, a companion of Cadmus, and a builder of Tebes, who was faid to be made by Palus of a Dragons tooth. Likewife the Serpentes were called Ophodraftus of Cadmus Rho., by Pylus, becaufe in a famine they were contrained to eat Serpents.

S. Augufline maketh mention of certain blafphemous Heretiques, who were called Ophites, becaufe they worshipped a Serpent, and faid that the Serpent which deceivd our firft Parents Adam and Eve, was Christ. Wherefore they kept a Serpent in a Cave, whom they did nourifh and worship, which at the charm of the Priet would come out of his Cave, andlick the Oblations which they fet upon his Den; rowling and folding himself round about them, and then would go in again: then did they abominable Hereticks break thefe oblations into the Eucharift, and receive them as fannified by the Serpent. And fuch alfo is the fiory of Cadmus Rho.: where he tearneth the great Devil Ophius, whom both holy Scripture, and ancient Heathen fay, that he fell out of Heaven. But all thefe things are bu but the way, upon occafion of that unnatural conceit of fome men called Opbiogenes: that is, defcended or begotten by Serpents. Therefore I will return where I left,
left, namely, to the hatred of Men to Serpents, and of Serpents to Men again: In testimony whereof, there have been mutual slaughters, namely Men which have killed monstrous Serpents, and Serpents which have killed men again.

Hercules being but an Infant, (as Poets faign) killed those two Serpents which Jupiter sent to his cradle to destroy him; for Juno is said to be much offended at his birth, because he was begotten by Jupiter upon Aleuca; and therefore there was reserved the Image of Hercules at Athens, strangling a Serpent. But Pierius maketh of this fiction a good moral or Hieroglyphick, when he faith, that by Hercules strangling of the Serpents in his cradle, is understood, how those men which are born for any great enterprises, should kill their pleasures while they be young. I need not to stand long upon this point, for it is evident, that to this day there are many Hysers, both men and women, which are not afraid to kill the Serpents brood. But such as have perished by Serpents, I mean men of any note, are also expressed, whereof Ovid writeth of Eneas, the son of Priamus and Deidamias, who following the Nymph Heferia, (with whom he was in love) was suddenly killed by a Snake biting his foot. So were Apeastes, Munitus, Euridyce, Laocoön, Ophites the son of Lycurgus King of Nemes, Orsiet, Idmon, and Mops, slain by Serpents: whereof Ophites, by the negligence of his Nure Hypsibis, leaving him unguarded in his cradle.

It is recorded by Elianus and Pliny, that when a Serpent hath killed a Man, he can never more cover himself in the earth, but in punishment of so vile an offence, wandereth to and fro, subject to infinite miseries and calamities, not being acknowledged by his female if he be a male, nor yet by the male if it be a female; and is forsaken of all his crew or society. The earth it self not daiging to entertain a man-murtherer into her bowels, but contraining him to live Winter and Summer abroad upon the open earth. And thus hath the Divine Providence dispensed his justice, that he suffereth not murther of men to be unpunished among the greatest haters and enemies of men.

What monsters therefore are they which have Serpents in their delights, and admire that in them which should be hated of all men. And how base were those minded Gesicians, which worshipped the Serpent for a God? Or the Athenians, which kept a Serpent in their Temple, for an opinion that the same did conserve their Tower or Castle from all enemy. Jupiter was also worshipped in many places in the shape of a Serpent. And the ancient Burfranci worshipped a natural Serpent of the earth. It is strange to consider the error of the King of Cal skeleton, who doth as severely punish the slayer of a Serpent, as he doth the slayer of a Man; and not only restraineth his subjects from harming them, but also buildeth for them little coats, wherein they safely lodge in the Winter time. And the cause of this error, is their conceit, that they think Serpents are Divine powers dropped out of Heaven, which they prove, because when they fling fiercely, they quickly kill, and dispatch their enemy suddenly. Wherefore they think that no creature can kill so speedily, except an Angel of God. Some of the Heathen had their Opiboeatea Beasts with Serpents heads, which they did worship for a God. And the Poet Virgil hath an excellent description of Eneas his sacrificing to the ghost of his Father Anchises.

And to make an end of this Section, of the Antipathy between Men and Serpents, that whatsoever is of the Woman's feet, may profees himself an enemy to the Serpent, let him but consider how that hateful monster Heligalebus, having by the help of the Marsick Priests gathered together many Serpents, one day in the morning, when the people were gathered together to see some rare and unheard of spectacles, suddenly he let loose the Serpents, and hurt many of the people. Tzetzes telleth another story, of a devil or warlike stratagem, how Serpents by slings or trunks, were sent abroad among the Camps of their enemies. So doth Galen, of Serpents included in an earthen pot, and call like darts among the Tents of the Romans. And so did Hannibal shew to Antiochus, how in a battle by Sea, he might shoot Serpents among the Mariners to his Enemies, and hinder their rowing: for when he did follow the same devil as Prufne, he went away Victor and Conqueror. And thus I will conclude this part, with the Emblem of Alcatus, which he wrote unto the Duke of Millian upon his Arms, being an Infant proceeding out of a Snakes jaws.
Of Serpents in General.

Exilium Infans sinuo est faucibus anguis,
Est Grelitius nobile semina tuo.
Talia Pelleus gifiisse numinum regem
Vidimus, bisque saeum cancelbras, genius.

Out of the mouth of winding Snake,
Great Duke, this is thy Cree,
A leaping Infant making scope
From jaws, a world wide:
The like Caesar did Pelleus King
Upon his silver preye;
As we have seen, the fame to sing
Of Kindreds worthiness.

And the like by the same Author is expressed upon this Themis, That the widflame of man is foolishness with God; therefore upon the unnaturall conjunction of two mortall enemies, framed into one body, he thus writeth elegantly;

Quid dicam, quaestam hoc compellem nomine Monstrum?
Biforme quod non est homo, nec est draco.
Sed sine sere pedibus, summis sine paritibus anguis, Vir angui-potis dici, & hominem anguis potest:
Angume pedes hanc, hominem reddavat & anguis,

That is to say;

What shall I call? or how this Monster rightly name?
Biformed, which nor man nor Dragon, in all the same.
But man unleged, and Snake unbeded: doublef parts,
Man-faue, Snake-man, exceeding humane arts.

Man talit breedes Snake, and Snake a man up-called,
One end is not of man, nor other of wilde beast tajlet.
Such one was Cecrops, learned Athens King,
And Giants such did earthly mother bring,
Mishapen then, an earthily minde expresseth,
Devoid of grace for worlds good only wifheth.

Thus then will I leave to talk of our most juft (and by God ordained) hostility, betwixt men and Serpents, and defend to a particular discovery, how Serpents and other beafts are for manes fakes at the like enmy. And first of all will I begin with the Fowls, and fo defend to four-footed beafts, and Infects, or imperfect creatures.

Eagles are always in warre with Serpents, from an high they espy them, and suddaine flye down upon them, with a greatye nofe or cry, tearing out their bowells, and cutting affide their venom or poyfon. And some (as Albertus) say, that they will in particular deal with Vipers, Tigers, and Dragons, when the feth them hunting thofe small beafts or birds which are their prey. This fight is thus des cribed by Virgil, how the Eagle griping the Serpent in her talons, flyeth into the air.

In English thus;

At Eagle flieth on high, and in her claws a Dragon beareth,
Fledd within her feet, wounded, dying to her talons cleareth.
The Serpent fierce nou windeth round, and with her head ered,
Flying out threats, rough foles softlifted that were dejected,
To fright her fhe, but all in vain, for she with beast doth strive,
And beat the air with wings of force, till Dragon cede to live.

There is in the seventh book of Ælianus History of living Creatures, a notable and elegant story of an Eagle which was almost overcome by a Serpent, and yet preferred and made Conquerour by a man. There was (faith he) fourteen men which were thrashing of corn in the heat of the Sun, by reason whereof they became very thirsty, then they agreed to fend one of their company to a Fountain not far off, to fetch some water for them all to drink; and so the Meffenger coming to the Fountain, found an Eagle almof killed by a Serpent: for whiles from an high he beheld the Serpent, being more greedy of the prey for to feed her young, then wary to avoid danger, fell down upon her botto, which was too strong for her; for the Serpent received her adversary with fell force, power, and preparation to fille, and so indeed she had accomplished, had not by chance this threfter come unto them: for the Serpent had so enflared and wrapped up the Eagle
Eagle with her long body, that she was nearer ad peruncium quam ad peredium, that is, to be killed, then to kill, or get a prey. The Man beholding the fight, with his sickle cut another, and the Serpent, so delivered the Eagle: but how the Eagle required the Man, shall be shewed in the history of the Eagle.

In the Mountains of Morfilium, there are great store of great Serpents, which are very dangerous, but there are also great white Eagles, which do eat and destroy them. Some say that the Vulture doth destroy Serpents, but herein I cannot be satisfied, for all Eagles do not hunt after this game, but only the lesser fort of them. Eagles when they build their nest to breed in, they seek out a certain stone called Actites, the virtue whereof keepeth Serpents from their young, and also make their eggs fruitful, so as it is a rare thing for Eagles to have a rotten egg.

All kinds of great Hawks, Buffalards and Kites, are also enemies to Serpents, Snakes, and Adders, and the Kites will eat them, if they finde them alive or dead, as I myself have often seen by experience. The Storks also do hunt after Serpents, whereof in Theflay, it is as unlawful to kill a Stork as to kill a Man; for they have many deviles to catch Serpents, and all venomous Beasts, and thereof to eat without harming themselves: and not only eat themselves, but give thereof to their young ones, as Juvenal witnesseth:

—Serpente ciconia pullos
Nutrit, & inventa per devinura locusta.

In English thus;
The stork her young ones, according to kinde,
In Serpents and Lizards, do their meat finde.

Sometime they fight together irefully, and the Serpent strangleth the Stork by twyning about her neck; again, the Stork killeth the Serpent by pecking upon her head, and so sometimes they are both found dead together. As the Eagle hath the stone Actites, so hath the Stork Lychnites, to defend her self and her young ones from the rage of Serpents. There is (as Oppianus writeth in his Iscaticus) this vulgar story in Italy. There was a certain Serpent, which came two years together to the nests of divers Storks, and destroyed their young ones, neither could all the Storks make sufficient force against her with all their might to save their brood. The third year the Serpent came again to attempt the like slaughter; but there among the Storks she found a certain strange Bird never seen before, being shorter then the Storks, and yet had a great long sharp bill, as sharp as the point of any sword. This Bird (as it feemeth) was brought thither by the Storks to guard their young ones, when the Parents were gone abroad to forrage for them. Then, as soon as the young ones were hatcht, out cometh the Serpent from his hole, and beginneth to affail the nests of the Storks, but the guardian Bird, (according to the true committed to her) resifted the Serpent, and pecked at her mortally with her sharp beak. The Serpent to end his adversary, nimby advanced himself upright, and endeavoured to reach the Bird, but the wary Bird foared to high above his reach, that the langrel Serpent could not catch him, and so they continued in fight, till at last the Bird killed the Serpent, after that the Serpent had once only fastened his venomous teeth upon the Bird, which afterward so wroght upon this Bird, that all her feathers did flie off from her back.

But of all other Fowls enemies to Serpents, there is no other more or more deadly, then the Bird called ibis, which the Egyptians do wonderfully honour; for when swarms of Serpents come into Egypt, out of the Arabian gulfes and isles, these Birds meet and destroy them: and there is such an admirable fear in Serpents of these Birds, that they do not only tremble, and fall fentilest at their fight, but also at the sight of their feathers: they do harm to no other living thing, except Locuits and Caterpilars, whereof they are very nourished, and called Ismica & populaver Serpentina, enemies and destroyers of Serpents.

All kindes of Pullen, as Cocks and Hens, are likewise enemies to the brood of Serpents. And a good courageous Cock, (as Columella saith) is able to kill and refit a Serpent. For, (as Radosleutis saith) he hath found in the crop or claw of Pullen, young Serpents devoured by them. But from whence Albertus had his relation, that a Hen cannot be hurt that day by a Serpent wherein the layeth an Egg, I cannot tell; and therefore leave it to the Reader to believe or refuse.

And it is also said, that the feth of Hens applied to the bittings of Serpents, doth cure them, or else caue a Hen to fit upon the wounded place; but if the Beast which is wounded, be a Cow with Calf, or any such other famel with young, howsoever it fareth with the old one, surely the young ones shall perish.

There is also another Bird, which for his combating with Serpents, is termed Opiliomus, a fighter with Serpents. Although Gesner be of opinion, that Opiliomus never figifteth a Bird. Of this Bird the Septuagints make mention, Levit. 11. but many of the better learned, do interpret it for a Lizard, or a Locuit, or an Ichneumon. The Peacock also is a terour to Serpents, so as they will not abide within the hearing of his voyce, for it is perpetual with all venomeous beasts. And the Vultur, as we said before, is a terour unto them, inso much as one of their feathers burned will by the favour of the Insoak drive away the Serpent. And to conclude, the Swallows also are at variante with the Serpents brood, for the Snake will creep up to the Swallows nest, and therein suddeenly surprize the young, for the old ones will fly away cluttering, and chirping in morousful fort, not being...
Of Serpents in General.

being able to hinder or rett the chick-devouring foes. But at the last, when they see all their young ones dispatched, as if they could not endure to live for sorrow, or else thinking it possible to fly into the snakes belly to fetch out again their devoured young ones, they fall down upon their enemies jaws, doing what can to make them devour and swallow them up also. And thus much for the hatred betwixt fowls and Serpents: Wherein, although they kill the Serpent, either in their own defence, or else for ravage and prey, yet may we admire the prudence of the most mighty Creator, who hath so disposed of his power, that he causeth the Fowls of Heaven to revenge Mans quarrel upon the Serpents of the earth, by whose subfubitie Man was plucked from Heaven, and they made subject to corruption.

In the next place, God hath also framed an opposition betwixt Serpents, and the Beasts of the earth and water, which live with Serpents in the same Element, that so they might be both annoyed at home and abroad. I will therefore begin with the Dog, who is a notable enemy to the Serpents, as I say, have been seen in England, for he will earneitly seek them out with nose and foot, both in waters, dunghils, and hedges, and when he hath found any one, he will suddenly snatch him into his mouth, biting him about the middle, and so holding it in equal poyle, will fling and shake it about his ears very falt and violently, till he perceive it can firr no more, and then suddenly again lettech it fall out of his mouth to the earth; but if it begin to firr, he snatcheth it up again, and shake it about his ears as before, and so never giveth over till it appear dead: but they seldom kill them, only they affoainih them, and so may a young childe knock out their brains. However, when they fight in defence of their Matters, then they kill them, by biting them in pieces. And yet is it more safe for them, to affoainih them, and leave them for dead, by flaking them about their ears, then by biting them in pieces, for that commonly then, while they thare them aunder, they are strong or bitten by the Serpent. And this I have seen often in mine own experience. But one of the greatest enemies of Serpents are Harts, a timorous beast of all other, and yet greedy to combat with the Serpent, wherefore I will briefly describe this their war and hatred, out of Solinus, Elianus, Plinie, and Opiannus.

The Hart will greedily follow out the path of the Serpent, and finding it lodged in his den or hole, by the vertue of his nose draweth it out of the Earth, and thereof some have derived Elaphot, a Hart, of Elantrin tos ophex, that is, driving away of Serpents. And herein I think it not reason to follow the opinion of Elianus, who intreating of Harts drawing Serpents out of the earth, faith, that the Serpent is inticed and allured out of her hole, by the breath of the Hart, as by a Phil-tere or Cup of love; for seeing that there is so great an hoftility, and antipathy in nature, betwixt their whole disposition, how can it come from any secret sympathy, that the Serpent (which is the subtillforce of all beasts) should be bewitched with the love of his enemies breath? But if it be said that Serpents, which are by nature very cold, can easilly be drawn forth by a warmer breath, as it were by the sweet beams of the hot Sun; how then falleth it not out, that when any other Beasts breatheth upon their lodging, and into their dens, they are not removed? But let it be granted that the warmnesse of the Harts breath maketh him for fake his denyet it cannot be ascribed to any secret in nature, as if there were a fire of love in the Harts throat or bones, but only from the natural concomitant quality of heat, with expiracion, refpiration, and inspiration: and therefore I cannot but conclude, that there is not any possibility or probability in nature, that where the spirits, which take and make the breath, are at such variance, there the breath proceeding from the one adversary, should do the hurt and buide off the other.

But the true cause of this extraction of Serpents out of their lodgings, is, as I conjecture, not her warm breath that allureth, nor yet forsooth and burneth her adversary; but that when the Hart hath found the den of the Serpent, by her violent attraction of the air out from the Serpent, the enforcement for the safegard of life to follow it out of the den. As a vessel is broched, or vended, the Wine followeth the flying air; or as a Cupping-glass draweth blood out of a feared place of the body: and so is a Serpent against her will, drawn to follow the breath of her destroyer. Oriham and Guntrius do subscribe unto this opinion, and take it for most consonant to reafon and truth, and therefore I will not follow it any further: for by the self fame manner do the Sea-Rams draw the Sea-calls out of their lodgings among the Rocks under the earth, when they have found the Calf, they keep it from air, and prevent their refrigeration.

When the Serpent seeth himself so drawn forth by his adversary, he being above measure incendened to rage, flyeth away, and maketh his poyfon more noifome, violent and powerful, for which cause, there was wont to be a Proverbial caveat or warning: Cave ne inideria in Serpentem, quem extrales et lateris anhelitus cervi effugeris, tunc enim propter iracundiam utreminum et uepramenis: Take heed left you meet with a Serpent flying away from the Hart, after she is drawn out of her den by her breath, for then, by reason of her rage, her poyson is more forcible. But I will proceed to the more strange and wonderful combatte betwixt Serpents and Harts. For when the Serpent perceivesthe unavoidable danger, and that the mult needs fight for her life, she hissett strongly, lifting up her head from the earth, even to the throat of the Hart, and thereat catcheth and gnatheth with her teeth; but on the other side, the valiant Hart, (if such a word may be given to a fearful Beast) as it were derid ing his adversaries weak endeavours to harm, suffereath the Serpent to winde about his breast and belly, and to embrace both neck and legs with his long and weak body, that so he may have the more power upon it, for he t reareth it into an hundred pieces.
But the most strange combats are betwixt the Harts and Serpents of Libya, where hatred hath his deepest footing, for there the Serpents watch the Hart when he lieth down to sleep upon the ground, and being a multitude of them set upon him all together, fasting their poyonfull teeth in every part of his skin, some on his neck and breasts, some on his fides and back, some on his legs, and some hanging upon his privy parts, biting him with mortal rage, to end and overthrow him. The poor Hart being thus oppreft with multitude, and affaileth without any warning to the battle, in vain attempteth to run away, for their cold earthy bodies, winding tayls, and pinching teeth, hinder his wonted pace, and overcharge his strength: whereat being forced to quit himself in the best manner he can, enraged, with teeth, feet, and horns affaileth his enemies, whose spears and arrows of teeth and flings, fick to fall in his body; tearing them in pieces which he can touch with his teeth, beating others afunder where he can reach them with his horns, and trampling under his feet thole which cleave to his lower parts: and yet such is the rage and dauntlesse courage, or rather hatred of these enemies, not willing to die alone, (but like Champions to end their lives upon and with their adversary) do still hold fast, and even when their bodies are beaten in pieces, their heads flick close, and hang sharp upon the Harts skin, as though they would grow with him, and never fall off till he should alfo fall down dead. But the Hart feeling some ease, and having by the slaughter of their bodies delivered his feet from thraldome, by a divine natural inclination, flyeth and runneth fast to some adjoyning fountain, where he seeketh for Sea-crabs, whereof he maketh a medicine, that shaketh off their heads which cleave to fast unto him, and alfo cureth all their wounds and poyon. This valiant courage is in Harts against Serpents, never yeelding, tyring, or giving over, and yet otherwise, are afraid of Hares and Coynes by nature.

But what is the caufe of this hollithy betwixt Harts and Serpents? Is it for meat, or for medicin and cure? Surely they would abhorre to eat them, if it were not for health and natural medicine, for sometimes the pores of their body are dullered and shut up, sometimes the worms of their belly do ascend up into the roof of their mouths while they chew the cud, and there cleave fast; for remedy whereof, the Hart thus affiected, runneth about to seek for Serpents, for the eating of a Serpent cureth this malady. Pliny faith, that when the Hart waxeth old, and perceiveth that his strength decayeth, heart changeth, and his body begins to be feeble, then for the renewing of his strength, he first devoureth a Serpent, and afterward runneth to some fountain of water. Whereof when he hath drunk, he findeth a sensible alteration, both in horn, hair, and whole body, And this thing is also delivered by the Writer of the Glossio upon the 42. Plain, which beginneth, Like at the Hart describeth the water springs, so lungeth my soul after my GOD. But for the ending of this question, we must consider and remember, that there are two kinds of Harts, one eateh Serpents, and feeling the poyon to work, straight way by drinking cafltheth up the poyon again, or else cureth himself by covering all his body over in water. The other kinde only by nature killeth a Serpent, but after victory forbeareth to eat it, and returneth again to feed in the Mountains. And thus much for the discorde betwixt Harts and Serpents.

In the next place, great is the variance betwixt Serpents, Dragons, and Elephants, whereof Pliny and Solinus write as followeth. When the Elephants called Serpent-killers, meet with the Dragons, they easily tread them in pieces, and overcome them, wherefore the Dragons and greater Serpents use subtilety in flead of might; for when they have found the path, and common way of an Elephant, they make such devises therein to intrap him, as a man would think they had the device of men to help them, for with their tails they do ensnare the way, that when the beast cometh, they intangle his legs as it were in knots of ropes; now when the beast floppeth down with his trunk to loose and loosen them, one of them suddenly forseeth his poyon full head into his trunk, whereby he is strangell. The other also (for there are ever many which lie in ambush) for upon his face, biting out his eyes, and some at his tender belly; some wounding themselves about his throat, and all of them together, fling, bite, tear, vex, and hang upon him, until the poor beast, emptied of his blood, and sweelden with poyon in every part, fall down dead upon his adversaries, and so by his death kill them at his fall and overthrow, whom he could not overcome being alive. And whereas Elephants (for the most part) go together in flocks and troops, the subtle Serpents do let passe the foremost of every rank, and set only upon the hindremost, that so one of the Elephants may not help another; and these Serpents are said to be thirty yards long.

Likewise, forasmuch as these Dragons know, that the Elephants come and feed upon the leaves of trees, their manner is to convey themselves into the trees, and lie hid among the boughs, covering their foreparts with leaves, and letting their hinder parts hang down, like dead parts and members; and when the Elephant cometh to browse upon the tree-tops, then suddenly they leap into his face, and pull out his eyes, and becaufe that revenge doth not satisfie her, thirsting only after death, she twineth her gable-long body about his neck, and so strangelleth him.

It is reported that the blood of Elephants is the coldest blood in the world, and that the Dragons in the scorching heat of Summer, cannot get any thing to cool them except this blood: for which cause they hide themselves in Rivers and Brooks, whither the Elephants come to drink, and when he puttheth down his trunk they take hold thereof, and instantly in great numbers leap up into his ears, which only of all his upper parts are moist naked and unarmed, out of which they suck his blood, never giving over their hold till he fall down dead, and so in the fall kill them which were the procurers of his death. So that his and their blood is mingled both together, whereof
Of Serpents in General.

whereof the Ancients made their Cinnabaris, which was the best thing in the World to represent blood in painting: Neither can any devise or art of man ever come near it; and beside, it hath in it a rare vertue against poison. And thus much for the enmity betwixt Serpents and Elephants.

The Cato by Albertus is said to be an enemy to Serpents, for he faith he will kill them, but not eat thereof; howbeit, in her [ sic ] killing of them, except the drink incontinently, the dyeth by poison. This relation of Albertus cannot agree with the Monks of Mifian their relation about their Abby-cat. But it may be that Albertus speaketh of wilde-cats in the Woods and Mountains, who may in ravin for their prey kill a Serpent, which followeth with them the same common game.

The Roes or Roe-bucks do also kill Serpents, and the Hedge-hog is enemy unto them, for sometimes they meet both together in one hole, and then at the sight of the Serpent, the Hedge-hog foldeth himself up round, so as nothing appeareth outwardly, fave only his prickles and sharp bristles: the angry Serpent fetteth upon him, and biteth him with all her force; the other again, irritateth herelf above measure, to annoy the Serpents teeth, face, eyes, and whole body: and thus when they meet, they lie together afflicting one another, till one or both of them fall down dead in the place. For sometimc the Serpent killeth the Hedgehog, and sometimc the Hedge-hog killeth the Serpent, so that many times the carrieth away the Serpents flesh and skin upon her back.

The Weasels also fight with Serpents with the like furious: the cause is, for that one and other of them live upon juye, and so for their prey or booty, they fall together in mortall warre. Herein the Weasel is too cunning for the Serpent, because, before the fightheth, the feeketh Rue, and by eating thereof quickly discomforteth her adversary. But some fay, that the eatheth Rue afterward, to the intent to avoid all the poison the contracted in the combat.

The Lyon also and the Serpents are at variance, for his rufing mane is discouraged by the exctoll- ed head of the Serpent to his breath. And therefore as S. Ambroje faith, this is an admirable thing, that the Snake should run away from the Hart, the most fearfull of all other beastes, and yet over come the Lyon, King of all the residue.

The Ichnammon or Pharaoh Mouse is an enemy to Serpents and eatheth them, and because he is too feeble to deal with a Snake alone, therefore when he hath found one, he goeth and calleth as many of his fellows as he can finde, and so when they find themselves strong enough in company, they feet upon their prey, and eat it together; for which cause when the Egyptians will signific the weaknesse they paint an Ichnammon. Andmerely likewise is also a protected terror, and courage to Snakes and Adders, and they will not endure neer those places where they hear their voice. The Swan and Swine, do also hate and abbhor Serpents, and the little Sorex hath most advantage against them in the Winter-time, when they are at the weakest. To conclude, the Horse is wonderfully afraid of all kindes of Serpents if he see them, and will not go over, but rather leap over a dead Snake. And thus I will end the warre betwixt Serpents and Four-footed beasts and Fowles.

Now left their curfe shoul not be hard enough unto them, God hath also ordained one of them to destroy another, and therefore now it followeth to shew in a word the mutuall discord betwixt themselves. The Spider, ( although a venomous creature ) yet is it an enemy to the Serpent; for when the feeth a Serpent lie under her tree in the shadow, the weaveth or twillet a thred down from her web upon the head of the Serpent, and suddently biteth into his head a mortal wound, so that he can do nothing but only roul to and fro, being ftricken with a Megrim, whereby he hath not so much power as to break the Spiders thred hangeing over his head, until he be dead and overthrown. The Cockatrice is eac a enemy to some kindes of Serpents, that he killeth them with his breath or hissing.

The Lizard a kinde of Serpent is most friendly to man, and very irefull against Serpents, to the uttermost of his power, whereof Erasmus ( in his book of Friendiship ) telleth this story: I saw ( faith he ) on a day, a very great Lizard fighting with a Serpent in the very mouth of a Cave, at the first fight whereof I marvailled at the matter, for the Serpent was not visible out of the earth: there was with me an Italian, who said, that surely the Lizard had some enemy within the Cave. After a little while the Lizard came unto us, and shewed us his fide all wounded, as it were craving help, for the Serpent had bitten him fore, for of green he made him appear red, and this Lizard did suffer himselfe to be touched of us: Thus faith Erasmus.

Again, in the same place he faith, that when a Lizard saw a Serpent lie in wait to set upon a man being asleep, the Lizard ran to the man, and never ceased running upon the mans face, stretching his neck and face gently with his clawes, until he had awaked the man, and so submissive to him his great danger. The Loculli also fighteth with a Serpent, and killeth him when he lufeth, for he geteth hold with his teeth upon his lower chap, and so destroyeth him: but this is not to be understood of everie kinde of Loculli, but only of one kinde, which for this cause is called Ophiomacism genus.

The Serpent is also an enemy to the Chamaeleon, for in the extremity of famine, the fetteth upon them, and except the Chamaeleon can cover her self from his rage, he hath no defence but death. Albertus calleth a certain Worm, Spisator colubri, because ( as he faith ) it will take faiith hold upon a Serpents neck underneath his jawes, and never give over till he hath wearied and destroyed his adversary. The Tortoises are enemies to Serpents, and will fight with them, but before they enter combat, they arm themselves with wilde Marjoram or Pennroyall.
Of Serpents in General.

But there is not any thing in the world that figheth more earnestly against Serpents then Sea-crabs and Creavies; for when the Sun is in Cancer, Serpents are naturally tormented with pains and feavers, and therefore if Swine be rung or bitten with Serpents, they cure themselves by eating of Sea-crabs. There is a great water near Ephesus, at the one side whereof there is a Cave full of many noyfome and unclefual Serpents, whose bitings by often probation, have been very deadly both to men and beasts. These Serpents do often times endeavouer to crawl over the pools; now on the other side, there are great flore of Crabs, who when they see the Serpents come crawling or swimming, they instantly put out their crooked legs, and as it were with tongs or pinfers, reach at the flying Serpent, wherewithall the Serpents are so deterred, that through their fight, and often remembrance of their unhappy faceffe with them, they turn back again, and never dare any more adventure to the other side. Where we may see the most wise providence of the Creator, who hath set Sea-crabs the enemies of Serpents, to guard both men and Cattell, which are on the opposite side: for otherwife, the inhabitants would all perife, or else be drove away from their dwellings. To conclude, not only living Creatures, but alfo some kinde of earth, and Plants are enemies to Serpents: And therefore most famous are Ebulus and Creet, as some fay, although Belonius say, that there are Solipendiaeres Vipers, and Slow-worms in Creet, yet he fay they are without venom: and there are very few in England and Scotland, but none at all in Ireland, neither will they live if they be brought in thither from any other Country. This antipathy with Serpents, proceedeth from living to dead and vegetable things, as trees, herbs, and plants, as may be feen by this discourse following.

There is fuch vertue in the Aft-tree, that no Serpeft will endure to come neer either the morning or evening shadow of it, yea though very far diftant from them, they do fo deadly hate it. We let down nothing but that we have found true by experience: that a great fire be made, and the fame fire enclosed round with Aften boughs, and a Serpent put beath the fire and the Aften boughs, the Serpent will sooner run into the fire then come near the Aften boughs. Thus faith Pliny; Olaus Magnus faith, that thefe Northern Countries have great flore of Aft-trees, do want venemous beafts, of which opinion is alfo Pliny. Callimachus faith, there is a Tree growing in the land of Triaconias, called Smile, to which if any Serpents do either come neer or touch, they forthwith die. Democritus is of opinion, that any Serpents will die if you call Oken-leaves upon him. Pliny is of opinion, that Athlabiunum, which is a kinde of wilde Bugfloe, is of the fame ufe and quality; and further, being chewed, if it be spit upon any Serpent, that it cannot possibly live. In time of thefe solemn Feafts which the Athenians dedicated to the Goddeffe Ceres, their women did use to lay and threw their devils with the leaves of the Plant called Agnes, because Serpents could not endure it, and because they imagined it kept them chale, wherupon they thought it very pleasant. The herb called Rosemary, is terrible to Serpents.

The Egyptians do give it out, that Polydamna, the wife of Thrace their King, taking pity upon Helen, caufed her to be fet on fhole in the Illand of Pharos, and belowed upon her an hearb (whereof there was plenty) that was a great enemy to Serpents; whereof the Serpents having a felling fenfe (as they fay) and fo readily known of them, they ftraiightways got them to their lurking holes in the earth: and Helen planted this herb, who coming to the knowledge thereof, the percieved that in his due time it bore a feed that was a great enemy to Serpents, and thereupon was called Helenium, as they that are skilfull in Plants affirme; and it groweth plentifully in Pharos, which is a little ille againft the mouth of Nilus, joyned to Alexandria with a Bridge. Rue, (called of some Herb of grace) efpecially that which groweth in Lybia, is but a back friend to Serpents, for it is molt dry, and therefore caufing Serpents foon to flay and lofe their courage, becaufe (as Simocatus affirme) it induceth a kinde of heavinesse or drunkenneffe in their head, with a vertiginy or goddines, through the exces of his drincks, or immoderate ficcity. Serpents endue not the ftrength of Rue, and therefore a Weafeil when she is to fight with any Serpent, eateth Rue, as a deffenative againft her enemy, as Ariftate, and Pliny his Interpreter are of opinion.

The Countrie-people leaving their Veffels of Milk abroad in the open fields, do befieem them round about with Garlick, for fear left fome venemous Serpents fhould creep into them, but the smell of Garlick, as Efedim faid, driveth them away. No Serpents were ever yet feen to touch the herb Trifolue, or Three-leaved grasse, as Aedonius would make us believe. And Cardan the Phyfitian hath observed as much, that neither Serpents nor any thing that is venemous, will lodge, dwell, nor lurk privy neer unto Trifolue, becaufe that it is their bane, as they are to other living Creatures: and therefore it is fown to very good purpofe, and planted in very hot Countrie, where there is most flore of fuch venemous Creatures. Arnoldus Villanovanus faith, that the herb called Dresnue killeth Serpents. And Florentinus affirme, that if you plant Wormwood, Mugwort, and Sothernwood about your dwelling, that no venemous Serpents will ever come neer, or dare enterprie to invade the fame. No Serpent is found in Vines when they flourifi, bearing flowers or blossoms, for they abhor the smell, as Ariftote faith. Aiden an Arabian Phyfitian, faith, that Capers doe kill Worms in the guts, and likewise Serpents. If you make a round circle with the herb Betony, and therein include any Serpents, they will kill themselves in the place rather than firve to get away. Galbanum killeth Serpents only by touching, if Oyl and the herb called Fennel-giant be mixed withall. There is a shrub called Therionarca, having a flower like a Rofe, which maketh Serpents heavy, dull, and drowifie, and do killeth them, as Pliny affirme.

Albertus
Of Serpents in General.

Albertus and Arianus affirm, that there is a certain Tree in Asia, called Hyperdicus, which foundeth as much as against the right hand, with whole sweet fruit Doves are delighted; but there are Serpents which are fore enemies to the Doves: so lying in wait for them, and not being able to abide the smell & shadow of the tree, the Doves notwithstanding very safely do there in the tree seek their refuge, and finde food wherewith to sustain themselves. Kafir (who practished Physick one hundred years) affirmeth, that if any man do melt Sal Ammoniac in his mouth, and then spit it into a Serpent's mouth, that he will die of it.

Of the Medicines made and taken out of SERPENTS.

It is manifest, that if any man be wounded of a Serpent, though the wound seem incurable, that Remedies to be

the bowels or inward parts of the same Serpent, being applied to the wound, will cure the bad and taken

fame; and those that have eaten the liver of a boyled Viper at any time, shall never after be

wounded of any Serpent. Neither is a Snake venemous, unless at some time of the Moon, when

she is thoroughly moved or angered. And a live Snake or Serpent being caught, if the bitten place

be bathed, loked, or washed with the Snake being bruised in any water, it is of notable effect.

Befides, they are thought to be very sovereign against many infirmities, and therefore (as Pliny

faith) they are dedicated to AEolapius.

Ajax, faith, that if any be troubled with the Leprosie, he is to be cured by taking a black Serpent,

and being exconated, he must be buried so long till there breed Worms of him, and then

be is to be taken forth of the earth and dried, and so to be given to the leprous perfon for three

days together, the quantity of one dram at every time, with syrup of Hony. Pliny, and with

him agreeeth Cornutus Celsus, affirmeth, that if any one do eat the middle part of Snakes or Ser-

pents, calling away the heads and tails, they cure Strumen, which we in English call the Kings-evil.

There is a disease called Elephantia, or Elephantiasis, which is a kind of Lepry, proceeding of me-

ancholy, choler, and phlegm, exceedingly adult, and maketh the skin rough, of colour like an Ele-

phant, with black wanne spots, and dry parched scales and scurf: This disease (I say) go grievous,

and Strumen, are exceedingly holpen by eating often of Vipers and Serpents, as John Tegnetis in his

Irish Book Influen, Chirurg, hath assured us.

Pliny, faith, that if you take out the right eye of a Serpent, and so bind it about any part of you

that it is of great force against the wathering or dropping of the eyes, by means of a rheum

slung out thereat, if the Serpent be again let go alive. And so he faith, that a Serpents or Snakes

heart, if either be bitten or tyed to any part of you, that it is a present remedy for the tooth-

ache: and be addeth further, that if any man do taste of the Snakes heart, that he shall never after

be hurt of any Serpent.

Paulus Venetus in his second Book, Chap. 40. wrieth, how that in the Province of Caratian,

here be Serpents of exceeding greatnese, which being killed, the inhabitants of the Country

to pull out their gall, which they use to prize at a very high rate when they fell any of it, for it is

very medicinal: so that they which are bit of a mad Dog, if they take inwardly in any drink

but the quantity of a penny weight of this gall, they are presently cured. And if a woman be in

her travail of child-birth, if the taffe never so little of this gall, the birth will be the more speedy.

So if any be troubled either with the Pyles, or Hemorrhoids in the fundament, if that the place

be anointed with this gall, after a few dayes he is set free from his disease. Hippocrates giveth the

eed of Serpents as a remedy against the suffocation of the belly.

Nicolaus Myrsipus preferreth this medicine against strains and hardnesees. Take a dead Ser-

pent and put him into a new pot, luting it very well with Cyprum, then set it in a furnace that it

may be burnt, after that, commixe the ashes of a Serpent with an equal quantity of the seeds of

arum, so being wrought up with Attick Hony, and throughly digested, anoynt the place

affected. And with him agreeeth Pliny, who expressly affirmeth, that the ashes of Snakes and Ser-

pents, being anoynted upon Strumen, either with Oyl or Waxe, is a singular medicine. And like-

wise to drink the ashes of a Serpent that is burnt to powder in a new earthen pot, is very good:

but it will be the more effectuall, if the Serpents be killed between two tracks or furrowes that are

made with Cart-wheels. The ashes of a Serpent burnt with salt in a pot, being put with Oyl of

alamis into the contrary ear, helpeth the tooth-ache.

An unguent against the Morphue, prescribed byonus Magnus. Take of the ashes of a Serpent

burnt in a new pot, and well covered, two ounces, Liubarre, Galbanum, Ammoniacum, and Opoponax,

dissolved in Vinegar, three ounces, boil them until the Vinegar be consumed, then strain them,

putting to them of Turpentine three ounces, Frankincence, Mallick, and Sarccolla three ounces,

asforn two ounces, working them with a Spathtuler till they be cold. The powder of a burnt Ser-

pent, is likewise good against Fihulasa. The fat of a Snake or Serpent mixt with Oyl, is good against

strumen, as Pliny faith. The fat of Snakes mixt with Verdegrease, healeth the parts about the eyes

that have any rupture. To which agreeeth the Poer, when he faith:

Anyhain crepitis adipes argyrae mine,  
Hi putent us acutum jngere partes.

Which may be thus Englished;

The fat of Snakes mingled with Iron rust,  
The parts of eyes doth mend, which erd were burst.

G g g 2
It is certain that barrencnes cometh by means of that grievous torment and pain in childe-birth; and yet Olympos of Thebes is of opinion, that this is remedied with a Bulls gall, the fat of Serpents, and Verdigrase, with some Hony added to them, the place being therewith anointed before the coming together of both parts. When a Woman is not able to conceive by means of weakness in the retentive vertue, then there is no doubt, but there must needs grow some membra in the belly entrance, for which it is not amifs to make a Poffary of the fat of a Serpent, Verdigrase, and the fat of a Bull mixt together, &c. and to be applied, Hippocrates in lib. de Sterilit. &c.

Hippocrates had a friend who signified to him by his Letters, that the fat of a Serpent was sent to him from those fulphureous bitches which were neer unto Camaeriacum, and was fold at a very dear rate, namely, twelve pounds for every ounce, and sometimes dearer. They use to mix it with the emplater of John de Vigo, (that famous Chirurgeon) for all hardnesse, and other privy and unfeeuable (though not unfelt) torments proceeding of the Spanifh pox. They use it yet further, against leprous swellings and pimples, and to smooth and thin the skin. Mathildius faith, that the fat of a black Serpent, is mixt to good purpose with those Ointments that are prepared against the French or Spanifh pox. And Pliny mixeth their fat with other convenient medicines, to cause hair to grow again. The suffmigation of an old Serpent, helpeth the monthly course. Michael Allosius faith, that Oyl of Serpents decocted with the flowers of Cowflips, (ever remembering to gather and take that which swimmeth at the top) is singular to anoint podagrical persons therewith.

Now followeth the preparing of Serpents: Take a Mountain Serpent, that hath a black back, and a white belly, and cut off his tail, even hard to the place where he fendeth forth his excrements, and take away his head with the breadth of four fingers; then take the residuo and squeeze out the blood into some vesel, keeping it in a glafs carefully, then flew him as you do an Eele, beginning from the upper and groffer part, and hang the skin upon a flack and dry it, then divide it in the middle, and reserve all diligently. You must waft the flesh and put it in a pot, boyling it in two parts of Wine, and being well and throughly boyled, you must feast the broth with good Spices, and Aromatic, and Cordial powders, and so eat it. But if you have the bene to roft it, it must be fo rofted, as it may not be burnt, and yet that it may be brought into powder and the powder thereof must be eaten together with other meat, becaufe of the loathing, and dreadful name, and conceit of a Serpent: for being thus burned, it preferveth a Man from all fear of any future Lepry, and expelleth that which is present. It keepest youth, caufing a good colour above all other Medicines in the world; it cleareth the eye-sight, garded furily from gray hairs, and keepteth from the Falling-ficknefs. It purgeth the head from all infirmity, and being eaten (as before is said) it expelleth fcbabines, and the like infirmities with a great number of other difeafes. But yet such a kind of Serpent as before we have described, and not any other, being also eaten, freeth one from deafnes.

You may also finely mince the heads and tails of Serpents, and feed therewith Chickens or Geefe, being mingled with crums of Bread or Oates, and thefe Geefe or Chickins being eaten, they help all to take away the Leprofie, and other founlness in Mas body. If you take the dryed skin, and lay it upon the tooth on the inner fide, it will mitigate the pain thereof, specially if it proceed from any hot caufe. In like forte, the fame skin wafted with fipttle, and with a little piece of the tail laid upon any Impollume, or Null me tangere, it will tame and muffen the pain, caufing it to putrefie more easily and gently, and fcarceely leaving behind any cicatrice or skar. And if a Woman being in extremity of pain in Childe-birth, do but tie or binde a piece of it on her belly, it will caufe the birth immediately to come away. So the skin being boyled and eaten, perfometh the fame effects that the Serpent doth.

The blood of a Serpent is more precious then Balsamum, and if you anoint your lips with a little of it, they will look pafing red: and if the face be anointed therewith, it will receive no spot or feld, but caufeth to have an orient or beatifull hew. It repleffeth all fcbabines of the body, finking in the teeth and gums, if they be therewith anointed. The fat of a Serpent, speedily helpeth all renefs, fports, and other infirmities of the eyes, and being anointed upon the eye-lids, it cleareth the eyes exceedingly. Iem, put them into a glaffed Pot, and fill the fame with Batter in the Moneth of May, then lute it with well with Paffe, (That is, Muel well kneaded) fo that nothing may evaporate, then fet the Pot on the fire, and let it boil well the half a day; after this is done, drain the butter through a cloth, and the remainder beat in a mortar, and drain it again, and mix them together; then put them into water to cool, and fo referve it in filver or golden boxes, that which is not evaporated, for the older, the better it is, and fo much the better it will be, if you can keep it forty years. Let the fick Patient, who is troubled either with the Gout, or the Pallsie, or anoint himself often againft the fire with this unguent, and without doubt heall he freed, especially if it be the Gout. All these prefcriptions, were taken from the writings of a certain namelefs Author.

Hippocrates faith, that a Hart or Stag having eaten any Serpents, the worms in their guts are thereby expelled. And Albusius hath the fame words, that Harts by eating of a Serpent, do kill and expell worms from their guts. Hierolets, to a certain medicine which he prepared for the Strangulation in a Horfe, mingled the dung of a Lyzard, and Stearbergou, (that is, as I interpret it) the fat of a Serpent, the bloude of Dove, &c. Laurence Ruffle faith, that it is good to give the flesh and decoction of Serpents to madde, biting, and flirking Horfes. And that the fat of a Serpent, &c.
doth cure the puffing or swellings that arise in Horses backs, which come by means of any compre-
ッション, or close fitting and thrumming down.

Item, The unguent that dropeth from a Serpent, while it is rolled on a spit, is highly comm-
ッション for Fiffuhas that are in Horses hoofs. *Galen* and *Rafus* do counsel us to cut in pieces a 
Snake or Serpent, and to lay the fat thereof upon a flick, and to anoint the outward parts of the 
hoof of any Horse. *Horse-leaches*, live Mice, the green Lizard being burned, if they be given to a 
Hawk in her meat, they do cause a speedy mutation of her feathers or wings; and the fame effect 
have little River-fishes, finely beaten or flamped, if they be cast upon any meat.

Item, the Serpent that is speckled, and of divers and sundry colours, of all others hath the least 
poyerons; and in the German tongue it is called *Huf* (peradventure it is that which we call a Snake) if 
(I lay) you take this Serpent, and boil it with Wheat, and give the fame Wheat to a Hen to feed upon, 
being mungled amongst her meat and drink with the venom of a Serpent: a Hawk being fed with 
the flesh of such a Hen, forthwith caileth her fick feathers, and is freed from any other disease, if 
the have any at all, as *Albertus* faith.

The old skin of an Adder or Snake, that he casts off in the Spring time, if it be rubbed upon the 
eyes, cleareth the fight, as Phiny faith. And Galen biddeth us, if any be troubled with blood-shotten 
eyes, to take the old cast skin of Serpents, &c being beaten with Sea water, to anoint them therewith. 
And *Gardon* faith, that the cast skin of a Snake, if the eyes be rubbed therewith every morning, that 
they will never be very dim of sight, nor yet ever have any pin or web in them. Amongst com-
positions that are made for the eyes, they use to mix the cast skin of Snakes, as *Diosets* affirmeth, 
adding further, that the old age, or cast skin of a Snake being boiled in Wine, is an excellent 
help for pain in the ears, if a little thereof be dropped into them. Boyl the cast skin of a Snake with 
tops of Poppy, and drop a little thereof into the ears, if any be troubled with pain thereof, and 
this is an excellent remedy, as Galen in his third Book, *De Compottis medicamentis s. loca*, hath taught 
us, having himself learned the fame from *Archigenes*. The cast skin of Serpents being burned in a pot, 
or on a hot burning tyle-hard, if it be mingled with Oyl of Rofes, and do dropt into the ears, is 
proved to be very effectual against all fores, and ficknesles of the ears; but especially against the 
flinking favour of them: or if they be purulent or full of matter, then to be mixt with Vine-
gar. Some use to mingle Bulls gall therewith, and the juycie of the flesh of Tortoifes being boyled. 
*Marcellus* faith, that if you take the gall of a Calf, with a like quantity of Vinegar, and mix 
them with the cast skin of a Serpent, if then you dip a little Wooll into this medicine, and put it 
to the ear, that it helpeth very much, especially if with a plunge being foked in warm-water, 
you first foment the ear. *Disaroides* and Galen do affirm, that the cast skin of a Serpent, if it 
be boiled in Wine, doth cure the tooth-ach, if the pained place be wafhed therewith. But yet, in 
tolerable pains of the teeth, this is proved more fingular. Take the cast skin of a Serpent and burn 
it, then temper it with Oyl till it come to the thicknes or confiflence of hard Honey, and cover the 
tooth/being first foured and cleafned therewith, anointing all the near places to the fame, and put 
some of it into the hollownes of the tooth. And as *Archigenes* faith, if you lay the cast skin of 
a Snake unto the teeth, not being burnt, they will all fall out. It cureth likewise the lowlie 
evil called *Pithritis*. And Galen prefcribeth this cast skin of Snakes or Serpents, for a re-
medy against the Colick, if it be put into a bras pot with some Oyl, and be burnt to pow-
er; if then it be dissolvd in Oyl, and the place therewith anointed, it is of great vertue. And if it 
be boiled in a Tin veffel with some Oyl of Rofes, it remedieth the Bloody-fix, and 
such as be troubled with Tenife, which is, a great defire in going to ftool, and yet can do 
nothing.

*Arnoldus de Villa nova*, in his Breviary faith, that if you take the cast skin of a Serpent, *Opoppaix*, 
Myrrhe, *Galbanum*, *Cafforeum*, yellow Sulphur, Madder, Pigeons or Hawkes dung, and incorpo-
rate them with the gall of a Cow, they being fift pulverized, and the fume thereof received through 
a tunnel at the lower parts, it bringeth forth either the dead or living birth. *Gardon lib. de Subtilit* 
faith, that the cast skin of a Serpent burned in the full of the Moon, and entering into the first de-
gree of *Aries*; if the ashes thereof be sprinkled on the head, that thereby terrible and fearful 
dreams will follow. And if the face be anointed or wafhed therewith, being fift laid in water, that it 
caueth one to look very fearfully and horribly: and if it be held under the tongue, it will make 
one very wyue and eloquent: and if it be kept under the foals of the feet, it maketh one very gracious 
among Princes, Magiftrates and Great men. And another faith, that this cast off skin being pul-
verized when the Moon is in her increase, and in the first degree of *Aries*, if the powder thereof be 
set on the table, in a wooden or metaline dish; if any poeyon be therein, it will be dispersed and 
do no hurt, and yet the powder will remain safe and whole: and if given to a Leprous person, his 
difeafe will spred no further. And if you put a little of this powder into any wound, it will cure it 
within three days. I have feen (faith Galen) Goats that have eaten of the boughs and leaves of Ta-
marisk, and I have found them without a Spleen: alfo I have feen other Goats that have lick up 
Serpents after they had cast their skin; and I have proved, that after that, they have grown very 
white, and to have kept their young years a great while; so that it was long before they waxed old.
Of the way to drive away Serpents. Of their poyson and bitings.

A certain and sure way to cure those who either have been poisoned, invenomed, or bitten by them.

To expell and drive farre away any venomous Creatures, we use to make fumigations of the root of Lilies, Harts-horn, and the horns and hoofs of such beasts as be cloven footed: likewise of Bay-leaves and berries, Calamint, Water-cress, and the ashes of the Pine-tree. The leaves of Vitex, Bitumen, Galfortum, Melanthium, Goats-horns, Cardamomum, Galbanum, Propolis, which may be called Ben-glew, the herb called Horstrange, Panax, Opopanax, Flethure, the thaynings or frapings of the Cypresse or Cedar-tree being steeped in Oyl, the Jet-stone, Sagginum, the herb called Pley, Fern, and all other things that have a strong or vehement ill favour, being cafl on the coals for a fumigation, do with their vapour chafe away venomous beasts. For whereas all venomous Creatures have the passages or pores of their bodies very flat and narrow, they are very eafily and fafted, and are quickly flopped and fufficient by fuch like fents and smells.

Sextus in his thirteenth Book fettefth down an excellent fume after this manner. Take of Galbanum, of Sandracha, Butter, and of Goats-fat, of every one alche much, they make them into Pills, and ufe them for a fumigation. Nicander in Theriacs fettefth down fome make, for them into Verfes.

The breadth or vapour that iffeth from Serpents is fo poifent, that it killeth all young chieffins, as Calamella faith; and for preventing of this milchef, it is good to burn Harts-horn, Woman's hair, or Galbanum.

The breath or vapour that iffeth from Serpents is fo poifent, that it killeth all young chicks, as Calamella faith; and for preventing of this milchef, it is good to burn Harts-horn, Woman's hair, or Galbanum.

The breath or vapour that iffeth from Serpents is fo poifent, that it killeth all young chicks, as Calamella faith; and for preventing of this milchef, it is good to burn Harts-horn, Woman's hair, or Galbanum.

Of Serpents in General.

The powder of a Cedar tree, put forth to flight venomous Serpents, as Virgil in the third of his Georgics witnesseth.

Dolce & odoratum stabulis ascenderet Cedrum,  
Galbanoque agiari gravet nidor celydro.  
Which may be Englished thus;

Learn how of Cedars, fire in thy fold to make,  
And with Galbanante savour, put to flight the Snake.

Things that are throtted or laid under us, both in our houses and in high-ways or beds, William defend and from venomous creatures: as for example; Southernwood, Dittander, Fleabane, Calamin, Gentian, Hufaft regia, Sage, Nightshade, S. Johns wort, called of some Fuga demon., Marjoram, Origan, wide Rue, wide Thyme, Bay-leaves, the shavings or tops of the Cyres or Cedar-tree, Cardamum, Penroyal, Wormwood, Mugwort, Lysmachia, called in English Loofe-strie, and Rosemary. And if we cannot lie upon such a bed;

Tunc justa virides sineuis vorticis alvus,  
Amnicolum nepetam per dehis colice ripar.  
Aut ubi celia faxis, pulchro quae foere remeis,  
Prebeat, infratae fuctum fronde grautam.  
Sicquique montum petillum, cujas grave firmans  
Horret odor, nemensque sciam quae debit obtinens.  
Herba, & ab Excina que fertur oreignon urbe,  
Quacunque illius dicenepant oblique, profect.  
Quin eitiam multis per-optica cumbina fines.

In English thus;

Then by the winding banks of crooked streams,  
The Water, nay take up, which under foot is tread,  
Or the cloud Offic, whose faire flower bath beams  
And leaves, scarce from serpents make thy bed.  
The Mountain Paly, whose strong smelling breath  
The makes abour, & that which doth th hydra name,  
The Origan which comes from Euxmus earth,  
Do profit all against Serpents, if you bear the same.

Rident abronum, pecorige ingrata petillum  
Pabula perplum, multi quod passitur borto.  
Prasfit item exiguam circumlimb plantas,  
Urticaque omnes, & spinas anagros;  
Sir & panicea fuisse eis arbore ramis,  
Regalisque amplis erit haffa frondibus urti.  
Acipe ism invocato medicaeque frigore firosum,  
Arque in vasa pigit Syra prions aera pulchritus.

Nicander.

In like fort, to sprinkle the place with water, where in Sal Ammoniacum is dissolled, driveth away Serpents, as Avicen affirmeth.

If any one appoint himself either with Dears-sweat, the fat of Elephants or Lions, Serpents will shun that persifon: and there be some, (as Philo faith) that for fear of Serpents, do anoint their bodies with the seeds of Juniper. The juice of the black Vine extracted from the root, and anointed on the body, performeth the like. For preservation from Serpents, Nicander compounded this ointment. Take two Vipers about the end of Spring time, Deer-fewt thirteen drams, Unicertas thirty six drams, crude Oyl of Olives as much, comin them with nine ounces of Wax, boil the Serpents till the fielth fall from the bones, which you must cast away because they are venomous.

They that will yet be more assured, let them anoint their bodies with a thin erat, made of Wax, Oyl of Rofes, a little Galbanum, some powder of Harts-horn, or else Cummin-seed of Ethiopia, &c. Actius. If a man carry about him the tooth of a Stag, or those small bones which are found in his heart, he shall be secured from Serpents. If any one do bear about him wide Buglos, or the root of the wide Carot, he cannot be wounded of any Serpents. Grevisium is of the mine, that the Jet-flone, besides other manifest qualities, hath yet this as peculiar to it self, that he which carryeth it about with him, need neither to fear Serpents, nor any other poysons.

Now for venomous beasts, which are found in any houses, the belt way is to pour scalding water into their dens and lurking holes. And if any man (contraried by necessity) can finde no other place to sleep, but such a one as where Salamanders, the Spiders called Phalangii, or the like Serpents do abound it is good to stop the holes and corners with Garlick beaten with water, or some of those herbs which before we have spoke of. But yet men now adays hold it the safest course, to pour unquenched Lime sprinkled with water into their dens and secret corners.

As they are bitten by a mad Dog, so all such persons be wounded by venomous creatures, are in exceeding great danger, unlefe at the first they receive speedy help and succour: The safest way therefore to cure the poyson, is by attractives, which draw from the more inward parts to the surface, and not to make too much pollhaft in closing up the wound. But if any one hath swallowed down, and taken inwardly any poyson, the belt way is (as Dioscorides writeth) to vomit often; but if any be wounded by biting, then it is belt to use scariification, and to fallen Cupping-glafses upon the place affected, to draw out the poyson. Some use to suck the venom out, and others to cut off and dilimber the part. And this is to be observed, that if any one will undertake to suck out the venom, the party that attempteth must not be falling; and besides, he must with his mouth with
Of Serpents in General.

some Wine, and after that, holding a little Oyl in his mouth, to fuck the part, and to spit it presently forth. And before Cupping-glasses be applied, the part must first be fomented with a Spurge, then scarified deeply, that the venomous matter may the more speedily be drawn out from the more inward parts; and yet cutting off the flesh round in a compass, doth more good then any scarification.

But if the place will admit no section or incision, then cupping-glasses, with deep scarification, with much flame, must needs be used: for by attraction of the bloud, and other humors with windines, the poyfon it self must of necessity follow. And Aetius in his 13. Book and tenth Chapter, counselth that the sick perfon be kept from sleep, and so sit still, until he finde some ceasing or releas-

ing from his pain. Besides, the member which is envenged, ought to be bound round about, that the poyfon may not too easily convey it self, and penetrate into the more noble and principal parts, as the heart, liver, or brain. And in this manner having applied your Ligature, you must by the advice of Fumanellus, let on your Cupping-glasses, and they being removed, apply the herb Cala-

mint upon the place, and to give the patient some of the root of Mugwort in powder, or the best Treacle, and such Cordials as do corroborate the heart; and for this intent, Buglofs, Borage, Balm, and any of their flowers are much commended.

A Dove or Pigeon being divided in the midle, and applied hot to the place affected, attracteth poyfon to it self, and healeth. And the same effect and virtue have other living creatures, as namely, Hens and Chickens, young Kids, Lambs and Pigs, if they be fet to in the beginning, immediately after the Cupping-glasses be removed, for being as yet hot and warm, they draw away the poyfon, and mitigate pain. But if neither any one for love or money can be found, that will or dare fuck out the venom, and that no Cupping-glas can be provided, then it is best that the patient do sup of Mutton, Veal, or Goose broth, and to provoke vomiting. Yet they that will more effectually and speedily give help, use to kill a Goat, and taking out the entrails, with the warm dung there-

in found, forthwith bind to the place.

The learned Physitian Mathiobus, in his Comment upon Dioscurides, faith; to avoid the danger that cometh by sucking out the venom, men now adays use to apply the fundiment of some Cook or Hen, or other Birds after the feathers are puld off, to the wounded place, and the first dy-

ing, to apply another in the same order, and so another and another, until the whole venomous matter be clean driven away: whereof one may be certainly assured, if the last Hen or Bird so ap-

plied, do not die. Avicen, the Arabian faith, that the Physitians of Egypt, in which Countrey there be infinite flour of venomous Beasts do haften to burn the part with fire, as the safest and surest remedy, when any this way is endangered: For fire not only expell eth poysons, but many other grievances. But the way how they used to burn with fire, was divers in these cases: For sometimes they used to fear the place with a hot Iron, and other whiles with a cord or match being fired, and sometimes scalding Oyl, and many other devises they had with burning medicaments, to finish this cure as faith Hieron.Mercurialis in his first book De Murb.Venenaetis writeth, and John Taz-

gault, Inflit. Chrurg. lib. 2. faith, that the wound must first be feared with a hot Iron (if the place can endure it) or else some cautick and vehement corrodung medicine must be used: for all such wounds are for the most part deadly, and do bring present death, if speedy remedy be not given: and therefore, according to Hippocrates counsel, to extream griefs, extream remedies must be applied; so that sometimes the safest wayes to take or cut off that member, which hath either been bitten or wounded.

Neither am I ignorant (faith Dioscurides) what the Egyptians do in these cases: For when they reap their Corn in Harvest time, they have ready at hand prepared, a pot with pitch in it, and a string or band hanging at it; for at that time of the year they are most afraid of Serpents, which then chiefly do hide themselves in dark holes, and caves of the earth, and under thick clots and turffs, for Egypt aboundeth with such venomous and poysonful creatures. When as therefore they have wounded either the foot or any other part, they that are present, do put the string into the pot of pitch, and binding the place, they cut it off with some instrument round in compass as the string is yed, after this done, they pour in of the pitch a sufficient quantity, then untying and loofing the band, they laftly anoynt it with Garlic and Onions.

A certain Countryman being bitten of a Serpent, perceived by and by his foot to swell, and by little and little the force of the poyfon to swell up higher, and nearer to the heart, the Calf of life: who being taught and instructed of an old woman, to bury his foot under the earth, and to cut a hole in two parts to apply to the wound, and to the Hen the wished him to lay a live Frog, who continually sucking the bloud from the Hens flesh, might by this means at length attract and draw all the poyfon into it self. So when he had held his foot a whole night covered and buried under the earth, and finding no abatement, but rather an increasement, at length by the advice and direction of a certain Noble Matron, he drank a good draught of Turcine and Hen's tempered in Ale, and so after a few hours fell on a great and continual vomiting, by which means he was perfectly freed from the pains of the upper parts of his body, his feet notwithstanding continuing in their former swelling: which was also taken clean away, only by drinking the milk of a black Goat, so much in quantity at a time as once Egge-shell would contain, his foot in the mean time being held or plunged in a sufficient quantity of the same milk. From which there issued and ran a foul stinking glutinous and finewly matter, and this he was admonished to do by a certain Priest. But yet afterwards by chance, waisting himself in a hot sunny day in a certain River, and
Of Serpents in General.

and sitting upon the bank, his feet hanging down into the water, and he falling fast asleep, (he knew not well how long time he so continued) at length awaking, he plainly perceived the water that was neer, on all sides to be filthy, tainted and polluted with much thinking matter, and as it were dreggy, refuse and feculency, and from that time forwards, he remained well and lusty, and as found as a Bell.

Another time a Maid being bitten of a Serpent, laid presenty upon the wound some fresh Cheefe made of the milk of a white Goat, and pouring or sprinkling her foot with the milk of the same Goat, as a defensive for that part, by this means restored to her former health, as a certain learned man testified in his Letters written to Geffier.

\textit{Vegetius} affirmeth, that if any living creature be bitten and wounded of venomous Beasts, the place which is hurt, must first of all be suffumigated with Hen's Egg-feels burnt, which first ought to be infused in Vinegar, with a little Harts-horn, or \textit{Galbanum}. After fomentation, the place must be scarified, and the bloud must be let out, or else the place must be feared with a hot Iron, so far as the venom extreemeth. And this care must be had, that the Cauteur be never applied and laid either above the joints, or finewy parts at any time, for the feines or joints being feared and burnt, there must of neccellity a continual weakness and debility follow. Therefore great diligence must be used, that neither a little above, nor a little beneath the nerves and joynets, we lay any Cauterizing medicine, yea, although neccellity biddeth us. But it is also requisite that every one thus wounded, go gently and easily provoke sweating with warm clothes cast upon him, and afterwards to walk up and down, and to take Barley-meal in his meat, with some leaves of the Afn-tree, and the white Vine added to it. And to the wound it is good to apply \textit{Attick} Honey, or Cummin heated and parched, and so mixed with old Wine. Some use to mix new Hogs dung and \textit{Attick} Honey tempered together with Wine, and so be warmed, to apply it as a Cataplasm, adding to it some urine of a Man.

I have said before, that young Chickens being dissetted or cut in pieces when they are warm, ought to be laid to the flinged part: and some there be that yeild this reaason why they should be good for this purpose, because (say they) there is a natural antipathy betwixt them, and venomous creatures. But this reason is reafonless, and I think rather, that Hen's or young Birds, being of a very hot nature and complexion, do easily concoct and digest notable poyson, and their flocks make consume both dry and hard feeds, which the strongest man living cannot do; which may easily also be proved by this argument, that many times by their ravening, they swallowing down, and little fiones, which they do easily diffuse, and their crops very soon discharge, without any offence to them at all. And therefore the spirits of an innavenous person, being helped and refrehed with the lively and strong natural heat of these fowls thus applied, and receiving and acquiring strength from the part wounded, and so healthily leaping out as it were, and quickly Sparkling forth, they do expel, shunt and draw out the poyson.

Now, after we have described the general method of curing this mischeulous evil, we will now descend to particular remedies, observing over this rule and order, that first I will speak of such means as are topical, or such as are outwardly applied; and next of such as be taken inwardly, and in both of them I will first describe compound, before I speak of simple medicaments. This one Lesson you must carry with you, that many remedies are prescribed and set down, which be not only good for the bitings of Serpents, but also for the bitings and flingings of all other venomous creatures, as Scorpions, Tarantulaes, Spiders, and the like. But yet, sith these do properly respect Serpents, I will in this place fet them down: beginning first (according to my promise) with such compounded medicines, as are applied outwardly for the help against the flingings of Serpents.

\textit{Thurisca Andromachi} applied Plaitier-wife, is notable for this purpose. So there be other vehement strong Plaitiers, whose vertue is to attract, expel, and disgust venom, of which are those which are made of Salt, Niter, Mustard-feed, and Rosemary-feeds, Dittany, or Dittander, and the root of Chamalexon: and this that followeth is of singular vertue. Take of the fum, froot, or fponge of Silver, one pound, Cerufe, and of the bell Turpentine, of either as much as of the former, old Oyl three pounds, Wax fix ounces, \textit{Ammoniacum Thymiama}, four ounces, and of \textit{Galbanum} as much: boil the Cerufe, the fum of Silver, and the Oyl fo long, that they will not cleave unto the hands, then melting the other ingredients, incorporate them all together, and use them when need is for any bitings, &c.

There is an Empaitier fathered upon one \textit{Epigenes}, and bearing his name: for this \textit{Epigenes} being in close Prison, and condemned to die, for revealing this Medicine had his Pardon granted him, and was freely discharged, because he therewith healed the daughter of the Emperor \textit{Marcellus}: for being formerly wounded by a Serpent in her breast, and all other Physicians defpairing of help, yet with this the she was recovered. It is also good for all new and old Ulcers, and for such as are either bitten by any kind of venomous creeping Worms and Serpents. Take of \textit{Squama erus}, (which is the scales and offal of Beals, blown from it in melting) of \textit{Ammoniacum}, \textit{Alcis brachia}, Verdigrisse, of \textit{Elium}, of Frankincense, \textit{Sal ammoniacum}, \textit{Arthesis arosanda}, of every one half an ounce, Turnep-feeds three scruples, of the root of Dragon-wort half an ounce, feed of Mugwort nine scruples, pure Wax five pound, of \textit{Colubrina} one pound, old Oyl three ounces, sharp Vinegar half a spoonful, Mustard-feed three scruples, \textit{Spadin} nine scruples, Stone-allum and \textit{Oppianus}, of either half an ounce: Infule the metalline ingredients for three days space in Vinegar,
Vinegar, and beat and powder them together, melting those that are to be melted, then sprinkle on those that are dry; and all of them being thoroughly wrought and made up, according to the form of an Emplaiter, use them where necessity requireth.

Antonius Emanuellus, a late Physitian, prescribeth an experiment, and (as he calleth it) a divine Oyl against any poyfon taken into the body, or the biting of any venomous Beasts and Serpents, whether it be received inwardly by drinking it down, or anointed outwardly upon the body, and this is it that followeth. Take of Oyl of Olives one pound, the flowers and the leaves of the herb called S. Johnswort bruised, boyl them for the space of three hours, and strain them, then boyl again other fresh flowers and leaves of the same herb and strain them hard, and do again the third time, then add to them of the roots of Gentian and Tormentil, of either one ounce, boyl and strain them as you did before, and reserve this Oyl for your use.

Andreas Matthioli in his Commentaries upon Disforides, doth exceedingly commend Oyl of Scorpions, because being anointed upon the pulse outwardly, it is (as he affirmeth) a singular remedy, not only against any poyfon taken inwardly into the body by the mouth, but for the bites and stings of any venomous creature whatsoever. The way to prepare and make it, he describeth at large, in his Preface upon the first Book of Disforides, which I think needles here to describe to avoid tediousness; therefore if any one be desirous to know the composition of it, let him read Matthioli in the place before cited. Unquenched Lime mixed with Hony and Oyl, and applied to the place the thickness of a corset, is good against the wounds that come by any venomous Beasts biting.

Now I think it meet to set down those simple medicaments which are used outwardly, to be either by laying on, or by anointing, against the gling and venomous biting of Serpents. It is best first to foment the fore part of the wound with hot Vinegar, wherein Catamin hath been boyled, and in a lead of Vinegar, one may take Salt-water, or Southernwood, Maidenhair and Garlic, either in drink, meat, or to be used as an Ointment. The root of Aram, and Althoerge, and the leaves of the true Daffadil, and Oyl of Balm, is most effectual: also Bdellium, and the root either of the white or black Beet, is good against the bites of Serpents.

Betony, Coleworts, especially the wilde Coleworts, Calamin, the leaves of the wilde Fig-tree, Century, Onions, Germander, Chamaleon, the herb called Fleabane, wilde Carrers, Rocket, Heath, Fennel, Figs, Winter Cherries, Enula Campa, Barly-meal, the Day-lilly, Hytop, the Flower-deluce-root, Horehound, Balm, Water-cresses, and Sage, Origan, Plantine, Leeks, Turneps, Madder, Rue, Verven, Mulhard-feed, Siaious, and Saint Johnswort, all these plants are greatly praised among the Writers of Phyfic, for the mitches above said.

Pliny is of opinion, that the bowels or entrails of Serpents themselves, being applied, will surely cure the wounds of all other Serpents, although they seem incurable. A live Serpent being caught, if it be bruised, beaten and stamped in water, and the hurt place fomented therewith, will assuage help and do much ease.

Quae nocet Serpens, furtur eaptit illuniapiV
Vulneribus jungis, sanat que suacid aptus;
Ui Larissae curatvs Telephus hosla. Qua Serenvs.

Which may be thus thus Englished;

What Serpent burneth, Men say by long experience,
His head applyed doth cure: for where the wound,
The help is also made, as in Telephus senfe,
Harm'd by Larillus speqr, by it was cured found.

And Guli. Varignana faith, divide or cut a Serpent, and lay it upon the place, and it will mitigate the anguish and pain. The seed of Thropsi and of Tithimal (which is a kind of spurge) is greatly used for this; Tithimalis astra, vulmar que utaperungat. Some befides these, do put the root of black Hellebore into the wound, because it draweth out the poyfon, as I by mine own experience can tell thee, faith Matthioli.

There be also sundry Antidotes and Preparatives which are taken inwardly, that are very effectual against the bites of Serpents and venomous beasts, as namely that, which is called Thervica Andromachi, or Mithridate, and the like compositions. Galien in his Book De Tervica ad Pummonem pretterreth Thervica Andromachi before all other medicines either simple or compound, for virulent wounds; because it perormeth that effect for which it is miftried. For it was never as yet heard, that ever any one perished of any venomous hurt or biting, who without any delay forthwith drank this medicine: and if any man had taken it before he received any such dangerous hurt, if he were fed upon and assailed by any poyfous creature, it hard not lightly been heard that he hath dyed of the fame. There be many Antidotes described by the Anciennes, which they set down to be admirable for these purposes: As for example, that which Avicen termeth Thervica mirabilis, whose composition is as followeth. Take of Opium and of Myriste, of either of them a dram, Pepper one dram and a half, the root of Arholotheca longa and rotadi, of each of them three drams, Wine two drams; make them up with Hony and Rocket water, so much as is sufficient for an Elecuary: the quantity to give, is four scruples, relented in some fit and convenient decoction.
Of Serpents in General.

King Antiochus, furnamed Magnus, had a kinde of Zopyrus which he used against all poisons, which is described by Pliny in his 20 Book and last chapter in this wise. Take of wide Thyme, Opponanx, and the herb called Gromel, of each a like much, two drams; Trifolium one dram, of the seeds of Dill, Fennel, Smallage, Anise, and Anemon, of every one alike fix drams, of the meal of Orosom twelve drams; all these being powned and finely feared, melt with Wine a sufficient quantity, be made into Trochiches, whereby every one mult weigh one dram, give thereof one dram at a time in a draught of Wine. There is another Antidote and prefervative against any poison, described by Paulus Argimen- nates, much like unto this, which is thus: Take of Bryony, Opponanx, of the root of Iris Ilicer, and of the root of Rosemary, and of Ginger, of each of these three drams, of Anisopodaria five drams, of the bell Turpentine, of wide Rue, of each three drams, of the meal of Orosom two drams; make them into Trochiches with Wine, every weighing one scripule and a half, or two scripules to be given in Wine.

Galen in his second Book De antidotis, chapter 49, discourseth of a certain Theriacal medimento, called Zopyra antidotis, (to taking the name of one Zopyra) which was notable against all poisons, and bitings of venomous creeping creatures. This Zopyra in his letters written unto Mithridates, solicited him very much, that he would make some experiment of his Antidote; which as he put him in mind he might easily do, by causing any one that was already condemned to die, to drink down some poyfon aforehand, and then to take the Antidote: or else to receive the Antidote, and after that to drink some poyfon. And put him in remembrance, to try it also in those that were wounded in any manner of way by Serpents, or thofe that were hurt by Arrows, or Darts, orpoisoned by any destroying venom: So all things being dispatched according to his promition, the Man (notwithstanding the strength of the poyfon) was preserved safe and found by this alepharmacetical medicin of Zopyra.

Matthiæus in his Preface upon the fifth Book of Dioscorides, entretaining of Antidotae and prefervatives from poyfon, faith; that at length, after long study and travell he had found out an Antidote whose vertue was wonderful and worthy admiration; and it is a certain quinlence extracted from many simples, which he fetiteth down in the fame place. He faith it is of such force and efficacie, that the quantity of four drams being taken either by it self, or with the like quantity of some sweet fenting Wine, or else with some distilled water, which hath some natural property to stregthen the heart; if any perfon hath either been wounded or strucken of any venomous living thing, and that the patients life be therewith in danger, so that he hath loft the use of his tongue, feeing, and for the most part all his other senses, yet for all that, by taking this his Quinlence, it will recover and raife him as it were out of a dead sleep, from ficknefs to health, to the great astonishment and admiration of the fadors by. They that defire to know the compofition of this rare prefervative, let them read it in the Author himfelf, for it is too long and tedious to describe it at this time.

There be besides these compounds, many fimple medicines, which being taken inwardly, do per- form the fame effect, as namely the Thiffle, whereupon Serenus hath these verities following:

Cardam & nordum detis fumonibus optum.
Ex illo radix repido potatis in amni.
That is to fay;
The root of Thofl young, for Fullers yet unfit.
Drick in warm water, venom out doth fitte.

That Thiffle which Qu. Serenus here underfandeth, is properly that plant which of the Greke is called Stolonys. Yet it is taken sometymes for other prickly plants of the fame kinde, as for both the Chaemalons, Dipace, or Labrun Venenis, Spina aika, Erygium, and fome other. But Dioscorides attributeth the cheefe vertue againft poifons, to the Thiffle called Chaemalena albus, and to the Sea-thiffle called Erygium marinum, which fame call Sea-hul, or Halver; for in his third book and nine chapfer,entretaining of Chaemalena albus, be faith thus; The root of it taken with Wine inwardly, is as good as Treacle againft any venom: and in the 21 chapter of the fame Book, Erygium, is (faith he) taken to good purpose with fome Wine, againft the biting of venomous creatures, or any poyfon inwardly taken. And the fame Serenus adscribeth to the fame vertue to the Harts curd or rennet, as followeth.

Cervino ex satu committae coagula vino
Sumantur, queres membris agit atra venena.

In English thus;
Wine mixt with Rennet taken from a Hart,
So drunk, doth venom from the members part.

He meaneth a young Hart, being killed in the Dams belly, as Pliny affirmeth also the fame in his 8. Book and 30. chapter in these words; The cheefe remedy againft the biting of Serpents, is made of the Coagulum of a Fawn, kill'd and cut out of the belly of his Dam, Coagulum, is nothing else but that part in the belly which is used to thicken the Milk.
Of Serpents in General.

Proderit & caulem cum vino baurire (ambics).

Which may be Englished thus; In drink, the powder of an Elder-stalk,
Gainst poison prostheth, as some men talk.

That vertue which Serenus here giveth to the stalk of Dwarf Elder, (for that is meant in this place) the same effect Diocletianus attributed to the root in his fourth Book, and Pliny to the leaves. The herb called Betony is excellent against these foreaid affects, and by good reason, for the great-est part of poisons do kill through their excess of coldness, and therefore to overcome and refit them, such means are necessary, by which natural and lively heat is stirred up and quickned, and so the poison hindered from growing thick together, and from coagulation.

Again, all men do agree, that those medicines are profitable which do extenuate, as all those do which have a property to provoke urine, and Betony is of this quality, and therefore being taken with Wine, it must needs do good in venous bitings, and that not only in the bitings of Men and Apes, but in Serpents also. Radifh also hath the same quality, being taken with Vinegar and Water boiled together, or else outwardly applied, as Serenus affirmeth.

Sive homoeo, sec familis turpifima beftia nobis
Vulnora dente dedit, viam simul intimi atrum,
Vetaniam ex dolo prodest affirmere Bactho. In English thus;
If Man, or Ape (a filthy beast most like to us)
By biting wound, and therein poison thrift,
Then Betony in hard Wine steeped long,

There be certain herbs and simples, as wilde Lettice, Vervin, the root called Rhubarb, Agrick, Oyl of Oliander, and the leaves of the same, the seeds of Petony, with a great number a little before described, that being taken either inwardly or outwardly in juice or powder, do cure poisons, yes though it be received by hurt from envenomed arrows, shafts, or other warlike engines and weapons: for the Arabians, Indians, the Greeks (now termed French-men) and Scythians, were wont to pouyon their arrows, as Pau lin Orosius in his third Book telesinth of the Indians, where he writeth, how Alexander the Great, in his conquering and winning of a certain City, under the government of King Ambros, took the greatest part there of his whole Army with envenomed darts and quarrels. And Celso in his fifth Book faith, that the ancient Galles were wont to anoint their arrows with the juice of white Hellebore, with which they did great mischief. Pliny affirmeth the fame to be used of the Scythian Nation. The Scythians (faith he) do anoint their Arrow-heads with the corrupt, poisonous, and filthy stained dreggy bloud of Vipers, and with Mans bloud mixed together: so that the wound seemeth to be incurable. And to this alludeth Quintus Serenus.

Cuspidat non quisquam, longa arcusque cade furris,
Fumigne mungaudi, vulnora nec selle jagitae
Quam cito Vipero potis est affigiter istus:

dare apeam diemamus opem, ficcusque manente.

Which may be thus Englished;

There is no Man with Spear or Lance-Point,
Sharp edge of Sword, or swift Arrows might,
To kill so soon, as Vipers force doth dint:

Then fit is the aid and means that it acquire.

There is a certain kinde of people to whom it is naturally given, either by touching or fucking, to cure the woundinge of venomous Serpents, called Pylli, (a people of Lydias) and Maris, people of Italy, bordering upon the Sammites, and Epi-clustania, and those that were called by the Ancient Writers Obiogens, which dwelt about Hellespont, as both Pliny, Aelius, and Euseus Sylvius do witness.

Cellus in his tenth Book of the history which he wrote of Aegaeae is the Saracen faith, that if any man were bitten of a Serpent, if either a Lybien by birth, or any Pyllas, whose body was accounted venom to Serpents, was either purposely sent for, or came that way by chance, and saw the wound but indifferently, and not so very tormenting the Patient, that if he did lay but a little of his spittle upon the biting or stroke, that presently the aching and pain would be mitigated. But if he found the sick Patient in great and intolerable anguish and pain, he took this course in his curation, that first he would suck and draw up into his mouth a great deal of water, and first rafe and wash his own mouth therewith, and after this, pouring it all out of his own mouth into a cup, he would give it to the poor wounded person to sup off. Lastly, if the malignity and strength of the venom had crept and spread it self very far and deep into the body, so that there was danger of death, then would he strip himself stark naked, and so lie and spread his body upon
Of Serpents in General.

upon the naked body of the sick person, and so by this way of touching, break the malice and quality of the poisons, and give perfect cure to the man. For more confirmation hereof, Nicander Colophonius, is sufficient authority, whose verses I will here describe.

Andreus Libycus Pyllos, quos afferat Syrtes Serpentumque ferax patria alit populus, Non cura infilvium dirae, marifque venenum

Which is in English thus:

The people Pyllos bred in Lybia Land, Neer Syrtes, where all Serpents do abound, Are never stung not bitten by that band

Some of the Greeks have left in writing that the Idolatrous Priests and Prelates of the God Vulcans, that dwelt in Ile Lemus, had a special vertue given them to cure those who were wounded by Serpents: whereupon it is said, that Philostratus being wounded by a Serpent before the Altar of Apollo, went thither to be remedied of his hurt. Cornelius Celsus saith flatly, that the people called Pyllos had no such peculiar gift in healing them that were hurt of Serpents, either by fucking or touching the place, but being boldly adventurous, had presumed thereby to attempt and do that, which others of less courage had no stomach to do: for whatsoever dutif so confident are, as to follow their example, should himself be out of danger, and assure the other safe and free from fear of further hurt.

Galen in his book De Theriac ad Pifanem, manifestly saitheth, that the Marsi, who lived in his days, had no such special quality against the poisons of Serpents, but that with their crafty dealing, and knavish tricks, they beguiled the common people. For faith, those Juglers and Deceivers do never hunt Vipers at any convenient time, but long after the prime of the year and Spring, wherein they call their skins, when as they are weak, and have left their strength, and are very faint: then do they take them, and do by long use and continuance, teach them, and inure themselves one to another, and bring it to, so that they will feed them with strange and unaccustomed meats to their nature; yea they will permit them to taft of flesh; and constrain them to be continually gnawing and biting of the fame, that by their so labouring and thriving; their poisons may by little and little be spent, and purged out of their bellies. Besides all this, they give them a kind of bread made of milk and flour, that by this means the holes in their teeth may be stopped: and so by this laborious course of dieting them, they bring the matter so about, that their bitings are very weak, and do small annoyance to any that they strike at. So that the feers and lookers on, account it a thing exceeding common reason and nature, and blaze it abroad for a miracle.

Matthiolius also, a Physician of late days, agreeeth with him in this point, affirming expressly, that these kinds of crampetres and crafty fetches are much put in practice in these times, by such bold and impudent Quack fathers, Mountebanks, and coulumens of plain Country people, who dare face it out, lie, faign and cog, that they are descended from the race and lineage of Saint Paul, wherein they fwear themselves notorious liars, &c. Thus far Matthiolius.

Serpents do sometimes creep into the mouths of them that are fast asleep, wherein a certain Poet saith:

Non mihi tune libet darsa jactisse per berbam.

Which may be Englished thus:

There would I not upon the gras,
Lye on my back where Serpents pas.

For if a man sleep open mouthed, they filily convey themselves in, and winde and roll them round in compasse, so taking up their lodging in the stomache, and then is the poor wretched man miserably and pitifully tormented; his life is more bitter then death, neither feel he any releafe or mitigation of his pain, unless he by feeding this his unwelcome guest in his gueft-chamber, with good flore of milk, and other such meats as Serpents delight of. The only remedy against this mischief, is to eat good flore of Garlick, as Erafmus in his Dial. De Amicitia saith. Cardan saith, how that it was reported for a certain, that a Viper entering into a Mans mouth being asleep and gaping with his mouth, the venomous Worm was expelled only with burning of Leather, and so receiving the flaming fume at his mouth, the Viper not enduring it, he escaped with life. But of this more in our discourse of the Viper.

A certain man called Cifca, being very devout in the service, and much addicted to the worship of the God called Serap, being treacherously wound in and intrapped, by the crafty wilnes of a certain woman, which first he loved and afterward married, when by her means he had eaten some Serpents egges, he was miferably vexed, and torn and rent with diuifit and torment through all his body, so that he seemed to be in great hazard of present death. Whereupon, forthwith repairing and praying heartily to this his God, for his help and deliverance, he received answer, that he must go and buy a live Lamprey, and thrust his hand into the vegetable or place where it was kept and preferred, which he forthwith did, and the Lamprey caught fast hold on his hand, biting hardly, and holding fast by the teeth; and at length, when he was pulled from her hold, the skine and grievous torment of his body was plucked away, and he freely delivered from that threatening danger. Thus far Aelianus.
The Conclusion of this General Discourse of SERPENTS.

Having thus discourse of the medicinal qualities in Serpents, and the remedies which Almighty God in nature hath provided against their venom, now for a conclusion, I will add some other natural uses of them, and shew up all in Morals, and in sundry ways to take them.

There were certain Amazons, as Pictius note, that in their warlike preparations and Arms, did use the skins of Serpents. And to the intent that this may not seem strange, the Etrusks did eat Serpents and Lizards, for they lived in Caves in Head of Houses, and their voyce was not a significant voyce, but a kind of shrieking, like gnashing. And for these causes, Serpents are very much afraid of any one of this Nation. Likewise certain of the Cynolists were called Ophiophagi, that is, Eaters of Serpents; and one part of the people of Arabia eat Snakes. But in India, Ethiopia, and an Island in the Ocean, found out by Jambolan, there are Serpents which are harmless, and their flesh very sweet and pleasant to be eaten: So are there in Maximian, a Province of Asia. In Manaz in the upper India, and Carasia, they fell the flesh of Serpents in open Markets. These Serpents are called Cuane, and the common people are forbidden to eat them, because they are very delicate, even as Pheasants, Partridges and Peacocks are in France. Yet is there but one way to dres them, which is, to roast them in Lard, and so to eat them. For first they bewail them, then wash them and fold them up together round, putting them into a pot no bigger then to receive their quantity; upon them they call Pepper with water, and so eat them upon wood and coals that will not smoke.

With this Lard there is made a broth sweeter then any Nectar, which they use in many banquets of great account.

But for the taking of Serpents, I will yet add one or two more experiments, wherein the Ancients revenged themselves upon these irreconcilable enemies of Mankind. They did use to set in to the earth a deep pot, whereunto all venomous creatures would gather and hide themselves, then came they suddenly and stopped the mouth of this vessel, whereby they inclosed all that were taken, and, making a great fire, cast the said pot of venomous Serpents into the same, which consumed them all. Otherwise they took a living Serpent, and digged in the earth a deep Well or pit so deep as nothing at the bottom could climb up to the top thereof, into this pit they would cast the Serpent, and with her a brand of fire, by means whereof the enclosed Serpent would fall a hissing for her life, at the hearing whereof, her fellows of the same kind, were thereby easily invited to come at her call to give her relief. (As we have th ewed elsewhere) who finding the noise in the bottom of the pit, do slide down of their own accord, whereby they likewise intrap themselves in the same pit of destruction.

But the Juglers or Quick-falvers take them by another course: for they have a taffe flat at one end like a pair of tongs, those stand open by a pin, now when they see a Serpent, Viper, Adder or Snake, they set them upon the neck near the head, and pulling forth the pin, the Serpent is inevitably taken, and by them looled into a prepared vessel, in which they keep her, and give her meat.

It is reported, that if a Serpent be stricken with a Reed, the banded thill at the first blow, as if she were altonished, and so gathereth herself together; but if she be so stricken the second or third time, as one delivered from her astonishment and fear, she recolseth her wits, and strength, and flideth away. The like observation unto this, is that of the Ancients, that a Serpent cannot be drawn out of her den by the right hand, but by the left: for they lay, if one lay on her tail by the right hand, she will either slide farther into the earth from him, or else suffer herself to be pulled in pieces, never turning again, and therefore saith mine Author, Non creditur tantos, fed elatiur fugiens, aut corte abruptar, the yeeldeth not to him that draweth her, but flideth away, flying from him, or else suffereth herself to be pulled in pieces in the combate.

The sundry Hieroglyphicks, statues, figures, Images, and other moral observations about Serpents, are next here to be expressed, which the Ancients in their Temples, Shields, Banners, Theatres, and publice places had erected for their honours and dignity. And first of all in the Temple of Deiphor, near the Oracle, there was placed the Serpent which provoked Apollo to fight with him, wherein it was by him slain. And the Hermopolitanus did referre the Image of Typhon, in a Sea-horse, whereupon for fighting a Hawk and a Serpent: by the Sea-horse they signified the Monster Typhon, by the other beasts, as namely the Hawk and the Serpent, how by this principality and government, which he had gotten by violence, he troubled both himself and others.

Hercules had in his shield certain Serpents heads, pictured with these verses.

Bis fam hic video, fridentibus orefa flamia,
Colla venenata velut maculae draconum.

Tom magis offus, forantia guttare vixim,
Quam magis Alcides effeis jarque pugnat.

Which may be Englished thus:

Of Draught heads twice fix me mails thou fixe,
Raging amongst the flames with posioned foated face:
Casting most venom forth when they enraged be,
As when Alcides saw his blood disfis alope.

And
Of the Adder.

And so Virgil of Aventinus.

Clypeus insignis parentem
Centum anguis, cintamque gerit Serpentibus Hydra,
That is to say,
Hit shield an hundred Snakes, his Fathers crest,
An Hydra in their compass is enfeft.

Ofus which reigned among the Tyrrhenians, gave in his Standard and Coat of Arms a Serpent. Also, the people Ofii (from whom it may be he was sprung and derived) lived in Campania in Italy, as we have shewed already.

In ancient time we read, that when hoftility began to be compounded, they had Heralds and Embassadors of Peace, which they called Caduceators, which carried upright a certain Rod or Staff called Caduceus; this Rod was very straight, and at the either side were artificially joyuned two Serpents figures, winding and crooking into each other as the manner of Serpents is. This Rod was so faced, that it was a great offence to violate or offer any injury unto it: for by the straight Rod, was signified Perfect and Upright Reafon or Understanding; by the two crooked Serpents at either side thereof, was figured the two Armig;es invading and affailing the Upright Understanding, yet not prevailing: For this paffed through and betwixt them without harm, by truce and entreaties of Peace. This Rod was therefore consecrated to Mercury, the tails of the Serpents reaching down to the handle or half of the Rod, where they were adorned with winged wings. Aciatus made these Emblematical verses upon the Caduceus.

Anxibus implicitis, geminus Caduceus alis,
Inter Amathos cornua retus eedit.
Pellenll se mente viri, sancepe peritos
Judicat, at raram copia multa bect.

In English thus:
Twixt Ceris borns the Rod of Peace doth stand
Upright with winding Snakes, and double-winged tails,
To shew that minde and tongue with Learning's brand,
Are blest with plenty in all worldly soils.

But having thus entred into the Hieroglyphical Emblems, if I should say so much as I finde made ready, and squired for the architecture of this discourse, I might lose my self in a voluminous world of matter, therefore I will but give the Reader a tafe hereof. By the Serpent in holy Writ, are many obserbative figurations; and first, that the Devil himself, which is Malus Deus mundi, an evil God of an evil World, should be teard and express'd by a Serpent. The cause of which, is, in lingua materna, the continual and never ceasing motion of a Serpents tongue: and so the continual and ever-working perswations of Diabolical tentations, and a true mixture and limb of this old Serpent, speakes the other wise with his tongue, then he thinketh with his heart. Therefore it is also said, that a natural Serpent hath a cloven or twysted tongue.

Clementy is, truly, that Serpents do also signifie Men given over to sins, and fraudulent impostures or malices, Omnis hybridos bo ophidae, Iudas agris bo pleonctico, Ias opis bo aputans, that is, There is an imbolent and an interperate Afs, there is a raging Wolf which is covetous, and there is a Serpent which is an Impofor and fraudulent. The same learned Man saith, that Riches are like to a Serpent: For as when an ignorant Man thinketh to take a Serpent without harm by the tail, she turneth back again and biteth him; but if he take her by the neck, she cannot execute any part of her malice: even so when a Wife Man hath the managing of riches, by vertue of his discretion he doth charmeth them, that there is not in them any harm at all: But the foolish Man is mortally flung by his imprudent possiflion and dispensation of them.

Of the A D D E R.

I t falleth out in the particular Discourse of Serpents, that I express the most known Serpent to us in England, in the first place, according to alphabetical order, that is, the Adder. For although I am not ignorant, that there be which write it Nadder, of Natris, which signifieth a water Snake, yet I cannot confent unto them fo readily, as to depart from the more vulgar received word.
of a whole Nation, because of some likelihood in the derivation from the Latine: For whereas Nadder may seem not improperly to be derived of Natix, and Natix of Natando, that is, swimming in the water, the first conjectural derivation is destroyed by the latter, because this Serpent whereof we now treat, haunteth not the waters, except for drink in her time of thirst, and therefore I mil-like the writing of Nadder for Adder: and rather take that word to signify a Land Snake. And yet it there be any good argument of derivation in English from Latine, I would not have the Reader think, but that the Adder may as well be derived a terrae, from the earth which it uiteth, or of ater, black, which is the colour that it beareth, or from ateros, fierce, (for there is no Serpent of that quantity, more fierce, angry, or hurtful,) as well as Nadder from Qutix.

The Latins do express this kind of Serpent by the word Coluber, whereof some give fundry reasons either because colis umbra, it haunteth and liveth in the hedged and shadowy places, or else a libriscus etaldus, of his winding pac or path. Gelenius deriveth it of the Greek word Koloboura, which signifies wanting a tail, because the Snakes which are about houses, are sometimes found without tails, which have been bitrook off by men: but this opinion hath no reason for the Adder, which is not domestical. Indeed I confess that Pliny ueth Coluber for a general word for Serpents, when he faith Coluber in aqua vivissim, which deceived Theophrastus and Grecians, applying it to the water Serpent. And so Erasmus and others, tranlate Opibus coluber, that is, the general Greek word for a Serpent, an Adder. There is also Colubra, as in Lucilius, Uran, & Nomius Marcellinus appeareth; whereunto agree Horace, Virgil, and Cornelius Celsus. The Italian call this Serpent La Serpiente, Scasufr, Calubra, la Scouzzana, la Scouzana. The French, Colemure; the Spaniards, Calubra, and at this day the Greeks, Naphilus, and thus much for the name; except I may add these verbes of Virgil in his Georgics.

Aat tellt ofssetum Coluber succedere & umbra
Pefis acerba boun, prorue argerfere virus
Feuit hommum. Cape jaxa marn, cape robota paflor.
Tollemتمر minors, & fibilica cotta tumentem

Dejicte, jamque fuga tumidum caput addibit alis
Cum medit inux, extremque aqunia caudae
Solvuntur, turdofae rabit simus ultimus orbes.

In English thus;

Or when the Adder suling bone or shade
Bred in the earth, the bane of Shep and Neat,
Then stepheade take both stone in hand and blade,
To quaff hit swelling neck and hissing threat.

This is usual to call a Water-adder, a House-adder, a Land-snake, and such other, but catchrelli-
cally confounding one kind with another. And thus much for the name of this Serpent. The parts differ not from the general description before recited, it is long like an Eeie, and hath many Epithetis, as umbres calberis, green Adders, long, rough, venomous, divers coloured, sweling, fliding, winding, bloew, terrible, secret, hurtful, Medusam, Cyniphian, Gorgonian Lybifine, biting, spotted, wreathing, black bending, heavy, scaly, and divers such other, as the Grammarians have observed. But concerning the colour hereof, it is most commonly black on the back, sometimes greenith and yellowith. The scales of it are more sharp then of the Snake, and therefore the Egyptians were wont to say of the Thesburan Adders, that they had a certain appearance of horns upon them, as we shall shew more at large in the story of Cerdips, or the horned Serpent.

Vitibus speaking of the great worms which are bred in Mens bellies, both call them Coxas Colubras, blinde Adders; but otherwise, the Adder which is proper to the earth, is not blinde, but seeth as sharply as any other Serpent either by day or by night. They are hotter then the Snakes, and therefore live more in the shadowes, and liye for the most part round, folded up together like a rope, as the Poet noteth saying;

Hirtus & at coluber, nodosare gramine tellus
Ventre cubat flore, semper collectus in orbem.

In English thus;

At the rough Adder in knotty grafs is covered,
Lyth on her belly, and round in cirle gathered.

They are a crafty and subtill venomous Beast, biting suddenly them that pass by them, whereupon Jacob said that his son Dan should be Coluber in vis, an Adder biting the Horfe-heels. When the hath bitten, with her forked or twitted tongue the infufeth her poiyon, whereof and the remedy serving thereunto, there is this Hilvary in Ambrosius Paragas. At what time (faith he) Charles the ninth lay at Moines, I and Doctor Le Feure the Kings Phyffian, were sent for to cure a certain Cook of the Lady Gaftropersues, who was bitten by an Adder, as he was gathering wilde Hops in a hedge. The Cook affoon as he was bitten in the hand, fucked the wound with his mouth, thinking thereby to mitigate the pain, and draw out againe the poiyon; but affoon as his tongue touched the wound, presently it fo swelled that he could not speak: and besides, his arm or shoulder swelled into a high bunch or tumour, which did put him unto painful torments, infomuch that he Founted twice in our prefence; his face and colour changed as though he would prefently die: Whereat we all depaired to cure him, yet did not forfake him, nor left to try
some means to ease his torments. Then we washed his tongue with Triacle, mixed with an equal proportion of white Wine and Aqua vitae; then also I cau'd the arm to be bandi'd all over, and lanced the place where the Adder had bitten him, out of which flowed abundance of corrupt matter blood. Then we washed the wound with Triacle and Mithridate, in Aqua vitae, so we cau'd him to be laid into warm bed, there to sweat and command'd to keep him awake, which was done accordingly; and so the next day the swelling was abated, and the malignant symptoms were all evacuated: so we gave order to keep the wound or lanced place open, and afterward the Cook began to be well again. This one example in hea'd of many, I thought good to insert into this place, that hereby the general cure may be learned and followed.

It agreeth with all other Serpents in the changing or putting off the skin; for after that by falling it hath made his flesh low and abated, then by hiding through a narrow passage, whereas of Vogi thus writeth.

Qualis ubi in lucem caluber, melo graminis postumus,
Labrica comoda subiete pedere terego
Frigida sub terra, tumidum quern brama tegens:

Which may be Englished thus,

Even as the Adder in the Spring is fed and lean,
Leaves her winding limbs, holding up her breath,
When Winter cold and white her earth made snow,

S. Jerome saith, that when the Adder is thirsty and goeth to drink, the first of all at the water sidecasteth up her venom left that by drinking it defendeth into her bowels, and so destroyeth her soul; but after that she hath drunk, she licketh it up again; even as a Souldier re-armed after he was disarmed. The voyage of this Serpent is higling, although it be very feldom heard. And it is said, that when Caesar undertook to wage war with Cyren, the Suburbs of Saratii were all filled with Adders, which were devour'd afterward by Horfes in the passages. Whereat the King and people were not a little moved: But the Priests, after consultation with the Oracle, told them that it signified, how strangers should devour the people of that City; because that Adders were bred in those coasts; therefore they took them to signify natural Inhabitants, and because Horfes came from other Countries, therefore strangers, (as Cyren and his Soldiers) should be thereby signified. And this is to be noted, that all the enemies of this Serpent, are the fame that are common to other, and the Hart above all other beasts of the earth. Yet this Serpent (sai'th S. Ambrof) will killa Lion and run away from a Hart.

The Medicines arising out of this Beast, are briefly these; The water wherein an Adder is Pliny. preserved alive, is a remedy against the poyson of a Toad: Alfo Adders or Vipers included in a pot Silvius, with the scrapings of Vines, and therein burnt to ashes, do help the Wens or Kings-evil. And Pliny also affirmeth, that if a Man which hunteth Crocodiles, bear about him any part of the fat of an Adder, or the gall mixed with the herb Pomamigitus, he cannot be hurt by that Beaffe.

Serpents and Adders, especially deal Adders, signify unrepentant wicked men, and also discord as Virgil, the Poet describeth it, when Acest sent a Serpent, Snake or Adder, to move contention in the family of Amata. Libro 7. Ennida. And thus much for the Adder.

Of the AMMODTYE.

His Serpent I call after the Greek name, Ammodytes, an Ammodyte. It is also found to be called Ammodyte, and Centrieis, or rather Centria, or Centriiis, because of the hardenes of their tails, which are also cloven on the upper side. The Italians call it Apide del carne, because it hath upon the upper chapp a hard Wart like a horn. The head of this Serpent is longer and greater then a Vipers head, and her chaps wider; besides the late express'd difference upon the upper lip: and yet it may well be tearmed a kinde of Viper. It is Invennis is a, a fierce wide Beaffe, in length not above a cubit, having divers black spots upon the skin, and certain appearances of skakes or small lines upon the back. The colour of the other parts is ever like the hind wherein it keepeth and maketh abode, according to these verses of Lucan.

Concolor exquisitis, atque indiscretus arnis
Ammodytes.
In English thus;

The Ammodytes, indiscreet on the Land,
Dost hold the colour of the burning hind.

The Countries most of all annoyed with these Serpents, are Lybia, Italy, and Libya, especially about Gortinium, and the Mountains of Lampidi. Their harms are not inferior to the flinging and poyson of Aips, for Matthiibus writeth, that he hath known some to die thereof within three hours after the wound received. And if they do not die within short time, then doth the blood issue forth in abundant manner out of the hurt, and the wound swelleth. Afterward, all is turned into

Hh b 3

matter,
matter, and then followeth durlnes in the head, and diuration in the minde; they live long which endure it three days; and it was never known that any lived above seven days: this also being observed, that those that be hurt by a female do die sooner. For together with their biting, they influe a vehement pain, which caueth swelling, and the fore to run.

I finde the cure hereof in Aris to be thus, firft of all Triacle must be given to the sick person to drink, and also laid upon the wound, allo drawing or attractive Plaisters, and such Poultelles which are fit for running Ulcers. But firft before the Plaisters, firifie all the places about the hurt, and binde the upper parts hard, then launce the fore a little with a Pen-knife, and let him drink sweet water with Rungwort, Gourds, Caftoreum, and Gaffia. Arisven prefcribeth in the cure of these Serpents venom Castoreum, Cinamon, the root of Centory, of each two ounces with Wine, and the root of long Hartwoode, of Afpes, the juice of the root Gentian. And for emplaister, Homy rod and dryed, and so pounded, the roots of Pomgranates, and Centory, the seed of Flax, and Lettuces, and wilde Rue: And fo I conclude with Doctor Gefner, Ferussin ab Ammoniye festinet ad remedium, sine quo nemo affurgere, He which is hurt by an Ammoniye, let him make haill for a remedy, without which never Man escaped death.

of the ARGES and ARGOLÆ.

Here is mention made in Galen and Hippocrates, of a Serpent called Arges: Now Arges signifieth in Greek white, swift, idle, ill mannered.: of this Serpent Hippocrates telleth this story. There was a youth he a young man drunk, which lay asleep upon his back in a certain house, gaping: Into this Mans mouth entered a Serpent called Arges, the young Man perceiving it in his mouth, strived to speak and cry, but could not, and so suddenly gnashing his teeth, devoured and swallowed down the Serpent. After which he was put to intolerable pains, his hands stratching and quivering like as a Mans is hanged or strangled, and in this fort he call himself up and down and dyed. It seemeth therefore that this Serpent hath his name from the sudden destructive he bringeth to the creatures it smitteth, and therefore in ancient time we read that Mercury was called Argiphan, for killing of Serpents.

The Argile are only mentioned by Suidas, for he faith, that Alexander brought them to Alexandria from Arges, and call them into the River to expel and devour the Apses: where they continued a long time, till the bones of the Prophet Jeremy were brought out of Egypt unto Alexandria, which flew them, (as the same Author writeth:) And thus much of these two kindes of Serpens.

of ASPES.

In Hebrew as appeareth, Deut. 32. the Afp is called Pethos, in Psal. 58. Akicub, in Isa. 59. & 62. Ziphren, an Afp or a Cockatrice, worfe then a Serpent. The Arabians, Phoso, and Hasos; the Greeks, Apsi; the Romans, Apsi, and Apsides: the Spaniards, Bivora; the French, Un Apsi, the Germans, Ein Schlange, and the Latines, Apsi. About the notation or derivation of this word, there is some difference among Writers. Arystophanes deriveth it from Alpha, an intensive Particle, and Spiza, which signifieth to extend; either by reason of his sharp shrill hissing, or for the length of his body. Others derive Apsi from Hios, which signifieth venom or poyson, and therefore saith the Scripture; The poyson of Apsi, because that is a predominant poyson. The Latines call it Apsi, quod venenum apsperit mortis, because it sprinkleth abroad his poyson when it biteth. Besides we read of Apsi a Buckler, an Island in the Lybian Sea, a Mountain in Africk, and there is a fashion of camping Souldiers in the field called Apsides.
Of the Asp.

The Epithets declaring the nature of this pestiferous Serpent, are  

"Laskreta, rejoicing in poisons,  

Eliskes, winding, Lichemes, putting out the tongue, Smerdace, tearful, Phoinesfa cruelly killing.

Likewise in Latine, dry, fleeing, drouthie, deadly, swelling, and Asp or Aps, a Pharian Asp, so called of the Illiad Phorbus, where they abound. It is said that the Kings of Egypt did wear the Pictures of Col. Rubid Alsps in their Crowns; whereby they signified the invincible power of principality in this Creature, whose wounds cannot easily be cured: And the Priests of Egypt and Ethiopia did likewise wear very long Caps, having toward their top a thing like a Navel, about which are the forms of winding Alsps, to signify to the people, that those which fulfill GOD and Kings, shall perish by irreclaimable violence. Likewise by an Asp stopping his ear, was figured and understood a Rebel, obeying no laws or degrees of the Higher power: But let us leave this discourse of moralities, and come nearer to the natural description of Asps. There are many kinds of Asps after the Egyptian division, for one kinde is called Aspis, a dry Asp. This is the longest of all other kindes, and it hath eyes flaming like fire, or burning coals, another kinde is called Asps, which doth not only kill by biting, but also by putting, which it fendeth forth while it fetheth his teeth hard together, and lifteth up the head. Another kinde is called Lymno, because of the similitude it keepeth with Swallows, for on the back it is black, and on the belly-white, like as is a Swallow. We read also in Albertus of Aspis Hispaniae, and Hippophaes, but it may be that both these names signifie but one kinde. This Hispades killeth by sleeping, for after that the wound is given, the Patient falleth into a deep and sweet sleep, wherein it dyeth: and therefore Leucigenius saith: Iam suffe, ex cura veneno sibi Cleopatra jam unam mortem conficit; it was the fame which Cleopatra bought to bring upon her self a sweet and easy death. There is also an Asp called Aberus, which is of divers colours: But I do consider that all the kindes may well be reduced to three, that is, Pyas, Chersio, and Chelidion; Pyas hurteith by poysoning mens eyes, by spittin forth venom, Chersio liveth on the land, and Chelidion in the waters.

The Asp is a small Serpent, like to a land Snake, but yet of a broader back, and except in this difference not much from the Snake, their necks dwell above meafeure, and if they hurt in that passion, there can be no remedy, for the strowk of their eyes are exceeding red and flaming, and there are two pieces of flesh like a hard skin which grow out of their foreheads, according to these Veres of Nicander:

Pratera gemina calli infrar fronte cornuca  

Hertens, fanguinae simulint dimina flammas.  

That is to say;

At hard as Braun two bunches in their face.

Do grow, and flaming bloody eyes grace.

And the dry Asp, so called because it liveth in mid-lands, farre from any water, hath a vehement strong fiiight, and these eyes both in one and other are placed in the Temples of their head. Their teeth are exceeding long, and grow out of their mouth like a Boars, and through two of the longest are little hollowes, out of which he expresseth his poyson: They are all covered with thin and tender skins, which slide up when the Serpent bitcheth, and so suffer the poyson to come out of the holes, afterward they return to their place again. Of all which thus writeth Nicander:

Quatuor buis intra Marilla conscava dentes,  

Radias sivee fas, quae jandha quibusdam;  

Pellicula tuncia obductis, triste unde venenum  

Esfindit, si forte突如其来 opprimit hosti.

In English thus;

Within the hollow of their cheeks, fiery teeth are seen.

Fast rooted, which a coat of skin doth join and over-hide.

From whence sad venom issueth forth when she is keen;

If that her foe she chance to touch as she doth glide.

The scales of the Asp are hard and dry, and red, above all other venomous Beasts, and by reason of her exceeding drought, she is also accounted dead. About their quantity here is some difference among Writers: For Aelianus saith, that they have been found of two cubits length, and their other parts answerable: Again, the Egyptians affirm them to be four cubits long: but both these may stand together, for if Aelianus say true, then the Egyptians are not deceived, because the greater number containeth the better. The Asp Pyas is about two cubits long; the Chersioan Asps of the earth, grow to the length of five cubits; but the Chelidonian not above one, and this is noted, that the shorter Asp killeth soon, and the long more slowly: one being a pace, and another a fathom in length, Nicander writeth thus:

Tam proceram exenta quamrunt quam brachia duob,  

Tumque crassities efi, quantum missile telon;  

Quod faciens hostias dolet; fuber expoliit arte.
The History of Serpents.

Which may be thus Englished;
As wide as arms in force out-stretched,
So is the Asp in length,
And broad even as a casing Dart,
Made by a wise Smiths strength.

The colour of Asps is also various and divers, for the Irundo Asp, that is, the Chelidonian, resembleth the Swallow; the Pyror or spitting Asp resembleth an Asp colour, flaming like Gold, and somewhat greenish: the Cherfan Asp of an Asp-colour or green, but this latter is more rare, and Pietum faith, that he saw a yellow Asp near Beulam: Of these colours writeth Nicander:

Squalidus interdum color albet, sape nitenti,
Cum macula sape est cinere imitate figura,
Nonnullus ardentis veluti succenditur igne,
Thus overtherwise;

And spots which do the Asp resemble,
Some fiery red: in Aship black Asps are seen,

The Countrys which breed Asps, are not only the Regions of Africk, and the Confinces of Nilus, but also in the Northern parts of the World (as writeth Olam Magnus) are many Asps found: like as there are many other Serpents found, although their venom or poyfon be much more weak then in Africe; yet he faith, that their poyson will kill a man within three or four hours without remedy. In Spain also there are Asps, but none in France, although the common people do style a certain creeping thing by that name. Lucan thinketh that the Original of all came from Africe, and therefore concludes, that Merchants for gain have transported them into Europe, laying;

Ipsa coloris agens, gelidum non transi in orbem
Sponde sua, Niloque tenus metitur arenas.
Selquis erit nobis lucri pudor? Inde petuntur,
Hoc Lybice mortes & securum Aspida merces.

In English thus;
The Asp into cold Regions not willingly doth go,
But near the banks of Nilus warm, doth play upon the sands.
Oh what a frame, of wicked gain must we then undergo,
Which Lybian deaths and Aspish waves have brought into our lands?

Their abode is for the most part in dryest soyles, except the Chelidonian or Water Asp, which live in the banks of Nilus all the year long, as in a house and safe Cell, but when they perceiveth that the water will overflow, they forsake the banks fides, and for safeguard of their lives, betake them to the Mountains. Sometimes also they will ascend and clime trees: as appeareth by an Epigram of Ambologus. It is a horrible, fearfull, and terrible Serpent, going flowly, having a weak sight, always sleepy and drowsie, but a shrill and quick fenfe of hearing, whereby she is warned and adverted of all noyse, which when she heareth, presently she gathereth her self round into a circle and in the middes lifteth upon her terrible head: Wherein a man may note the gracious providence of Almighty GOD, which hath given as many remedies against evill, as there are evils in the World. For the dunneffe of this Serpents sight, and flownife of her pace, doth keep her from many mischiefs. These properties are thus exprest by Nicander;

Formidabile cui corpus, tardamque volumen,
Quandoquidem transuerfa via eft prolixaque ventris,
Spira, veteremque nivere videntur occili.
At simul ac facili fortes observavit aure

In English thus;
The scaring Asp hath flow and winding pace,
When as her way on belly she doth traverse,
Her eye fromeak in her bead, winking appear in face,

Vel minimum strictum, signet & corpore fomnos
Excertit, & terreret simum faxa apera traubam,
Hortendiamque caput, porcellaque pedos atollat.

This scaring Asp hath flow and winding pace,
When as her way on belly she doth traverse,
Her eye fromeak in her bead, winking appear in face,

Till that some raise her watchfull ear doth receife,
Then steep sheek'd off, round is her body gathered,
With dreadful head, on mounted neck vp lifted.

The voice of the Asp is hisling, like all other Serpents, and felidome is it heard to utter any voyce or found at all, except when she is endangered, or ready to set upon her enemy. Whereupon faith Nicander;

Grave silsilat ipsa
Besilia, dum certam vomit ira concita mettem.

In English thus;
This beast doth hisse, with great and loudest breath,
When in her mood she threatneth certain death.

That
Of the Aps.

That place of David, Psalm. 58. which is vulgarly read a death Adder, is more truly translated A of Aps, which when he is enchanted, to avoid the voyage of the Charmer, the hoppeth one of her ears with her tail, and the other the holdeth hard to the earth: And of this enchantment thus writeth Vincentius Bohemensis: Viurit quaorumdem verborum incantatam Aps, ne venemintemut, vel ne quidam dicatur ut quieta capi posset, et gemma de fronte ejus austerit, que natur alter in omnis, that is to say, The Aps is enchanted by vertue of certain words, so as the cannot kill her by poion, or as some say, be taken quietly without resistence, and so the Gem or precious Stone be taken out of her forehead, which naturally groweth therein. And from the words of the Psalm aforefaid, not only the certain and effectual use of charming is gathered by Pliarius, but also by many justified in the cafe of Serpents. Would not I have already given mine opinion in the former general Treatise, unto the which I will only adde thus much in conclusion, which I have found in a certain unnamed Author: Dominus diurnum jurn verbor ad Serpentes: & infidiae interior bec faciant, ut Serpentes ad naturam voram movantur, ac sine lefione tradantibus exhibantur: Which is thus much in effect: Devils run up and down with words of enchantment to Serpents, and by an inward or secret infection, they bring to pass that the Serpents dispose themselves after their pleasure, and so are handled without all harm. And indeed, that it may appear to be manifest, that this incantation of Serpents is from the Devil, and not from God, this only may suffice any reasonable man: because the Psalmist plainly expresseth, that the Serpent thirsteth it off, and avoideth Periculum miftantum incantationes, the most skilful Charmers. Now if it came from the unresistable power of Almighty God, it should pass the resistence of them or Devils; but being a falsity of the Devil, the Serpent (wiser in this point then Men that believe it) easilie turneth it against it: and in this thing we may learn to be wise as Serpents, against the enchanting temptation of the Devil or Men, which would beguile us with shadows of words and promises of no valuable pleasures.

It we may believe Pindar, Alciatus, and Philarchus, the Egyptians lived familiarly with Aps, and with continued kindnesse with them to tame. For indeed among other parts of their savage beastlines, they worshipped Aps even as household Gods, by means whereof the stubil Serpent grew to a senibile conceit of his own honour and freedom, and therefore would walk up and down and play with their children, doing no harm, except they were wounded, and would come and lick meat from the table, when they were called by a certain signification, made by knocking of the fingers. For the guests alter their dinner, would mix together Hony, Wine, and Meat, and then give the sign, at the hearing whereof they would all of them come forth of their holes; and creeping up, or lifting their heads to the table, leaving their lower parts on the ground, there licked they the said prepared meat, in great temperance and little with little without any ravening, and then afterward departed when they were filled. And so great is the reverence they bear to Aps, that if any in the house have need to rise in the night time out of their beds, they stirr all give out the sign or token, left they should harm the Aps, and so provoke it against them: at the hearing whereof all the Aps get them to their holes and lodgings, till the perfon uttering be laid again in his bed.

The holy kindes of Aps they call Thermastis, and this is used and fed in all their Temples of Isis with the fat of Oxen or Kine. Once in the year they crown with them the Image of Isis, and they say that this kind is not an enemy to Men, except to such as are very evil, whereupon it is death to kill one of them willingly.

It is reported of a certain Gardiner making a ditch or trench in his Vineyard, by chance and igno- rantly, he let his horse upon one of these Thermastis Aps, and so cut it auster, and when he turned up the earth, he found the hinder part dead, and the fore-part bleeding and uttering: at which sight his superfluous heart overcome with a vain fear, became so passionatly distrest, that he fell into a vehement and lamentable frenzy. So that all the day time he was not his own man, and in the night, in his mad fits he leapt out of his bed, crying out with pitifull and eager complaints, that the Aps did bite him, the Aps did wound him, and that he saw the picture of the said Aps (by him formerly thin) following him, and tearing his flesh, and therefore most instantly craved help against it, saying full he perifhed by it, he was mortally wounded. And when he had now (faith Alciatus) continued a while in this superfluous fury and disafe of the mind, his kindred and acquaintance brought him into the house of Serapis, making request unto that famed God to remove out of his fight that spectre and apparition; and so he was released, cured and restored to his right minde. This kind of Aps they also say is immortal and never dyeth, and besides it is a revever of sacrifice, as may appear by such another History in the same place. There was a certain Indian Peacock sent to the King of Egypt, which for the goodly proportion and feature thereof, the King out of his devotion consecrated to Jupiter, and was kept in the Temple. Now there was (faith he) a certain young Man which set more by his belly, than by his God, which fell into a great longing for to eat of the said Peacock: and therefore to attain his appetite, he bribed one of the Officers of the Temple with a good sum of Money to feast the said Peacock, and bring it to him alive or dead. The covetous wheaten enraged with the desire of the Money, sought his opportunity to feast away the Peacock, and one day came to the place where he thought and knew it was kept, but when he came, he saw nothing but an Aps in the place thereof, and so in great fear leaped back to save his life, and afterward dislofed the whole matter. Thus far Alciatus.

The domifical Aps understand right and wrong, and therefore Philarchus tellet a story of such an Aps, which was a female, and had young ones: in her absence one of her young ones killed a child
child in the House: When the old one came again according to her custom to seek her meat, the killed child was laid forth, and so the understanding the harm: Then went the and killed that young one, and never more appeared in that house. It is also reported, that there was an Afp that fell in love with a little Boy that kept Geese in the Province of Egypt, called Hurkute, whose love to the said Boy was so fervent, that the Male of the said Afp grew jealous thereof. Whereupon one day as he lay asleep, set upon him to kill him, but the other seeing the danger of her love, awaked and delivered him.

There is much and often mention made of Apfs in holy Scripture, beside the forenamed place, Psal. 58, as in Esa. 59. the fers are compared to Apfs, and their labours to Spiders webs. And Esa. 11. The jutting childi shall play upon the hole of the Afp. Whereupon a learned man thus writeth; Qui

Suidas.

Pliny.

Selus eam pois efte Ichnemon vintere peflern,
Cun grave cuncta ei bellum parat, editis: &ca,
Sue fover in multorum hominum insuperabilis lebum,
Omnis fraltda terit, mardarq; dente lacift.

That is to say;

Ichnemon only is of strength, that left to overspuell,
Gainst whom in wary wife his war be doth prepare,
Her reptes, a deadly death to many men, in fand be doth out smell,
To break them all within his teeth, this nimbre beast doth dare.

Pliny, Cardan, and Constantine affirm, that the herb Arum, and the root of Winterberry, do so aflonish Apfs, that their presence layeth them in a deadly flep: and thus much of their concord with other creatures.

Gal en writeth, that the Marsians do eat Apfs without all harm, although as Mercurial faith, their whole fleeth and body is fo venomous, and so replact with poyfon, that it never entereth into medicine, or is applied to fick or foue upon any Phyfical qualification: the reafon of this is given by himself and Fraccorius, to be either, because Apfs under their Climate or Region are not venomous at all, as in other Countries, neither Vipers nor Serpents are venomous: or else because those people have a kinde of sympathy in nature with them, by reafon whereof they can receive no poyfon from them.

The poyfon of Apfs faith Myfet, Deut. 32. is crudele venenum, a cruel poyfon, and Job, 30. cap. expressing the wicked mens delight in evil, faith; That be shall fack the poyfon of Apfs. For which caufeth, as we have theved already, the harm of this is not easily cured. We read that Canopus, the Miner of Menelaus ship, to be bitten to death by an Afp at Canopus in Egypt. So also was Demetrius Philocles, a Scholar of Theophras, and the Keeper of the famous Library of Ptolemæus Soter. Cleopatra likewise to avoid the triumph that Augustus would have made of her, suffered her felf willingly to be bitten to death by an Afp. Wheepon Propertius writeth thus:

Brachia
Bracta fvečavi sacris admoso colubris,  
Et trahere occultum membra sparsit iter.  

In English thus;  

Thus I have from these wounded arms,  
With seas'd Snakes bitten deep,  
And members draw their poison'd harms,  
Treading the way of death's found sleep.

We read also of certain Mountebanks, and cunning Juglers in Italy, called Circulators, to perifie by their own devices through the eating of Serpents, and Aps which they carried about in Boxes as tame, using them for ostentation to get Money, or to fell away their Antidotes. When Pompeius Rufius was the great Master of the Temple-works at Rome, there was a certain Circulator or Quack falsely, to shew his great cunning in the presence of many other of his own trade, which fell to his own Aps, presently he sucked out the poyfon out of the wound with his mouth: but when he came to look for his preservative water, or antidote, he could not finde it; because whereof the poyson fell down into his body, his mouth and gums rotted presently, by little and little, and so within two days he was found dead. The like story unto this is related by Amb. Parame, another, which at Florence would fain fell much of his medicine against poyfon, and for that purpose suffered an Aps to bite his flesh or finger, but within four hours after he perifh'd, notwithstanding all his antidotical preservatives.

Now therefore it remaineth, that we add in the conclusion of this History, a particular discourse of the bitings and venom of this Serpent, and also of such remedies as are appointed for the same. Therefore we are to consider, that they bite and do not sting, the females bite with four teeth, the males but with two, and when they have opened the flesh by biting; then they infuce their poyfon into the wound. Only the Aps Pijar, killeth by fplitering venom through her teeth, and (as Aesop faith) the favour or smell thereof will kill, but at the least the touching infecteth mortally. When an Aps hath bitten, it is a very difficult thing to epy the place bitten or wounded, even with most excellent eyes, as was apparent upon Cleopatra aforefaid; and the reason hereof is given to be this, because the poyfon of Aps is very sharp, and penetrateth suddenly and forcibly under the skin, even to the innoin parts, not slaying outwardly, or making any great visible external appearance. Yet Galen writing to Pij, affirmeth otherwife of the wound of Cleopatra; but becaufe drownines and feep, followeth that poyfon, I rather believe the former opinion: and therefore Lucan calleth the Aps, Somnifera, that is, a sleep-bringing Serpent. And Pelioius also subfcribeth hereunto.

A pida & morfa lefum dormire fatentur  
In mortem, antidum nec valdeffc scrutu.  

Which may be Englished thus;  
He that by rage of Aps tooth is bitten or is wounded,  
They say with sleep until his death cureless, he is confounded.

The pricks of the Aps teeth, are in appearance not much greater then the prickings of a needle, without all swellings, and very little blood issueth forth, and that is black in colour, straightway the eyes grow dark and heavy, and a manifold pain ariseth all over the body, yet such as is mixed with some fene of pleafure, which caused Nisander to cry out, Perimitque virum abfioque dolores, it kills a man without pain. His colour is all changed, and appeareth greenish like grapes. His face or forehead is bent continually frowning, and his eyes or eye-lids moving up and down in drownines without fene, according to these verses following.

Neo tamen ullcis vides impressi vulnera morfas,  
Neo dignus fars tumor illum corpus adorit.  
Sed qui lefus homo oft, citra omnem fat als dolores  
Claudet, & ignavo moriens torpore fatificit.  

Which I tranflate thus;  
Wounds of impressd teeth, none canst thou see,  
Nor tumour worth the naming, smitten body burning,  
But yet the hurt man painfuls takest deftiny,  
And sleeping dyeth, flaggylye hie turning.

The true signes then of an Aps biting, is stupeur or alonishment, heavinesse of the head, and flothinesse, wrinking the fore-head, often gaping and yawning, and nodding, bending the neck, and Convulsion; but those which are hurt by the Pijar, have blindness, pain at the heart, deafnesse, and swellings of the face. And the signes of such as are hurt by the Chaladian or Chefean Aps, and the Terrestrial are all one, or of very little difference, except that I may add the Cramp, and the often beating of the pulse, and frigidity of the members or parts, or pain in the stomack, but all of them in general, deep sleep, and sometimes vomitting. But by this, that the blood of the place by them bitten turneth black; it is apparent and manifie, that the poyfon of the Aps mortifieh or
or killeth the natural heat, which is overcome by the heat of the poiyson outwardly, and the dark-
ness or blindnese of the eyes proceedeth of certain vapours which are infected, and ascend up to
the disturbance of the brain: and when the humors are troubled in the stomac, then followeth
vomiting or else the cramp, and sometimés a loosenesse when the knuckles are drawn in by the ve-
nomous biting, or the infected humors falling down into the in trial. To conclude, for great is the
tablish effect of this poiyson of Aps, that it is worthily accounted the greatest venom, and most
dangerous of all other; for also, his Serpent venomenum cum pelliferorum fub, tunc muto apud pellif-
entur, the poiyson of all Serpents is pelliferous, but the venom of the Aps most of all. For if it
touch a green wound, it killeth speedily, but an old wound receiveth harm thereby more hardly. In
Alexandria, when they would put a Man to a sudden death, they would fet an Aps to his bosom or
breath, and then after the wound or biting, bid the party walk up and down, and fo immediately with-
in two or three turns he would fall down dead. Yet it is reported by Pliny, that the poiyson of
Aps drunk into the body doth no harm at all, and yet if a Man eat of the flesh of any beast slain by
an Aps, he dyeth immediately.

But concerning the cure of such as have been, or may be hurt by Aps, I will now entreat, not
spending any time to confute thofe, who have wrote that it is incurable: on the contrary it shall
be manifelt, that both by Chirurgery and Medicines, compound and fimple, this both hath been
and may happily be effectecl. First, it is neceffary when a Man is flung or bitten by a Serpent, that the
wounded part be cut off by the hand of fome skilful Chirurgeon, or else the fried round about the
wound, with the wound it felf to be circumcified and cut with a fharf Razof; then let the hotteft
burning things be applied, even the fearing Iron to the very bone. For then the occasion being taken
away from the poiyson to spread any further, it muft needs die without any further damage. Then
also the holes in the mean time before the ejection muft be drawn, either with Cupping-glaifes or with
a Reed, or with the naked rump of a Ring dove or Cock; I mean the very hole fet upon the bitten
place. And because the hole is very narrow and small, it muft be opened and made wider, the blod
be drawn forth by scarifications, and then muff fuch medicinal herbs be applied as are moft oppofite
to poiyson, as Rue, and fuch like. And because the poiyson of Aps doth congeal the blod in the
veins, therefore againfit the fame muff all hot things made thin be applied, as Habitodatum and Tri-
acle dissolved in agua viva, and the fame also dissolved into the wound; then muf the Patient be
ufed to bathings, iricasing or rubbing, and walking, with fuch like exercises. But when once the
wound beginneth to be purple, green, or black, it is a fign both of the extinguiting of the ve-
nom, and alfo of the fuffocating of natural heat, then is nothing more fafe than to cut off the mem-
bers, in fo alfo be able to bear it. After Cupping-glaifes, and Scarifications, there is nothing that
can be more profitably applied then Century, Myrrh, and Opium, or Sorrel after the manner of a
Plafier. But the body must be kept in daily motion and agitation, the wounds themselves often
fearched and prezifed, and Sea-water used for fomentation. Butter likewise, and the leaves of
Yew, are very good to be applied to the bitings of Aps. And in the Northern Regions, (as witneffeth
Oian Magnus) they use nothing but Bran like a Plafier, and their Cattle they anoint with Triacle and
Salt all over the bunch or swelling. And thus much for the Chirurgical cure of the biting of Aps.
In the next place, we may alfo relate the medicinal cure, especially of fuch things as are compoud,
and received inwardly.

First, after the wound, it is good to make the party vomit, and then afterward make him drink
juice of Yew and Triacle, or in the default thereof, Wine, as much of the juice as a great weight,
or rather more. But for the tryal of the parties recovery, give him the powder of Centory in
Wine to drink, and if he keep the medicine, he will live, but if he vomit or caft it up, he will dye
thereof. But for the better avoidance and purging out the digefted venom, diftributed into every
part of his body, give the party Garlic beaten with Zythum, until he vomit, or else Opomone in
Wine allayed with water: also Origan dry and green. After the vomit, the former antidotical me-
dicines may be ufed. And the Northern people use no other Triacle then Venetian. Whereas there
are abundance of all manner of Serpents in the Spanifh Islands, yet never are any found there to ufe
Triacle, neither do they account it of as of a thing any whit vertuous, but inledref thereof they ufe
the bearded 1bopif, Gilly-flowers, and red Violets, and the herb Ambra, boiled in Wine Vinegar,
which that may be gotten, and a found mans Urine, wherewithall they bath the wounded
part, although much time after the hurt received. But faith Amb. Fereu, it is much better for the
Patient to drink thereof fasting, and before meet two hours, three ounces at a time. And by the
help of this notable experiment, the Inhabitants of thofe Islands are nothing afraid to offer their
bodies to be bitten by the moll angry Aps. And thus much for compound medicines in general.

It is laied, that the firft and cheifteft easie remedy for fuch as are bitten by Aps, is to drink to much
of the sharpell Vinegar, as he can fenfibly perceive and feel the fame upon the right fide of his mid-
riff, because that poiyson firft of all depriveth the liver of fene. For Pliny faith, that he knew a
man carrying a bottle of Vinegar to be bitten by an Aps, whiles by chance he faw on the fide, but
as long as he bore the Vinegar and did not fet it down, he felt no pain thereon, but as often as to
eafe himfelf he fet the bottle out of his hand, he felt torment by the poiyson, which being related
to the Phyficians, they knew thereby that Vinegar drank into the stomack was a foeveraign antidote
againft poiyson. Yet fome fay, that the firft knowledge of this vertue in Vinegar, grew from the
neciffity which a little boy bitten by an Aps had of drinking, and finding no other liquor but a
bottle of Vinegar, drank thereof a full draught, and was eafeed of his pain. For the reafon is,

Of the Bee.

that it hath both a refrigerative, and also a dissipating vertue, as may appear when it is pored upon Cor. CoEas. the earth, because it yeeldeth a froth, and therefore when it cometh into the stomack, it dissipeth all the infected humors.

The Northern Shepheardes do drink Garlick and itale Ale against the bitings of Asps. And some hold an opinion that Aniseed is an antidote for this fore. Others use Hart-wort, Apium seed, and Wine. Arun being burned, hath the vertue to drive away Serpents, and therefore being drunk with Oyl of bays in black Wine, it is accounted very soveraign against the bitings of Asps. The fruit of Ballam, with a little powder of Gentian in Wine, or the juice of Mints, keepeth the stomach from the Creeph after a Man is bitten by an Afp. Others give Caforum, with Lynum Coffee, and some the skin of a Thrush stomach or maw. There be certain little filthy and corrupt Worms bred in rotten wood or paper, called Cimies, these are very profitable against poysion of Asps, or any other venomous biting beast, and therefore it is said that Hens and other Pullein do earnestly seek after these worms, and that the flesh of such fowl as have eaten thereof, is also profitable for the same purpose.

Ahernum also wright, how certain Thieves were condemned to be caft to Serpents to be destroyed, now the morning before they came forth, they had given them to eat Citrons; when they were brought to the place of execution, there were Asps put forth unto them, who bit them, and yet did not harm them. The next day, it being suspected, the Prince commanded to give one of them a Citron, and the other none, so when they were brought forth again the Asps fell on them, and flew them that had not eaten Citron, but the other had no harm at all. The Egyptian Clematis Pliny, or Patring drunk in Vinegar, is very good against the poysion of Asps; so likewise is Corral in Orpiment. Wine, or the leaves of Yew. Henbane bruised with the leaves thereof, and also bitter Hops have the same operation. The urine of a Tortoise drunk, is a medicine against all bitings of wild beasts, and the urine of a Man hurt by an Afp, as Marcus Varro affirmed in the eighty ninth year of his age, according to the observation of Serenus saying;

Si vero borreandum vulnus fera fecerit Afpis,
Urinam cedens propriam conculcere potu:
Varonis fuit ifia senis sententia, nec non
Pliniu ut memorat, fumpti juxta imber aceti.

Which may be Englishted thus;
If that an Afp a mortal wound do bite,
It's thought his urine well doth cure again,
Such was the saying of old Varro bright,
And Pliny too, drink Vinegar like drops of rain.

But it is more safe to agree with Pliny in the prescrifion of Mans urine, to restrain it to them that never had any beards. And more particularrly against the Afp called Pyas, and Matthiolus out of Distoverdi faith, that the quinteunce of Aqua vitae, and the usual antidote, both mixed together and drunk, is most powerful against the venoms of the deaf Afp. And thus much for the antipathy and cure of Asps biting venomous nature, whereunto I will add for a conclusion,that proverbial speech, of one Afp borrowing poysion of another, out of Tertullian against the Heretick Murcetion, who gathered many of his absurd impieties from the unbelieving Jewes. Definatum nec hereticum & Judaeus alpis quad aliqui A Vpere mutuari venenum, that is, let the heretick nowe caufe to borrow his venom of a Afp, as the Asps do borrow their poysion from Vipers. And true it is, that this proverb hath eipical use, when one bad man is holp or counselld by another; and therefore when Digests law a company of women talking together, he faid merrily unto them, Afpis par' echidnus pharmacon dami-zerai,that is, the Afp borroweth venom of the Viper. Thus much of the Afp.

A Mongst all the forts of venomous Infests,(or cut-wafted creatures) the soveraigne and preheminence is due to the Bees, who only of all others of this kinde, are made for the nourishment of mankinde, all other (cut-wafted) serving only for medicinal use, the delight of the eyes, delection of the ears, and the ornament, trimming, and sething forth of the body, which they perform at the full. They are called of the Hebrews, Devarob; the Arabians term them, Albara, Naba-bolea, and Zabar: the Lyrians and Seleouianis, Wetzilla; the Italians, Ape, Api, Uma sticha, Melicatella, Ape or Scoopa, Pecchi; the Spaniards, Abeia; Frenchmen, Moufchis au miel; the Germans, Eer yxte, open. The Flemings, Biz; the Polonians, Pazzota; the Irish men, Camilli. In Wales a Bee is called Gwenis. Amongst the Greecians they have purchased fundry names, according to the diversity of Nations, Countries and places, but the most vulgar name is Melis, and in Hermodus, Melis. Otherformes call a Bee Plafris, a fingend, or framming. Some again Ambledon: and of their colour, Xanthai. Of their Offices and charge, Eggomes, ab imperando, from governing, Sirenes, of stavi canus, from their sweet voyce. The Latines call them by one general name, Apiis and Apes. Vetrovartimes termes them Aves, but very improperly, for they might better be named Polacres, not Aves. So much for their names, row to the definition.

Of the Description and differences of B E E S.

A Mongst all the forts of venomous Infests,(or cut-wafted creatures) the soveraigne and preheminence is due to the Bees, who only of all others of this kinde, are made for the nourishment of mankinde, all other (cut-wafted) serving only for medicinal use, the delight of the eyes, delection of the ears, and the ornament, trimming, and sething forth of the body, which they perform at the full. The Flemings, Biz; the Polonians, Pazzota; the Irish men, Camilli. In Wales a Bee is called Gwenis. Amongst the Greecians they have purchased fundry names, according to the diversity of Nations, Countries and places, but the most vulgar name is Melis, and in Hermodus, Melis. Otherformes call a Bee Plafris, a singing, or framming. Some again Ambledon: and of their colour, Xanthai. Of their Offices and charge, Eggomes, ab imperando, from governing, Sirenes, of stavi canus, from their sweet voyce. The Latines call them by one general name, Apiis and Apes. Vetrovartimes termes them Aves, but very improperly, for they might better be named Polacres, not Aves. So much for their names, row to the definition.

Iii A Bee
A Bee is a cut-wafted living creature, that can fly, having four wings, and bloudleffe, the only Crafts-master of Hony-making. Their eyes are somewhat of a hornye subfiance; bid deep in their bodies, as is also their fling: they want neither tongue nor teeth, they have four wings, being of a bright and clear colour, growing to their shoulder-blades, whereof the two hinder-moat are the lefter, because they might not hinder their flying: and out of their short feet or fumps there grow forth as it were two fingers, wherein they carry a little flone, for the poifing and making weighty their small bodies in fiorrey, tempeftuous, bluttering or troublefome weather, for fear left they might be driven from their houfe and home, by the contrary rage and violence of the windes.

They do not breath (by Plinix good leave) but either pant, move, or flir (as the heart or brain doth) and by tranfpiration they are comforted, refreshed, and made lively. Their flomach is contexted and framed of the thinnest part of all their members, wherein they not only retain, but alfo digife, purifie, and clene it, which is the true and only reafon, why the Honey of Bees is longer kept pure and fine, than any Manna or Meldow, or rather it is not at all subjett to corruption.

Bee, even by nature are much different: for some are more domelical and tame, and other again are altogether wilde, uplandish, and aperitiue. Thofe former are much delighted with the familiar friendship, custom and company of men; but these can in no wise brooke or endure them, but rather keep their trade of Honey-making in old trees, caves, holes, and in the ruders, and rubbiffh of old walls and houfes. Of tame Bees again, fome of them live in pleasant and delightful Gardens, and abounding with all sweet fenting and odoriferous plants and herbs; and therefe are great, foft, fat, and big belled. Others again, there be of them that live in Towns and Villages, whose fuddy and labour is to gather Honey from fuch plants as come next to hand, and which grow farther off, and therefe are leffer in proportion of body rough and more unpleafant in handling; but in labour, industry, wit and cunning, far surpassing the former. Of both forts of thefe, fome have flings (as all true Bees have:) others again are without a fling, as counterfeit and baftardly Bees, which (even like this idle, fluggifh, lither, and ravenous cloyster Monks, thrice worse then thieves) you shall fee to be more gorbelled, have larger throats, and bigger bodies, yet neither excellent or markable, either for any good behaviour and conditions, or gifts of the minde. Men call thefe unprofitable cattle, and good for nothing, Fust, that is Drones; eithe because they would seem to be labourers, when indeed they are not: or because that under the colour and pretence of labour (for you shall sometime have them to carry wax, and to be very办te in forming and making Honey-combes,) they may eat up all the Honey. Thefe Drones are of a more blackifh colour, and some what fhining, and are easily known by the greatneffe of their bodies. Besides fome Bees are defcended of the Kyngly race, and born of the blood Royal: whereof Arebile maketh fuch two forts; a yellow kinde, which is the more noble, and the black, garnifhed with divers colours. Some make three Kings, differing in colour, as black, red, and divers coloured. Memareus faith, that thofe who are of fundry colours are the worfer, but in cafe they have diversity of colour with some blackifh, they are efteemed the better. He that is elected Monarch Cæsar, and Captain General of the whole Swarm, is ever of a tall, perfonable, and herculean nature, being twice as high as the reft, his wings shorter, his legs ftraight, brawny, and strong, his gate, pace, and manner of walking is more loftly, latefly, and upright, of a venerable countenance; and in his fore-head there is a certain red spot or mark with a Diadem; for he far differeth from the popular and inferior fort in his comlineffe, beauty, and honour. The Prince of Philofophers confoundeth the fex of Bees, but the greatest company of learned Writers do dilguifh them: whereof they make the feminine fort to be the greater. Others again will have them the leffer, with a fling: but the founder fort (in my judgement) will neither know nor acknowledge any other males, befores their Dukes and Princes, who are more able and handfome, greater and stronger then any of the reft, who flay ever at home, and very feldom (unlike to the whole Swarm) they flir out of doors, as thofe whom nature had pointed out to be the fitfell to be fander-bearers, and to carry ancients in the camp of Venus, and ever to be ready at the elbows of their loves to do them right: Experience teaching us, that thofe do fitt on Eggs, and after the manner of birds, do carefully cherish and make much of their young, after the thin membrane or skin wherein they are enclosed is broken.

The difference of their age is known by the form, flate, and habit of their bodies. For the young Bees have very thin and trembling wings, but that they are a year old, as they that are two or three years.
years of age are very trim, gay, bright-shining and in very good plight and liking, of the colour of Oyl.

But those that have reached to sevenen years, have layed away all their flatness and smoothness, neither can any man afterwards either by their figure and quality of their bodies or skins, judge or discern certain their age (as we by experience in Horses:) For the elder fort of them are rough, hard, thin and lean scraws, flourlings, losthome to touch and to look upon, somewhat long, nothing but skin and bone, yet very notorious and goodly to fee to, in regard of their gravity, hoariness and acieney. But as they be in form and shape, nothing fo excellent, fo yein experience and industry they fall out-fit the younger fort, as those whom time hath made more learned, and length of days joyed with ule, hath sufficiently instructed and brought up in the Art or trade of Honey-making.

The place likewise altereth one whiles their form, and sometimes again their nature, (as their sex and age do both.) For in the Islands of Molucca, there be Bees very like to winged Pinnates, but somewhat leffer then the greater Bees, as Maximianus Transfiguratus, in an Epistle of his written to the Bishop of Saltspurgh, as large relate it. Andrew Boret in his book that he wrote of the New-found World, Chap 31. amongst other matters reporteth that he did see a company of flies or Honey-bees about a tree named Vibebafyn, which then was green, with the which thefe Honey-bees do live and nourish themselves: of the which trees there were a great number in a hole that was in a tree, wherein they made Honey and Wax. There is two kinds of the Honey-bees, one kinde are as great as ours, the which cometh not only but of good smelling flowers, alfo their Honey is very good, but their Wax not fo yellow as ours. There is another kinde half fo great as the other: their Honey is better then the other, and the wilde men name them Hira. They live not with the others food, which to my judgement maketh their Wax to be as black as coals, and they make great plenty, specially near to the River Vajfes, and of Plate. The Bees called Chalcoder, which are of the colour of brats, and somewhat long, which are fayd to live in the Island of Coza, are impalacable, great fighters and quarrellers, excelling all others in their wings, and more cruel then any others, fo that with their wings they have chaid the Inhabitants out of their Cities; the remainder of which Bees do remain and make their Honey-combes (as Elianu Leith) in the Mountain Ida. Thus much of the differences of Bees, now it remaineth to discourse of the Politick, Ethical, and Oeconomick vertues and properties of them.

Bees are governed and do live under a Monarchy, and not under a tyrannical State, admitting and receiving their King, not by succission or caiting of lots, but by respective advice, confident judgement, and prudent election; and although they willingly submit their necks under a Kingly government, yet notwithstanding they still keepe their ancient liberties and priveledges because of a certain Prerogative they maintain in giving their voices and opinions, and their King being deeply bound to them by an oath, they exceedingly honour and love.

The King as he is of a more eminent stature, and goodly corporature (as before we have touch'd) then the reft: fo likewise (which is singular in a King) he excelleth in midnes and temperatenes of behaviour. For he hath a fling, but maketh it not an instrumen of revenge, which is the caufe that many have thought their King never to have had any For these are the laws of nature, not written with Letters, but even impressed and engraven in their conditions and manners: and they are very flow to punifh offencers, becaufe they have the greatest and Sovereign power in their hands. And although they seem to be slack in revenging and punifhing private injuries, yet for all that they never suffer rebellious persons, refractorious, obinate, and such as will not be ruled, to eleape without punifhment; but with their pricking things they grievously wound and torment, so as they dispatching them quickly. They are fo tindus of peace, that neither willingly nor unwillingly they will give any caufe of offence or displeasure. Who therefore would not gratefully be displeased with, and hate extremly those Dismal Dan Tyrants in Sicilia, Clearisius in Hierachia, and Apodorus the Theif, Peiter and fooper of the Caffandrius? And who would not detest the ungratioufnes of those lewd claw-backs, and Trencher-parafites, and flatterers of Kings, which dare impudently maintaine, that a Monarchy is nothing else but a certain way and rule for the accomplishing of the will, in using their authority as they list, and a fience or skilful trade, to have wherewith to live pleasantly in all sensual and worldly pleasure: which ought to be far from a good Prince, who whilst he would seem to be a Man, he them himself to be far worser then these little poor winged creatures. And as their order and course of life is far different from the vulgar fort, so also is their birth; for they of the Kingly race are not born after the manner of a little Worm, as all the Commonalty are, but is forthwith winged, and amongst all his younglings; if he finde any of his sons to be either a fool, unhandsome, that none can take pleasure in, rugged, rough, Ioon angry, fumifh or too realty, ill shaped, not beautiful or Gentleman-like, him by a common confent, and by a Parliamentary authority they destroy, for fear left the whole Swarm should be divided and distracted into many minides, and so at length the Subjects undone by factions, and banding into parts.

The King prefereth laws and orders to all the rest, and appointeth them their rules and measures: for some he straitly chargeth and commanndeth, (as they tender his favour, and will avoid his displeasure) to fetch and provide water for the whole Camp. He enjoineth others to make the Honey-combes, to build, to garnish: and trim up the house well and cleanly, to diminish perfectly the work, to finde and allow, to promote and shew others what to do. Some he sendeth forth
The History of Serpents.

Nymphi due regum facies, due corpora gentis

etr sunt muculis auro squamibus argento,

et utiles squamis, insignis & ore.

Eadar est alter mullo, quum putare aballo

Quam venit & facto terram fructus arcvator.

Defidia latamque travers in longiore aluam—Hunc
desc neci, melior vacua fine regnet in aula.

In English thus;

The two apells of Kingly Bees, two Nations do destine,
One of them, Golden light red, burning with pale brow,
And having foales bold red and clear, and great about the nose,
The other filthy to behold like dust, for it is true,
Which burnes finest upon dry land, whenull is crusty and prey,
In stilt bely broad, doth travail worser then the leaff,
Him kill, let the other reign,
Aline, in empty Court, do not disdain.

And thus hitherto have we spoken of their Kings and Dukes: now will we bend our discourse to the common fort of Bees.

Bees are neither to be accounted wilde, nor altogether calm and quiet creatures, but of a nature betwixt both: and of all other they are esteemed most serviceable and profitable. Their fling giveth both life and death to them, for being deprived of it, they surely die: but having it, they repel all hostility from their swarms. Of these there are none idle, although they be not all Honey-makers, neither are the most sluggish of them all, like unto the Drones in their inclination and manners: For they do not corrupt and mar the Honey-combs, neither do they lie in wait by treachery and deceit to fitch Honey, but are nourished by flowers, and fleeing forth with their fellows, do get their living with them: although some of them want the skill to make and lay up the Honey finely and safely, yet notwithstanding every one hath his proper charge and business to use and prafche; for these bring witter to the King, and to the older Bees that cannot travail.

The elder part if they be of a strong and robustous constitution, are chosen for the guard of the King person, as the fittest persons to be about him, in regard of their approved worth, faithful dealing, and uprightnes of conscience, for the ordering and disposing of all matters. Some give Physick to those that are sick, by making and giving to them a medicinal alement of Honey, that is drawn from Amlie, Saffron and Hymecomes. But if any through age or sickness chance to die, then they whose office it is to carry forth the dead bodies to burying: do forthwith flock together, carrying the dead body of their brother on their shoulders, as it were on a Beere, left the pure Honey-combs might be tainted with any uncleanliness, flink, or malminess.

Bees have also their Ambassadors and Orators, sent with commission or authority, and put in trust to deal in their Princes affairs, their old hested Souliders, their Pipes, Trumpeters, Horn-winders, Watchmen, Scout-warches, and Sentinels Likewise Souliders ever in a readi-
Of the Bee.

readiness to defend, and look to their Honie-wealth and goods, as if it were a City committed to their truft and valiancy, and there do punish, torment, and throw to the ground all flying Theevs and Worms, that dare invade secretly by any cunning passage, or mine into their mansions. And that they might bear the world in hand, that they are no priu or secret Theevs in their flying, they make a noyse and humming, which together with their flight, is heard both to begin and end: Which found, whether it proceedeth from the mouth, or from the motion of their wings, Aristotle and Hesychius do much vary and contend.

Their Pipers and horn-blowers do edere Zingos, as Helcchius faith (the Englishmen term it Sing) and that they make to be the watch-word and priu token, for their watch and ward, sleep, and daily labour. They love their King so entirely, that they never suffer him to goe abroad alone, but their Army being divided into two parts, and by heaps winding themselves round, do as it were enclose and fence them on all sides. If in any journey the King hap to wander from his company, and cannot be found, being driven away by the force of some horty winde or weather, they all forthwith make a priu seach, and with their quick-venting, periule and follow the chafe so long, until he be certainly found; and then because he is tyred with flying, and the tediousnes of temptells, the common fort lift him upon their wings, and so triumphantly convey him home as it were in a Chariot. But if he die by the way, then they all mournfully depart, every one to his own place separating themselves, or peradventure for a while, they work up their Honeycombes not yet finished, but never make any more Honie; So that at length, growing to be lazy, sickly, waited, conumed and disannam with their own fifth and corruption, they all miserably perih. For they cannot possible live without a King, against whom, none is so hardy as to lift up his finger to offer him any violence, much les to compire his destruction, unlehe he (after the fashion of Tyrants) do overthrow and turn all things upside down, after his own will and luft, or neglecting carfully the Weal publique, feteth all upon fix and feven. Yea, if he acceptum himself to go often abroad, (which he cannot do without the great hurt and prejudice of his Citizens) they do not by and by kill him, but they take from him his wings, and if he then amend his life and look better to his office, they singularly affect and honour him.

When the King by flying away hath left his Bees, they fetch him again, and being a fugitive from his kingdom, they follow him amain by his smell, as it were with hue and cry, (for amongst them all the King smelth beall) and so bring him back to his Kingly house. None dare venture out of his own lodging first, nor seek his living in any place, except the King himself first going forth, do rect them the way of their flight. For I am hardly of a srisfates minde, who affirmeth that the King never cometh abroad, but when the whole iwarm dooth, which is seldom seen. But if by reason of his tyranny, cruelty, and violent rule, they be forced to seek some other dwelling places, then a few days before the time appointed, there will be heard a solitary mournful, and peculiar kind of voice, as it were of some trumpets, and two or three days before they fly about the mouth of the Hive; so when all things are in a readiness for their flight, being all assembled, they flee all speedily away, and kill the Tyrant (whom they left behind) if he attempt to follow them But a good King they never forfake; and if at any time he pine and fall away by reason of ficknesses, any plague, or murrain, or through old age, all the meaner fort do make mone, the whole rout and multitude of Senators and Aldermen do greatly bewail him, not conveying any meat into their Hives, nor yet looking out of doors for meer grief, filling the whole house with sorrowful hummings and laments, and gathering themselves by heaps about the carkass of the dead King, they do with great noise tragically mourn for him. Neither doth continuance of time mitigate or take away their grief, but at length all of these faithful friends, partly through grief, and partly through famine, they are clean conumed and brought to death.

Whilest they have a King, the whole iwarm and company is kept in awful order, but he being gone, they go under the protection of other Kings. They have not many Kings at once, neither can they endure usurpers, overthrowing their houes, and rooting out their flock and family. And if in one iwarm there be two Kings, (as sometimes it falleth out,) then one part adhereth to the one King, and the other fide cleaveth to the other, so that sometimes in one hive you find finde Honeycombs of sundry forms and fashions: where they behave themselves so honestly and neighbourly, that one the meddith not with the others charge and busines, having no minde to enlarge their Empire, to entice, draw, or win by fair means the subjects of the other side, but every one being obedient to his own King without contradiction. They honour him so highly, that being loft they complain; being deceit, they prefervre and keep him; being weary, they carry him round about with them; being dead, they bewail him with all funerall pomp and heaviness, yeading up at length even their very lives for an affurance of their loves and faithful dealings. Oftentimes they arear beat deadly war against strangers born, for the Honie that they have stolen from them, as for the catching and snatching up afore-hand thofe flowers whereon they purposed to fit on; so that sometimes the quarrel is determined by dint of sword in a just battall. Oftentimes again they wrangle about their Honey-combes and dwelling houses, but then the deadly and unappeasable war is, when the contention is about the life, crown, and dignity of their King, for then they behirr themselves most eagerly, defending him most valiantly, and receiving the darts or things that are bended against him, with an undaunted courage, by the voluntary and thick interposing of their own bodies, betwixt the darts and the person of their King.
The History of Serpents.

Neither are Bees only examples to men of Political prudence and fidelity, but also preudets for them to imitate in many other virtues. For whereas Nature hath made them Zoos opelae, that is, creatures living in companies and swarms, yet do they all things for the common good of their own rout and multitude, excepting ever the Drones and Theeves, whom if they take tripping in the manner, they reward with condign punishment. Their houses are common, their children common, their laws and statutes common, and their country common. They couple together without question as Cams do, privily and apart by themselves, which whether it proceed of modesty, or be done through the admirable instinct of Nature, I leave it to the dispute and quaint resolution of those grave Doctors, who being laden with the badges and cognizances of learning, do not flick to affirm that they can render a true reason even by their own wits, of all the caufes in nature, though never so obfure, hid and difficult.

Flies and Dogs do far otherwife, whole impudence is fuch, that having no regard of times, perfons, or places, they will not give place, or be disjoyned. Yea the Muficks (as Herodotus writeth) having their quiver of arrows on their cars, they dealt with their wives very unfeafonably, and though all men beheld it, yet they most impudently contempted it. And that which is worfer, this beastly faction is crept amongst the ufurpers, or at least profesffors of the Christian name, who shame not openly to kiss and embrace, yea even to play and meddle with filthy whores and brothely queans. Bees farely will condemn thefe kinde of people of beafial impiudency and wanton flanelefnes; or caufing them to fluth if they have any grace, will teach them repentance. Neither are they altogether such creatures as cannot endure or away with Mufick, (which is the Princefh of delights, and the delight of all theunlearned) as many unlearned people confen, but who procede delightfully with tune in any harmony wherein is no jarring, so the fame be simple and unaffectted.

And although they have not the skill to daunce according to due time, order and proportion in Mufick, as they say Elephants can, yet do they make twifter or flower their flight, according to the Trumpetors minde, who with his tharp and thrill found caufeth them to beftir themselves more speedily; but befting flowing and not fo loud upon his brafen instrument, maketh them more flow, and to take more leisure. Neither hath Nature made them only the most ingenious of all living creatures, but by discipline hath made them tame and tractable. For they do not only know the hand and voice of the Honey-man, or him that hath the charge and ordering of the fame, but they alfo affuer him to do what liketh him felf: which every man muft needs confefs to be an argument of a generous and noble disposition, thus to undergo the rule of their Over-feers and Surveyors, but the hand and discipline of a stranger they will by no means endure.

As for economical virtues they excel alfo, and namely for moderate frugality and temperance, not profutely and prodigiously wasting and devouring the great flore of Honey which they gathered in the Summer feafon, but they fulfill themselves therewith in Winter, and that very sparingly: And fo whileft they feed upon few meats, and thofe of the pureft fort, they purchafe long life, (the reward of fobriety.) Neither are they fo niggardly and fordidious minded, but when as they have gathered more Honey then their number can well fpend, they communicate and impart some very liberally amongg the Drones. As for their cleanlines there may be certain arguments, that they never exonerate nature within their hives, (except contrainfained thereto by fome ficknes, foul weather, and for fome urgent neceffity) that they convey away the dead caftaffles, that they touch no roten nor flinking fheel, or any other thing, no herb that is withered, nor no ill fenfing or decayed flowers.

They kill not their enemies within their hives, they drink none but running water, and that which is thoroughly defepted: they will not dwell in houfes impure and foul, finifh, black, or full of any feculent or decy, efufe, and the excrement of the labourers and fickly, they gather on a heap without their pavilions, and aflon as their leifure felfeth it is carried clean away. Concerning their temperance and challices (although it hath been partly touched before,) yet this I will add, that it is wonderful what fome men have obferved. For whereas all other creatures docouple in the open light of men, the Elephant only excepted, and Wafps likewise not much differing in kind, do the fame: yet Bees were never yet been fo to joyn together, but either within their hives very modeftly they apply themselves to that bufines, or else abroad do it without any witneffes. And they are no less valiant then modest and temperate, *Dum corpora bellos objecunt, pulchrameque petunt per suillum larvalens.* Their war is either civil or forain. Of the former there be divers caufes, that is to fay, the multitude of their Dukes or Captains lying in wait to betray both King and Kingdom: scarcity of victual, ftraightnes of place and room, corruption of manners and idlenes. For if they have no Dukes, then it is expendient (as other whiles it happeneth) they flay the overplus, left the number of them growing too great, either violence might be offered to the King, or the Commons drawn to some feditidion.

They kill them molt of all, when as they have no great flore of young Bees to plant any new Colones, overthrowing and spoiling withall their Honey-combs (if they have any:) They execute alfo Theeves and Drones, fo often as they have not room enough to do their bufines in, (for they hold the more inward part of the Hive,) fo taking from them at one time, both their Honey-combs and meat. The fcarcity and lack of Honey, caufeth them alfo to be at deadly feud,fo that the fhort Bees do encounter the long with might and main. In which the bickering, if the fhort be Conquerors, it will be an excellent Swarm, but if fortune smile on the long Bees side, they live idly, making neuer any good Honey. Whofoever getteth the day, they are fo given to rapine and re-venge,
Of the Bee.

venge, as they take no prisoners, nor leave any place to mercy, but commit all to the sword.

Now concerning their longain wars, I must say they give place to no other living creature, either in swiftness, or hardy venturing: and if either men, four-footed beasts, birds, or Wasps, do either hinder, dispute, or kill any of them, so that they be not well contented, against all these they oppose themselves very hourly, according to their power wounding them. They have extremely audacious and fierce, and such men as be in armed with any Ointment, those that have curled or clipped hair (as also all unfaithful and bafe raskally people) and all those that wear any red clothes of the colour of blood: as concombrise they love and reverence exceedingly their Maiters, Keepers, Tutors, Defenders, and Maintainers: so that fitting upon their hands, they do rather tickle and lie them in sporting wife, then either wound or hurt them; though never so little with their wing. Yea their men may safely without any touch of hurt, and without any covering to their hands, gather together the swarms in a very hot Summer; yea, handly, place them in order, heap up together, sit or stand before their Hives, and with a flick take clean away Drones, Theeves, Wasps, and Horses.

If any Souladay looth his wing in fight, like one that had his Sword or Spear taken from him, he presently is discouraged and despaires, not living long, through extremity of grief. Going forth into the field to fight, they lay till the watchword be given, which being done, they flock in great heaps about their King (if he be a good one) ending all their quarrel in one feet barrel. In their order of fighting, how great vertue, courage, strength, and nobleness these poor creatures have, as well we ourselves can cete him, and they better who have assurred us by their writings, that whole Armies of armed men have been tamed by the flings of Bees, and that Lions, Bears, and Horfes, have been slain by means of them. And yet (how fierce and warlike soever they be, by,) they are appeased and made gentle with continual or daily company, and unless they be too much netted and angered, they live peaceably enough without any great trouble, never hurting any one maliciously or deceitfully, that standeth before their Hives. If I should go about to declare at large their ingenuity, natural inclination, cunning workmanship and memory; I should not only give unto them of Virgil: Patricianum urae divinae, but also bauful mens abtree, and (tefet Etybogoric errore,) the Metempscyphous of that ingenious Philosopher. For after that they are inclosed in a clean and sweet hive, they gather out of gum and moist liquor yeelding trees a kind of glutinous fluid, thick, clammy and tough, (called of the Latin, Chemonis, and of the Greeks, Mytis,) especially from Elms, Willows, Canes or Reeds, yeas even from Rones; and this they lay for the first foundation of their work, so covering it all over as with a hard crust as firft, bringing to it afterwards another layer of Piffecres, which is a kind of juice of Wax and Pitch, made with Gum and Robin, and over that again they lay Propolice, which we call Bee-glew.

In that same three-fold title, and sure ground-work thus artificially begun, they do not only laugh to corn, jet at, and mock the eyes of the over-curious spectators of their Common-wealth and works, but that which no man considers, they do hereby defend both themselves and theirs, against rain, cold, small vermin and beasts, and all their enemies. Then after this they build their Combes, with such an Architectonic prudence, that Archimedes in respect of them seems to be no body. For if of all they set up the cells of their Kings and Princes in the higher place of the Honey-combes, being large, fair, tumpous, flately and lofty, being cunningly wrought, of the most tried, purest and refined Wax, trenching them round for the greater defence of the Regal Majesty, with a mould and enclosure as it were with a strong Wall, Bultwark, or Rampiere.

And as Bees in regard of their age and condition, are of three sorts, so likewise do they divide their Cells: for to the most ancient they appoint houses next to the Court, (as those that are the fittest to be of his privy Counsel, and guardians of his Person) next to these are placed the young Bees, and those that be but one year old. And they of middle years and stronger bodies, are lodged in the utmost rooms, as those that are fittest and best able to fight for their King and Country. Yet Aristotle, faith, that Bees in the making of their Tents or Cells, do first of all provide for themselves, and next for their King and his Nephews, and lastly for the Drones. And as in the fabricature of their Honey-combes, they make the fashion according to the magnitude and figure of the place, fashioning it either orbicular, long, square, sword-like, or foot-like, &c. according to their own liking, running out sometimes in length eight foot: so their little Cells contrariwise, are framed after a certain form in a Geometrical proportion and measure: for by rule they are justly Sexangular, and capable enough to hold the tenant.

The whole Combe containeth four orders of Cells: the firft the Bees occupy; the next the Drones poifeel; the third, those that are called of the Greeks, Chadones; of the Latines, Apum taboles, (call them if you please Sabadones.) The laft is appointed for the room of Honey-making. There be some who contently aver, that the Drones do make combes in the same hive the labouring Bees do, but that they lack the skill and power of mellification, it being uncertain whether this comes to pass either through their grossefnes and big-bellied fatnes, or through their feld and natural lazines. And if through the weightines of the Honey the combes begin to shake and wag, and to lean and bend as though they were ready to fall, then do they rear them up, and under-prop them with pillars made Arch-wife, that they may the more readily dispatch their business, and execute their charges, (for it is necessary that to every combe there be a ready way.)
The History of Serpents.

In some places, as in Pergamum, and in the City of Amisus, Bees make white Honey, without any combs at all, but this is seldom seen. And if a man would consider the rare and admirable contexture and fabric of their Honey-combes, far excelling all humane Art and concert, who would not subscribe with the Poet, Exe Ammian partem divina memine, & longue aliter esse? who will deny them (I say) either imagination, fantasy, judgement, memory, and some certain glimpse of reason? But I will not dispute of this, neither am I of Pythagoras minde, who conceived that the souls of wise men, and of other ingenious creatures, departed into Bees. But whoever will diligently examine how they divide their labours, as some to make up the combs, some to gather Honey, to keep together their meat, to trim and dress up the houles, to cleanse the common draught, to under-shore the ruinous walls, to cover those places wherein any thing is to be kept, to draw out the very strength of the Honey, to digg it, to carry it to their cells, to bring water to the thirsty labours, to give food at last and appointed hours to the old Bees that fit to defend their King with such over-flight and painful regard, to drive away Spiders, and all other enemies; to carry forth the dead, (that no stink or ill favour hurts,) every one to know and go to his own proper cell, and generally, all of them not to stray far from home to seek their living; and when the flowers arespent neer their lodgings, to send out their espials to look for more in places further distant, to lie with their faces upward under the leaves when they have fet forth any voyage by night, left their wings being much moistened by the dew, they should come tardy home the next day; to balance and poyle their light bodies with carrying a flone in stormy weather, and when there is any whirl-winde, to fly on the further side of the hedge, for fear lest either they might be disturbed, or beaten down by the boylerous violence thereof. Whosoever (I say) will duly consider all this, must needs confefs, that they observe a wonderful order and form in their Common-wealth and government, and that they are of a very strange nature and spirit.

I had almost omitted to speake of that natural love which they bear to their young, a great vertue, and seldom seen in the parents of this age. For Bees doe fit upon their combs (when they have laid their increase) almoft like unto birds; neither will they thr from thence but in case of pinching hunger, returning out of hand to their breeding place again, as though they were afraid lest by any long stay and abstinence, the work of their little cell might be covered over by some Spiders web (which often happeneth) or the young by taking cold might be endangerd. Their young bees not be very nice or tender, nor cockerelly brought up, for being but bare three days old, as soon as ever they begin to have wings, they enjoy their task, and have an eye to them that they be not idle, though never so little. They are so excellent in divination, that they even feel aboard, and have a lene of rain and cold that is to come, for then (even by Natural instinct) they flye not far from home; and when they take their journey to seek for their nectar, (which is never done at any set and ordinary time, but only in fair weather) they take pains continually and diligently without any flay, being laden with such plenty of Honey, that oftentimes being over-wearyed, they faint in their return to their own private cottages, not being able to attain them. And because some of them in regard of their roughnes are unfit to labour, by rubbing their bodies against flones and other hard matter they are smoothe, afterwards addressing themselves most floutly to their busines. The younger sort behir them right doubtfully without dores bringing to the hive all that is needfull. The elder look to the family, placing in due order that Honey which is gathered and wrought by the middle aged Bees. In the morning they be all very filent, till one of them awaken all the rest with his chrice humming noye, every one bullting himself about his own proper office and charge. Returning at night, they are as it were in an uproar at the first, and after that they make a little muttering or murmuring among themselves, until the principal Officer appointed for the setting of the watch, by his flying round about, and his softe and gentle noyse, doth as it were covertly and privily charge them in their Kings name to prepare themselves to rest; and so this token being given, they are as silent as fishes, so that laying ones ear to the mouth of the hive, you shall hardly perceive any the least noye at all: so dutiful they are to their King, Officers, and Rulers, repoling themselves wholly in his books, favour, and pleasure. And now I will intreat of their excellency and use.

Whereas the Almighty hath created all things for the use and service of Man, so especially among the rest hath he made Bees, not only that they should be unto us patterns and prefigualds of political and economical vertues, (of the which before I have discoursed) but even Teachers and School-masters instructing us in certain divine knowledge, and like extraordinary Prophets, premonishing theucces and event of things to come. For in the years 90. 98. 113. 208. before the birth of our bleffed Saviour, when as great swarmes of Bees, lighted in the publique and Ox-maker, upon the houses of private Citizens, and the Chapell of Mass, many conspiracies and treasons were intended against the State at Rome, with which the Common-wealth was weignly deceived, infinuaded, gored and overthrown. In the days of Severus the Emperour, Bees that swarmed in the Environs, banners and standards of the Souldiers, and almost all of the camp of Niger, after which enufi given, confiding betwixt the Armies of Severus and Niger, Fortune for a time imparting her favours equally to them both, but at length Severus side carried away the bucklers. Swarmes of Bees also filled the Statues which were set up in all Hestoria, representing Antonius Plus, and after that they fell in the camp of Caius, and what hurly bursly after that followed, Julius Caecilius will resolve you. At which time also a great number of Romans were intrapped and slain by an ambusc of Germans in Germany, P. Fabius and Q. Elius being Confuls. It is written that a swarm lighted
lighted in the tent of Hesilius Butilius, who was in the Army of Drusus, and did there hang after such a manner, as they did enclose round his Spear which was fastened to his Pavilion, as it had been a rope hanging down. M. Lupidus and Munatius Plancus being Consuls. Also in the Consulship of L. Paulus and Caius Metellus, a swarm of Bees flying up and down, presaged the enemy at hand, as the Soothsayers well divined. Pompy likewise warning against Cesar, when for the pleasing of his Cæsars, he had let his Army in array, going out of Dyrbachium, Bees met with him, and darkened even the very Ancients with their great multitude. We read in the Histories of the Hebrews, how that in the year of our Lord 1385, when Leopold of Augrihich prepared to go against Semypach with an Host of men, being yet in his journey, a swarm of Bees fled to the Town, and there rested upon a certain great Tree called Tilia; whereupon the vulgar fort rightly foretold the coming of some strange people to them. So likewise Virgi in the seventh Book of his Äneis, feemeth to describe the coming of Äneas into Italy after this manner.

Lauri

Examen subito ramo frondente pendit.

Adventae virum.

Stridore ingenti liquidum trans atbera viete

That is, a tale of wonder to be told, there came a swarm of Bees, which with great myse within the air a Bay-tree did attain, where leg in long they crept fast, and top of all degrees. O're-spread, and suddenly a bine of them remained there hanging down: whereas the Prophet said, some stranger here shall come to us all afraid.

Which thing also Herodotus, Pauflanias, and divers other Historiographers, have with greater observation then reason confirmed. Láun Acouchmèns, when he could not finde the Oracle of Strophium, by a swarm flying thither he found the place. In like fort, the Nurés being abient, Jupiter Mettius, Hiero the Sycophant, Plato, Pindaris, and Ambrus, were nourished by Honey, which Bees by little and little put in their mouths, as Pitharcb, Pauflanias, and Textor are Authors. Xenophon likewise in his Oeconomiky, termeth Honey-making the Shep of virtues, and to it tendeth mothers of Houfholds to be instructed. Poets gladly compare themselves with Bees, who following Nature only as a School-miferesse, woth no Art. So Plato faith, that Poets ruled by Art, can never perform any notable matter. And for the same reason Pindaris maketh his brags, that he was superior to Bacchides, and Simonides, having only Nature, not Art to his friend. Bees unlesse they be incendi to anger, do no hurt at all, but being provoked and shirred up they flyng moft sharply: and fuch is the disposition and natural inclination of Poets; and therefore in his Mino strictly enjoyeth, that those who love their owne quiet, must take great heed that they make no wars either with Poets or Bees. Finally, they have to many virtues which we may imitate, that the Egyptians, Chaldeans, and Grecians, have taken divers Hieroglyphicks from them. And he that will read over Picius, shall there finde flore of Emblems of them.

The Country people in like manner have learned of them Acromantie, that is, Divination of things by the air, for they have a fore-seeing and understanding of rain and winde afoot, and do rightly prognosticate of storms and foul weather; So that then they flye not far from their own homes, but fuitain themselves with their own Honey-fuck already provided. Which being true, we mutt then think it no strange matter, that Aristim, Philius, Arifom тысяч Solenfic, Menus the Summit, and fix hundred others that have wite of the Nature of Bees, bidding adiew to all tho pleasures and delicacies that are found in Cities, for fifty and eight yeeres space together, inhabited the Woods and Fields, that they might more exactly come to the knowledge of their order of living, and natural dispositions, leaving it as a monument for posterity to imitate. But what their bodies do work in ours, I judge worth the labour and pains taking to let you understand, that we may be averse there is nothing in Bees, but maketh to the furtherance of our health and good.

First therefore, their bodies being taken newly from the hives and bruised, and drunk with some Medicinal ufe diuertical wine, cured mightily the Dropifie, breaketh the stone, openeth the obstructed passages of the Urine, and helpeth the suppression thereof. Being bruised, they cure the gripings and gripings of the belly, if they be laid upon the place affected: and if any have drunk any poynous Honey, Bees being likewise drunk do expell the same. They mollifie hard ucles in the lips, and being bound to the part, they cure a Carbuncle and the Bloody-flaxes, amending alfo the crudity of the flomack, and all spots and flecks in the face, being tempered with their owne made Honey; as both Hollicius, Alexandcr, Benedicit, and Pliny have written.

Gaen affirmeth, that if you take live Bees out of their Combes, and mix them with Honey wherein Bees have been found dead, you shall make an excellent Ointment to be used against the shedding and falling of the hair in any place of the head, causimg it to grow again, and come shrest. Pliny again willeth us to burn many Bees, commixing the ashes with Oyl, and therewith to anoint the bld places; but we mull (faith he) take great heed that we touch no other place neer adjoyning. Yea, he affirmeth, that Honey wherein is found dead Bees, is a very wholesome medicine, serving
Bees also are very profitable, because divers living creatures are nourished by, and do feed full
favourably on their Honey, as the Bear, the Badger or Brock, Lizards, Frogs, Serpents, the Wood-
pecker or Eat-bee, Swallows, Lapwings, the little Timtoume, which of some is called a Nanne, be-
cause his head is filletted as it were Nun-like, the Robin-red-breast, Spiders, and Wasps, as Bellonius
hath well observed.

But to what end (you will say) serveth their sting, against whose poison Pliny knew no remedy?
I must needs confess truly that which cannot be denied, that the stings of Bees are sometimes
venomous, but that is when either they are mad and raging, and be exceedingly disquieted by
means of anger, or some vehement Fever, for otherwise they do not sting. But prick but a little:
and therefore Dioscorides never made mention of the stinging of Bees, supposing it very unmeet for
a man to complain of so small a matter as the sting of a sily Beel. But yet they that have ac-
ceeded him, have observed pain, redness, and swellings, as companions and effects of their ma-
lice, especially if the sting do stick in the flesh, which if it do very deep, then death hath sometimes
followed, as Nicander writeth in his Theseeus. In like manner the people of the old World (that
we may prove the sting of Bees to be converted to some good use) did (as Suidas writeth) puni
those persons who were found guilty of coulenage, and deceitful counterfeiting of merchandise,
alter this sort: First, they stripped the offender stark naked, anoynting his body all over with Ho-
ney, then setting him in the open sun with his hands and feet fast bound, that by this means being
tormented with Flies, Bees, and scorching beams of the Sun, he might endure punishment, pain,
and death, due to his lewd and wicked life. With which kindes of punishment and torture, the
Spaniards doe grievously vex the poor naked Indians of America at this day, (now called the Weh-
Indies) who are under their rule and government, not for jullice Jake, (as those Ancients did) but for
satisfaction and fulfilling of their barbarous wills, and basely tyranny, that they might seem to be
more cruel than cruelty it self.

Nama faith, that if the herb Balm (called Apialetum) be beaten, and anoynted with Oyl upon
the stung place, that there will ensue no hurt thereby. Florent w. counselleth the gatherer of Ho-
ney, to anoynt himself with the juice of Marsh-mallowes, for by that means he may safely and
without tear take away the Combes. But the juice of any Mallow will do as much, and especially
if it be mixed with Oyl; for it doth preferveth from stinging, and besides it remedieth the stings.

But admit that Bees by their stinging do vexe and diserte us, yet notwithstanding the dead Bees
so found in the Honey do speedily bring cure to that hurt, if they be duly applied, abating and ta-
kings away all the pain and pyoin. What should I say? No Creature is so profitable, none leffe
sptomptous. GOD hath created them, and a little money and coft will maintain them, and small
provision will content them. They live almost in all places, yea, even in Forresets, Woods, and
Mountains; both rich and poor by their good husbandry do gather good customes and pensions by
them, they paying (as all men know) very large rents for their dwelling houses; and yet for all their
tribute they pay, a man need neither keep one servant the more for the gathering of it, nor set on
pot the oftner. Merula faith, that Varro gathered yearly five thousand pound weight of Honey :
and that in a small Village of Spain, not exceeding one acre of ground, he was won to gain by Ho-
ney there gathered, ten thousand Sefterties, which is of our English Cyn about fifty pounds.
We are furnished also out of their work-houses or Shops, with Waxe, Sandarax, Bee-glee, Combs,
and dregs of Wax, which no Common-wealth can well spare. To speak nothing of the examples
of their vertues and noble properties, being no leffe wholesome for the soul, then these others are
for the good provision and maintenance of our life, and for nourishment of our bodies necessaries
and commodious.

Now for the confusion of Bees, it is very meet (as Pliny writeth) that we come by them law-
fully, and by honest means, that is, either by gift, or by buying of them; for being taken away by
theft, they will not prosper with us: even as the heare called Rue being ilone, will very hardly
or never grow. Furthermore, to keep these good pay-masters, and to make them to love in you, you
must remove from their Hives mouths, unluckly, mischievous, and deceitfull people, and idle
persons, yea, and have nothing to do, causeth them to stand further off: As all to those that are di-
flayed with wholedome, or infected with the disafe called Gongrorhea, or the fluxe of menstrues,
bathes, or any thing that smellet of smook, mud, dung, or orudence of Cattell, men or bea,
houses of Office, shops, or kitchens. Mundifie and correct the air oftentimes, infected with the
breath and vapour of Toads and Serpents by burning of Balm, Thyme, or Fennel; having great
care to keep them neat, clean and quiet. Destroy all Vermine, and seerers to prey upon their Ho-
nay, robbers, pillers and pollers, and if at any time they be sick, give them phylrick.

Now the signs of their unhealthinesse, as of all other living creatures, are known by three
things; that is, from the action offended, the outward affect of the body, and excrements. For
their cheerfulnesse being gone, flaggers dulnesse, a giddy and vertiginous pace, often and idle stand-
ning before the mouth of the Hive, lack of strength, weariness, litchenesse, languishing, and want
of spirit to do any businesse, detestation of Flowers and Honey, long watchings, and continuall
sleepings, unaccustomed noyes and hummings, are sure arguments, that Bees are not in good
health. As alio if they be somewhat rough, not fine and trim, dry and unpleasant in handling,
not soft, harf, and rugged, not delicate and tender, if their Combes be infected with any manner of
of filthy, corrupt, and noyome favour, and that their excrements melt, thinke, and be full of worms, carrying dead carcases daily out of their houles, that they have no regard to their Bees and Bee-hives, it is a certain token that they are sick, and that some epidemical, general Petholence or plague rages amongst them, whereof that famous Poet Virgil hath very elegantly, but confusely touched some part, in the fourth Book of his Georgickes, in these following Verifies.

"Si vero (quantum lapsus Apibus quoque nofris
Vita tulit) tristis languentur corpora morte,
Iud non dubia poterit cognoscre signa.
Continuus est aegris alius color, borrida vultum
Deformat macies, tum corpora lucem non ausent.
Exportant telis, & tristis funera ducunt.
Aut ille pedibus connexa ad limina pendebit,
In English thus:

The life of Bees is subject unto fall,
Their bodies languish with disdised sad:
This by undoubted signs discern you shall,
Their bodies then with other colour is clad.
A baneous rough dust then deform their face,
Then doth the living bring dead bodies out,
And for their felowers make a funeral place,
Morning sad excites their dwellings all about.

And so the sicknesses of Bees being evidently known, plainly perceived, and cured, they will live many years, although Aristotle, Theophrastus, Pliny, Virgil, Varro, Columella, Cardan, and finally all Authors, would make us believe, that they seldom attain to nine years, but never to ten. Although we know by good experience, knowledge of place, and the credible attestation of men worthy belief, that they have lived thirty years. Which only reason hath induced me to believe, that Bees (even by Natures appointment) are long lived, and that only with Albertus I only doubts, whether they die by means of old age.

I am not ignorant, how they are made away with the rage and violence of diseases, and other enemies, but if they have all things furnished fit for the preservation of their life, and prolongation of health, and the contrary far from them, I know no reason but that I should conclude them long lived, yea, more durable then any other living Creature, and never to die, but that i may not deny their time and turn to be mortal. For they only do feed upon Honey, that immaterial Nectar, sent from heaven, and gathered from a divine dew (the very life and soul of all herbs, fruits, trees and plants.) Of whose nature, use and excellency, if you would know more, I must referre you to the learned writings of Physitians.

Of Bees called Drones and The Evans.

A Drone or a Dran in English, is of the Latines called Fucus, of the Greeks Kephon, and Thronos, of the Tyrianc Caesae, of the Germanic Trenemus, of the Belgic Scenoricis, of the Spaniards Zangane, of the Italic, Apo che non fa mele, of the French Baradon, and Fabelon, of the Pannonians (now called Hungarians) Here, of the Polonians Caesaeus. This kinde of Bee is called Fucus, as some think, quasi Furs, because he doth fortimella dwetore, devour Honey by stealth: although it be more agreeable to truth that it is termed Fucus, because he doth Apibus Fecum fraundique fature: And through the colour and pretence of keeping warm the Hives, he helpeth their flock and undoes all their Honey-making. And therefore for some to derive Fucus the Latin word from Plouzmai the Greek, feemeth to be farre fetched: Some again will draw Fucus, de suendo, quia infodendo supra juvet fascias, and this in my mind is as harshe as the former.

Many men make the Drone to be one of the four sorts of Bees, which is very unadvisedly done, as some would make us believe: Because they belowe no pains in gathering the Honey, nor labour on it throughly to have it perfectly wrought. He is twice so great as the common Bee, and greater then the Thief, so that in bignessee he eveneth, yea, surpasseth the King himselfe: and yet he attaineth unto this greatnesse, not by the gift of Nature, but by his custom and trade of life. Whereas as Bees do prepare and make the Cells for the breeding of Drones: they make them leafer then the Drones, and not here and there through the Hive, but only in the uttermost, and as it were in the banished or most out-cast place of all in the whole Camp and lodged Army. Besides, the small Worms of the Drones are far smaller at their first bringing forth, then those that are of the Kingly race, and lineage of their Dukes: Who yet at length grow greater then any of them all, in regard that by labour and travail, they waste and diminish nothing of superfluus matter, and those grousse humours, wherewith they abound, as also that both day and night (like Oxen lying at Rack and Manger) they glutonously raven and fluffe themselves with the Honey-liquor, which they again pay for full dearly, in time of any general dearth and scarcity of victual and provision.
Further this is to be added, that the Drone is of a more shining black colour then the true labouring Bee, he is also greater then the greatest, without sting, sluggish, idle, slothful, without heart or courage, cowardly, and unapt to war, not daring to venture life and limb in manly Martial trade, as the true legitimate Bees will.

Aristotle faith, that they breed and live amongst the true Bees, and when they fly abroad, they are carried flatteringly, here and there aloft in the air as it were, with some violence or tempest; so exercising themselves for a time, they return from whence they came, there greedily feeding upon the Honey. Now why the Drones may be compared with the Dukes and Princes, in respect of their corporeality, and Bees like unto them in their sting, let us hear Aristotles reason. Nature would (faith he) there should be some difference, left always the same stock should encrease one of another confusedly, without order or consideration, which is impossible: For so the whole stock would either be Dukes or Princes. And therefore the true Bees in strength and power of engendering, and breeding, are comparable to their Dukes, and the Drones onely in greatness of body resemble them: to whom if you allow a sting, you shall make him a Duke. Thee Drones further of the Greeks are called Colours, because he puttheth not forth any sting: whereof Herodotus hath thefe Verites thus interpreted;

Huius vero Dii succensent & homines quiunque otiosus
Virtus, factis ac acutis carentibus similis studie,
Qui sum omni laborum absuant otiosi
Vorantes.

Both God and men disdain that man
Whose Drone lies in the hive,
Nor good, nor ill, endeavor can
Upon himself to live,

In English thus:

Eat idle is, and without sting,
And gives the labouring Bee

Deserving that which be borne brings,

Not yielding help or fee.

So that either he hath no sting at all, or else maketh no use of it for revengement. Pliny faith flatly, that they are fingleffe, and would have them called imperfect Bees, and the famous Poet Virgil styleth them, Ignorum pres: that is, idle, and unprofitable, good for nothing. Columella maketh them a race or flock of a larger size, very like unto Bees, and accounteth them very aptly to be placed in the rank of ordinary forts of Creatures, of the same kind and company with Bees. They suffer punishment and are scourged many times in the whole Bee-common-wealth not only for pretence of idlenesse, glutony, exortion, and ravenous greediness, to which they are too much addicted; but because lacking their sting, and by that defect, being as it were emasculated, they dare not shew themselves in public.

Pliny doth not express their nature and quality. The Drones are fingleffe and so to be reckned imperfect Bees, and of the basest sort, taking their Original from tired and worn out Bees, and such as be past labour and service, living only upon a bare pension: we may call them the very slaves and bond-men of the true Bees, to whom they owe all due homage and subjection, wherefore they exerce their authority over them, thruting them first out of doors by head and houlders, like a company of drudges to their work; and if they be any thing negligent, not behirring themselves quickly and lively, they give them correction, and punisheth them without all pity and mercy. For in the moneth of June, two or three Bees (especially of the younger sort) will hale out of the Hive one Drone, there beating of him with their wings, pricking and tormenting him with their wings, and if he offer any resistance to their Lordly rule, then they violently call him down from the shelf or step whereon he holdeth, down to the earth as though they would break his neck. Thus when they have glutted their wills, and punished him at the full, they at length put him to a shameful death, all which we have often beheld, not without great admiration and pleasure.

Sometimes the Drones remain like banished persons, before the entrance of the Hive, and dare not venture to preff in. For three caues specially the Bees do drive and caull out the Drones: either when they multiply above measure, or when they have not place enough left for their labourers, or that they be pinch'd with hunger and famine, for lack of Honey. And as they carry a deadly hatred against the Drones, so to make it more apparent they will not hurt such persons as offer either to take away with their bare hands any of the Drones, and to caull them away, yet though they be in the greatist heat of their flight. Aristoile in his ninth Book, De Bibls. Animal, Cap. 40 affirmeth, that Bees are engendred apart one from another, if their Captain liveth: but in case their King and Captain dies, some day they breed in the Bees Cells, and that of all others of this kind, they are the most noble and courageous.

The young Drones are bred without any King, but the true younger Bees never: for they derive their Original and stock from the Kingly flock. Some will say that the young Drones do fetch their Original from the flowers of the herb Cerinthe (described by Pliny, which is a kind of Honeyfuckle, having the taste of the Honey and Wax together) from the Olive tree and Reed, but this opinion is weakly grounded, and standeth upon small reason.

Aristotle affirmeth, that they proceed from the longer and bigger Bees, yea, and thole that are termed Thieves: which without question he received either from the ancient Philosophers, or some
some others that had the charge and were skilful of ordering Honey, that lived in his time. Some will have them to breed and come from putrefaction, as Hidrae from hydrating and putrefied Mules; Cardan from Alces, Plutarch and Servius from Horces. Other some are of opinion, that they first proceed of Bees, and that afterwards they degenerate bawdlardike from them, after they have lost these things, for then they become Drones; neither are they afterwards known to gather any Honey, but being as it were deprived of their strength, they grow effeminate, ceasing either to hurt, or to do any good at all.

Some again hold the contrary side, affuring us upon their knowledge, that the true labouring Bee fetheth his beginning from the Drone, because long experience (the Medres of Wildrome) hath taught us, that there is yearly known to be the greater swarm, when there is the greater multitude of Drones. But this to me seemed rather the devise and invention of some curious brain, than any true grounded reason. For because that many Drones breed (as it cometh always to pass in good and plentiful years) therefore there should be greater swarms, is no good confeguent: but contrariwise, because the multitude of Bees do greatly increase through the moderatenesse of the pure air, and the plenty of the Honey-dropping dew, and through the abundance of this mellifuous moisture, there must needs follow a greater foison and flower of Drones: as the Philosopher hath well observed. But admit that this be true, that whereas there is the greater increase of Drones, there should yearly ensue the more swarminings: yet must we not thereupon conclude, that Bees do owe, and ought to ascribe their first original from Drones, but rather that they are indebted and bound in honesty to the Drones, because in time of breeding, they give much warmth and comfort to their young, (as Pliny lib. 11. c. 11. faith) conferring upon them a lively heat, fit for their increase and prospering. Some divide them into male and female, and that by coupling together they make a propagation of their kind, although (as Athenaeus writeth) neither Drones nor Bees were ever yet seen of any one to couple together.

But whereas Wasps, Hornets, and other Cut-wafted creatures that make any combs, and breed in the same, have been sometimes (though feldom) seen, both by us and Aretin, to joyn together, I can surely see no caufe why we should utterly take from them the ufe of Venus, though in that respect they be very model and moderate.

I have before in the discourse of their generation, laid, that the Bees do make the male kind, and the Drones to be but the female; but fith that in the of Honey-making they punifh them fo sharply after they have ejected them from poffeflion firft, fo that afterwards they put them to death, I can hardly be induced to believe that the Drones are but the female kind, considering that one thing wouldiffe and overcall all those replendent vertues which all men know to be in Bees, to deal thus cruelly with their Parents. To what ufe therefore ferve they in Hives? Seeing Virgil in the fourth book of his Georgics thus describeth them;

\[\text{Immutaque felifens aliena ad pabula fove.}\]

That is to fay;

\[\text{The Drones or free and bold doth fit,}\]
\[\text{And naft of others food commit.}\]

Where Pefius taketh Immutaque, for lazy, idle, unierceivable, unprofitable, and fuch as are nothing worth, except perchance after the guifte of wicked men, they fo serve their own turns, as to live by the sweat of other mens labours, and to bring out of order, or utterly fook to overthrow the whole frame of the Common-wealth.

But the most approved Authors set down divers good ufe of Drones. For if there be but a few of them among the Bees, they make them the more careful about their affairs, and to look more duly to their task: not by their good example, (for they live in continual idlenesse) but because they might continue their liberality towards strangers, they work the more carefully in their Honey-shop. And (if Bartolomeum do not deceive us) thefe Drones be not altogether idle: but they employ themselves about the building of the Kings Houfe, which they make large, flately, and very fumptuous in the higher and middle part of the combs, being very fair to fee in respect of their covering.

So then they are but lazy, in respect of Honey-making and gathering: but if you look toward their Art or Science of building, they are to be accounted excellent devifes of the frame and chief Masters of the whole work. For as the Bees do fashion out the combs of the Drones nigh the Kings Palace: so again, for the like counterchange of kindenesse, the Drones are the sole inventors, and principal work-masters of the Kings Court; for which caufe both they and their off-spring, kinfolks and friends, (if they have any) are bountifullly rewarded of the whole flock of Bees, by giving them frankly and freely their diet and maintenance which coltheth them nothing.

The Lockers or holes of the up-grown Bees, are somewhat too large; if you respect the quantity of their bodies, but their combs leffer; for thofe they build themselves, and thofe other are made by the Bees, becaufe it was not thought convenient and indifferent, to great a portion of meat to be given to fuch vile labouurers and hirelings, as was due to their own fons and daughters, and thofe that are naturally fubjects.

The other Greeks do besides affirm, that the Drones are the Bees Butlers or Porters to carry them water, afcribing moreover to them a gentle and kindly heat, with which they are faid to keep warm, cherifh and nourifh the young breed of the Bees; by this means as it were, quickening them, and adding to them both life and strength.

\[\text{K k k}\]
The History of Serpents.

The same affirmeth *Coloptera* in their words. The Drones further much the Bees for the propagation of their issue, for they sitting upon their kind or generation, the Bees are shaped and formed to their figure, and therefore for the maintenance, education, and defence of a new issue, they receive the more friendly entertainment. And *Pliny lib. ii. c. ii.* differeth not from him. For not only they are great helpers to the Bees in any architectural or cunning devised frame (as he saith) but also they do good in helping and succouring their young, by giving them much warmth and kindly heat, which the greater it is (unlesse there be none lack of Honey in the mean space) the greater will the swarm be.

In sum, except they should stand the Bees in some good stead, the Almighty would never have enclofed them both in one house, and as it were made them freemen of the same City. Neither doublethee would the Bees by main force violently break in upon them, as being the sworn and professed enemies of their Common-wealth, except when their flavish multitude being too much increased, they might fear some violence or rebellion, or for lack of provision: at which time who feeth not, that it were far better the Maker work-men, free Masons, and Carpenters might be spared, then the true labouring Husbandman, and tiller of the earth? Especially since that milking these, our life is endangered for lack of meat, and other necessaries, and those other for a time we may very well spare without our undoing, and for a need every one may build his own lodging. But as they be profitable members, not exceeding a flinted and certain number, so if they be too many, they bring a picknife called the Hive-evil, as well because they consume the food of the Honey-making Bees, as for that regard of their esteem heat, they choke and suffocate them. This diseafe is by the Author of *Geoquyicon* thus remedied. Moitified with water inwardly the lid or covering of their Hive, and early in the morning opening it, you shall finde Drones sitting on the drops that are on the covers, for being glutted with Honey, they are exceeding thirsty, and by that means they will stick falk to the moist and dewie places of the cover: So that with small ado, you may either destroy them quite, or else if you please, take away what number you lift your self. And if you will take away withall their young, who are not yet winged, and first pulling off their heads throw them among the other Bees, you shall bellow on them a very welcome dinner. But what the welling of Drones portended, and what matter they minifter in the Hieroglyphical Art, let *Apomnecur* reveal and disclose out of the Schools of the Egyptians and Persians. I think I have discharged my duty, if I have set down their true ues, true nature, generation, degeneration, description, and names.

*Fur in Latin, or Theef in English,* is by *Arystote* called *Phoer,* of *Hefockian Phoerist* : from whence I take the Latin word *Fur* to be derived. Some have thought that Theeves are one proper sort of Bee, although they be very great, and black, having a larger belly or bulk then the true Bee, and yet leffer then the drones, they have purchased this theevish name, because they do by theft and robbery devour Honey, belonging to others, and not to them. The Bees do easily endure, and can well away with the presence of the Drones, and do as it were greet and bid one another welcome, but the Theeves cannot endure, in regard that the Bees do naturally hate them, for in their absence the Theeves privately and by stealth creep in, there robbing and consuming their treasure of Honey, so greedily and haidly (without chieving) swallowing it down, that being met withall by the true Bees in their return homewards, and found so unwelie by means of their fulnes, that they cannot get away, nor able to refit, but are ready to burn again, they are fiercely punisht, and for their demerits by true Justice put to death. Neither thus only do they prodigally consume and spend the Bees meat, but also privily breed in their cells, whereby it often cometh to passe, that there are as many Drones and Theeves, as true and lawful Bees.

These neither gather Honey, nor build houes, nor help to bear out any mutual labour with Bees: for which caufe they have Watch-men or Warders appointed to observe and oversee by night such as are over-wearied by taking great and undefatigable pains in the day time, to secure them from the Theeves and Robbers, who if they perceive any Theeves to be floln in a doors, they presently set up, on him, best, and either kill him outright, or leaving him for half dead, they throw him out. Oftentimes also it happeneth, that the Theeves being glutted and over-cloyed with Honey, cannot fly away or get himselfe gone in time, but lyeth wallowing before the Hives entrance, until his enemies either in coming forth or returning home do so finde him, and so with shame, discredit and scoffing frown flay him.

*Arystote* appointeth no office, charge or businesse to the Theefe, but I think that he is ordained for this end, that he might be as it were a spur to prick forwards, and to whe and quicken the courage of the true Bees, when the other offer them any injury: and to flir and to encourage them to a greater vigilance, diligence, and doing of right and justice to every one particular. For I cannot see to what other purpofe Theeves should serve in a Christiant Common-wealth, or what ufe might be made of such as lie in wait to displease, and practice by crafty feche, ambithes, and deceitfull treacheries to wound their Neighbours, either in their elimination, credit, or goods. Thus having at large discoursed of the lefe hurtful and stinging sort of Bees, I will now apply my self to a more luttful, teuly, angry, Wafipht, and implacable generation, more venomous then the former, I mean Wafps and Hornets.
A Wasp of the Chaldeans is termed Delbrine. Of the Arabians, Zambor. Of the Englishmen a Wasp. Of the Germans, Ein Weisse. Of the Belgics, Harzel. Of the Gobiers, Bonzirong. The common people of Italy term Vespa, and some of them do usually call it Mosconi, and the Bene- 
mark, Velpes. The French, Guappe, The Spadardi, Aspres, and Vespas, imitating the Latines, who 
call it Vespa. The Polesants, Offa. The Selavonians, Woff. The Hungarians, Daras. Calpeine faith, 
that it is called Vepaqua vesperi moscon venatur in cibum. The Greeks do also name them diversly, for 
commonly they are called Spokes. The Schoiailist of Nicander calleth them Lucowsiks; and Suidas, 
Delaius, and Delphes. Of Hebrus, Auleus, and Passifores; and Grecs naymeth them Ambreus: 
for these ought rather to be called Bees: Exiabritus deriveth Term Spexus, apx tris deslujogen, because 
they seem to be so much cut tinder the waffe or middle, as that they seem to gaze and to be clean 
cloven asunder, as by the figure here fet before your eyes you may plainly perceive. A Wasp is 
a kind of insect, that is fruit, living in rooms and companies together, having somewhat a long body 
encircled, with four membranous wings, (whereof the two former are the greatest) without bloud, 
flung inwardly, having also six feet, and a yellow colour, somewhat glittering like gold, garnithed 
with divers black spots all over the body in form of a triangle. Whereupon peradventure This 
would needs have it called Disphrus. 

The body of a Wasp seemeth to be fastened and tyed together to the midst of the breast, with a 
certain thin fine thread or line, so that by means of this disjoynd, and not well compacted compo-
sition, they seem very feeble in their loins, or rather to have none at all. Whereupon Aristophanus 
the Greek, Poet, in his Comedy, entituled Spheces or Waps, tearmeth all those Mids which are fine, 
slender, and pretty small in the waffe, Sperateus, resembling them to Waps, as if one should call 
them Wasp-waited-wrenches, whom Terence very quaintly and elegantly tearneth Spernos, that is, 
slender, long, and small, like to a Bulrush. I think that all the whole pack of them have flings in ge-
neral, although I am not ignorant that some Authors hold the contrary, affirming that the breeding 
female Waps do want them: but thus much I can fay of my own knowledge, that on a time 
finding a Waps net, and killing them ever one by pouring hot scaling liquor into their holes, 
because I would bolt out the truth, I plainly perceived by long viewing of their bodies, that there 
was not one of them all but had a fling, either thrust out evidently, or closely and secretly kept and 
covered. So that:

Quid nobis certa dvis est
Sensibus esse potest, quoe verae se falsa venum?

In English thus;

What can more certain be then sense,
Discerning truth from false pretence?

They make a found as Bees do, but more fearful, hideous, terrible, and whistling, especially when Lucretius, 
they are provoked to wrath; from whence Therestus inteacheth this prover, Spexis bombonm trettus 
venation, that is, Scelit obtirruman atmunda espisa viensa: and this old fald Saw may well be applied to 
those who being themselves unlearned, will not fick to cry out, exclaim, and procure trouble to thole 
that be more learned: or to such as be weak, feeble, and impotent persons able to do nothing, that 
will offer to contend with their betters and Superiors with their brawling speeches, and spirituall 
raylings. And this Latin proverb carryth the fame fense, Canina lemmn adieritum.

If you will have the gifts and ornaments of their minds described, you must consider that a Wasp 
is a creature that liveth in companies together, one with another, subject to a civil government un-
der one King or Ruler, indeltrious, mutual friends one to another, ingenious, crafty, suble, quick, 
and cunning, of a very quarrelsome nature, and much subject to anger and retiliness. This is a good 
Argument of their Civil and Political manner of life, in that they live not solitarily in a Deer or 
Wilderness where no man keepeth, but they build for themselves a City, both excellent and admi-
orable for the notable buildings and houses in it, where they spend their time (for the moft part) ac-
cording to the mutable and never-failing laws of Nature, observing and keeping ever the Golden 
mean, as well in their daily tasks, as in their dispositions and affections of mide.

Besides, they are governed with a Kingly, not with a tyrannical government, (as Elianus 
faith) although by nature they are great fighters, eager, boylerous, and vehemently temperate-
ous: and he is led to fay this, because their Dukes or Generals are wingles, or rather having flings 
as their subjets, they will not use the fame to the hurt of their inferiors, by thruffing it forth, or 
striking in paffion.

Now although they be twice so great, and harder and rougger then the other Waps, yet 
are they not unfinishd of the vertue of patience and clemency, or gentle and debonair behav-
our, by which means they keep in order, and contain in their lils, as it were by gentle langue, 
their unruly rout, and mutinous companies. There is no man but will confede, that this is an 
evident token and argument of their mutual love, and great good liking which they bear one to 
another: for whofoever dare be so knock-hardy as to come near their houses or dwelling places

K k k 2 where
The History of Serpents.

where they have to do, and to offer any violence or hurt to the same, at the noylfe of some one of them, all the whole swarm rusheth out, being put into an amazed fear, to help their fellow. Citizen, and do so busily betrifh themselves about the ears of their molefters, as that they fend them away packing with more then an ordinary pace: and if we will credit Euhistus, the Phenof-

lies in times past were condemn'd to forfakke their City, for all their defence, munition, and Ar-
mour, only through the multitude and cruel fiercecffe of the Wafps, wherewith they were annoyed.

Again, this manifeftly proueth that they want not a hearty and fatherly affection, becaufe with more then hercillif courage and invincible fury, they fez upon all perfons, of what degree or quaf-

ity forever, that dare attempt to lye in wait to hurt or defoy their young breed, no whit at all dreading Neptolemus, Pyrtius, Helcor, Achilles, or Agamemnon himfelf, the Captain generall of all the whole Grecians, if he were prefent. Yea, the Divine Poem Homer, in 12. lib. of his Iliads, when he would exprife the haughty and generous spirits of the Grecifh Cheifains, he likeneth them to Wafps in these words, Spekoffa ajalios traden kai Toumon ebouphi, that is, having the hearts and flomacks of Wafps, when they are to fight for their private dwellings, their dear Progeny and off-

spring. The love that Bees carry to their issue is great, but it cannot be greater then that of Wafps, neither can they have a greater promptitude, alacrity, or defire to defend their young ones, if they be any way offended by passengers. Which thing Homer in his Iliads, lib. 12. intimateth by the example of the chafing god Jupiter, who took it marvellous angry, and much repined at the furious flomacks of the Grecians, adding, that the Grecians did defend themselves as valiantly, and endur'd the fhook and affault of their enemies, as ever Wafps or Bees would in defence of their chil-

dren or issue; in thefe Verfes following;

Non enim ego putavi heros Aobivos
Suffrunturos nostrum robur, & manus invictas:
Ili autem quae in axeet atque aetis,
That is to fay,

Quae nidos faciant ad iam pulverulentarn,
Neque deferunt cum dorum; fed expellant
Vires venatoris pingent pro filius.

I did not think our noble Grecian Lords could bear
Our force, and with unconquered hands maintain
Our right: but they like Wafps and Bees devout of fear,
Which by hiego-ways their bujes use to frame,

Besides this, they further build for them very large dwellings, with Chambers and floors, in a round and orbicular form, with rooms one above another, finely and wittily compacted, fo that there is space enough of ingrefle and regrefle, and very defensible againsf all winde and weather, and yet their nefts or houfes are not all made after one fahion, but very different; fome of them re-

preffenting a Harp, fome made much after the fahion of a Pear, a Toadftool, a Bottle, or budget of Leather, and some like a flanding Cup with handles.

Some affirm, that the mater of their Combes is confufed, rude, and iflafouredly heaped up, full of bark and sand, but I could never as yet fee it otherwise then light, slender, and thin like pa-

cer, dry, tranparent, gummy and thin, as though it were thin leaves of gold, flaken very easily hither and thither with the winde, and rising many times from the foot or foundation very small, and broad above like unto a Top. The place of this their building is divers, and much different for some repects. For if they have loft their Duke or principal Leader, then do they make them nefts of clay in the high holes of walls and hollow Trees; and as some fay (although hither I could never fee it) they make Wax there also.

But in cafe they have a Generall or Duke, then they make their nefts under the earth, their Cells or Chambers being formed with fix angles or corners, much like unto Bees. They make their Combes round, much after the fahion of a broad Toad-Toof, from whole centers there go-

eh forth as it were a fhort flalk or tying, by which the Comb cleaveth, and is faffened hard to the earth, or fome tree, or peradventure to fome other Combe. They have fuch a tender care over their females, (especialy at fuch time as they are great with young) and fuffer them fo much to have their own wills, as they will neither permit them to take any pains abroad for their living, nor yet to fee for their meat at home: But the males flying about, (like good Purveyers) bring all home to their own dwellings, thereby as it were strictly enjoying the females to keep them-

selves within doors.

All which fore-cited particulars, if a man would duly enter into consideration of them, he must needs confeffe, (will he will he) the admirable induftry, diligence, wit, prudence, Art, sweat, and labour that is in thefe poor vermife. Their natural inclination to anger, and the bafy furnifhme-

nts of Wafps, not only Cocks, which do scratch and scrape up with their fpirs their nefts, doe finde im-

placable, but even all other difturbers and provokers: From whence I take it that proverb hath sprung, Spicfian eritbinicein, which the Latines as Plintus almoft in the fame fene ufeth, Irritare Cra-

bromes: For Crabro among the Poets, is used fometimes for a Hornet, and otherwhiles for a Wafp.

In like manner Clemens Alexandrinus, Stromaton 2, when he would exprefse and declare the foun
delefs and abominable hurt of fuch firs that do lie in wait as it were to deceive, and watch to do displeasure to the life of man, hath these words, Houoi gar (inquit) oi antegenisfal patheis koi

Olympi-
Of the Wasp.

Olympioes, ifbecon bas exper esti diesmutrai, kai maleta hekone. That is, these fat, dull, grogge, and Olympical enemies of ours, are worser then Waps, more cruel and pleafant, and especially fenfual and worldly pleafure. Yea, whofoever dare adventure to challenge into the field this hardy and couragious little Creature, he shall (I dare be bold to fay) but Cademqem witfatum reparetse, lofe more then he fhall get, when his sword againft himfelf, and return home by weeping croffe, conffdering that befides the noblenefle of their fluent flomacks, and armed flings, they are withall fo flife and obfinate, as that they will never give over.

They differ alfo in their firft breeding, flock, sex, place, feeding, and manner of labour. Iflode faith, (although perhaps not fo truly) that Waeps do firft proceed from the rotten Corkafes of dead Afles: for all hold opinion, that the black Flies called Beetles, do take their Original from them. But I am rather moved to think that they were firft bred from the dead body of some warlike and fierce Horfe, and fo also thinketh Pliny, in his eleventh book and twentieth Chapter. And the Gra- ciuns have ufually this famous and vulgar Verfe in their ordinary talk.

Hippa men bebeo genefis, Tauri de melifin, 
Equi enim seipsum generatis, Tauri vero Apum.

In English thus;

Waps do firft come from Horfe, and Bees are bred from Bulls.

And surely their incredible witneffe in their flight, their ardent and burning defire have they to fighting, are fufficient inducements to move me to think, that they took their firft beginning from fome gaffant Horfe, and not from Afles, Oxen, or COWes, and much leffe from the tearful Deer. For Dame Nature hath feldome been fo indulgent and friendly to any one beast besides an Horfe, as to excell both in witneffe of pace, quickneffe of spirit, courage of flomack, and magnanimity. And I rather lean to this fide, becaufe elfe I do not know what fenfe I fhould have to give that

Aristotelian Proverb;

Chairete allpopound thougaters ippon,
Selvete volupedum filie Equorum:

Which may be Englished thus;

All bali ye daughters of swift, footeed Horfs.

For befides the truth that lyeth in the bare words, I take the morall of it to be uttered as a witty check, or a figurative flout, conceitedly to rebuke and hit in the teeth those threwd women, curft and fclouding wives, which are fo peevifh that they will not be pacified, who are like unto Waps in their fullen difpleafant humours, tempestuous madneffe and pelting chafe.

Some Waeps do proceed from the finking Corkafe of a Crocodile, if we may give any credit to the Egyptians and their fellows; and for that caufe, when they imagine or think a Wasp, they paint and draw out the shape and form of a Crocodile or a Horfe. From hence Hieron Gardant would make this collection, that of every corrupted living Creature another doth proceed: which in my conceit is very abfurdf and againft all reafon. For this being granted, the generation of Waeps would be infinite, and daily experience would read a Lecture of contradiction againft him, upon the progreffe of Natures works. Many times Waeps do breed by the mutual company of the male and female together, which though Athenæum counteth but a fable, yet for all that, fith the Philosopher doth plainly tell us, that he hath been an eye-witneffe to the fame, (as in his firft book De gener. Animal. cap. 16, and in his ninth book De fuis. Animal. cap. 41.) I will wholly incline to his judgement. But what manner of beginning they have by joyning together, and how itis perfected and accomplifhed, let us a little lend our listening eare to Aristotle, and Pliny his Interpreter.

The Princes or Ring-leaders of the Waeps, when they have made choice of a fit place for themselves under the earth, either in the holes, chinks, or clefts of the Rocks, or in thatched houfes, (as I have often feen) there they make their Combes in the begining of Summer, fashioning their small Cells with four little doors, wherein small Worms do breed, who when they are more grown, they make yet other greater doors or hatches, and then again when their young are at the greaftefl, they make others, fo that towards the end of Autumn, you fhall finde many, and those very large nelfs; wherein their principal Commander doth breed, not with every Wasp indifferently, but only with thofe of his own race and princely linage. They are bred in the molt eminent and highest place of the Wasp-nell, like unto great Worms, their Cells being four or five in number, clofe joyned and couched together, for otherwife they would increafe after the fame fort in all repleft, as the common Waeps do.

The excrement is only in the small Worms, and their young increafe remaineth immovable without any flirring before they be able to fly, and whileft they are covered as it were with a thin membrane, and yet in the fame feafon of the yer, and in the space of one day, you fhall manifiely perceive a great difference: for one flyeth out, another flicketh full as it were in the shell, another rolleth and tumblcth, and a fourth cannot flir one whit. All these have their beginning and increafe for the molt part in Autumn, not in the Spring, and especially in the full of the Moon. This one thing here is to be noted, that Waeps do not inflame, and that in Summer-time they are subject to Kings, and in Winter, Gunaivovratais, the females regiment, or Muleth's

K k k 3 Imperius
of Serpents in General.

imperium prevaleth. And when they have renewed and repaired their issue with a great supply, and that they be fresh and juicy, the Empire again returneth to the Masculine kind, and yet it is but a short, brittle, and ruinous Empire, notable to bear up itself, although by Nature immutable decreed orderly ruled, and rightfully governed.

Arifate faith, that it is not likely that the young Wasps are brought forth as a brood, because they be so great in bulk, as that in reason it should not seem probable, that so small a file as a Wasp, should have such great young ones. But this is a bare and weak reason, not beleeving the dignity of so great a Philosopher. For what can any man allledge to the contrary, why Nature in a lawful birth and breeding, should not as soon and as speedily finish, as the doth in generation that proceeds of rottenneffe or corruption, which I hold to be but illegitimate? Let us but call fonts young birds, in how short time after they be out of the shell, they be feathered, they are able to go, to eat, yet quickly increas'd in strength, and grown to their full greatneffe, so that they are in their full flower ere one be a ware. All which when one hath thoroughly considered, he will easily judge that famous Philosopher Arifate, to have relied but upon a weak prop, having scarce probability to stand on his fide for the maintenance of his opinion. His credit therefore at this time must not be sufficient to barre us the liberty of contradicting him.

The fame Arifate, the Monarch of our modern learning, faith that the small worms of Wasps, before they have any wings at all, are somewhat long, not much unlike those worms which Hippocrates calleth Eulcis, that breed in feft, called (as I judge) Maggots, but in our Country, Gentiles: and these Wasps worms are somewhat white, known and easily difcover'd by their fkins or dathes, the hinder part of their body being very thick and groffe, having a black lift or line running along their backs, without feet, not creeping, but rolling and tumbling themfelves this way and that way confusedly. When they have disburthened themselves of their breed, they close up their cells with a certain thin small skin, which again being broke when they come to any perfection or growth, they get themfelves out of dores into the clear light, and at two days end will be able to fly round about. The Philosopher maketh two kindes of Wasps, the one wide and fell, the other more meek and quiet. The wilder fort is seldom feen, for they live and breed in Mountains and Woods, in Oak, trees, and not in the earth, and this kindes is greater, blacker, more diversly cou'd, and fignet more cruellly then the other. After they have lived one whole year, they are seen to fly away, if in the Winter the tree be cut down. Thofe kindes of Wasps I did once fee in a Wood in Effex, where going unwarily to gather fimples with another Physitian, and offending one of this fumnifh generation, the whole swarm of them presently runned forth about mine ears, and fully had I not had in my hand fome fprings or branches of broom for my defence. I had undoubtedly paid dearly for this my unadvisedneffe, if it had not got me my life, for they purfued me in every place of the Wood, with a vehement rage for a long feafon, infomuch that I was fain to take me to my heels, and fo to seek to fave my felf from further danger. And if our own Countryman Sir Francis Drake himfelf had been there, although he was (as Materia in a stranger, and fo unpartial) in his Bar- gick History right truly obferved,) Omnim ductum nufri sfech fortifimus ac famofifimus, yet I make no doubt, but he would have taken my part, and been a companion with me in this my fearful flight.

Some of thefe Wasps, as well tho'fe of the crueller kindes as tho'fe of the gentler, do lack a flinging, (or rather, I think they feem not.) Otherfome again of both forts, are furnifhed with wings, and fome that want them, are ever the leffer and weaker, neither revenging themselves any way, nor offering to make reffilation. Contrariwise, tho'fe who have flings are greater, stronger, more quarrellefs, contentious, flibborn and eager. Some account thefe the males, and tho'fe other flingflefe to be the females. Many of thofe which have flings, do forgoe and quite lofe them when Winter draweth on, as fome make reckoning, but it was never my hap to fee this, faith the Philosopher in his 9. Book De hift. Animal. capi. 41.

If you catch a Wasp, holding her falt by the feet, fuffering her to make her ufual humming found, you fhall have all tho'fe that lack flings prefently come flying about you, which the finged Wasps never are feen to do. Therefore fome hold this as a good reafon, to prove that the one fhould be the male, the other the female. Both thefe forts, both wilde and wiludle, have been feen to couple toger after the manner of flies. Befides, (in reffpect of the) both kindes of Wasps are divided into Captains or Ring-leaders, and into labourers: tho'fe former are ever greater in quantity, and of more calm diifpofition; tho'fe other, both laffer, more frowndly, telly, peevifh, and divers. The males of labourers, never live one whole year out, but all of them die in the Winter: time, which is evident by this, becaufe in the very beginning of cold weather, they are as it were frozen or benumbed, and in the depth or midil of hard winter, a man thall hardly or never fee any of them.

But yet for all that, their Dukes or principal Chief-tains, are feen all the Winter long to lie hid in their lurking holes under the earth: and indeed many men when they plowed or broke up the ground, and digg'd in Winter, have found of this fort. But as for the labouring Wasp, I never as yet heard of any that could finde them. Their Principal or Captain, is broader, thicke, more ponderous and greater then the male Wasp, and fo not very swift in flight, for the weightneffe of their bodies is fuch an hinderance to them, that they cannot fly very far: whereby it cometh to paffage, that they ever remain at home in their hives, there making and deviling their combs, of a certain glutinous matter or bulblance, brought unto them by the Work-wasps: thus spending their time in executing and doing all tho'fe duties that are meet, in their Cells.

Wasp
Wafps are not long lived, for their Dukes (who live longer,) do not exceed two years. And the labouring, that is the male Wafps, together with Autumn, make an end of their days: Yea which is more strange, whether their Dukes or Captains of the former year, after they have ingendered and brought forth new sprung up Dukes, do die, together with the new Wafps, and whether this do come to paffe after one and the self fame order, or whether yet they do and may live any longer time, divers men do diversly doubt. All men hold the wilder kinde to be more strong of nature, and to continue and hold out the longer. For why, these other making their nefts neer unto common highways and beaten paths, do live in more hazard, lie open to divers injuries, and fo more subject to shortness of life.

The brevity of their life, is after a fort recompensd, and some part of amends made by the rare clammy glewifhneffe of the fame; for if you separate their bulks from the head, and the head from the treat, they will live a long while after, and thrust out their iling almost as strongly as if they were undividable, and free from hurt and deaths harm.

Apionism calleth Wafps Omeoloris, and Ariftote, Melorotis; although they do not only feed on raw fleth, but also on Pears, Plums, Grapes, Railins, and on divers and sundry fruits of flowers and fruits; of the juyce of Elms, Sugar, Honey, are in a manner of all things that are feazoned, tempered, made pleafant, or prepared with either of these two laft rehearsed.

Fliny in his i. Book capi. 53. is of opinion that some Wafps, especially thofe of the wilder and feller kinde, do eat the fleth of Serpents, which is the caufe that death hath oftentimes enu'd of their poifonous Stinggng. They also hunt after great flies, not one whit sparing the harmefle Bees, who by their good deeds have so well deserved. According to the nature of the foyl and place, they do much differ in their outward fform and fashion of their body, and in the manner of their qualities and dispositions of their minde: for the common Wafps being acquainted, and familiarly ued to the company of Men and Bealls, are the gentler; but the Hermites and foltary Wafps are more rude, cruel, and tempeffual: yet Nicander exemps them Olws, that is, pernicious. They are also more unhappy, dangerous, and deadly in very hot Countries, as Ouidius reporteth, and nameth in the Welf-Indies: where both in their magnitude and figure, there is great difference betwixt theirs and ours, so that they are accounted far more poifonous and deadly, then either the Englifh, French, Spanifh, or Barbarian Wafps. Some of thofe dangerous generation do also abound in exceeding cold Countries, as Oleum Magnus in his 22. Book telleth us.

Their ufe is great and fingular: for besides that they ferue for food to thofe kind of Hawks which are called Kaifrets or Fleingtals, Martinets, Swallows, Owls, to Brocks or Badgers, and to the Camefion: they do also give great pleafure and service to men fundry ways, for the kill the Pbalangium, which is a kinde of venomous Spider, that hath in all his legs three knots or joynts, whose poifon is pernicious and deadly, and yet Wafps do cure their wounds.

Raynard the Fox likewise, who is fo full of this wiles and crafty shifting, is reported to lie in wait to betray Wafps after this fort. The wily thiefs thrusteth his burny tail into the Wafps neft, there holding it fo long until he perceive it to be full of them, then drawing it flily forth, he beatheth and fmiteth his tail full of Wafps againt the next flone or tree, never refenting fo long as he feeth any of them alive; and thus playing his Fox like parts many times together, at laft he feteth upon their combs, devouring all that he can finde.

Fliny greatly commendeth the foltary Wafp to be very effectual againft a Quartain Auge, if you catch her with your left hand, and tie or affain her to any part of your body, (always provided, that it muft be the firft Wafp that you lay hold on that year.) Miscalcius memor. Cell. 7 attributed a great vertue to the difiled water, and likewise to the decoction of common Wafps, affirring expressly, that if any part be therewith anointed, it straight ways caueth it to fwell monifteriously, and to be puffed up, that you would imagine them to be fick of a Drapie: and this courtefy drabs and queens ufe to perfwade their sweet hearts, that they are forfooth with chide by them: thus many times beguiling and blinding the eyes of wary and expert Midwives. Whereupon we may very confidently conclude, that their poifon is very hot, flatulous or windy. Some do prole efter Wafps, and kill them by other flights and deviles. For when the labours do much ufe and frequent Elms, which they do very often about the Summer follisice, to gather from them some gummy and clammy matter, their Dukes and Princes being at home, not flanding full, but letting themselves to their bullines or tribe, and helping to bathe up their young, they are suddenly choked with the fume of Bromptone, Garlic, the branches of Coleworts, or other pot-herbs, or elfe by breaking down and overthrowing their combs, they dye through famine.

When you are minded to defend the Bees from the invasion and profe of Wafps, you muft fet a pot with some pieces of fleth in it neer the Hive, and when the Wafps (in hope of some prey) are entered, sudenly clap over the cover, and so destroy them, or elfe by pouring in some hot water at the top, you may flay them all to death in the pot. In like fort, some do gentle breath upon Railins, Fruits, Sugar, Honey, Oyl, by which, either the Wafps are chafed away, or by tayling the Oyl do die. And again, some do mix corróvives with Honey, (as for example, Sublimates, Vitriol, Aurigentum, &c.) that by taking this venomous or poifon infected drink, may fuffer condfign punishment for their intemperate and inftafiable glutony.

Of the flinging of Wafps there do proceed divers and fundry accidents, passions and effeots, as pain, diluqueting, vexation, swelling, redneffe, heat, fweetings, disposition or will to vomit, loathing and abhorring of all things, exceeding this finelife, and now and then fainting or fwooning; especially
especially when after the manner of venomous creatures, they have infected their stings either by
tailing the flesh of some Serpents, or by gathering their food from venomous plants.

I will now fet before your eyes and ears one late and memorable example of the danger that is
in Wasps, of one Allen's wife, dwelling not many years since at Lowick in Northamptonshire, which poor
woman reporting after her usual manner in the heat of the Summer to Dr. Goddard's house, being extremely thirsty, and impatient of delay, finding by chance a black Jack or Tankard
on the Table in the Hall, the very inconsiderately and rashly fet it to her mouth, never suspeeting
or looking what might be in it, and suddenly a Wasp in her greeneffe paffed down with the
drink, and stinging her, there immediately came a great tumor in her throat with a redness, puf-
ing and swelling ot all the parts adjacent; fo that her breath being intercepted, the miserable
wretch whirling her selfe twice or thrice round, as though she had had some Vertiginy in her brain,
prefently fell down and dyed. And this is known for a truth, not only to me, but to most of the
Inhabitants thereabouts, being as yet fresh in their memories, and therefore their authorities as I
take it, is unproveable.

Now, for fear left I should lose my self in this troublesome and vast Ocean of Natures admirable
fabricate, I will now difcoure of such medicinal means, as will defend from their furious malice.
The vertue of Mallows, and of Althea, (called Marsh-mallow) is notable against the stings of
Wafs. For the foftest and molt emollient herb, is applied as a contrary to a warlike and hurtful
creature, whose juicce being anointed with Oyl, either abate the rage of Wafs, or be blunted
and dulled their fting, that the pain is not very sharp or biting. Pliny lib. 21. cap. 171. And of
the fame minde is Asitum; Wafs (faith he) will not come near any Man if he be anointed with Oyl and
the juicce of Mallows. For as a foft anwer doth frangere iram, and as the Grecians have a faying,
Edu Meijnas efm atn eger pharmaken lagos: So alfo in natural Philosophy we fee, that hard things
are quelled, and their edge even taken off with foft and fuppling: as Iron with a fine, small, and foft
feather, the Adamant fhone with blood, and the fling of Wafs, Hornets and Bees, with Oyl and
Mallows.

What is fooner then a Caterpillar? and yet if Asitum credit be of sufficience, the fame being beaten
with Oyl, and anointed upon any part preferveth the fame from the wounds and flings of Wafs.
And of the fame vertue the herb called Balm, being ftemped and mixed with Oyl. The fame
symptoms or accidents do follow the flinging of Wafs, as of Bees, but far more painful, and of
longer continuance, to wit, redneffe, and intolerable pain, and Apofumes. And if any be
trucken of the Orange or yellow coloured Wafs, especially in a fnewy or fome fенitive part,
there will follow a Convulfion, weakenefte of the fkins, ftwounding, yea, and sometimes death, as be-
fore I have touched.

Against the flinging of Wafs divers medicines are precribed by Phiftians, but I will speak of
fuch only as I have made proof of, and fuch as are confirmed by long experience. Gilbert the Eng-
lifhman, faith, that Wafs being bruized and applied to the place affected, do cure their own
wounds very ftrangely. The fame vertue peradventure, not only the Scorpion, but the greater
part of Infects have, if any one would make any diligent trial thereof. If a man be stung of any
venomous Wafs (which is easily known by the bluenesse of the place, madneffe, raving and faint-
ing of the party, and coldneffe of the hands and feet) after you have given him inwardly fome Alexi-
pharmaca medicine, the place afceived must be linched, or rather opened with a Cautery, fo being
thus enlarged and opened, the venom must be well fucked out, and the paring or ftaving of that
earth wherein the Wafs build their nets, must be wounded and kneaded with Vinegar, and so ap-
plied like a Cataplasm.

A plaifter also made of Willow-leaves, Mallows, and the comb of Wafs, is very medicable for
the fame, as by the counsel of Holy Abbas I have experimensed. The English Northern men, do pre-
pare molt excellent emplifier worth gold, againft all flings of Wafs, only of that earth whereof
their Ovens are made, having Vinegar and the heads of Flyes commixt therewith. Let the place
be very well rubbed with the juicce of Citrals, and withall, let the party that is pained drink of the
feed of Marjoram beaten to powder the quantity of two drams: or thus Take of the juicce of Mar-
joram two ounces of Bole Armony two drams, with the juicce of unripe Grapes so much as is suffi-
cient, make an emplifier. Another. Anoint the place with the juicce of Purcellane, Beets, or fweet
Wine, and of Oyl of Rofes, or with Cows bloud, or with the feeds of the Spiritng or Wilde Cucumber
(called Nelis: tangere) beaten with fome Wine. Thus far Galen. Barley Meal wrought up with Vi-
negar, and the Milk or juicce of a Fig-tree, Brine, or Sea-water, are excellent for these griefs (as
Diofcorides lib. 8 cap. 20. writte) if the wound be often fomented, bathed, or foaked with any of
them. To drink, give two drams of the young and tender leaves of Bays with harth Wine, and if
the part affected be only anointed with any of thee, they are much available. In like for the deco-
ration of Marjoram mallows drunk with Vinegar and water, are much commended, and outwardly falt
with Calves fat: Oyl of Bays draweth out the poyson of Wafs. The leaves of Marsh-mallows (as
Asitum faith) being bruized and applied, do perform the fame.

The juicce of Rue or Balm, about the quantity of two or three ounces drunk with Wine, and the
leaves being chewed and laid on with Honey and Salt, or with Vinegar and Pitch, do help much.
Water-creffes, Rosemary, with Barley meal, and water with Vinegar fog together, the juicce of Ivy
leaves, Marigolds, the blood of an Owl, all these are very effectual against the flings of Wafs;
as Pliny lib. 31. cap. 9. tell us: the buds of the wilde Palm-tree, Endive with the root, and wilde
Thyme.
Thyme being applied plaiter-wife, do help the stinging of Wasps. After the venom is drawn out by tickling, the place affected must be put into hot water the space of an hour, and then suddenly they must be thrust into Vinegar and Brine, and forthwith the pain will be assuaged; the tumor cease, and the malice of the venomous humor clean extinguished. Rhazes faith, that the leaves of Night-shade, or of Sengreen, do very much good in this case. And in like fort Bole Armony with Vinegar and Camphire, and Nuts beaten with a little Vinegar and Casforum.

Also take the Combe with Honey applying to the place, and hold the grieved place near the fire immediately, and laying under them a few ashes, bind them hard, and forthwith the pain will be swaged. Sausio faith, that Savory, or Cressels applied, and the feed thereof taken in drink, and the juice of the leffer Centory mixt with Wine, are very meet to be used in these griefs; he also commendeth for the same purpose the leaves of Basil, the herb called Mercury, and Mandrakes, with Vinegar. Ardeynus is of opinion, that if you take a little round ball of Snow, and put it into the fundament, the pain will cease, especially that which proceedeth by Wasps. Let the place be anointed with Vinegar and Camphire, or often fomented and bathed with Snow-water. Take of Opium, of the feed of Henbane and Camphire, of each alike much, and incorporate them with Rose-water, or the juice of Willows, and lay it upon the wounded place, applying on the top a linnen cloth, first therewith wetted in wine. Johannes Nefius (who of some is called Evangellina medicorum) prescribed this receipt of the juice of Sifimbrium two dram and a half, and with the juice of Tartarus make a potion. The juice also of Spina Arabica, and of Marjoram are nothing inferior to these formentioned. Aaron would in this grief have water Lintels (called by some Ducks meat) to be dipped with Vinegar, and after to be applied.

Constantine affiruther us, that Alcanas tempered with Barley meal and Vinegar, and so bound to the place, as also Nuts, leaves of Wall-nuts, and Bleets, are very profitable in this passion. Item, apply very warm to the wound a Spiders web, bruised with a white Onion, and sufficient Salt and Vinegar, will perfectly cure it. Guill. Placentinus will warrant, that a plate of cold Iron laid upon the wound, or Lead steeped in Vinegar, will do the deed. Gardnerius counsel is to rub the place with Sage and Vinegar, and afterwards to foment it with water and Vinegar fold together. Varignana would have us to apply Chalk in powder, and inwardly to take the feeds of Mallow boiled in Wine, Water, and a little Vinegar.

Matthioli much commendeth Sperage being beaten and wrought up with Honey, to anoint the place. Likewise the bees beaten and anointed on the place, winter Savory, Water-cressels, with Oyl of Momordica, give most speedy help. A. Naldius Villanovensis affiruther us, that any fresh earth, especially Fullers earth, is very available, and the herb called Peley, used as an Unguent, or else Goats milk. And Marcellus Empiricus is not behind in his commendations for the use of Bullocks dung, to be applied as a poulsceffe to the stung part.

These and many others may any Man ascribe that hath had but an easie taft of the infinitie of Physick's speculations,for the store-house of Nature, and truly learned Phystitians, which way soever you turn, you will minuter and give sufficient store of alexiterial medicines for the expelling of this grief. In conclusion one and the self same medicament will serve indifferently for the curing of Wasps and Bees, faying that when we are sung with Wafps more forcible remedies are required, and for the hurt that Bees do, then weaker and gentler are sufficient. In the hundredth and ninetieth year before the birth of our blessed Saviour, an infinite multitude of Wasps came flying into the Market place at Capua, (as Julius witneffeth) and lighted on the Temple of Mars, all which when with great regard and diligence were gathered together and solemnly burnt, yet for all that they prestignified the coming of an enemy, and did as it were fore-tell the burning of the City, which shortly after came to passe. And thus much for the History of the Wasp.

Of the Wasp.

Hornet is called of the Hebrews, Tsrubah. Of the Arabians, Zabor, and Zembor. Of the Germans, Ein bornaufo, Hufite, Frofier, Ofterzweible. Of the Flemings, Hufite. Of the Frenchmen, Trelions, Feonians. Of the Itallians, Calvaron, Crabron, Staven, and Calvanon. Of the Spaniards, Taboros Mofcaros. Of the Eyrions, Hufien. Of the Scandavians, Sierzen. Of us Englishmen, Hornets, and great Wasps. The Grecians call them Ambrenos, and Ambremos, because with their sting they raise an Ather or Carbuncle, with a vehement inflammation of the whole part about it. The Latins call them Crabronos, peradventure of Crabro, a Town so named in the Territory of Tusculanum, where there is great plenty of them; or they may be they are tearmed Crabronos of Cabull (a Horse) of whom they are first engendered: according to that of Ovid, 15. Metamorphos.

Pref us humo bolster equestris Crabronis origo est.

That is to say:
When War-horse dead upon the Earth lies,
Then doth his steeds breed Hornet fies.

Albertus tearneth a Hornet Apis citrina, that is a yellow or Orange coloured Bee. Carden laus much to prove that dead Mules are their first beginners. Plutarch is of opinion, that they first
first proceed from the feet of dead Horses, as Bees do out of a Bull's belly: and I think that they have their breeding from the harder, more firm and solid parts of the flesh of Horses, as Wasps do from the more tender or fift. Hornets are twice as great as the common Wasps, in figure and proportion of body much resembling one another. They have four wings, the inward not being half so large as the outward, being all joined to their shoulders, which are of a dark, brownish, and of a Cheimant-like colour; these wings are the cause of the swift flight: they have also five feet of the same colour and hue, that their breast and shoulders are of. There is somewhat long of the colour of Saffron, their eyes and legs are hanging or bending downwards, crooked and made like a half Moon, from which grow forth two peaks like unto Sitches or two ditches, nothing varying in colour from their feet. Their belly is as though it were tied to their shoulders with a very fine thread, the forward and middle part whereof is overcast with a brown colour, and begins as it were with a girdle of Saffron. The hinder part is altogether yellow, easily discerned and remarkable for those brown pricks or licks, every one of them being much like unto a small triangle, besides they have certain clefts or slits on both sides, both before and behind, by which they can at their pleasure when they lift, either shrink up themselves, or draw and gather themselves together, and with the same again lengthen and stretch out their bodies. They have also near to their belly on both sides four black spoils, and in their tail they are armed with a strong piercing sting, and the same very venomous. They make a sound or a buzzing strange noise, more hideous and dreadful then Wasps do. They are thried, fierce and cruel, quickly angry and wrathful, and although they live in companies together, yet notwithstanding they are ever known to be but of an homely, rude, curt, and untractable disposition and nature, and will never be brought by any Art or fashioning to lay aside their uplandish wildenefs. (As some herbs will do that are transplantted into Gardens.)

They are besides this of such a mischievous malignity and venomous quality, that as some affirm, nine of their flies will kill a Man, and three times nine will be able to kill a strong Horse; especially at the rising of the Dog, that is to say, a great and very venomous Wasp to anger: which I suppose they used as a by-word against the properties, natures, and froward behaviours of women, who being in their wonted familiar mood, if once you go about to overthwart them, or a little to contrary their willfulness, you shall pull an old house over your own head by a further provocation, and perhaps if you get you not the sooner out of their flight and reach of their clutches, you may chance have somewhat more flying about you ears then you would.

And therefore it is no marvel though in holy Scripture, they are compared or likened to men fierce and cruel enemies, which should put and call forth the Cainites, Pelites, and Chevites, Exo 23. 28. So likewise Ovid in the eleventh Book of his Metamorph. hath these words, *Spicula car- num ardentia.* The burning flies of Hornet: And Virgil in the fourth Book of his Georgics, call them *Aferpima,* most sharp and violent. *Terence* (the most eloquent of all Comical Poets) in his Comedy intituled *Pharmio,* and *Plautus* in his *Amphiptero,* have this Proverb, *Inquitul-crabrum,* I have provoked or incensed the great Waps to anger: which I suppose you used as a by-word against the properties, natures, and froward behaviours of women, who being in their wonted familiar mood, if once you go about to overthwart them, or a little to contrary their willfulness, you shall pull an old house over your own head by a further provocation, and perhaps if you get you not the sooner out of their flight and reach of their clutches, you may chance have somewhat more flying about you ears then you would.

It is good therefore if you have a Wife, that is *Calceato immunity hydra,* unquiet and contentious, to let her alone, not to make an angry Dog: and when a mischievous sill quieted and brought asleep, to go your ways and lay never a word. Whereas among Bees, their Drones and Kings do want things; yea, and some Wasps too, as before I said, it being notwithstanding all Hornets in general, as well the greater fort of them that build their houses in trees, as the lesser fort that dwell in earth, are provided of things, neither do their King, leader seem to be unarmed. For Wasps have their Prifidens of their own society, and their Captains general as well as Bees and Wasps, whatsoever *Fly lib. 11. cap. 21. dream to the contrary: which in proportion and quantity are far greater (if you respect the bodies of other Hornets) then either the Captains of the Bees and Wasps are in comparition of their subj ects. These also spend their time within doors, as the Captain of Wasps do, not having many but one head to guide and rule over them, left by banding into parties and factions, some civil war (wherein all things are miserable, as *Tally faith*) or other mutiny might arise to their final destruction. They are great vexers and trouble-makers, and even like such as had sworn the death of their enemies, robbers, and thecheves: And yet at home they nourish peace, excelling even the very Bees themselves in their painful, earnest, and willing desire to maintain their flock and common society.

For neither do they chide, braul, or contend, nor yet make any flir or ruffling when any is promoted to any office or place of preferment in their corporation; neither are they distracted into divers minds with their businesse, neither yet do they raise any tumult, make any uprore, or keep a coil or ruffling at the election of their Prince and Captain general, but with common content they use but one Table, taking their commons together like good friends and fellows, and whatsoever they kill, they carry some part of it home, frankly imparting it to their neighbours, children, and companions.

Neither do they yearly drive and expel forth of the doors to seek new habitation, where they can, (as some Bees deal very churlishly and unnatural with their young) but they contrarily wise in their boime defend and keep warm their new springing up progeny and race, building for them greater Houses, and raising of moe Sellers and flowes, bounding and planking the fame in cafe of necessity, never ceasing till they be fully rear'd and made fit for defence and safety. But as for their
King and Captain (whom they exceedingly honor and highly esteem) they make choice of such a one, as neither seemeth to be a King without a Kingdom, nor a Prince without people and possessi-
on, and yet he so behaveth himself, and carryeth himself so evenly, as though he had but little to do in this his Empire. And yet in largeness of body and greatness of his heart, in Routine and stateliness of stomach and person, he flaitheth all the rest, carrying away the prize from them all: and when there is Proclamation of War to be made against any forain foes, and that their flags and ancients be displayed by founding his deadly blast, he giveth defiance to his enemies, most courageously bestridith himself more than any of his followers, shewing himself both moit vehem-
ent, warlike, and skilful in fight, and yet again at home towards his subjects, (like a true noble spirit) he is very generous, gracious, and temperate, tractable, easy to be intreated, and most ready to for
give. They make for themselves certain holes or dwelling places under the ground, calling forth the earth much after the fashion of Phinires: for you must understand that neither Wasps nor Hornets do send forth any Swarms as Bees do, but those young Hornets which spring from them now and then, do there remain among their breeders, making their beds or hives much greater, by means of the earth formerly cast out.

They enlarge their combes exceedingly, by adding more and more unto them, so that of a strong and healthy flock of Hornets, it hath been known they have gathered three or four trays or baskets full of combs. If any Hornets flye from their own home, they repair to some tree, and there in the top of it make their combes, so that one many times may very easily and plainly perceive them, and in these they breed, the Captain General, or great Commander, who when he is grown to be great, he carrieth away the whole company, placing them with him in some convenient lodging. Wilde Hornets (as Pley fith) do live in the hollow trunks or cavities of trees, there keeping them-
selves close all the Winter long, as other Cut-wafts do.

Their life is but short, for they never exceed the age of two years. Their combes are wrought with greater cunning, more exquisite Art, and curious conceit, then those either of Wasps or Bees, and these excellent devisers do make them one while in the trunks of trees, and sometimes again in the earth, encreafing them at their pleasure with more floors and buildings, according to the encrease of their issue, making them smooth and bright, decking and trimming them with a certain tough or binding lime or gelly gathered from the gummy leaves of plants. Neither do any of the little mouths or entries of their cells look upwards, but every one bendeth downwards: and the bottom is placed upwards, left either the rain might soke through in long showers, or the head of them being built upwards, they might lie open and be the more subject, and exposed to the unruly rage and furious blasts of windes and storms.

If you eye well their Neilts, you shall finde them all for the most part exactly fix and fig cornered, the outward form and fashion whereof is divided with a murrey coloured partition: and their membraneous substance is much like unto the rinde or bark of Birch, which in the parching heat of Summer cleaveth and openeth it self into chaps. The flinging of Wasps is for the most part ac-
 companied with a Fever, causinf withial a carbuncle, swelling, and intolerable pain.

My self being at Downward in Huntingtonshire, my native loy
, I law on a time a great Wasp or Hornet making after, and fiercely purfuing a Sparrow in the open street of the Town, who at length being wounded with her sting, was precitely cast to the ground, the Hornet satisfying her self with the fucked blood of her quelled prey, to the exceeding admiration of all the beholders and considerers of this seldom seen combat. Aftrifede, whom I fo greatly reverence, and at whose name I do even rise and make curt flicks, knows not of a surely how Hornets do engender, nor after what manner they bring forth their young breed. But since we are affured of this, that they bring forth their young by the fides of their Cells, as Wasps and Bees, we need not doubt, but that they do all other matter after their manner, and if they couple together, they do it by night, as Cats do, or else in some secret corner, that no man with his hundred eyes can never epy it.

Hornets gather meat not from flowers, but for the most part they live upon fleth, whereby it cometh to paffe, that you shall often finde them even in the very dunghills, or other ordure. They also proue at great Flyes, and harry their slender small Birds, which when they have caught into their clutches, after the manner of hunger Hawks they first wound them in the head, then cutting it a
under, or parting it from the shoulders, carrying the rest of the body with them, then beeat them themselves to their accustoied flight. The greater fort of them die in the hard Winter, because they lose not themselves suficiently aforehand with any suifitenance as Bees do, but make their provision but from hand to mouth, as hunger enforce them, as Aftrifede enforme us. In like fort Lani
, hath well observed, that Hornets both day and night keep watch and ward besides the hives of Bees, and so getting upon the poor Bees backes, they use them in head of a Waggion or carriage: for when the fitle Bees laboureth to be discharget of his cruel Sitter: the Hornet when he hath sucked out all his joyce, and clean bereit him of all his moisture, vigour and strengte, like an unthank-
ful Guest, and the most ungrateful of all winged creatures, he spareth not to kill, and eat up his fof-
ferate and chief maintainer.

They feed allo upon all sweet, delicious, and pleasant things, and such as are not untoothome
and bitter, and the Indian Hornets are so ravenous, and of such an incontinent glosynony (as Cu
b לדמ reporteth) that they flie upon Oyl, Butter, greafe Cooks, all forts of sharp fawce used
with meats, and all motl and liquid things not sparing the very Napkins and Table clothes, and other
linnen that is any way foiled, which they do filthily contaminate with the eirements of their belly,
The History of Serpents.

But as they get their living by robbery, and purloining of that which others by the sweat of their brows, by their own proper wits and invention, and without the aid and help of any do take great pains for: fo again they want not revenge to punifh, and a provost Marshal to execute them for their wrongful dealings: term'd of some a Gray, Brock, or Badger, who in the full of the Moon makest forcible entrance into their holes or lurking places, destroying and turning topfe-turvy in a trice their whole stock, family, and lineage, with all their household stuff and possessions.

Neither do they only minifter food to this palling, profitable, and fat beast, but they serve in stead of good Almanacks to Countrey people, to foretell Tempefts and change of weather, as Hall, Rain, and Snow: for if they flie about in greater numbers, and be ofteener feen about any place, then usually they are wont, it is a figne of heat and fair weather the next day. But if about twilight they are obferved to enter often their nefts, as though they would hide themselves, you mutt the next day expext rain, winde, or some fomny, troublesome or boylerous feafon: whereupon Aevem hath thefe verfes;

Sic & ceraeomum raua aemina fit volitare
Fines sub Autumni confertvis atheae lune,
Fam vorstertinos primas cum communes ortus
Virginis, pelago dicit infare pocillum.

In English thus;
So if the buzzing troops of Hornets howse to flie,
In fparious air how Autumn end ye fee.
When Virgil fcar the evening lump efte,
Then from the Sea fome fomny tempeft pure fhall be.

Furthermore, for it is moft certain that fome remedies which do heal the ftingings of Waifs, do alfo helpe fuch wounds and griefs which Hornets by their cruel ftinging caufe, yet notwithstanding, as Aggregat hath pronounc'd, the Zabor is the Bezaor, or proper antidote of his own hurt, if he be ofteentimes applied with Vinegar and Water, Oyl and Cow-dung tempered together. In like fort all manner of fols and earths that are miry and muddy, are much commend'd in this cafe, fuch as Baccius applied to bald Selenus, who was wounded with Hornets, when longing for a little Honey, he jogged and shaken their nefts, thinking he had lighted upon some Bees Honey, which Cuvil molt elegantly 3. Felifum hath defcribed in thefe verfes;

Millia cradavum cernens, & vertice mudo
Spicula defignans, ora; prima manent:
Ile cedit propetus, & color feritum asfelli:
Inclamat fociis, auxiliis, vocat.

Concurrent Satyri, turgenterag; ora parentis
Rident, perculs claudicat ille genus,
Riders & ipse Deus, limineque inducere monstrat:
Hic parent monitit, & limita lato.

In English thus;
Of Hornets thousands on his head full bare,
And on his face their fryon'd fpears flock faff.
Then headlong down he fell, and Affe foot him fnote.
Whiles he for help his voyce to fellows caft.
The Satyrs flock came run spaces, and did deride.
Their firs fwooned mouthes, whiles Affe had made him lame.
The God himfelf did laugh; yet beawed an earth to hide.
The wound which he receav'd, and foid did beatifte fame.

If any one be defirous of moe medicines against the perillous and tranfiercing ftinging of these horn-mad Hornets, he fhall finde fome of them digelettled together in the Hillogy of Waifs: for their remedies are common, belonging as well to the one as to the other, there being no other difference but this, that here they must be given in a greater meafure or quantitie, and their use ought longer to be continued. And let this suffice to have spoken thus much of fuch Infests or Cat-waft ned vermine as are winged, and live in companies and routes together. Now wil I make choice to describe fuch as are winged and live solitarily, left I fhould feem to lose my felf in this troublesom and vall Ocean of Phyfical contemplation.

Of CANTHARIDES or Spanifhflies.

This kinde of Cut-waft is called of the Grecians, Spaniards, and among the Latins it changeth not his name, Of the Frenchmen Cantaride. Of the Italian, Cantarella. Of the Spaniards, Cubillo. Of the Germant, Grunke Kifer, Goldgrefter. Amongt the Belgis or Nederlanders, it is term'd Spanefbe Uitjehe; and of us Englishe men, Cantarides, and Spanifh Flies. I have feen two forts of Cantarides, the one great, and the other small. Of the greater fort some are thick, and long bodied, which are found among wheat, and these are thick, groffe, and unwieldy, like unto Beetles, they are also ofundry colours, and changeable hew, with golden freeks or lines croffing their wings, and these are beat to be used in Phyfick. They of the other lefter kinde, are lean and thin
Of the Cantbarides.

Scrags and starvelings, broad, hairy, heavy, and sluggish, and for physical ills little worth.

The greater sort also are not always of a glittering green colour, but otherwhiles you shall have them somewhat reddish or murrey coloured, but yet all of them of a glittering brightneffe, and marvellous shining gloffe, piercing the eyes with singular delight. The lesser fort are not so common as the greater, somewhat differing from them in shape and proportion of body, but in vertue, quality, and manner of breeding, there is no disagreement at all to be found.

Those of the lesser fort have their bodies and heads somewhat long and hooked, their eyes very black, and hanging out, their wings growing out from the midst of their Loyns, being marked with two silver specks or pricks, and some few white spots.

They are commonly found in the Summer Season, in the herb that is called Ciumatia, or wild Hemlock. Their feet and legs are very small and long, finely decked and garniished, as it were with a Vermillion red, or beautiful purple. There is also another fort of these anfwerable to the former, in colour of their bodies in every respect, faving that their eyes are green: their head very little; and the hinder part of their shoulders round and crooked.

The third fort have their head and thoulders all one, being fo clofely and confufedly joyned together, as if they were but one thing and could not by any means be separated, unlefe in imaginati

The fourth is very like to the third fort, but it is rather of a greenifh, then of a rufly Iron colour, but in all other respects there is no difference to be fenn, faving in their magnitude, for this laft decribed is the leaft of them all. But these kindes of Cantbarides as well the greater as the lefser, do firft proceed not from any beafts, as fome have thought, but they rather take their Original from some rotten, thinking, and corrupt moisture and fickness, Titilus gar en toon prom ptei licies kai toa agiraz, kai toa Sakeis profei to ton Cantbaridon phulon, the meaning whereof is, that the whole flock and kindred of Cantbarides do bring forth or lay their young in the vile, bafe, and imperfect force of heat or warmth; and further in moiff Figs, as Melampus in his ninth Book and thirty nine Chapter, word for word hath excribed out of Aristotle.

They do also breed from a certain little Worm which is found in the sponge of the Dog-bryer (called of the Phyffians bedeygus) and from Caterpillars of the Fig-tree, Popler, pear-tree, Ash, Olive-trees and Roses: in all these there be found certain Worms, the very Founders and Parents of Cantbarides, but yet in the white Rolfe thefe Worms are of much leffer force, power, and sufficiency, then in the former.

Cantbarides do couple togethcr and generate, but yet not any living creature of their own kinde, but only a little small Worm. They feed upon all manner of pulse and Corin, but especially Wheat, and then they are bell for medicinal ills. The small like unto Tar, and in their tale they much reSEMBLE the Cedar-tree, as Nisander reporteth. Their vertue and quality is to burn the body, to parch and to bring a hard scale or crullinesse upon any part they fhall be applied to, or as Diisorder faith, to gnaw or eat into, to raise blisters, excufurate and raise an inflammation, for which respect, they mix them with fuch medicaments as are appointed to heal Leprories, any dangerous Terrors and Ring-worms, or thofe that be Cancerous.

They are applied to hard, Scourvy, or Mangy nails, being firft tempered with fome fit plaiters or Cerotes tending to the fame purpofe, taking them fo clean away, that they fall off by the roots. Some fome alfo to temper them with fuch convenient medicines as are warranted to take away Warts, Corns, or any hard knobs or pieces of flesh growing in the hands or feet. Some again use to pulvere-fice Cantbarides, and then mixing them with Tar, do make an Unguent to cure the fallong away of the hair, or the shedding of it, either in the head or beard, but herein there muft be good advice required, left at any time by their caufick faculty they excufurate too deep into the flesh.

Cantbarides mingled with Lime, serve in head of a Pen-knife to eradicate and take away those little hard and red swellings rising chiefly in the crown of the head, armits, or privy parts, called of some Phyffians Pani: and fome there be again that will adventure a little of them in powder, to give with fuch Medicines whose property is to provoke Urine: But yet there is hard hold and tough reafoning on both fides, whether they ought to be given inwardly with Duretikes or not, confidering that being fo drunk, they are accounted amongft Strong poisons, tormenting the bladder without any ceafling: otherfome again hold the contrary, affuring us upon their own experience, that not exceeding their due quantity, they may be taken with other Correftories, to serve as a Retricle to transport them to the place affected, fo that you see either fide hath his strength and reafons.

\[\text{Jut a part premiitur velatam pondere libra,}\]
\[\text{Froma nec hoc plus parte fedes, nec fertis ab illo.}\]

That is to say:

\[\text{As when an even scale with equal weights is priced,}\]
\[\text{Not fails it down this way, or is it that way raised.}\]
The History of Serpents

But being mingled and wrought up with the juice of \textit{Una Tamnæa}, (which is a kind of Berry, growing on the herb called \textit{Anfælas angria}, a kind of Briony) Sheeps or Goats fweet, there is no doubt but that they do great good. Some of my Malters (faith Gaien, the Prince of all Physicians next to \textit{Hippocrates}) did use to put Cantharides amongst such medicines as they prepared to move urine, taking only their wings with the feet, but I (faith he) am wont to take Cantharides wholly, as well as some parts of them, and so I judge them the more safe to be used and prepared this way, especially I mistake not to make choice of such are found among Corn, and have as it were a yellow circle or encloure crouthing overthwart their wings, \textit{lib. 3. lib. & 11. de Simplic. Facult.}

Being applied rightly, they do also provoke the monthly terms, and that very effectually, and put into Antidotes, they are thought of many to helpHydropellic persons, as not only \textit{Hippocrates} and \textit{Diocedes}, but also \textit{Gaien, Avicenna, Rhazes, Pliny}, and other Physicians of both note and worth have wrote: I cannot here sufficiently commend their affured, tried, and approved use, being commixed with \textit{Salt}, and \textit{Gum ammoniacum}, for the diversion of Rheumes or Catarrhs, the taking away of all Goutifiable pains, out of the hanch or hip (called the \textit{Sciatica} of the popular fort) whilst they draw forth and confume from the center of the body, (being there thoroughly and deeply impafted) to the surface the matter or offending humours causing these griefs above said.

They are also good against the venom of a \textit{Salamandra}, as \textit{Pliny} in his 29. Book, and 24. Chapter affureth us. They are also highly esteemed of some, being duly prepared and orderly mixed with certain other medicines, to take away and correct the remiff negligence, falling-faintnefe, and heartlefe casting down of the Virile part, yea they do (as they say) very much provoke to venereal incitements.

But here I would counfel each one not to be knack-hardy bold, in medling with them, for these or the like intentions: for as they bring both health and help, being duly commixed, and orderly tempered, not exceeding their dole and first quantity; so again, if you fail in their due and skilful application or propagation, they induce and drive men into most intolerable grievous symptoms and accidents, and otherwhiles to death it self. \textit{John Langius} feteth down a true and very pleasant story, which in this place, becaufe it maketh greatly for our matter in hand, I will not refuse briefly to describe.

There was (faith he) at Bonony in Italy, a certain rich and Noble young man of France, (which \textit{Gal-}
\textit{luis}, to use his own words, was \textit{Galio quosin galitanoce falacior}) who falling extremely in love with a certain Maid in the same City, prevailed so far at length through his earnest importunities and incessant solicitations, that at length they appointed and agreed upon the time and place of their meeting, to keep their Revels for one night. So this juicy Gallant being thus inspired in the inextirpable labyrinth of her beauteous Phinny, fearing deadly, left his heart should turn into Liver, or that he might faint and lose his courage before he should attain to his journeys end; in this his doubtful coping, and dangerous skirmishing conflict, like a wife man fearing the worst, casting all dangers aforehand what might ensue, would needs know of a fellow-fouldier, and Countr耶man of his, who had as one may queffe born a standard in the Camp of \textit{Venus}, what were left to be done, to move him on a more vigorous courage, and to keep his credit for that time, left either he should turn Craven like an overtyred Jade, or else be utterly non-suitted, which was worst of all; who presently withfhit him to take some Cantharides in his Broath, which the other at all adventures forthwith did.

But it was not long before this jolly Yonker felt an itching about his lower parts, then being fro-like above measure, supposed to be the operation of his medicine that caufed this Colt-evil, he without any more ado hyed him to his Love, minding there indeed to draw the matter to a fet battel, and to end all controversies by dint of sword.

\textit{Tunc animis opus, Aenea, tunc pellere firmis.}

In English thus;

\textit{Of courage then indeed,}

\textit{Then of stout brood it is need.}

But yet for all this, in the fill of the night, when every one besides were at rest, my ruffled \textit{Frank} felt his whole body to be pokily torn, and miserably rent with fundry cruel prickings and stings, feeling moreover a strange tall in his mouth, like the joyce or liquor that issueth from the Cedar tree, flamping and flaming, raging and flaring like a furious mad, \textit{frantike Bediam}, being almost besides himself through the extremity of his pain, viritginy and giddinefe of his brain, with inclination to fainting or frowning: so being troubled, tolt, and perplexed, all fad, melancholike and male-content, deftitute of counfel and comfort, like a filthy Mifer, and an impotent Switer, and not like a couragious hot-fpur, he let his action fall, turning his back like a Novice and fresh-water Soulard, full fore against his will you may be sure, but there was no remedy, and so with as much speed as he could, bidding his Love adieu, he trudged home to his own lodging; whither being come, and finding no relief, but rather an ecrease of his torments, with a continual burning of his Urine and Strangury, he lamentably befouled, and with weeping and tears most humbly craved and cried out for help, requiring the
the favour and furtherance, both of my self and another Phyfitian for the cure: so I being admitted to visit this poor patient, I first gave him some Oyl to drink, thereby to provoke vomiting: then was there prepared a Glyfter, made of the herbs Hieraticu, Wallows, and the root of Althea decocted, wherein was disolved Coffe, with Oyl of Violets and Lillies. After the administering of this, I commanded him to take a good draught of Cows or Goats milk, once in every hours space, and if Milk could not be had, then I willed him to take an Almond Milk made Ex alniis pinnis, seeds of Mellons, Gourds, and Poppy bruised with the distilled Water of Wallows, and Alka- kent, and this would I have given to him in good quantity in read of the Milk if it were wanting.

But after that my fie Frrenchman had recovered his former health with thefe and the like remedies, and that the unavowed Author of this rash counsel had very humbly intreated pardon at our hands for this his great fault, he protested solemnly with a great oath, that he would never hereafter prescribe any Phyfick to any man living. Thus far Johannes Langius in his first Book Epiftola. Medicinal, forty eight.

There is also very profitable use to be made of Cantharides, for if you bear them to powder, and convey a little of it into Apples, Pears, Plums, Figs, Peaches, or Quinces: especially those that be fairest and ripest: and thofe that hang the lowest, finely closing it up again with the pill, which if any Theves or Robbers of Orchards shall taff of, they fall within a while after into an intolerable burning in their Urine and Strangury, making it only in dropping wife, whereby their thief is foon found out, and they well rewarded with fowe Sawte for their sweet meat. And this is an excellent night-spell, and therefore I was loath to pretermit it, but to make you acquainted withall.

There is also another excellent medicinal use of Cantharides, if they be duly, and according to truth administered, and with great warneffe for that passionate grievance, which at this time though some foolish Phyfitioners never heard tell of any fuch, I will call Pefiuo infinirius, yet I may not let it down in English, because I would have but a few acquainted with Secrets. Habeo enim ego singulare quoddam contra penis Languorem remedium, quos promiscuously uterem, ut ustrumque multis nobilibus (qui veneris utique studiis hiereticis) animos & vitres admasti abfine noxa. Unum tamen inter efferos fo obfult, ut a verae (cuium maxima litterar) fanguinem continuo mingeret, & lipophania frequentis laborem. Satis fatis laetis copia in protétulis fufficit, omnis interactus venereus pulsum, & veritus felactivus cupidiis paenuliffimus is accefo.

And let this suffice to have spoken of their medicinal vertues and qualities; Now will I proceed to tell you of their ill name, naughty, venomous, and pernicious properties. They are reckoned and scored up in the number of most deadly and hurtful poynons, not only because they caufe eftion and inflammation, but more in regard of their putrefactive quality and making rotten, where-in they exceed. Their juice being taken into the stomack, and fo piercing into the veins, or laid upon the skin outwardly fo long till it hath entered the veins, is a most strong poynon, where-upon Ovid when he with'd ill unto, or curfed his enemy, wrote this: Cantharidum fuccus dante parentem bibis. lib. Trifi. Cieris ad Iovem, in his ninth Book of his familiar Epiftles hath these words, Caecus accusavit L. Crasso, Cantharidam sanguifse dicerunt, as if he purposed by that way to make an end of himself by death. Galen in his third Book De Simplici medicam. facul: writeth thus:

If they be taken inwardly into the body, though but in small quantity, and mixed with other convenient corretories, they do mightily provoke urine, and sometimes corrode and fret the bladder, fo that it is as clear as the noon-day, that what things forever do overthrow nature, by reason of their extreme frigidity, if they be taken but in a very small quantity, yet will nourish the body: so on the other fide, whatsoever is contrary, repugneth or goeth against humane nature, by means of corrupting or any putrefactive quality like unto Cantharides, can never do fo. Bartholomei Montagnae, a learned Phyfitian, affureth us, that he once knew one Francis Bressa a Citizen of Padua in Italy, who having but outwardly applied Cantharides to his knee, yet their poynon spreading to other inward parts, he voided five pints of blood by way of urine: and this may any man see, if he will take the pains to read over Montagnae Crasfi. 182. Cap. 10.

The same accident hath also befaln them, who to be remedied of rough, hard, mangy, or leprie-like nails, have adventured to apply them to their great toe. So that Cantharides must not rashly be applied and used, as common deceivers, blindke Empericks, and confounding Land-lopers would make plain Countrie people believe. Pium relateth a story of one Coffinus a Roman Knight, who was deeply beloved of Nero the Emperor, who having a very dangerous Tetter (a dieafe in times past peculiar to the people of Egypt) a Phyfitian of that Countrie in heed of curing, did kill him by giving him Cantharides to drink.

But I should rather think that Coffinus dyed by the outward application of Cantharides, because by their burning and cautifick quality, they clean eat and confume away filthy Tetteres or Ring-worms, Manipinellae, Scorbutias, Lepries, and all hard Callous Warts, Corns, or pieces of feth that grow in the hands or feet: for I can see no reason why any would be fo wilfully blinde, as to give them inwardly for the curaion of any Tutteres or fuch like griefes: or at leaftwise I must think that the right use of Cantharides was unknown to the ancient Phyfitioners of the old world, as by Galen it may appear in his 11. Book De Simplici. Medic. fac. and in his fourth Book De vidia Aut.
The History of Serpents.

The same Pliny (in his twenty nine Book and fortieth Chapter) witnesseth, that Cantharides were reproachfully laid to Cato Uticensis charge, and that he was falsely blamed for offering to make a price of poisons, and to sell them openly, as in Port-fail to any that would give money, for that their price role to threecore sesterces. Being drunk in too large a quantity, or else applied outwardly to any part, either too long or too deep, they produce these or the like symptoms, accidents, and effects.

The party to whom they are any way given, feeleth a pricking pain and torment in his bowels and inward parts, extending from the mouth down to the lower parts about the Bladder, Reins, and the places about the wafe and short ribs: they do also ulcerate the bladder very dangerously, inflaming the yard, and all other parts near the same with a vehement apoplexyation: after this, they pule blood, and little pieces of feath.

Otherwhiles there will follow a great gask orBloody-flux, fainting and swooning, a mummeffe or duneffe of moving or feeling, debilitation, or feeblenesse of the minde, with alienation of the wit, as though they were bestraffed; likewie lothing or abhorring of meat with a disposition to vomiting, and otheren a ordinary desire to make water, and to exonerate nature, but all in vain. That he taketh them findeth in his mouth the tait or tallowe of Pitch: and all these symptoms, passiones, or effects, that they have, work they have much labour faithfully collected out of the sixth Book of Dioscorides, and the first Chapter. And out of Galen Lib. de Theriaca ad Pyl Phaser Cap. 4. and Lib. 3. de Temperam. Cap. 3. And out of ancient Rhazes (who practified Phystick one hundred years, if truth be truly related) Tit. 8. chap. 17. If any one be either affected or infected with any accidents, by means of Cantharides, Dioscorides doth thus cure them, as you may readily finde in the Book and Chapter before cited.

First of all he cauffeth them to vomit often and much: and after that he prescribeth Glypters to be made for the scouring of the belly with Nitre, and to preserve the bladder inwardly, to take Milk and Pfilum: and then he would have the matter of Glypters to be somewhat different from those which were to be made of Barley water, Marsh-mallows, the white of an Egg, the Mucilling of Line-feeds, Water of Rice, the decoction of Fenugreek, Hydromel, fat Broths, Oyl of Almonds, the fat of a Goose, and the yolks of Eggs. And inwardly to take at the mouth, he biddeth them to use Cows milk, Hydromel, the grains or fruit of the Pitch-tree, both the greater and the jeffer fort, Wine fodd to the half, Ducks fat, a decoction with some diuretical feeds (namely with the four greater cold feeds, which are Cucumbers, Gourds, Citrals, and Melons) and likewise some decoction made of Figs, with sirup of Violets. Oyl of Quinces is highly commended of some as a proper and special Antidote in this case, and so is Oyl of Lilies, and Terra Semia.

Rhazes counselis, after the taking of some Glypters made of any fat broths, to make an injection into the yard with Oyl of Roses, and the sick perfon to fit in a warm Bath. Tit. 8. Chap. 17. The Writers and Authors of Phystick and Philosophy cannot agree, in what part of the Cantharides their poeyon chiefly lurketh: for some will have it to be principally in the head and feet, and others again will none of that: And yet they all agree upon this point, that in what part of the body forever their poeyon is feated, that their wings are a sovereign remedy and preservative, and if they be wanting, that their poeyon is deadly: so that although they be never so poeyounous, yet have they their own remedy which in themselves they contain and carry about: Thus faith Pliny in his 11. Book and 35. chapter.

And peradventure for the same caufe, Galen in his eleventh Book, which he intituled De Simple, Medicament. facultatib, advizeth us expressly and learnedly, that Cantharides shoule be taken whole as they are, and so to be used either for inward or outward uses. For why it is far better, even in the outward application of them, that they should more gently and slowly corrode, gaaw, or fret surn, and that their burning vertue and quality shoule be a little corrected and weakened, then to perform their full effect to the great danger of the patient, and many times to his utter undoing and destruction. Therefore they are clean out of the way, who when they would use them for any inward caufe, do call away their wings and feet, whereas indeed they ought to take all of them, not rejecting any one part of them. For being given whole, they need not so much any corrective to bridge and leffen their powerful operation in regard of their wings and feet, the proper refillers and expellers of their own or other poeyon.

The fafelt courfe is to use all, and every part of them without exception, unlees you would have them to corrode, fret, inflame, or burn any part. Lyco Nesotiam is of opinion, that Purgcanee is their proper counter-poeyon, which vertue Pliny in his twentieh Book, Chap. 13. acribeth to the herb called wilde Bafil: who also many ways commendeth Actum Sylbicum, Olym Omantibum, Cows milk and brethes made of Goats flesh for these intentions, in his 23. Book, Chapter the second and fourth, and likewise in his 28. Book and tente Chapter. And for our History of Cantharides, let this for this time suffice, which I much wonder that the famous learned Gelfer hath in such deep silence passed over, never so much as mentioning them: whereof notwithstanding so many Authors, both of the Ancients and Neotericks, do so much ring.

Many moe authorities coule I have allledged concerning this my discourse of Cantharides, but that I suppose it a labour as endlesse in toyle, as needlesse in ufe; the one favouring of too much curiosity, the other of a frivolous affectation: so that I hope even amongst the whole College of
Of the Caterpillar.

of Phyfiitians, wherever in England (it their ears be not too dainty) to finde some few grains of their good words, and such curio outraged confruction, as that I may neither be charged with partiality of concealing (where it is met I should be mute) nor be suspected of unufficiency, for not pursing where I can finde no good footing.

Of CATERPILLERS, or PALMER-WORMS, called of some Cankers.

Now I come to speak of Caterpillers, sometimés the destroyers and walters of Egypt: as well Their name. in regard of the great difference that is found in their severall forts, as for their great dignity and life, whereon some of them are most notable and excellent. Some think that Ernea, which is Eng- lised a Caterpillar, hath his derivation ab erodendo, which is not altogether improbable: For they gnaw off and consume by eating, both leaves, bougnes, and flowers; yea, and some fruits also, as I have often seen in Peaches.

Ovidius the famous Poet, fileth them by the name of Tine a grefles:

Quaque solum canis frondes intexere filis,
Agrestis Tinea, ter observata colonis,
Feroci mutant cum papilionem figuram.

In English thus;
And throfe wilde Mothes by humbldmen obferved,
Which fold themselves in hoary stringing leaves,
Gainst force of famine, and fform to be preferv’d,
A shape from fruitful Butterflies receiv’d.

The Græcians call a Caterpillar Kompe, by reafon of his crooked winding or bending pace in wa- ving fort, whereby in creeping they bow, wry, and lift up themselves. Of the Hebrew it is termed Ghonainam, because it theareth, pilleth, and devoureth the fruits of the earth, as Kimbi upon the firft of Joel writeth. The Italians call it Bugaverme, and Brucho, for so Marcellum Virgiliim upon Diojcurides faith expressly, that in this time all the people of Italy, named it Ernea, Bruchi. The Spaniards term it Oruga. The Frenchmen, Chenille, and Chattepeluse. Of the English they are commonly called Caterpillers, of what kinde forever they be of. But the English Northern men, call the hairy Caterpillers, Obuts, and the Southern men usually term them Palmer-worms. Of the Polonians it is called by the name of Ruh- fanerka. In the German tongue Ein Raupe. In the Belgian, Rupe. Of the Illyrians, Gasemica. And Sil- vanus will have it called Cerris, and Cedebroa.

I should go about to define and set down all the differences and varieties of Caterpillers, I might perhaps undertake an endleffe and tedious labour. I think it therefore fittest to bend my flen- der skil, and to employ my bell forces, in speaking of such as are more notable and common with us in this Country: For some of them in touching are rough, hard, and itif, and other some again, are soft, smooth, and very tender. Some are horned either in the head or in the tail; and again, others have no horns at all. Some have many feet, and some fewer, & none at all have above sixteen feet. Most of them have a bending fift pace, and like unto waves, and others again keep on their way very plainly, soft- ly, by little and little, and without any great halt. Some change their skins yearly, others again there be that neither change nor call their old dry skins, but keep them still. Some of them cealing alto- gether from any motion, and giving over to eat any thing at all, are transformed very strangely into a kinde of vermin or worms, who being covered with a hard crift or shell, lie as it were dead all the Winter; and from thefe come in the beginning of hot weather, our ufal Butter-flies.

Many of thefe Caterpillers are bred of the egs of Butter-flies; and some again do breed in the leaves of trees, of their own proper feed, being left there in the time of Autumn, included in a certain web, or else by means of the dew or air, therein shut and putrefied, as commonly the little hairy Cankers or Caterpillers which are so full of feet, do breed. Beside, some of them do feed on leaves, some on flowers, and there are some which devour fruits.

All smooth Caterpillers which are not hairy, are of a yellow or green colour: some again are found of a reddith colour, or brownith, or else they be of sundry hews. But of all others, the moft excellent is the green coloured Caterpillar, which is found upon that great buoyf plant, usually termed Privet, or Primpnt, which hath a circle enclosing round both his eyes and all his feet, having alfo a crooked horn in his tail: thefe Caterpillers are blackish-red, with spots or streaks going overthwart their fides, being half white, and half purpulith, the little pricks in thefe spots are in- clining to red: The reit of their body is altogether green.

There is another Caterpillar feeding altogether upon Elder-trees, not much differing from the former, saving that this is altogether of a green colour, and wanting thofe overthwarting crofs white marks or spots, and the other small white pricks which we defcrib’d in the former.

There is alfo a third fort of green Caterpillers, which when Autumn or the fall of leaf draweth on, are turned into a certain fheth or cafe, being of a very hard and horibly substance, of colour very brown, and this feedeth altogether upon Pot-herbs, especially thofe that be soft, as Lettuce: where- upon it may not unfitly be termed, Ernea Lactucaria.

L. 113 Lastly,
Lastly, there is to be seen another sort, of a green colour, which is the least of them all, and this kind live and feed upon trees, (especially in the Oak) there drawing out their web, by means of which they are hired and shaken, they easily fall down upon the heads of travellers and passengers by the way side, clearing to their hats and garments. And this kind of Caterpillar is too well known and found in the Summer time, and when cold weather approacheth, they fold themselves into a rude, plain, and nothing curious web. And thus being included in a greenish scabbed or cale tending to red, they all die in Winter, and all these have ten feet, as all they have to go bending themselves upwards. But to leave the green, and come to those that are yellow, there is to be found a certain Caterpillar called Vimpla, being as the word foundeth, a very elegant and fine insect to look upon, and palling beautiful: and this kind I have often found amongst Willows, full favourly feeding upon their leaves. His lips and mouth are somewhat yellow, his eyes black as a cole, his fore-head purple coloured, the feet and hinder-part of the body, of a green grapple hue, his tail two-forked, and somewhat black. The whole body is as it were stained and dyed with thick Red-wine, which runneth along the neck and shoulder-blades, as it were in form of a Burgenian croffe, or of the letter X, made croffe-wise down unto the tail with a white line, addeth no small grace to the other parts.

There is yet another Caterpillar of yellow-blackish colour, called Porcellus, we may in English call it Bugs-fleur, in respect of the fashion of the head, especially the greater sort of these, for the leafer have round white specks upon their sides, and these live and are altogether to be found amongst the leaves of the Marsh Trifoly, which they consume and devour with an incredible celerity. In the wide Night-shade, (which the Italians call Belladona) there is found a smooth Caterpillar of a yellow-greenish colour, having a horn in his fore-head the length of a finger, which Hieron Cardan, the learned Physitian, reporteth that he had often seen.

The hairy Caterpillars are most mischievous and dangerous amongst them all, and these are either thick or thin haired, and the most venomous is that which is called Pityocampa, whose biting is poyson: and this is ever found in the Pine-apple-tree, being as thick as three little fingers, and three fingers long being laid a croffe. They confite of eleven flits or cuts between the head and the tail, and they have sixteen feet, according as all other hairy Palmer-worms have. That is to say, near the head on both sides, there, in the midst of their body on both sides, four, and at the end of the tail on both sides, one. Their former feet are crooked and small, with which they feel, try and affay the way whether it be passable or no, their other feet are broader, with many jags and notches like a saw, to take the safer hold, and fray with furcer footing upon smooth and slippery leaves. Their head is much like a Pifsière, and the rest of their bodies like other common Caterpillars. They are rough, and full of brily standing up hairs on all sides, and those in their sides are white, but those on their back do shine, being very bright and glittering, the midst whereof is garnished with many spots, as though it were full of eyes.

Their skin is black which is so often seen, their hairs being cut or taken clean away. All their hairs are but small; and yet they sting more vehemently than any nutter, whereby is caused intolerable pain, burning itching, a Fever, and much dyequenesce: when as their poyson is suddenly in a moment felt and conveyed without any manifest appearance, or kenfe of any wound to be judged by the eye, unto those parts that are next the entrailes, as the Heart, liver, and the rest. They weave their webs after a fine and exquisite manner, as Spiders do, drawing out in length, framing and trumming in good order, their hairy small threads. And under these when night draweth on, they lie in as their own proper tent and pavilion, adverted to avoid cold, as the discommodities of furious blastes and storms: for the matter and substance of this their tent is handfordemly wrought, for firm, flitte, clammy and sure, that they neither care for furious windes, nor yet any rain or Storm will ever euer foke through. Besides, the garnensse of this house is hie, and of fo great receit, as it will eieceive and lodge many thousands of Caterpillars. They make their nests or buildings in the highest branches of the Pitch and Pine-trees, where they live not solitarily (as other Palmer-worms do) but in flocks or companies together. Which way soever they take their journey, they are still spinning and drawing out their threads for their web, and early in the morning, (if it be like to prove fair) the younger sort by bees attend the elder, and having first bared and robbed the trees of all their boughs and leaves, (for they make cleanalliance of all whereabouts they come) they afterwards dexterously bend themselves to their weaving craft. They are the only plague and destruction of Pitch and Pine-trees, for unto any other roziny or gummy trees they never do harm.

There is great plenty of them to be found in the Mountain of Alba, situat betwixt Macedonia and Illyric, in the Woods of Tdiest, and in divers Valleys beyond the Alpes, in which places there is stotre of these fore-named trees, (as Mathewes faith.) They are doubleste most poysonous and venomous vermine, whether they be cruified outwardly with the hands, or taken inwardly into the body: yeas they are so known, manifest, and so never failing a poyson, and so efeemed of in times past, as that Pipian the famous Lawyer, interpreting the Law Cornelia de Siciariis, or privy murtherers, that he in that place, calleth and elethem the giver of any Pityocampe in drink, or otherwise to any one, to be doomed a murtherer, and their punishment to be equalized. Seil. Alium ft. ed Leg. Corn. de fit.

As soon as this kind of Caterpillar is receied into the body, there followeth immediately a great pain, extremely tormenting the mouth and palate, the tongue, belly, and stomack are grievously inflamed by their corrodong, and growing poysonous quality, besides the intolerable pain the receiv
Of the Caterpillar.

Which

 receives feeleth, although at first the party seemeth to feel a certain pleasant itching, but it is not long before he perceiveth a great burning within, loathing and detesting of meat, and a continual desire to vomit and go to the floor, which nevertheless he cannot do. At length, unless speedy succour be given, they so miserably burn and parch the body, that they bring a hard crustineffe, skurfe or flaid upon the stomache, as though the fides thereof had been plattened with some hard tharts, or other like things, after the manner of Arleincte, as Dofoiridies, Aetius, Pliny, and Ceffer do affirme us. In like manner Celen in his eleventh Book Simp. cap. 50. and Aetius cap. 25. have testified the fame.

And for this caufe Aetius and Aginnet do fay, that it is nothing wholesome for any to fit down to meat, to spread the Table, or make any long taneance under any Pine tree, left peradventure through the favour or smell of the meats, the reek or vapour of their breaths, or noife of men, the Pitycampe being disturbed from their homes and usual reting places, might fall down either into their meats beneath, or at left-wife cast down, or let fall any of their feed, as poyfonous as themselves. They that receive hurt by them, must have recourse to those prefervative and medicines, as were prescribed to thofethat were poyfoned by Cantharides, for by them they are to be cured, and by no other means. Yet for all that, Oyl of Quinces is properly commended to vomit withall in this caufe, which must be taken twice or thrice, even by the preffcript of Dosoiridies and Aetius. They are generated, or to speak more aptly, they are regenerated (after the manner of Vine-fretters, which are a kinde of Caterpillers, or little hairy Worms with many feet, that eat Vines when they begin to shoot) of that Autumnal feed of theirs, left and referved in certain small bags or bladders within their webs.

There is another fort of these Caterpillers, who have no certain place of abode, nor yet cannot tell where to finde their food: but like unto superflitious Pilgrims, do wander and fray hither and thither, and (like Mice) consume and eat up that which is none of their own: and these have purfued a very apt name among us Englishmen, to be called Palmer-worms, by reason of their wandering and roguifh life, (for they never stay in one place, but are ever wandering) although by reason of their roughneffe and ruggedneffe, some call them Bear-worms. They can by no means endure to be dieted, and to feed upon some certain herbs and flowers, but boldly and disorderly creep over all, and taint of all plants and trees indifferently, and live as they list.

There are sundry other forts of these Cankers or Caterpillers to be found, in the herbs called Cranesbill, Ragwort, Petic-mullen, Hops, Coleworts, Hafis, Marigolds, Fennil, Lycence, Bafil, Alder, Nightshade, Water-betony, Garden-Spurge, and other forts of that herb; in Elm-trees, Pear-trees, Nettles, and Glifforows. Ye there is not any plant to be found, which hath not his proper and peculiar enemy and deftroyer: all which because they are so commonly known of all, though perhaps not of all observed, I will (left I should seem to be infinite) passe over with silence.

But yet I will add a word or two of a strange and flinking Caterpillar, which it was never my hap as yet to fee, described by Conradus Geffer, in these words following: This flinking Caterpillar (faith he) is very like to thofe that are horned, but yet it wanteth horns, differing from them all in colour.

I first espied it creeping upon a wall toward the end of August, Anno 1570, there comeith from it a lothome and an abominable favour and smell, so that you would believe it to be very venomous. It went forwards very frowingly, and with a quick, angry, and delightful countenance, as it were in binding wife, the head always stretched up aloft with the two former feet: I judge her to be blinde. She was the length and breadth of a man's finger, with a few flattering and rugged hairs, somewhat brifly and hard both on her back and fides, the back was very black, the colour of her belly and fides was somewhat red, enlashing to yellow, and the whole body was distinguitfed, divid ded, and easily discerned with fourteen joynts or knots, and every joynt had a certain furre in a kind of wrinklle running all along the back. Her head was black and somewhat hard: her mouth crookedly bending like hooks, having teeth notched like a faw, and with thefe teeth as with pincers or nippers, whatsoever the laide hold on, the (as famished) did bite. She went on fourteen feet, as for the most part all the forts of Palmer-worms do. Without doubt, the muft be concluded to be exceeding venous.

The learned man Vergeniis, took it to be a Pitycampe, and others thought it a Scolopendra: but that could not be, by reason of the number of her feet. I could hardly with much ado endure her vile smell, till I had drawn out her description. She so infefted two Hot-houses with her abominable favour and flink, that the whole and thefle and they that were with me, could not endure in the place. Thus far Geffer, as I have to fhow out certain fcroles of paper of his, never as yet imprinted.

Now I will proceed to discourse of the original, generation, aliment, and metamorphos of Ca terpillers.
Deer Book, a witness of my labour true,
Be not ashamed to write of little worms,
Nor Caterpillers, which from bale things enfeue,
And into ease cast again return :
For these are framed by hand of God most wise,
Never abased in any work so small:

For out of Worms his wonders do arife,
As well as from great Beasts so tall,
Tower bearing Elephant, huge Whale,
And other monsters swimming in the Sea,
Irresistable beasts, in hills and deepseadale,
Death threatening to all that them distilse.

For so I think it best to begin with the verses of a good Poet, who indeed did see and admire the infurbritable wisdom and divine Providence of the Almighty, in the generation and breeding of Caterpillers. Whiles with divers Authors laboured to expresse and let down diversly, I know not what clouds of errors they have thrust us into; for swarming themselves besides the way, although they pretend a matchless understanding in the mysteries of Philosophy, they have cauht others to tread awry as much as themselves, and to be blinded with the macarados of absurdities. And first, if we will begin to rife in the monument of former times, I will here produce Arborifolus opinion in his fifth Book, Histor. cap. 19, who there expressly faith, that they take their beginning from the green leaves of herbs, and namely of Radifh and Coleworts, by means of their small feed of generation, being like unto Miller-feed, which is there left about the end of Autumn, from which female Worms proceed: and of these little Worms in the space of three days a Caterpillar is formed, about the Spring time, or toward the later end thereof, which growing to their due quantity, and well fed withall, they ceafe at length from any further motion, and when Autumn begins them, they change both form and life.

Pliny is of this minde, that Caterpillers fetch all their pedigree, race, parentage and birth, from a dew thickened and incrassated by the heat of the Sun, and fo hilt left behind in leaves: and Armodaus de Ville novae is of the fame judgement. Otherfome derive them wholly from Butter-flies, and will have them to proceed of no other beginning, which as soon as they are crept out of their hard shells or scabbards, wherein they had lain as it were dead all the Winter, affoon as Summer and warm weather draweth on, they call certain eggs either under or above the leaves of certain herbs, which eggs according to the quantity of their bodies, are either greater or leffer, and fome of these fells wherein they are included are of a sky colour; others yellow, white, black, green, or red: and fo being at length about fourteen days quickeened and nourifhed with the lively and kindly heat of the Sun, their hell-house being broken, firft cometh forth small Caterpillers, like unto little Worms, faying that they are diversely coloured, who at their firft appearance, being as it should feem very hungry, do altogether bend themfelves to devour and eat up both leaves and flowers, efpecially of thofe trees and plants whereon they were whileft they were in egges.

But I am of opinion, that not only this, but by divers other ways and means they may proceed and increase, for although the doctrine of Arborifolus in this point feemeth to be unfavourable, and nothing relieving divers fates, because he affirmeth, that that little Worm which is found upon Coleworts, doth turn into a Caterpillar: yet for all that, it is not fo much without fmes of falt, or fo abhorrent to reafon as they would make fome believe. For Nature, as she is able, and doth produce and bring forth a living creature from an Egg, fo likewife from a Worm the breedeth a more perfect living creature, by many degrees; and that by not way of corruption, but by way and means of her excellent perfection. For although a Worm afterwards be not that thing which before it was, (so far as is apparent to outward fens) yet for any thing we can gather or perceive, it is that which it was, and this Toft, is more by a great deal now, then before it was. For a Worm dyeth not, that a Caterpillar may thereby spring, but to the old body, Nature addeth a greater magnitude: as for example, feet, colours, wings: so that whileft life remianeth, it acquireth other parts and other offices.

There be some also that deride the opinion of Pliny, because he entendeth that Caterpillers have their beginning and production from dew. But it may not be denied in my conceit, that some imperfect small creatures are bred and take life from dew, and not without great reason. For the Sun by his kindly heat and warming quality, worketh and acteth, being as it were the form, and the moisture or humour is Passiffe, as the mater or the subject, for the heat of the Sun is different from that of the fire: for it either quickeneth and infipreth with life, or at least-child conferveith and mainaintth our life, by means of likenefe, proportion, or symmetry, wherein our lives and spirits respect each other. Besides, there is nothing more nourishing then Dew, for with it only some certain small creatures are fed, and do thereby live: which thing the divine Poet very well observed, when he uttered these words;

Quantum nos vide repetit.

So that in respect that it is humour, it is matter, in respect it is thin, it pierceth and easily entereth in, and in respect it is attracted and thereby concocted by the Sun, it is the apter made to generation. For the preparation of the form, carryeth with it the matter or stuffe, as his mate and companion: So these two meeting together, there consequently followeth the quickening or taking life of some one creature. And not only are some Caterpillers the off-spring and breed of dew, as common experience can witneffe, but even the greatest part of Caterpillers do fetch their stock and pedigree.
pedegree from Butter-flies, unless it be those that live upon Coleworts and Cabbages, and those that are called Vine-fretters, with some few other. For those that live and breed in Vines, (called of the Grecians, fats,) do proceed from dew, or some dewy and moist humor, which is included in their webs, and there grown to putrefaction. For then do they swarm so exceedingly in some Countries, as I dare neither affirm, nor otherwise imagine, but that they must needs have such a mighty increase from putrefaction. And this for the most part happeneth when the Eastern winde bloweth, and that the warmth of the air furthereth and haletheth forwards any corruption.

All the whole pack of them are great destroyers and devourers of herbs and trees: whereupon Philippus the Parasite, as Athenaeus faith in Pythogorista, braggeth of himself in this wife, Apollofia thumon lochanoste kamppe. Vefcens thymo oleegs, erawu fum. I am (faith he) a Caterpillar that eateth both Thyme and Pot-herbs. And to this lene speakeath Martial, Eruewm midâ pepeft bartu unam. A Garden hardly andandlerly can suffice to feed one Caterpillar. I think he meaneth, when the time of their wasting and devouring is gone and past, for they commonly leave but little behind. For that being past, they go wandering hither and thither, up and down uncertainly, waited and hunger-starved, and so at length pinning away by little and little through famine, some feek them fit places within, other-some above the earth, where they transform themselves, either into a bare and empty bag or cafe, or hanging by a thread into an Auricula covered with a membrane.

If this happen in the midft of Summer, the hard rinde or shell wherein they are inclosed being broken, about the time of 24. days, there flieeth out a Butterfly: but if it come to passe in the midft, or toward the end of Autumn, the Aurelia continueth a whole Winter, neither is there any exclusion before the vernal heat. And yet notwithstanding, all Caterpillars are not converted into Aurelias, but some of them being gathered and drawn together on a heap (as the Vine-frettres) do grow at length to putrefaction, from which sometimes there falleth as it were three blackish Eggs, the true and proper mothers and breeders of Flies and Cantharides. When the Butter-flies do joyne together very late, or after the time it ought to be, they do lay or cast their Eggs, which will continue vital, and that may live till the next Spring, (if a diligent care be had of them) as well as is often seen in Silk-wormes, whose Eggs the Spaniards fell, and that very usually by whole ounces and pounds. I have now according to my cunning, dircoufed of the transmutations and variable changes of Caterpillers; it followeth next that I write of the qualities and use of Caterpillers, together with those preservatives which experienced Physitians have warranted for true and infallible.

All Caterpillers have a burning quality, and such as will readily fetch off the skin, and fea it quickly, and raise blisters. If any one drink the Caterpillar that liveth in the Peach trees, there will forthwith follow a great pain about his mouth and jaws, vehement inflammation of the tongue, strong gripping and wringing of the Stomach, belly and intestines, with a fenible itching about the inward parts, the whole body is as it were burned and seared with heat and hot vapours, and the stomach abhorreth all meat: all which are to be remedied with the same means, as those that have taken Cantharides. Yet properly, (as heretofore I have touched) Oyl of Quinces given to cause vomiting, is the belt and failest. And if we may credit Physy, new Wine boiled to the third part; and Cows milk being drunk, are very effectual. There is not any one fort of Caterpillers, but they are allnaugnt, and venemous, but yet they are leafl hurtful who are smooth and without hairs; and the most dangerous of all the rest, is that which heretofore I termed a Pityocampe, whose poyfon for the most part is deadly.

The daughter of Callus Secondus living at Basfï in Germany, (as Geffiners faith) when she had unwarily and greedily eaten some Coleworts-leaves, or Cabbage in a Garden, and with them some Caterpillers, after a strong vomit that was given, her belly began to swell, which swelling, having continued these many years, could never as yet receive any cure. If you will have your Gardens and Trees untouched and preserved from their mischievous quality, you must first take clean away in the Winter time their webs, or any part thereof (though never so little) that you can finde clearing to the bare boughs: for if you let them alone till the Spring, you shall sooner see them, than finde them removed, for in a short space of time they devour up all that is green both leaves and flowers. Some use to anoint their trees with the gall of a green Lizard, and some with a Bulls gall, which as some commonly report, they can by no means away withall.

The Countrey people chose them with the vapour of a little Brimstone, with straw being fired under the tree, and so to smoother them. Some there be that make a fumigation with Galbanum, Harts-horn, the shavings of Ivory, and Goats hoofs, and Ox-dung. Didyma in Georgius faith, that if you bare the roots of your trees, and beinair or foyl them with Doves dung, they shall never be hurt by any Worms.

I should willingly have omitted, and not renewed with any fresh discovery Convolvulis remedy against Caterpillers, (or rather the immodest deceit and deluding trick of Democritus,) unleeffe experience, which is, Iterata ejusdem eventus observatio, a repeated observation of the same event, had approved the verity thereof, especially in the Country of Stiria. And Palladius in his firft Book, ch. 35. and Conslantius near the end of his 11. and 12. Books, whose words be these;

As si nulla voilet medicina repellere pufcere,  
Das dannet venient artes, nudisque plantas  
Familia, quae jutis tum demum operat juvante  
Logibus, obtrano mansit pudibunda et torve,  
Sed refoluta sine, refoluta magis cupido  
Ter circun atetis, & fecem dutius horti :
The History of Serpents.

Theophrastus faith, that Caterpillars will touch no plants which are moistened or beprinkled with Wine. They will die if they take the fume, or any be way finomced with the herb Pora. Actius. Whereby it is apparent (faith Sibirus) that the herb commonly termed Scabious is not the true Pora. Caterpillars that live and feed on Coleworts, if they be but touched with that kinde of Worm which is found in the Fullers Teafeil, they die. Phine. All to be prinkled a Colewort whileit hath but only three leaves, with Nitre, or with Sulphur and brimstone, and by means of the salteffe, the Caterpillars will quite driven away. Geopon. Palladium in this cafe preferreth the ashes of Fig-leaves. The Sea-onion called Squilla, being fown or hanged up in Gardens, hindereth the breeding of Caterpillars. Otherfome in the moft places of their Gardens, and round about them, sow and set. Myns, the pule called Orobos, which is somewhat like Vetches, and some Wormwood, or at leaft-wife hang them in bunches in divers places of the fame, to expell this kinde of noyfe creature.

Some very advisedly take dry leaves and stalks of Garlick, and with the fame do flyke and perfume their whole Garden, fo that by this way the fmocke being conveyed into all places thereof, the Caterpillars will fall down dead, as Palladium hath written, in whose writings any man may read of plenty of such Antidotes and Alexipharmical medicines, as may ferve to delroy Caterpillers.

Now will I speake of their use in Phyfick, and in the Common-wealthe. The web of Caterpillers being taken inwardly, flaty womenes fluxes, as Matthiauif faith. Being likewise burnt and put into the noftris, it flanches bleeding at the nofe. The Caterpillers that are found amongst the herbs called Spurges of all sorts, (by the judgement of Hippocrates) are notable for purulent and matterly Wombs, especcially if they be first dried in the Sun, with a double quantity of Earth-worms and a little Anifeed finely powdered, and all of them to be retained, and taken in some excellent White-wine. But in cafe they feel any heavinesse or aking in the belly after the taking of this medicine, then it would be good to drink a little Mulie thereupon. This faie Hippocrates in his Book De Superfata.

Disoerides in his firft Book and 90. chapter, gived in drink those common Caterpillers that live in companies together, against the disease called the Squinfie. But unleffe by some hid and fecret property, they do good in this grief being received inwardly, it were needful (in regard of their manifold venemous nature) that they were utterly rejected and condemned. Nicander ufe them to provoke feep, for thus he writhe:

\[ \text{Ei de fugis tripus olige en bommai kemnen} \]
\[ \text{Rpeien dissectam apu chreidea nato, etc.} \]

Which Hieremiuus Lertius hath thus tranflated;

\[ \text{Quod radentes olpe & frententia vermes} \]
\[ \text{(Sting. quibus virides deponent lipo colors)} \]
\[ \text{In medius ferca de Palladium arbore fucco} \]
\[ \text{Tivrinus, hincq tuum comorveus undig, corpus} \]
\[ \text{Tota dabis dulci fucruris membra quieti.} \]

Which may be Englifhed thus;

\[ \text{With herb-eatings, or green-lefs-gnawing, Worms,} \]
\[ \text{Whose backs imprinded are with colours lively green,} \]
\[ \text{All bruifed, mixed with juice from Pallus tree that rains,} \]
\[ \text{Anointed body brought to found feep is often feen.} \]

There are to be feen in divers thorny, prickly, sharp and rough herbs, (as for example in Nettle) sundry hairy or lanuginous Caterpillers, which being tyed or hanged about some part of the body, do by and by (as the report goeth) heal those Inflants which have any flopping of the meats passage when they cannot swallow.

A Caterpillar breeding in Pot-herbs, being frift bruised and then anointed upon any venemous bings of Serpents, is of great efficacy: and if you rub a naughty or a rotten tooth with the Colewort-caterpillers, and that often, within a few days following, the tooth will fall out of his own accord. As canna. Caterpillers mixt with Oyl, do drive away Serpents. Disoerides. If a man anoint his hands, or any other part with Oyl, it will caufe that he shall receive no hurt by the ftringing of Bees, Wasps, or Hornets, as Aius faith. Pliny citec many fond and superfitious fained and lying tales, devised by those who in his time were called Magi, Soothfayers or Diviners, concerning the admirable vertues of Caterpillers. All which, because I fee them hiffed out of the School of Divinity,
Divinity, and that in heart secretly I have condemned them, I will at this time let them passe without any further mention.

They are also a very good meat to divers Birds and Fowls, which are so needful for the use, benefits, and food of mankinde, as to Starlings, Peacocks, Hens, Thrushes, Daws or Choughes: and to hundy fifies likewise, as to the Tench, Pike or Pikere, and to a certain Sea-fish called a Scorpion: also to the Trout, and some others, who are easily deceived with a Caterpillarled hook. Which kind of infining fraud, if you would better be instruicted in, I must reier you to Tertinim in his Geoponicks, and to a little Book dedicated to Robert Dudley, late Earl of Leiceste, written by Master Samuel Vicer of Godmancheles in Hamburgh.

It is not to be paffed over in silence, how that not many years since, there came infinite swarms of Caterpillers out of Terasia into Polonia, Hungary, and beyond the limits of Germany, which did not only devour the fruits of trees, but whatsoever was green either in the medows and tilled fields, besides the Vines: which was taken for an evident prognoftick and sign (as many divined) of some great Turkishe Army to come swarming into those parts: neither herein did this their ghilliing and miiftuing, for the next year following was the fledge of Vienna in Austria, the warting, with dyling and over-running of Hungary: and the deadly English-sweating could not contain it self in an Illand, but must spread it self among them of the Continent, whereupon ensued the destruction of many thousands of people, before any remedy could be found out. In the year of grace 1573. there ruffed infinite swarms of Caterpillers into Italy, where they spoyled and made havoc of all green buds and graffe growing upon the face of the earth, so that with their unquenchable and infatiate voracity, they left nothing but the bare roots of trees and plants: and this hapned chiefly about Mantua and Brixia. And upon the neck of this, followed a terrible and fearful pellitence, of which there dyed about 50. thousand perons.

Also in the year of our Lord GOD 1570. there were two great and sudden swarms of Caterpillers that came ruffing into Italy in the face of one Summer, which put the Romanes into an exceeding great fear, for there was nothing left green in all their fields that could be preferred from their raisine, and from their gluttonous and puling maw. And although the fertility of the year immediately following, did almoft blot and rafe out the memory of this their heavy punishment, and that many seemed as it were to repent them of their repentence; yet are we not to doubt, but that many were truly penitent, and seriusly were drawn to amendment of life by a due confideration hereof. God grant that we may be warned by other mens punishments, left that poor creature, which we imagine to be the fiiileft and leaft able to do us harm, we finde the most heavy.

Of the BOAS.

It was well known among all the Romans, that when Regulus was Governour or General in the Pairick wars, there was a Serpent (neer the River Bagrade) killed with flings and and itones, even as a Town or little City is overcome, which Serpent was an hundred and twenty foot in length: whose skin and cheek bones were reserved in a Temple at Rome, until the Numantine war.

And this History is more easie to be beleived because of the Boas Serpent bred in Italy at this day: for we read in Suidus, that when Claudius was Emperor, there was one of them slain in the Vitusen at Rome, in whose belly was found an Infant swallowed whole, and not a bone thereof broken. The Germanes call this Serpent Uncke, and besides them I do not read of any other Name. Some have ignorantly confounded it with Cherisdrus, an Adder of the earth, but upon what reason I do not know, only Suidus dicouring of Calabria, might give some colour to this opinion, when he faies, Calabria Cherisdrus eft frequentisfima, & bodem gregit quem Anguem ad immensum molem ferunt coeloscrere: that is to faie, Calabria is full of Earth-adders, and it breedeth the Boas, which Snake some affirm will grow into a monstrous stature. Out of which words, there is no wise man can collect, that the Boas and the Adder of the earth are all one thing.

The Latines call it Boa and Bova of Bar, because by sucking Cows milk it so encreafeth, that in the end it destroyeth all manner of herds, Cartel and Regions. And our domestical Snakes and Aders, will also suck milk from Kine, as in all the Nations of the world is most manifeft to them that will obserue the fame.

The Italians do uttally call them, Serpent of Aque, a Serpent of the water, and therefore all the Learned expound the Greek word Hidra for a Boa. Cardan faith, that there are of this kinde in the Kingdom of Senega, both without feet and wings, but moft properly they are now found in Italy, according to these verues;

Boa quidem Serpent quem tellus Italia nutrit
Hunc babulum plures tac easimine ducunt.

Which may be Englished thus;

The Boa Serpent which Italy doth breed,
Men say, upon the Milk of Cows doth feed.

Their fashion is in seeking for their prey among the haers, to destroy nothing that giveth suck so long as it will live: but they reserve it alive until the milk be dryed up, then afterward they kill and
The History of Serpents.

and eat it, and fo they deal with whole flocks and herds. The poyzon of it, faith Fefius, maketh tumour and swelling in the body, whereunto all other agree, except Albertus, who in this point agrees not with himſelf, for in one place he faith, that they are venomous, and their teeth alfo like other Dragons, in anothre place he faith, their poyzon is very weak, and not to be regarded, becaufe they be Dragons of the third order or divifion. They go all upon their belly, and fo I will conclude their ifory with Manuian.

Turpi Boa flexilis also.
That is to fay;
The filthy Boa on his belly moves.

of the CHAMELEON.

I t is very doubtful whether a Chamaeleon were ever known to the ancient Hebrews, because there is no certainty among them for the appellation thereof, fome affirming one thing, and fome another. We read Levit. 11. among other beafts there forbidden to be eaten of, Kooby, or Koeb, which Rabbi Kimbi interpreteth a kinde of Crocodile, (Haoab,) Rabbi Jone in the Arabian, Hardun, and fo alfo doth Avicen. The Chaldree, Koob, the Persians, An Sanga; the Septuagints and S. Jerom, a Chamaeleon. The felf fame word is found Levit. 14. which the Jews do vulgarly at this day take for Semeus, a Crocodile of the earth. The word Oab or Oek, leemeth to come neer to this, which is fometimes interpreted a Tortoife, a Dragon, or a Monkey. And Oab by Sybagians, is translaffed a Salamander. Koab by the Jews, is translaffed a Cuckow, a Jay, a Pelican, and an Onnasina: and in the fcond of Sepby for a Chamaeleon. Some have framed an Hebrew word Gamalion, which is abfur'd, for Gamingon. Zameon, Ameleon, Hamaleon, and Meleon, are but corrupted terms of Chamaeleon, as Ijferum well obferveth, or elfe fignifieth fome of the kindes of Lizards or Stellions, as is manifeft in Albertus, and other learned Writers. Therefore I will not blot more paper about the Arabian beafts, Harbe and Albarbe, Arabian or Hardun, or Albarba, but leave them to the judgement of thofe, who delight in the inquifition of fuch fecrets.

Chamaeleon is a Greek word, from whence the Latines, and almoft all Nations have borrowed the name of this Serpentine or creeping beaft, except the Germans, and they only have famed names, as Lindsworm in Albertus, that is, a Worm of the Wood, and Rattader by Gefier, that is, a Ratmouse, becaufe in quantity and compofition it refembleth both thofe creatures. Some Latines by reafon of the fimilitude it holdeth with a Lizard, call it Muri Lacettum, a Moufe Lizard. The Greek word Cломейen, fignifieth a low and humble Lion, becaufe in fome parts and members, he refembl eth that lofty and courageous beaft. So do they derive the name of certain low and short herbs, from great and tall trees, as Glomaeurisstis Chamaedrae, and Chamaepitys, shrubs of Plumtree, Heath, Cypress, Ger- mander, and ground IVy, from the Cherry, the Cyprte, the Cedar, and the Pine tree. And thus much for the name of the Chamaeleon.

The Countries breeding Chamaeleons, are Africa, Asia, and India, and for the quantity thereof I do finde divers defcriptions, some particulars, as in Bellinum, and Scaliger, and fome general in other Writers, all which I purpoſe briefly and succifely to exprefs in this place. It is faid (faith Bellinum) that the Frog and the Chamaeleon are like one to the other, because they use the fame Art and industry in taking their meat: and to the intent that this thing may more evidently appear, both by the defcription and the picture, I have thought good to entreat of the Chamaeleon, among the Water-beafts, becaufe it liveth for the moft part in moist, marshy, and Penny places. I have feen of them two kindes, one, a leffer kinde in Arabia, being of a whitifh colour, all fet over with yel- lowifh or reddifh spots, and in quantity not exceeding the green Lizard. The other, in the hot places of Egypt, being twice as big in quantity as the Arabian, and of a changeable colour, betwixt white, green, brown and yellow, for which occafion fome have called it versicolar Chamaeleon, that is, a turn-coat-coloured Chamaeleon. But both thefe kindes of Chamaeleons have a coppered head, like to a Camel, and two bones at the top of their brows flanding upon either fide, and hanging out: their eyes are more clear and bright, about the bigneffe of a peaft, only covered with a skin, fo that their appearance outward, exceedeth not the quantity of the Millet-feed. They are very flexible, turning upwards and downwards, and are able at one time to look two ferveral ways, diftinfly upon two ferveral objects, wherein they exceed all other beafts. It is a heavy and dull beaft, like the Salamander, neither can it run, but like a Lizard, wherefore it is not afraid of the fight of men, neither doth it run from their preffence, neither is it easily provoked to harm or bite, a man : it climbeth little trees for fear of Vipers and horned Serpents.

Some have thought that it never eateth meat, but is nourifhèd with the wind, becaufe it draweth in very eagerly many times the winde into the belly, whereby it fwelleth; for it hath great lights stretched all along the fides of the belly: but this opinion is falfe, as shall be fhewed hereafter, al- though it cannot be denied that it is Oviparum patensfinulum famis: that is, The moft induring famin among all other Egg-breeding-beafts, for it faileth many times eight moonths: yea, a whole year together. In head of no trils and ears, it hath certain passages in thofe places, whereby it smellith and heareth.

The
The opening of the mouth is very large, and it hath teeth on the neather and upper chap like faws, such as are in a Slow-worm, the tongue very smooth, half a hand breadth long, where with it licketh in thoso in fentry Flies, Horse-flies, Locuits, and Emets whereupon it feedeth: For it keepeth at the mouth a certain fome or moisture, and also upon the tail or backer parts, where withal thoso Flies and other Creatures are fo much delighted, that they follow the Chameleons, and as it were bewitched with the defire thereof, they fall upon the moisture to their own perdition; and this is to be noted, that this moisture or fome in the backer parts of the belly is like a Spunge. It hath a line or brake under the belly, indented as it were with fcales, white in colour, and stretched out to the tail; but the feet seem to be of an artificial work of Nature, wherein is a curious difference between the former and the hinder: for the forefeet have three fingers or claws within, and two without: the hinder-feet on the contrary, have two without and three within. It layeth twelve long Eggs, such as Lizards do; the heart is not much greater than the heart of a domeftical Moufe or Rat: it hath two laps of a Liver, whereof the left is the greater, unto which cleaveth the skin of the gall, the which skin exceedeth not in quantity a Barley corn. And thus far the description by Bellamie.

In the next place for the better manifeflation of the nature of this beall, I will alfo add the description that Strigel maketh thereof. For he did, that when Johannes Landius was in the farthest parts of Syria, he saw five Chameleons, whereof he bought one, which with his tongue did very suddenly take off a Fly from his breast: Wherefore in the diʃference of the said Chameleon, he found that the tongue thereof was as long as a hand breadth, hollow and empty, in the top whereof there was a little hole with filthy matter therein, wherewithal he took his prey: which thing seemed new and strange unto them which heretofore thought that a Chameleon lived only by the air. His back was somewhat crooked, rifting with spotted bunches like a Saw, like the Turlbut fish, his belly closed with short ribs, his eyes most beautiful, which he turneth every way without bending his neck: his colour white, green, and dusky: naturally green, somewhat pale on the back, but paler and neerer to white on the belly, yet was it better all over with red, blew, and white spots.

It is not true that the Chameleon changeth her self into all colours: upon green growth greenneffe, upon the dusky is tempered a dusky colour; but upon blew, red, or white, the native greenneffe is not blemished or obscured, but the blew, white, and red spots yeld a more lively and pleafant aʃpect; upon black, standeth brown, yet so as the green hew feemeth to be confounded with black, and it doth not change his own colour into a suppozed colour, but when it is oppressd with fear or grief. That it liveth sometime of the air, a whole yer or more, doth appear, because it eateth no meat during that time, but gaping with a wide mouth draweth in the air, and then shutteth his chops again his belly swellth. Yea, I found one that constantly affirmed, that they turn themselves to the beams of the Sun, and gaping wide after them, follow them hard as it were to draw them in. They have five definct claws upon every foot, with two of which they clapp the round boughe or twigs of trees, as Parrats do when they fit upon their perches, and these claws stand not as other Birds do, three together and one by one, but in imparity or diflimilitude, three on the one side, and two on the other, and
The History of Serpents.

In English thus:

The Beasts that liveth by wind and weather,

Of each being touch'd takest colour.

The reasons of this change or colour are the same which are given of the Buffe and Pelte Fishe; namely, extremity of fear, the thimnefle, smoothnefle, and baldneffe of the skin. Whereupon Ter-ribbim writeth thus; Hic fci Chamaeleonti datum quod vulgo dilum eff de fua corti ludere: That is to say, This is the only gift of nature to a Chamaeleon, that according to the common Proverb it deceiveth with his skin; meaning that a Chamaeleon at his own pleasure can change the colour of his skin.

Whereupon Exafimus applieth the proverb, de aldeo corti ludere, to such as secure themselves with other mens peril. From hence alo cometh another proverb, Chamaeleontes untue adobolontes, more mutable than a Chamaeleon, for a crafty, cunning, inconstant fellow, changing himself into every mans disposition; such a one was Antipater, who was said to be in Albens, and of such a man remembering this beast, did Alcibiades make this emblem against flatterers:

A Chamaeleon of all Egge-breeding Beasts is the thimneft, because it lacketh blood, and the rea-son hereof is by Ariflades referred to the disposition of the foul: For he faith, through overmuch fear, it taketh upon it many colours, and fear through the want of blood and heat is a refrigeration of this Beast.

Plutarch also calleth this Beast a meticuluous and fearful beast, and in this cause concludes the change of his colour, not as some fay, to avoid and deceive the beholders and to work out his own happinefle, but for meer dread and terror.
change of Chameleons colour, not to fear, but to the meat and to the air, as appeareth by these verses:

Novi timor, imo clama, nimirum limpidus aer,
Ambo fumam vario membra colore novant.

Which may be thus Englished:

Not fear, but meat which is the air thin,
New colours on his body doth begin.

But I for my part do assign the true cause to be in the thinness of their skin, and therefore may easily take impression of any colour, like to a thin fleck of a horn, which being laid over black, seemeth black, and to other colours: and besides, there being no hinderance of blood in this Beast, but Intrails, except the lights, the other humors may have the more predominant mutation, and so I will conclude the discourse of the parts and colour of a Chameleon, with the opinion of Karmides, not that I approve it, but to let the Reader know all that is written of this Subject, his words are these; Chameleons singult huius dies mutat colorem, A Chameleon changeth his colour every hour of a day.

This Beast hath the face like a Lyon, the feet and tail of a Crocodile, having a variable colour, as if you have heard, and one strange continued nerve from the head to the tail, being altogether without flesh, except in the head, cheeks, and uppermost part of the tail, which is joyned to the body; neither hath it any blood but in the heart, eyes, and in a place above the heart, and in certain veins derived from that place, and in them also but a very little blood.

There be many membranes all over their bodies, and those stronger then in any other Beasts. From the middle of the head backward, there ariseth a three square bone, and the fore part is hollow and round like a pipe, certain bony brims, sharp and indented, standing upon either side. Their brain is so little above their eyes, that it almost toucheth them, and the upper skin being pulled off from those, there appeareth a certain round thing like a bright ring of Brass, which Scientists call Falsa, which signifieth that part of a Ring, wherein is set a precious stone.

The eyes in the hollow within are very great, and much greater then the proportion of the body, round and covered over with such a skin as the whole body is, except the apple, which is bare, and that part is never covered. This apple stands immovable, not turned, but when the whole eye is turned at the pleasure of the Beast. The snout is like to the snout of a Hog-ape, always gaping, and never shutting his mouth, and serving him for no other use but to bear his tongue and his teeth; his gums are adorned with teeth as we have said before, the upper lip being shorter and more turned in then the other. Their throat and artery are placed as in a Lizard: their lights are exceeding great, and they have nothing else within their body. Whereupon Theophrastus in Plutarch witnesseth, conceiveth, that they fill the whole body within, and for this cause it is more apt to live on the air, and also to change the colour.

It hath no Spleen or Milt, The tail is very long, at the end and turning up like a Vipers tail, winded together in many circles. The feet are double cloven, and for proportion resembles the thumb and hand of a man, yet so, as if one of the fingers were let near the side of the thumb, having three without and two within behind, and three within, and two without before, the palm betwixt the fingers is somewhat great: from within the hinder-legs, there seem to grow certain spurs. Their legs are straight, and longer then a Lizards, yet is their bending-like, and their nails are crooked and very sharp. One of these being deflected and cut asunder, yet breatheth a long time after, they go into the caves and holes of the earth like Lizards, wherein they lie all the Winter time, and come forth again in the Spring, their pace is very slow, and themselves very gentle, never exasperated but when they are about wise Fig-trees.

They have for their enemies the Serpent, the Crow, and the Hawk. When the hungry Serpent doth assault them, they defend themselves in this manner, as Alexander Mindius writeth: they take in their mouths a broad and strong italk, under protection whereof as under a buckler, they defend themselves against their enemy the Serpent, by reason that the italk is broader then the Serpent can gripet in his mouth, and the other parts of the Chameleon so firm and hard, as the Serpent cannot hurt them: he laboureth but in vain to get a prey, so long as the italk is in the Chameleons mouth. But if the Chameleon at any time see a Serpent taking the air, and running himself under some green tree, he climbeth up into that tree, and seteth himself directly over the Serpent, then out of his mouth he casteth a thread like a Spider, at the end whereof hangeth a drop of poyzon as bright as any pearl, by this ittling he letteth down the poyzon upon the Serpent, which lighting upon it, killeth it immediately. And Scaliger reporteth a greater wonder then this in the description of the Chameleon, for he faith, if the boughs of the tree so grow as the perpendicular line cannot fall directly upon the Serpent, then he can correct it and guideth it with his fore-feet, that it faileth upon the Serpent within the mark of a hairs breadth.

The Raven and the Crow are also at variance with the Chameleon, and so great is the adverse nature betwixt these twain, that if the Crow eat of the Chameleon being flain by him, he dyeth for it, except he recovereth his life by a Bay-leaf, even as the Elephant after he hath devoured a Chameleon, faeth his life by eating of the Wilde-olive-tree. But the greatest wonder of all is, the hostility which Plini reporteth to be betwixt the Chameleon and the Hawk. For he writeth,
that when a Hawk flyeth over a Chameleon, the hath no power to resift the Chameleon, but fallith down before it, yeilding both her life and limbs to be devoured by it; and thus that devourer that liveth upon the prey and bloud of others, hath no power to save her own life from this little Beast.

A Chameleon is a fraudulent, ravenous and glutinous Beast, impure, and unclean by the law of GOD, and forbidden to be eaten: in his own nature wilde, yet counterfeiting meekness, when he is in the custody of man. And this shall suffice to have spoken for the description of this Beast, a word or two of the Medicines arising out of it, and to a conclusion.

I finde that the Ancients have observed two kindes of Medicines in this Beast, one magical, and the other natural, and for my own part, although not able to judge of either, yet I have thought good to annex a relation of both to this History. And first of the natural medicines, Democritus is of opinion that they preserve a peculiar Volume, and yet he himselfe tellett nothing of them worthy of one page, except the lying vanities of the Gentiles, and superstitious of the Grecians. With the gall, of the succubus and leprous parts of the body be anointe three days together; and the whiteneffe of the eyes, it is believed to give a present remedy: and Arabigenus preferreth the fame for a medicine for the taking away of the unprofitable and prickling hairs of the eye-brows. It is thought if it be mixed with some sweet composition that it hath power to cure a quotidane Auge. If the tongue of a Chameleon be hung over an oblivious and forgetful person, it is thought to have power to restore his memory.

The Chameleon from the head to the tail, hath but one Nerve, which being taken out and hung about the neck of him that holdeth his head awry, or backward, it cureth him. The other parts have the same operation as the parts of the Hyaena and the Sea-calf. If a Chameleon be fed in an earthen pot, and confum'd till the water be as thick as Oyl, then after such feething take the bones out and put them in a place where the Sun never cometh, then if thee see a man in the fit of the Falling-sickneffe, turn him upon his belly, and anoint his back from the Os facrum to the ridge-bone, and it will presently deliver him from the fit: but after seven times using, it will perfectly cure him. The Oyl thus made must be kept in a Box. This medicine following is a present remedy against the Gout. Take the head and feet of a Chameleon, cut off also the outward parts of the knees and feet, and then keep by themselves those parts: that is to say, the parts of the right leg by themselves, and the parts of the left leg by themselves, then touch the Naul of the Chameleon with your thumb and right finger of your hand, dipping the tips of your fingers of the right hand in the blood of the right foot of the Beast: and so likewise the fingers of the left hand in the blood of the left foot, then include those parts in two little pipes, and so let the sick peron carry the right parts in the right hand, and the left parts in the left hand, until he be cured: and this must be remembered, that he must touch every morning about the Sun-rising the said Chameleon, yet living and lapped in a linnen cloth, with those parts that are oppreft with the Gout.

The like superflitious and Magical deviles are thofe that follow, as they are recorded by Pliny and Democritus: The head and throat being fet on fire with wood of Oke, they believe to be good against Thunder and Rain, and so also the liver burned on a Tyle. If the right eye be taken out of it alive, and appli'd to the whiteneffe of the eyes in Goats milk, it is thought to cure the same. The tongue bound to a woman with child, preferveth her from danger in childe-birth, if the fame tongue be taken from the Beast alive, it is thought it fore-warneth the event of judgement. The Heart wrapped in black Wooll of the first shearing, by wearing it cureth a quartane Ague; the right claw of the fore-feet bound to the left arm with the skin of his cheeks, is good against robberies and terrors of the night, and the right pan against all fears. If the left foot be forc'd in a furnace with the herb Chameleone, and afterward putting a little Ointment to it, and made into little Paffies, being carried about in a wooden box, it maketh the party to go invisible. The right shoulder maketh a man to prevail against his adversaries, if they do but tread upon the nerves call down upon the earth. But the left shoulder they consecrate the fame to monstrous dreams, as if that thereby a man might dream what he would in his own perfon and efect, the like in others.

With the right foot are all Paffies resolved, and with the left foot all Lathargies: the Wine wherein one side of a Chameleon hath been steeped, sprinkled upon the head, cureth the ach thereof. If Swines Grefe be mingled with the powder of the left foot or thigh, and a mans foot be anointed therewith, it bringeth the Gout, by putting the gall into fire, they drive away Serpents; and into Water, they draw together Weasels, it pulleth off hair from the body, so also doth the Liver, with the lights of a Toad; likewise the Liver dissolveth amorous Incantations. Melancholy men are cured by drinking the juice of a Chameleon out of a Chameleon skin. They also say, that the Intrails and dung of this Beast wafhed in the urine of an Ape, and hung up at our enemies gates, caufeth reconciliation.

With the tail they bring Serpents asleep, and lay the flowing of the floods and waters: the same mingled with Cedar and Myrrhe, bound to two rods of Palm, and driven upon water, caueth all things that are contained in the same water to appear; but I would to GOD that such Magitians were well beaten with Rods of stronger wood, until they forsook these magical fooleries: And thus much for the florey of the Chameleon.
T

His Beasts is called by the Grecians, Batilsous, and the Latins Regulus, because he feemeth to be the King of Serpents, not for his magnitude or greatness. For there are many Serpents bigger then he, as there be many four-footed Beasts bigger then the Lyon, but because of his flatly pace, and magnanmous minde; for he creepeth not on the earth like other Serpents, but gaeth half upright, for which occasion all other Serpents avoit his sight. And it feemeth nature hath ordained him for that purpose: for beside the strength of his poiyon which is uncurable, he hath a certain comebe or Coronet upon his head, as shall be showed in due place. It is also call'd St. Heli, as we read in Iffidur, Stibilum enim societ antiquam murdrerat vel exsua: The Cockatrice kilthe before it burneth. The Hebrews call it Pelven, and Carman, also Zapina, and Zaphhaini. The Oicle, Harmene, and also Carmene: The Egyptian, Ocre; the Germans, Ein Etre Schiingle; the French, Un Befilic; the Spaniards and Italian, Bafilico.

There is some question amongst Writers, about the generation of this Serpent: for some (and those very many and learned) affirm him to be brought forth of a Cocks Egg. For they say that when a Cock groweth old, he layeth a certain Egg without any shell, in read whereof it is covered with a very thick skin, which is able to withstand the greatest force of an eafe blow or fall. They lay moreover, that this Egg is laid only in the Summer time, about the beginning of Dog-days, being not long as a Hens Egg, but round and orbicular: Sometimes of a dultry, sometimes of a boase, sometimes of a yellow with muddy colour, which Egg is generated of the putrefied feed of the Cock, and afterward fer upon by a Snake or a Toad, bringeth forth the Cockatrice, being half a foot in length, the hinder-part like a Snake, the former part like a Cock, because of a treble comebe on his fore-head.

But the vulgar opinion of Europe is, that the Eggge is nourished by a Toad, and not by a Snake; howbeit in better experience it is found that the Cock doth fit on that Eggge himself: whereas Levius Laminio in his ewelth Book of the hidden miracles of nature hath this discourse, in the fourth Chapter thereof. There happened (saith he) within our memory in the City of Pirizes, that there were two old Cocks which had laid Eggges, and the common people (because of opinion that those Eggges would engender Cockatrices) laboured by all means possible to keep the said Cocks from flitting on those Eggges, but they could not with clubs and flaves drive them from the Eggges, until they forced to break the Eggges in funder, and trangle the Cocks. But this point is worth inquiry, whether a Cock can conceave an Eggge, and after a certain time lay the same without a shell. I for my part am perswaded, that when a Cock groweth old, and ceaseth to tread his female in the ordinary course of nature, which is in the seventh or ninth year of his age, or at the most in the fourteenth, there is a certain concretion bred within him by the putrefied heat of his body, through the baying of his feed generative, which hardeneth unto an Eggge, and is covered with such a shell, as is said already: the which Eggge being nourished by the Cock or some other beast, bringeth forth a venomous Worm, such as are bred in the bodies of men, or as Wasps, Horfe-flies, and Caterpillers engendered of Horse-dung, or other putrefied humors of the earth: Of the Cockatrices.
and so out of this Egg may such a venemous Worm proceed, as in proportion of body, and peltiferous breath, may resemble the African Cockatrice or Basilisk, and yet it is not the same whereof we purpose here to intreat, but will acknowledge that to be one kind of Cockatrice, but this kind is generated like other Serpents of the earth, for as the ancient Hermes writeth, it is both false and impossible, that a Cockatrice should be hatched of a Cocks Egg. The same writer maketh mention of a Basilisk ingendered in dung, whereby he meaneth the Elisir of life, wherewithal the Alchemists convert metals.

The Egyptians hold opinion, that these Cockatrices are ingendered of the Eggs of the Bird called Ibis, and therefore they break those Eggs wherefover they finde them: and for this cause in their Hieroglyphicks, when they will signifie a lawful execution after an upright judgment, and found institution of their fore-fathers, they are wont to make an Ibis: and a Cockatrice.

The Countries breeding or bringing forth these Cockatrices, are said to be thefe: First Africk, and therein the ancient seat or land of the Turks, Arabis, and all the Wilderneffe of Africa, and the Countries Cyrenet. Gauls among the Physitians only, doubteth whether they have a Cockatrice or no, whose whole authority in this case must not be followed, seeing it was never given to mortal man to fee and know every thing, for besides the holy Scriptures unavoidable authority, which both in the prophesie of Esay and Jerem, maketh mention of the Cockatrice and her Eggs: there be many grave humane Writers, whose whole authority is irrefragable, affirming not only that there be Cockatrices, but alfo that they infect the air, and kill with their bite. And Mercurial affirmeth, that when he was with Maximilian the Emperor, he saw the carcasse of a Cockatrice, referfed in his treasury among his undoubted monuments. Of this Serpent the Poet Georgium Philobatus writeth on this manner:

Rex eff Serpentum Basiliscus, quem modo vincant
Muifae injuflus, jevaque bella ferre.
Lernae vermen Basilisidis fads Cyrenae
Procula deinde maxima fperationem.

That is to say,

Et nefi eft omni galli, fi crederes fefi,
Decrepitis, in fima, fulo nitentes, docent.
Sed quamvis officina ladeat, vi fique ferorum
Omnis genus, credat nulla tenere bona.

We do read that in Rome, in the days of Pope Leo the fourth, there was a Cockatrice found in a Vault of a Church or Chappel, dedicated to Saint Luca, whose peltiferous breath had infected the air round about, whereby great mortality followed in Rome: but how the said Cockatrice came thither it was never known. It is most probable that it was created and fent of GOD for the punishment of the City, which I do the more easily believe, because Sigerinus and Julius Scaliger do affirm, that the faid peltiferous beast was killed by the prayers of the faid Leo the fourth.

I think they mean that by the authority of the faid Bishop, all the people were moved to general falling and prayer, and fo Almighty GOD who was moved for their firs, to fend fuch a plague amongst them, was likewise intreated by their prayers and fuits, not only to reverse the plague, but with the fame hand to kill the beast, wherewithal it was created: even as once in Ægypt by the hand of Moses, he brought Graffe-hoppers and Lice, by fo the fame hand he drove them away again.

There is some fmall difference among the Writers, about the quantity and parts of this Serpent: which I will briefly reconcile. First Æthiopian faith, that a Cockatrice is not paft a palm in compaffe, that is as much as a man can grip in his hand. Second faith, that it is as big as twelve fingers. Scaliger and Jefuites affirm, that it is but half a foot long.

African faith, that is the Arabian Harmonia, that is, the Cockatrice, is two cubits and a half long. Nicander faith, Et tribus extempe parcetibus corpore palmis, that is, it is in length but three palms. Actius faith, that it is as big as three handfuls. Now for the reconciliation of all thefe. It is to be understood, that Piny and Ælianus speakeith of the Worm that cometh out of the Cocks Egg: and in regard of the length, not of the quantity, and fo confound together that Worm and the Cockatrice. For it is very reasonable, that feeing the magnitude and greatneffe of the Serpent is concluded to be the leaft a span in compaffe, that therefore the length of it must needs be three or four foot at the shorft; elfe how could it be such a terror to other Serpents, or how could the fore-part of it arise fo eminently above the earth, if the head were not lifted at the leaft a foot from the ground. So then we will take it for granted, that this Serpent is as big as a mans writ, and the length of it anfevorable to that proportion.

It is likewise questionable whether the Cockatrice have wings or no: for by reason of his conceived generation from a Cock, many have described him in the fore-part to have wings, and in the hinder part to have a tail like a Serpent: And the conceit of wings seemeth to be derived from holy Scripture, because it is written Esay 14. verf. 29. De radicibus ostendit regulas & semen ejus aperit hominem: That is to say, Out of the Serpents roots fhall come a Cockatrice, and the fhit thereof fhall be a fiery flying Serpent, as we tranflate it in English: but Teemellius the beft Interpreter, doth render the Hebrew in this manner: Deractic Serpentinus proterba hominibus & fruticos illebus prefcri volant: That is to say, word for word, Out of the root of the Serpent fhall come the Homowe.
Of the Cockatrice.

I have, & the fruit thereof a flying Pheasant. Now we know, that the Hamath and the Pheasant are two other different kindes of Serpents from the Cockatrice, and therefore these Interpreters being the most faithful and learned, we will rather follow the holy Scripture in their translation, then the vulgar Latin, which is corrupted in very many places, as it is also Elyafi the Saxon verfe. For Pheasant there is again in the vulgar translation the Cockatrice: and for this cause we have not described the Cockatrice with wings, as not finding sufficient authority to warrant the same.

The eyes of the Cockatrice are red, or somewhat inclining to blackneffe, the skin and carkafe of this beast have been accounted precious, for we do read that the Pergamen did buy but certain pieces of a Cockatrice, and gave for it two pound and a half of silver: and becaufe there is an opinion that no Bird, Spider, or venomous beast, will indure the flight of this Serpent, they did hang up the skin thereof stuffed, in the Temples of Apollo and Diana, in a certain thin net made of gold: and therefore it is said, that never any Swallow, Spider, or other Serpent durft come within those Temples: And not only the skin or the flight of the Cockatrice worketh this effect, but also the flesh thereof, being rubbed upon the pavement, polls or walls of any Houfe. And moreover, if Scaliger. Silver be rubbed over with the powder of the Cockatrices flesh, it is likewise said, that it giveth it a tincture like unto gold: and besides these qualities, I remember not any other in the flesh or skin of this Serpent.

The hifling of the Cockatrice which is his natural voyce, is terrible to other Serpents, and therefore as soon as they hear the fame, they prepare themselves to fly away, according to these verses of Nicander;

uell auditas exspectant nullus suarum, 
Quantamvis magnis fiment animalia fivræ, 
Quam vel in paffium, vel space devia funt.

Which may be Englished thus;

When is the greatest winding Serpents bear, 
(Reading in Wood or pasture all abroad,)
Altho' inclin'd in many places, yet fear:
Or in mid-day the shades near Brooks road,

The fearful hissing of this angry beast, 
They run away, as fast as feet can lead them, 
Flying his rage unto some other field, 
Turning their backs whereby they do escape him.

We read also that many times in Africa, the Mules fall down dead for thirst, or elfe ye die on the ground for some other caufes, unto whose Carkafe innumerable troops of Serpents gather themselves to feed thereupon: but when the Bafilisk windeth the faire dead body, he giveth forth his voyce at the firft hearing whereof, all the Serpents hide themselves in the near adjoining sands, or else run into their holes, not daring to come forth again, until the Cockatrice have well dined and satisfied himself. At which time he giveth another signal by his voyce of his departure: then come they forth, but never dare meddle with the remnants of the dead beast, but go away to seek some other prey: and if it happen that any other pestiferous beast come unto the waters to drink near the place where the Cockatrice is lodged, so soon as it perceiveth the presence thereof, although it be not heard nor seen, yet it departeth back again, without drinking, neglecting his own nutriment, to save itself from further danger: whereupon Lucanus saith;

Lati si fibi submovet omné
Vul/us, Or in occaso regnat Basilissus arena.

Which may be thus Englished;

He makes the vulgar far from him to stand,
While Cockatrice alone raíngs on the sand.

So then it being evident that the hifling of a Cockatrice is terrible to all Serpents, and his breath and poýon mortall to all manner of Beasts: yet hath God in nature not left this vile Serpent without an enemy; for the Weafl and the Cock are his triumphant Victors; and therefore Piny saith well:

Hoc si talibus multo quad fampus eminum conspiret regs wider, mustellorum virus exitio efi, adox natura nilit placuit efs fine pari: That is to say, This monster which even Kings have defired to see when it was dead, yet is destroyed by the poýon of Weaflis, for so it hath pleased Nature, that no Beast should be without his match.

The people therefore when they take Weaflis, after they have found the Caves and lodging places of the Cockatrices, which are easily difcerned by the upper face of the earth, which is burned with their hot poýon, they put the Weafl in unto her: at the fight whereof the Cockatrice flyeth like a weakening overmatched with too strong an adversary, but the Weafl followeth after and killeth her. Yet this is to be noted, that the Weafl both before the fight and after the slaughter, armeth her self by eating of Rue, or else she would be poýoned with the contagious air about the Cockatrice; and besides this Weafl, there is no other beast in the World which is able to stand in contention against the Cockatrice, faith Lemau.

Again, even as a Lyon is afraid of a Cock, so is the Bafilisk; for he is not only afraid at his flight, but almost dead when he heareth him crow, which thing is notoriously known throughout all Africa. And therefore all Travellers which go through the Deferts, take with them a Cock for their safe conduct against the poýon of the Bafilisk: and thus the crowing of the Cock is a terror to Lyons, and a death to Cockatrices, yet he himself is afraid of a Kite.
The History of Serpents.

There are certain learned Writers in Saxon, which affirm, that there are many kindes of Serpents in their Woods; whereas one is not unlike to a Cockatrine: for they say it hath a very sharpe head, a yellow colour, in length not exceeding three Palms; of a great thicknefe, his belly spotted and adorned with many white pricks: the back blew, and the tail crooked and turned up; but the opening of his mouth is far wider then the proportion of his body, may seem to bear. These Serpents may well be referred to Cockatrices: for however their poiyon is not so great as the Basilisks of Africa, (even as all other Serpents of the hot Countries are far more pelliferous then those which are bred in the cold Countries;) the very fame reafon perfwaded me, that there is a difference among the Cockatrices, and that thofe of Saxon may differ in poiyon from thofe in Africa, and yet be true Cockatrices: Besides this, there is another reafon in Lemnias, which perfwaded the Reader there are no Cockatrices; because when the Countrymen fet upon them to kill them with Clubs, Bills, or Forks, they receive no hurt at all by them, neither is their any apparent con- cept of the air: but this is answered already, that the poiyon in the cold Country is nothing so great as in the hot, and therefore in Saxon they need fcar the biting, and not the airs infection.

Cardan relateth another story of a certain Serpent, which was found in the walls of an old decayed Houle in Milian, the head of it (faith he) was as big as an Egge, too big for the body, which in quantity and shape refeembled a Stellion. There were teeth on either chap, fuch as are in Vipers. It had two legs, and thofe very fhort, but great, and their feet had claws like a Cats: fo that when it ftood it was like a Cock, for it had a bunch on the top of the head, and yet it wanted both feathers and wings: The tail was as long as the body, in the top thereof there was a round bunch as big as the head of an Italian Stellion. It is very likely that this beaft is of the kinde of Cockatrices.

Now we are to intreat of the poiyon of this Serpent, for it is a hot and venomous poiyon, infec- ting the air round about, fo as no other creature can live near him; for it killeth, not only by its hisfing and by his fight, (as is faid of the Gorgons,) but also by his touchings, both immediately and mediatly; that is to fay; not only when a man toucheth the body it felf, but alfo by touching a Weapon wherewith the body was flain, or any other dead beaft flain by it; and there is a common fame, that a Horfe man taking a Spear in his hand, which had been thruit through a Cockatrice, did not only draw the poiyon of it into his own body and fo dyed, but alfo killed his Horfe thereby. 

Lucan writeth;

Quid profefit incerti Basilifum capite Mauro
Tranplus et volox currat per tela venenam.
Insaudit manum quoqueque.

In English thus;

What had the Moore to kill?
The Cockatrice with Spear, no
Sith the swift poiyon him did fail.
And Horfe that did, him bear.

The question is in what part of this Serpent the poiyon doth lie; some fay in the head alone, and that therefore the Basilisk is defat, becaufe the Air which ferveth the Organ of hearing, is renvolved by the intenfive caldity: but this feemeth not to be true, that the poiyon fhould be in the head only, becaufe it killeth by the fume of the whole body, and besides when it is dead it killeth by only touching it, and the Man or Beaf fio flain, doth alfo by touching kill another: Some again fay, that the poiyon is in the breath, and that therefore it breatheth at the fides, and in any other places of the body, through and betwixt the scales; which is also true, that it doth fo breath: for otherwife the burning fume that proceedeth from this poiyonful beaf, would burn up the Intrails thereof, if it came out of the ordinary place; and therefore Almighty GOD hath ordained, that it fhould have fpiraments and breathing places in every part of the body, to venf away the heat, left that in very fhort time, by the inculusion thereof, the whole compage and juncture of the body fhould be utterly difolved, and dispersed one part from another.

But to omi inquiry in what part of his body the poiyon lyeth, feeing it is most manifest that it is universal, we will leave the fear thereof, and difpute of the instruments and effects.

First of all therefore it killeth his own kinde, by fight, hearing, and touchings. By his own kinde, I mean other Serpents, and not other Cockatrices; for they can live one unlefe another, for if it were true (which I do not believe) that the Arabian Harmonis were any other Serpents then a Cocka- trice, the very fame reafon that Arabian gave the fellowship of these two Serpents together, (becaufe of the fimilitude of their natures) may very well prove that no divers kinde can live fo well together, in fafety without harming one another, as do one and the fame kinde togethcr. And therefore there is more agreement in nature between a Cockatrice and a Cockatrice, then a Cocka- trice and Harmonis, and it is more likely that a Cockatrice doth not kill a Cockatrice, then that a Cockatrice doth not kill an Harmonis: And again, Cockatrices are engendered by Egges, according to the holy Sprite; and therefore one of them killeth not another by touching, biting, or fee- ing, because one of them hatcheth another: But it is a quefion whether the Cockatrice dye by the fight of himfelf? Some have affirmed fo much, but I dare not fubcribe thereunto, because in

reason
reason it is impossible that any thing should hurt it self, that hurteth not another of his own kind, yet if in the secret of nature GOD have ordained such a thing, I will not strive against them that can fell it.

And therefore I cannot without laughing, remember the old Wives tales of the Vulgar Cockatricesthat have been in England

for I have oftentimes heard it related confidently, that once our Nation was full of Cockatrices, and that a certain man did destroy them by going up and down in a glasse, whereby their own shapes were reflected upon their own faces, and so they dyed. But this table is not worth refuting, for it is more likely that the man should first have dyed by the corruption of the air from the Cockatrices, then the Cockatrices to die by the reflection of his own fimilitude from the glasse, except it can be shewed that the poyfoned air could not enter into the glasse wherein the man did breath.

Among all living creatures, there is none that perisheth sooner then doth a man by the poyson of a Cockatrice, for with his sight he killeth him, because the beams of the Cockatrices eyes do corrupt the visible spirit of a man, which visible spirit corrupted, all the other spirits coming from the brain and life of the heart, are thereby corrupted, and so the man dyeth: even as women in their monthly courses do vitiate their looking-glasses; or as a Wolf suddenly meeting a Man, taketh from him his voyage, or at the eldest maketh him hoarse.

To conclude, this poyson infecteth the air, and the air infecteth killeth all living things, and likewise all green things, fruits, and plants of the earth: it burneth up the glasse whereupon it goeth or creepeth, and the fowls of the air fall down dead when they come near his den or lodging. Sometimes he biteth a Man or a Beast, and by that wound the bloody turneth into choler, and so the whole body becometh yellow as gold, presently killing all that touch it, or come near it. The symptoms are thus described by Nicander, with whom I will close this history of the Cockatrice, writing thus:

**Quod ferit his, multa corporis succedentiae igne,**

A membri refoluta fuit caro defuncti, & fit

Luiza & objuncta nigredinis apoia colors,

Nulla etiam volutae quo fada cadaveri pafsum,

Sic volutum hominem tangens, at vultum & omnes
trans luminis dixit, phoebeque rudibus auícula

Whose which may be Englished thus:

When he doth strike, the body burst on five parts,

And from the members falleth off the flesh with blood,

It rotten is, and in the colour black as anywhill.

But how doth feed, all green and small

Are all men so destroyed.

No Vulture or Biter fierce,

Or Weather telling-crow, or Death wildest beast,

Cerastes, nec quaescit: fera per devia ruftra

Dedigit, & tali catium fibit tabulae carnea.

Tum tetet vatus odor bine exhastat in auras,

Aque propriis mancipat retruant non fugiunt arua.

Sin tegunc fana omnes proximum ales,

Tristia fae refert, certamine ex aere mortem.

Which live in dens sustaining greatest famine's force,

But at their tables do this flesh defile.

Then is the one repeat with it's both some snail,

Piercing vital parts of them approaching near,

And if a bird it faoft to fill his hunger fell,

It dies aslaid death, none need it fear.

of the CORDEL.

Altho’ I finde some difference about the nature of this living creature, and namely whether it be a Serpent or a Fith, yet because the greater and better part make it a Serpent, I will also bring it in his due order in this place for a venomed Beast. Gefner is of opinion, that it is no other but a Lizard of the Water; but this cannot agree with the description of Aristotle and Bellinumus, who affirm the Cordil to have Gills like a Fith, and these are not found in any Lizard. The Grezians call this Serpent Cordilus, and Cordilus, whereof the Latinus derive or rather borrow their Cordilus, and Cordyla. Nimium maketh this a kind of Salamander which the Apothecaries do in many Countries falsely fell for the Scincus or Crocodile of the earth, and yet it exceedeth the quantity of a Salamander, being much lezse then the Crocodile of the earth, having gills and wanting fins on the sides, also a long tail, and according to the proportion of the body, like a Squirells, although nothing so big, without febbs: the back being bald and somewhat black, and horrible rough, through some bunches growing thereupon, which being preffed do yeeld a certain humor like milk, which being laid to the Nothhills doth smell like poyson, even as it is in a Salamander. The beak or snout is very blunt or dull, yet armed with very sharp teeth. The claws of his fore-legs are divided into four, and on his hinder-legs into five; there is also a certain flathy fin growing all along from the crown of his head, unto his tail upon the back, when which he swimmeth he erretheth, and by it is his body sustained in the water from finking, for his body is moved with crooked windings, even as an Eel or a Lamprey.

The inward parts of this Serpent are allso thus described. The tongue is soft and spungy, like as is the tongue of a Water-frog, wherewith as it were with glew, he draweth to his mouth, both Leeches and Worms of the earth, whereupon it feedeth. At the root of his tongue there is a certain bunch of flesh, as I think supplyeth the place of the lights, for when it breatheth, that part is especially moved, and it panteth to and fro, so that thereby I gather, either it hath the lights in that place, or else in some other place near the jaws. It wanteth ribs as doth the Salamander, and it hath certain bones in the back, but not like the ordinary back-bone of other such Serpents. The heart is also all spungy, and cleaved to the right side, not to the left: the left ear whereof supplyeth the place of the Pericardium.
The liver is very black, and somewhat cloven at the bending of floop fide: the mift somewhat red, cleaving to the very bottom of the ventricle. The reins are also very fpongous, joined almost to the legs, in which parts it is moft fleephy, but in other places, espeially in the belly and breasts, it is all skinne and bone. It alfo beareth egges in her place of conception, which is forked or double, which are there diſpoed in order, as in other living grifly creatures. Thofe Egges are nourifh'd with a kind of red fat, out of which in due time come the young ones alive, in great plenty and number as the Salamanders. And thefe things are reported by Bellotius, besides whom I finde nothing more faid, that is worthy to be related of this Serpent, and therefore I will here conclude the History thereof.

Of the Crocodile.

Beaufe there be many kindes of Crocodiles, it is no marvel although fome have taken the word Crocodilus for the Genus, and the feveral Species, they dilolving into the Crocodile of the earth and the water. Of the earth are super-diſtributed into the Crocodiles of Breſtilia, and the Scincus: the Crocodiles of the water into this here decribed, which is the vulgar one, and that of Nilus; of all which we fhall entreat in order, one fucceffively following another. But I will not contend about the Genus or Species of this word, for my purpose is to open their feveral natures, fo far as I have learned, wherein the words of Almighty God may be known, and will leave the strife of words to them that spend their wits about terms and syllables only. Thus much I finde, that the Ancients had three general terms for all egge-breeding Serpents. Namely, Rana, Tjiunds, Lacerta. And therefore I may forbear to entreat of Crocodilus as a Genus, and handle it as a Species, or particular kinde. The Hebrews have many words which they ufe for a Crocodile, Koab, Levit. 11. which the Arabians render Hardun; and the Persians, Sanga, which word cometh near the Latine word Scincus for a Crocodile of the earth, and yet that word Koab by Saint Jeram, and the Septuagints is tranflated a Chameleon.

In the fame place of Leviticus the word Zab is interpreted a kinde of Crocodile wherewithall David Kimbi confoundeth Crocodilus, and Rabbi Solomon Figet. The Chaldees tranflate it Zab; the Persians, An Rafia; the Septuagints, a Crocodile of the earth; but it is better to follow Saint Hieron in the fame, becaufc the Text addeth according to his kinde, wherefore it is superfluous to add the diſtinction of the Crocodile of the earth, except it were lawful to eat the Crocodiles of the water.

In Exod. 8. there is a fifth called Zephardeo, which cometh out of the waters and eateeth men, this cannot agree to any fifth in Nilus, save only the Crocodile; and therefore this word is by the Arabians rendered Al Timfeh. Some do hereby
Of the Crocodile.

by understand Pagurera, Grrenlera, and Butrachoi, that is great Frogs. Alitha by the most of the Jews understand a Horshafch, Prov. 30. but David Kimbi taketh and utter it for a Crocodile. For he faith, it is a great Worm, abiding near the Rivers sides, and upon a sudden feteth upon men or car- tel as they passe before him. Liffma and Alina are by Avoient expounded for a Crocodile: and Tenbora for that Crocodile that never moveth his neither or under chap.

Strabo faith, that in the Province of Argina in Egypt, there is a holy Crocodyl worshipped by the Inhabitants; and kept tame by the Peerys in a certain Lake; this sacred Crocodile is called Suchus; and this word cometh neer to Scimus, which as we have said signifieth any Crocodile of the earth, from which the Arabian Tinja semeth also to be derived, as the Egyptian Tampfai doth come neer to the Arabian Tinija. Herodotus calleth them Champsii, and this was the old Emarion word for a Vulgar Crocodile in hedges. Upon occasion whereof Scaliger faith, he asked a Turk, by what name they call a Crocodile at this day in Turkey, and he answered Kimfai, which is most evidently corrupted from Champsii.

The Egyptians vulgarly call the Crocodile of Nius, Cocatrix; the Grecians, Neithchroodex, generally Crocodilus, and at times Demulere. The Lattines, Crocodilus; and Albertus, Crocodilus; and the same word is retained in all languages of Europe. About the Etymology of this word, I finde two opinions not unprofitable to be reheard: the first, that Crocodilus cometh of Crocii, Saffron, because this Beast, especially the Crocodile of the earth, is afraid of Saffron, and therefore the Country people, to defend their Hives of Bees and Honey from them, brose upon the places Saffron. But this is too far fetched, to name a Beast from that which it feareth, and being a secret in nature, it is not likely that it was discovered at the first, and therefore the name must have lome other investigation.

Iuovus as faith, that the name Crocodilus cometh of Crocusc color, the colour of Saffron, because such is the colour of the Crocodile; and this semeth to be more reasonable. For I have seen a Crocodile in England brought out of Egypt dead, and killed with a Musket, the colour whereof was like to Saffron growing upon fields in flowers. Yet is it more likely, that the derivation of Varinus and Euga- thius was the original, for they say that the thores of sands on the Rivers, were called Croce and Cro- cocle; and because the Crocodiles haunt and live in those thores, it might give the name to the Beasts, because the water Crocodiles live and delight in those sands, but the land or earth Crocodiles abhor and fear them.

It is reported that the famous Grammarian Artemidius seeing a Crocodile lying upon the sands, he was so much touched and moved therewith, that he fell into an opinion that his left leg and hand were eaten off by that Serpent, and that thereby he loft the remembrance of all his great learning and knowledge of Arts. And thus much for the name of this Serpent.

In the next place we are to consider the Countries wherein Crocodiles are bred, and keep their habitation, and those are especially Egypt; for that only hath Crocodiles of both kinds, that is, of the water and of the land: for the Crocodiles of Nius are Amphibius, and live in both elements: they are not only in the River Nius, but also in all the pools near adjoyning. The River Bambus neer to Ato in Africa, doth also bring forth Crocodiles; and Pliny faith, that in Darat a River of Alainanta, there are Crocodiles ingendered. Likewise Apollinarius reporteth, that when he passed by the River Indus, he met with many Sea-horses and Crocodiles, such as are found in the River Nius, and besides these Countries do I do not remember any other, wherein are ingendered Crocodiles of the water, which are the greatest and most famous Crocodiles of all other.

The Crocodiles of the earth, which are of lesser note and quantity, are more plentiful, for they are found in Libya, and in Bybiana, where they are called Acaria, and in the Mountain Sayrus in Arabia, and in the Woods of Indus, as is well observed by Avicenn, Disporidius, and Hermes, and therefore I will not prosecute this matter any further.

The kinds being already declared, it follows that we should proceed to their quantity and sev- eral parts. And it appeareth that the water Crocodile is much greater, and more noble then the Cro- cadiles of the earth; for they are not about two cubits long, or sometimnes eight at the most, but the other are sixteen, and sometimnes more. And besides, these Crocodiles, if they lay their eggs in the water (faith Beliuerri) then their young ones are much greater, but if on the land, then they are lesser, and like the Crocodiles of the earth. In the River Ganges there are two kinds of Crocodiles, one of them is harmeless, and doth not hurt to any creature, but the other is a devouring unfruitful Beast, killing all that he layeth his mouth on, without all mercy or excorable quality, in the top of whose whote there groweth a bunch like a horn.

Now a Crocodile is like a Lizard in all points (excepting the tail, and the quantity of a Lizard,) yet it layeth an Egg no greater then a Gooses Egge, and from so small a beginning ariseth this monstrous Serpent, growing all his life long, unto the length of fifteen or twenty cubits. And as Phala- reus witnesseth in the days of Pharnaceus King of Egypt, there was one found of five and twenty cubits long: and before that, in the days of Amnis, one that was above fix and twenty cubits long, the reason whereof was their long life, and continual growth.

We have wheed already, that the colour of a Crocodile is like to Saffron, that is betwixt yellow and red, more inclining to yellow then red, not unlike to the blacker kinde of Chamaeleon: but Peter Martyr faith, that their belly is somewhat whiter then the other parts. Their body is rough all over, being covered with a certain bark or rinde, so thick, firm, and strong as it will not yeeld (and especially about the back) unto a cart-wheel when the cart is loaded, and in all the upper parts,
The History of Serpents.

parts, and the tail, it is impenetrable with any dart or spear, yeas scarily to a pistol or small gun, but the belly is softer, whereon he receiveth wounds with more facility: for as we shall shew afterwards, there is a kinde of Dolphin which cometh into Nitis, and fighteth with them, wounding them on the belly parts.

The covering of their back is distinguisht in divers divided shells, standing up far above the flesh, and towards the sides they are leffe eminent, but on the belly they are more smooth, white, and very penetrable. The eyes of a Crocodile of the water, are reported to be like unto a Swines, and therefore in the water they see very dimly, but out of the water they are sharp and quick sighted, like to all other four-footed Serpents that lay eggs. They have but one eye-lid, and that groweth from the neather part of the cheek, which by reason of their eyes never twinkleth. And the Egyptians say, that only the Crocodile among all the living creatures in the water, draweth a certain thin bright skin from his fore-head over his eyes, wherewithall he covereth his fight: and this I take to be the only caufe of his dim fight in the waters.

The head of this Beall is very broad, and his nose like a Swines. When he eateth or biteth, he never moveth his neather or under chap. Whereof Aristoteles giveth this reason, that seeing Nature hath given him so short feet, as they are not able to hold or to take the prey, therefore the mouth is framed in head of feet, so as it may more vehemently strike and wound, and also move speedily move and turn after the prey, and this is better done by the upper then the neather chap. But it is likely that he was deceived, for he speaketh of Crocodilus marinus, a Crocodile of the Sea, whereas there is no Crocodile of the Sea but rather some other, and such peradventure Albertus saw, and thereupon inconsiderately affirmed, that all Crocodiles move their under chaps, except that Teuches. But that the learned Vesalius proveth it to be otherwise, because that the neather-chap is so conjointed and fastened to the bones of the temples, that it is not possible for to be moved. And therefore the Crocodile only among all other living creatures, moveth the upper-chap, and holdeth the under-chap unmoveable.

The second wonder unto this, is that the Crocodile hath no tongue, nor so much as any appearance of a tongue. But then the question is, how it cometh to distinguisht the sapours and taint of his meat. Whereunto Aristoteles answereth, that this Crocodile is such a ravening Beall, that his meat tarryeth not in his mouth, but is carried into his stomack, as like as other water Bealls, and therefore they discern sapours, and relish their meat more speedily then other; for the water or humor falleth so fast into their mouths, that they cannot stand long upon the taint or disfaint of their meat. But yet some make question of this, and they anfwer that most men are deceived herein, for whiles they look for his tongue upon his neather-chap, as it is in all other Bealls, and finde none, they conclude him to want that part: but they should consider, that the tongue cleaveth to the moveable part, and as in other Bealls the neather-chap is the seat of the tongue, because of the motion, so in this the tongue cleaveth to the upper-chap, because that it is moveable, and yet not visible as in other, and therefore is very hardly discerned. For all this, I rather conclude with the former Authors, that seeing it liveth both in the waters and on the land, and therefore it refembles a fish and a beall, as it refembles a Bealt, locum obietis lingue, it hath a place for a tongue; but as it refembles a fish, Elingus els, it is without a tongue. It hath great teeth flanding out, all of them stand out before visibly when the mouth is open, and fewer behind. And whereas Aristoteles wright, that there is no living creature which hath both dentes prominenter, & serratis, that is, flanding out, and divided like a faw, yet the Crocodile hath both. Their teeth are white, long, sharp, and a little crooked and hollow, their quantity well refembling the residue of the proportion of the body: and some say, that a Crocodile hath three rows of teeth, like the Lyon of Cynos, and like the Whale, but this is not an approved opinion, because they have no more then four rows of teeth. They have also fixy joynts or bones in the back, which are also tyed together with so many nerves. The opening of his mouth reacheth to the place of his ears, and there be some Crocodiles in Ganges which have a kinde of little horn upon their noses or foun. The milk is very small, and this fawye is onl in them that bring forth egges, their frones are inward and cleave to their loyons. The tail is of the same length that the whole body hath, and the same is also rough and armed with hard skin upon the upper part and the sides, but beneath it is smooth and tender. It hath fins upon the tail, by the benefit whereof it swimmeth, as also by the help of the feet. The feet are like a Bears, except that they are covered with scales in head of hair; their nails are very sharp and strong for it is had a claw as well as it hath feet, the strength thereof would over-turn a ship. It is doubtful whether it hath any place of excrement except the mouth: And thus much for the several parts of the Crocodile.

The knowledge also of the natural actions and inclinations of Crocodiles is requisite to be handled in the next place, because that actions follow the members as sounds do instruments. Firt therefore, although Aristoteles for the most part speaketh of a Crocodile, calleth it aquatili & fluviatili, yet it is not to confine it to the Waters and Rivers, as though it never came out of them like fitches, but only to note that particular kinde which differeth from them of the earth, for it is certain that it liveth in both elements, namely earth and water: and for the time that it abideth in the water, it also taketh air, and not the humor or moisture of the water, yet can they not want either humor of the water or respiration of the air: and for the day time it abideth on the land, and in the night in the water, because in the day, the earth is hothir than the water, and in the night the water warmer than the earth: and while it liveth on the land, it is so delighted with the Sun-shine,
Of the Crocodile. 685

The eyes of a Crocodile (as we have said) are dull and blinde in the water, yet they appear bright to others, for this cause, when the Egyptians will signify the Sun-rising, they picture a Crocodile looking upward to the earth, and when they will signify the West, they picture a Crocodile diving in the water, and so for the most part the Crocodile lyeth upon the banks, that he may either dive into the water with speed, or ascend to the earth to take his prey.

By reason of the thornyness of his feet, his pace is very slow, and therefore it is not only easie to escape from him by flight, but also, if a man do but turn aside and winde out of the direct way, his body is too unstable to bend it self, that he can neither winde nor turn after it. When they go under the earth into their caves, like to all foore-footed and egge-breeding Serpents, as namely Lizards, Serpents, and Tortoises, they have all their legs joyned to their hides, which are so returned as they may bend to either side; for the necessity of covering their egges; but when they are abroad, and go bearing up all their bodies, then they bend only outward, making their thighs more visible. It is somewhat questionable, whether they lye hid within their caves four months or sixty days, for some Authors affirm one thing, and some another, but the reason of the difference is taken from the condition of the cold weather, for which cause they lye hid in the Winter time. Now as much as the Winter in Egypt is not usually above four months, therefore it is taken that they live but four months, but if it be by accident of cold weather prolonged longer, then for the same cause the Crocodile is longer time in the earth. During the time they lie hid, they eat nothing, but sleep (as it is thought) immoveably, and when they come out again, they do not call their skins as other Serpents do.

The tail of a Crocodile is his strongest part, and they never kill any beast or man, but first of all they strike him down and sloune him with their tails, and for this cause, the Egyptians by a Crocodile tail do signify death and darknesse. They devour both men and beasts if they finde them in their way, or near the banks of Nile, whereas they abide, taking sometimes a cafe from the Cow his Dam, and carrying it whole into the waters. And it appeareth by the pourtrature of Necte, that a Crocodile drew in an Afe into Nile as he was drinking, and therefore the Dogs of Egypt by a kind of natural intimation, do not drink but as they run, for fear of the Crocodiles: whereupon came the proverb, Ut Canis a Nilio bibit & fugit, as a Dog at one time drinketh and runneth by Nile.

When they desire fishes, they put their heads out of the water as it were to sleep, and then suddenly when they euy a booty, they leap into the waters upon them and take them. After that they have eaten and are satisfied, then they turn to the land again, and as they lie gaping upon the earth, the little bird Tryphiun makest clean their teeth, and is satisfied by the remains of the flesh sticking upon it. It is also affirmed by Aristotle, that it is fed with mud, but the holy Crocodile in the Province of Arabia, is fed with bread, flesh, wine sweet and hard, fod flesh and cakes, and such like things as the poor people use unto it when they come to see it. When the Egyptians will write a man eating or at dinner, they paint a Crocodile gaping.

They are exceeding fruitul and prolifical, and therefore also in Hieroglyphicks they are made to signify fruituineffe. They bring forth every year, and lay there egges in the earth or dry land. For during the space of three score days they lay every day an Egge, and in the like space they are hatched into young ones, by sitting or lying upon them by course, the male one while, and the female another. The time of their hatching is in a moderate and temperate time, otherwise they perish and come to nothing, for extremity of heat spoyleth the egge, as the buds of some trees are burned and scorched by the like occasion. The egg is not much greater then the egge of a Goole, and the young one out of the shell is of the same proportion. And so from such a small beginning doth this huge and monstrous Serpent grow to his great stature, the reason whereof, (Iaith Aristotile) is, because it groweth all his life long, even to the length of ten or more cubits. When it hath laid the egges, it carryeth them to the place where it shall be hatched, for by a natural providence and foresight it avoweth the waters of Nile, and therefore ever layeth her egges beyond the compass of her floods; by observation whereof, the people of Egypt know every year the inundation of Nile before it happen. And in the measure of this place it is apparent, that this Beast is not induced only with a spirit of reason, but also with a fatigual or prophetical geographical delineation, for so the placeth her egges in the bank or bank of the flood (before the flood cometh) that the water may cover the nest, but neither fell that firsteth upon the egges. And the like to this is the building of the Beaver, as we have showed in due place before in the History of four-footed Beasts.

So soon as the young ones are hatched, they infantly fall into the depth of the water, but if they meet with Frog, Snail, or any other such thing fit for their meat, they do presently tear it in pieces, the dam beast it with her mouth, as it were punishing the pusillanimity thereof, but if it hunt greater things, and be greedy, ravening, induratus and bloody, that the makest much of, and killing the other, nourisheth and tendereth this above measure: after the example of the wise men, who love their children in judgement, foresee their induratus inclination, and not in affection, without regard of worth, vertue, or merit. It is laid by Plinie, that after the egges is laid by the Crocodile, many times there is a cruel stinging Scorpion which cometh out thereof, and woundeth the Crocodile that lyd it. To conclude, they never prosper but near the waters, and they live three score years, or the age of a mans life.
The nature of this beast is to be fearful, ravening, malicious, and treacherous in getting of his prey, the subtlety of whose sly is by some attributed to the thinness of his boid, and by other to the hardnese of his skyn and hide. How it dealeth with her young ones, we have shewed already, as it were trying their nature whether they will degenerate or no, and the like things are reported of the Alps, Cancers, and Tortoys of Egypt.

From hence came the concept of Petia Crocodill, the piety of the Crocodile. But as we have said, it is a fearful Serpent, abhorring all manner of noise, especially from the brained voyce of a man, and where he findeth himself valiantly assaulted, there also he is discouraged, and therefore Marcel-linus faith of him, Audax Monitum Jucundius, at ubi audaces feeretis timidissim: An audacious Mon-ter to them that run away, but most fearful where he findeth resistance.

Some have written, that the Crocodile runneth away from a man if he wink with his left eye, and look steadfastly upon him with his right eye, but if this be true, it is not to be attributed to the veruue of the right eye, but only to the rareneffe of fight, which is conspicuous to the Serpent from one eye. The greatest terror unto Crocodiles, as both Senex and Pliny affirm, are the Inhabitants of the Ille Tenturus within Nilus: for those people make them run away with their voyces, and many times pursue and take them in snares. Of these people speaketh Salinas in this manner: There is a generation of men in the Ille Tenturus within the waters of Nilus, which are of a most adverfet nature to the Crocodile, dwelling alfo in the same place. And although their peracons or presence be of small nature, yet herein is their courage admired, because at the sudden sight of a Crocodile they are no whit daunted: for one of these dare meet and provoke him to run away. They will also leap into the Rivers and swim after the Crocodile, and meeting with it, without fear call themselves upon the beasts back, riding on them as upon a Horse. And if the beast lift up his head to bite him, when he gapeth they put into his mouth a wedge, holding it hard at both ends with both their hands, and so as it were with a bridle, lead, or rather drive them captive to the land, where with their noise they do terrifie them, that they make them cast up the bodies which they had swallowed into their bellies; and because of this antipathy in nature, the Crocodiles dare not come near to this Island.

The like thing we have before in our general discourse of Serpents, shewed to be in the Indian Pilibus against the greatest Serpents. And Strabo alfo hath recorded, that at what time Crocodiles were brought to Rome, these Tenturius followed and drove them. For whom there was a certain great pool or fish-pond aligned or walled about, except one passage for the beast to come out of the water into the Sun-shine: and when the people came to see them, these Tenturius with nets would draw them to the land, and put them back again into the water at their own pleasure. For they do shew them by their eyes, and bottom of their bellies, which are their tenderest parts, that like as Horses broken by their Riders, they yeld unto them, and forget their strength in the presence of these their Conquerors.

Peter Martyr in his third Book of his Babylonian Lexicon, faith, that from the City Cair to the Sea, the Crocodiles are not so hurtul and violent as they are up the River Nilus into the land, and against the stream. For as you go further up the River, near the mountain and hilly places, so shall you finde them more fierce, bloody and unrefeilible, whereof the Inhabitants gave him many reasons. First, because that part of the River which is betwixt the City Cair and the Sea, is very full of all sorts of fishes, whereby the beast is so filled with devouring of them, that they lift not out come of the water on the land to hunt after men or cattel, and therefore they are the least hurtul, for even the Lyon and Wolf do cease to kill and devour when their bellies are full. But sometimes the Crocodiles beneath the River, follow the pales or troops of fish up the River, like so many father-men, and then the Country Fisher-men inclofe them in nets, and so destroy them. For there is a very great reward propos'd by the law of the Countrie, to him that killeth a Crocodile of any great quantity; and therefore they grow not great, and by reason of their fmalnesse are least adventorous. For so loon as a great Crocodile is discovered, there is such watch and care taken to intercept and kill him for hope of the reward, that he cannot long escape alive.

Thirdly, the Crocodiles up the River, towards the Mountains, are more hurtul, because they are presed with more hunger and famine, and more seldom come within the terror of men, wherefore they forcake the waters, and run up and down to seek prey to satisfie their hunger, when which they meet withall, they devour with an unrefeilible defire, forced and pressed forward by hunger, which breaketh loose walls. But most commonly when the River Nilus is lowest, and sunck down into the channel, then the Crocodiles in the water do grow most hungry, because the fish are gone away with the floods; and then the subtle beast will heal and cover himself over with sand or mud, and so lie the bank of the River, where he knoweth the women come to fetch water, or the cattel to drink, and when he espieh his advantage, he suddenly taketh the woman by the hand that the takef he up water withall, and draweth her into the River, where he eateth her in pieces and eateth her. In like fort dealeth he with Oxen, Cows, Affes, and other cattel. If hunger force him to the land, and he meet with a Camel, Horse, Affe, or such like beast, then with the force and blows of his tail he breakeh his legs, and so laying him flat on the earth, killeth and eateth him: for so great is the strength of a Crocodile's tail, that it hath been seen that one stroke thereof hath broken all the four legs of a beast at one blow.

There is also another perill by Crocodiles, for it is said that when Nilus faileth, and the water waxeth low, the Barks through want of winde, are fain by the Mariners to be tugged up the
the stream with long lines and cords: the stubile Crocodile seeing the fame, doth suddenly with his tail strike the same line with such force, that either he breaketh it, or by his terrible violence turneth the Mariner down into the water, whom he is ready to receive with open mouth before he can recover. Yea many times by means thereof the Bark it felt so tormented and regale, that the violent beak taketh a man out of it, or else clean over-turneth it, to the destruction of all that are in it.

Albanus faith, that among the Ombia which are in Arsinur, the Crocodiles are harmless, having several names when they are called, do put their heads out of the water and take men gently, which means the head and garbage of such fisheries as are brought thither. But in another place he writeth, that among the Ombia or Capite, it is not safe for a man to fetch water from the River, or to wash their feet, or walk on the Rivers side, but with great caution and wariness. For eventhose beaks which are most kindly used by men, do rage against their Benefactors, as namely the Crocodile, the Ichneumon, the Wilde-cats, and fuch like. And yet Plathus in his Book de ani-
mammis, faith, that the Priests, by the custom of meat-giving, have made some of them tame, that they will sufler their mouths and teeth to be cleansed by men. And it is further said, that during the feven Ceremonial days of the nativity of Aph, there is none of them that the weth any wilde trick or cruel part, but as it were by compact between them and the Priests, they lay aside all cruelty and rage during that time.

And therefore Ciera writeth most excellently, saying: **Egyptium marum qui genet et quantum initio** addicet, *quorum carnis decidere putamus, quam sibi, aut adivi, aut Crocoidum violent. That is to say, Who is ignorant of the custom of the Egyptians? whose minds are to be ad- foned and induced with erroneous wickedness, that they had rather undergo any torment, than offer violence to an Ibis, an Aip, or a holy Crocodile. For in divers places, all these, and Cats also, were worshipped by the people, according to the saying of *Juvenal*:

*Crocodiln ad ads part bae Egypt, Ibis paret autum Serpentibus ibim. Which may be Englisht thus:

*This part of Egypt Crocodile adore,
That, the Ibis, fed with Serpents here.*

But the reason of divine worship or honour given to the Crocodiles are worth the noting, that the devout Reader may the better have some taste of that ancient blindenesse whereby our fore-fathers were misled and seduced, to forfake the most glorious and ever-blessed principles of Divinity, for arguments of no weight.

First therefore the Idolatrous Priests thought there was some divine power in the Crocodile, becaufe it wanted a tongue, for the Deity or Divine speech hath no need of a voice to express his meaning, according to the saying of the Grecians, Kai di apelphon bainoun kileuthn hain dikes, te sbeta agkatua sken: For by a mute and silent way it attendeth, and bringeth all things mortal to a vocal justice, which speaketh in action though not in a voice even as that is in the Crocodile, is action and not voice.

Secondly, by reason of a certain thin smooth skin coming from the midst of his fore-head, C sillius, wherewithall it covereth his eyes, so that it is thought to be blinde, yet it feeth: even so it is with the Ibis, for power, for even then when it is not seen, yet doth it see perfectly all mortal things.

Again, by their eggs and nells they usually fore-shew the over-flowing of Niles, to the infinite benefit of their Country wherein they live, for thereby the husband-men know when to till their land, and when not, when to sow and plant, and lead forth their flocks, and when not: which benefits is also attributed to Divinity, and therefore the Crocodile is honoured with divine power.

Again, it layeth three core eggs, and liveth three core years, which number of threccore, was in ancient time the firft dimension of heaven and heavenly things.

Ciera also speaking against this Egyptian vanity, faith, that they never consecraht a bealf for a God, but for some apparent utility, as the Ibis for devouring of Serpents; and the Crocodile for being a terror to thieves: and therefore the Arabians and Lybian thieves durst not come over the River Niles to rob the Egyptians for fear of the Crocodiles.

There is a tale in *Didotis Sicilum* of the original of a Crocodile divine worship, which although it cannot be but fabulous, yet I have thought good to insert it in this place, to shew the vanity of sup- perition and Idolatry. There was a King of Egypt called Mina, or as Herodotus calleth him Mentis, who following his Hounds in hunting into a certain marith of Maris, fell in with his Horse, and there fluck fast, none of his followers daring to come after him to release him, so that he had there perished, had not a Crocodile come and taken him up upon his back, and set him safe upon the dry land. For which miracle, the said King built there a City, and called a Crocodile to be worshipped, which was called Sybonus, by all the Inhabitants of that City, and also gave all the said Marith of Maris, for the bulternece of the same. It was nourished with bread, flesh, and Wine, Cakes, fod flesh, and sweet new Wine: so that when any man came to the Lake wherein it was kept, the Priests would presently call the beall out of the water, and being come to the land, one of them opened his mouth, and the other put in meat, delicacies, and Wine.
This Crocodile of *Marius*, is the name that is called *Aristoc*, and like to that at *Thebes*, about which they did hang jewels of gold, silver, and jems of ear-rings, bracelets, and such other things of price. When it dyed, they did seafon the body thereof with falt, and buried it in the holy Tombes or burying Pots. The name also are called *Ombries*, I mean the people of that *Egypt* which dwell in *Aristoc*, and for the love of the Crocodiles, they abandon all manner of Hawks their enemies, into much that many times they take them and hang them up in publique upon gallows for that purpose erected. And further, they keep certain days of triumphs like the *Olympiades*, and games of honour: and so far they were blinded with that superition, that they thought themselves exceedingly bleffed if they loe their children by them, and thought themselves much honoured, if they saw them with their eyes fetched out of the streets and playing places by Crocodiles.

Again, all the *Egyptians* hold opinion, that the Crocodile is a Divinator, which they prove by the testimony of *Polybeus*, who calling one of the sacred Crocodiles, which was the eldest and best of all, he would not anwer him, and afterward offering him meat, he also refused it, whereas many wondered: and some of the Priests faid, it was some prophetical sign either of the Kings death or his own, and so it fell out shortly after, for the fame Crocodile dyed. As though a Swine might not as well be accouunted divine, seeing it alfo refufeth all meat and provocation at the time of their feafe, and before death.

There is a City in *Egypt* called *Apollinopolis*, the City of *Apollo*, where the Inhabitants abhor and condemn the worship of Crocodiles, for when they take any of them they hang them up and beat them to death, not withftanding their tears and cryings, and afterwards they eat them: but the reafon of their hatred is, because *Typhon* their ancient enemy, was clothed with a Crocodile flape. Others alfo say, the reafon of their hatred is, because a Crocodile took away and devoured the daughter of *Pyramus*, and therefore they enjoyed all their polfetry to hate Crocodiles.

To conclude this discourse of Crocodiles inclination, even the *Egyptians* themfelves account a Crocodile a favage and cruel murthering Beaf, as may appear by their Hieroglyphicks, for when they will decipher a mad man, they picture a Crocodile, who being put from his defired prey by forcible refifiance, he prefently rages againft himself. And they are often taught by lamenetable experience, what fraud and malice to mankind liveth in these Beafes, for they cover themfelves under willows and green hollow banks, till some people come to the Waters side to draw and fetch water, and then suddenly, or ever they be aware, they are taken and drawn into the water. And alfo for this purpose, because he knoweth that he is not able to over-take a man in his courfe or chafe, he taketh a great deal of water in his mouth, and cafteth it in the path-ways, fo that when they endeavour to run from the Crocodile, they fall down in the slippery path, and are over-taken and destroyed by him. The common proverb alfo, *Crocodil lobryme*, the Crocodiles tears, juftifieth the treacherous nature of this Beaf, for there are not many brute Beafes that can weep, but fuch is the nature of the Crocodile, that to get a man within his danger, he will fob, figh, and weep, as though he were in extremity, but suddenly he deftroycythem. Others fay, that the Crocodile weepeth after he hath devoured a man. Howsoever it be, it noteath the wretched nature of hypocriticks, which before-hand will with faigned tears endeavour to do mischief, or else after they have done it be outwardly forry, as *Judas* was for the betraying of Christ, before he went and hanged himself.

The males of this kind do love their females above all measure, yea even to jealoufie, as may appear by this one Hiftory of *P. Martyr*. About the time that he was in those countries, there were certain Mariners which faw two Crocodiles together in carnal copulation upon the fards neer the River, from which the water was lately fallen into a certain Iland of *Nium*, the greedy Mariners forfook their ship, and betook themfelves to a long boat, and with great shouing, hollowing and crying, made towards them in very couragious manner: the male at the firft affault fell amazed, and greatly terrified ran away as falt he could into the waters, leaving his female lying upon her back, (for when they ingender, the male turneth her upon her back, for by reafon of the shortneffe of her legs the cannot do it herfelf) fo the Mariners finding her upon her back and not able to turn over herfelf, they eafily flw her, and took her away with them. Soon after the male returned to the place to fee his female, but not finding her, and perceiving blood upon the land, conjectured truly that she was slain, wherefore he prefently call himself into the River of *Nium* again, and in his rage swam ftrongly againft the fream until he over-took the ship wherein his dead female was, which he prefently fet upon, lifting up himfelf and catching hold on the fides, would certainly have entered the fame, had not the Mariners with all their force battered his head and hands with clubs and flaves, until he was wearied and forced to give over his enterprife, and go with great fighing and fobbing departed from them. By which relation it is moft clear what natural affi- ction they bear one to another, and how they choose out their fellows, as it were fit wives and huf- bands for procreation.

And it is no wonder if they make much of one another, for besides themselves they have few friends in the world, except the Bird *Trochilus* and Swine, of whom I can fay little, except that this that followeth. As for the little Bird *Trochilus*, it affieth and followeth them for the benefit of his own belly; for while the Crocodile greedily eateth, there ficketh falt in his teeth fome part of his prey, which troubleth him very much, and many timesingendereth Worms, then the Beaf to help himself taketh land, and lyeth gaping againft the Sun-beams weftward, the Bird perceiving it,
Of the Crocodile.

689

lyeth to the jaws of the Beast, and there first with a kind of tickling-scratching, procureth (as it were) licence of the Crocodile to pull forth the Worms, and so eateth them all out, and cleneth the teeth thronghly, for which cause the Beast is content to permit the Bird to go into his mouth. But when all is cleneth, the ingratitude Crocodile devoureth suddenly the Bird, which maketh no reckoning of friendship, but the turn serves, requetheth good with evil. But Nature hath armed this little Bird with sharp thorns upon her head, so that while the Crocodile devoureth to shut his chapts and close his mouth upon it, those sharp thorns prick him into his palate, so that full force against his unkinde nature, he leeth the very faye away. But whereas there be many kinds of Trochili, which are greedy of these Worms or clennings of the Crocodiles, some of them which have not throns on their heads pay for it, for there being not offence to let the closing of the Crocodiles mouth, they must needs be devoured: and therefore this enforced amity betwixt him and the Crocodile, is only to be understood of the Cledoraynmbys, as it is called by Hermolaus.

There be some of that opinion, that he devoreth all without exception that thus come into his mouth, and other some say he devoreth yet, but when he feeleth his mouth sufficiently cleneth, he waggeth his upper chap, as it were to give warning of avoidance, and in favour of the good turn, to let the Bird flye away at his own pleasure. Howbeit, the other and the former narration is more likely to be true, and more constantly affirmed by all good Authors except Plutarch, and Leo Aferi. faith, that it was the conftant and confident report of all Africa, that the Crocodile devoreth all for their love and kindeness, except the Cledoraynmbys, which they cannot, by reason of the thorns upon their head.

That there is an amity and natural concord betwixt Swine and Crocodiles is also gathered, because they only among all other living four-footed Beasts, do without danger dwell, feed and inhabit upon the banks of Nilus, even in the midst of Crocodiles; and therefore it is probable that they are friends in nature. But oh how small a sum of friends hath this Beast, and how unworthy of love amongst all creatures, that never in nature hath but two, in heaven or earth, air or water, that will adventure to come near it, and one of these also, which is the belt destroying, it devoreth and destroyeth if it get it within its danger.

Seeing the friends of it are so few, the enemies of it must needs be many, and therefore require a more large catalogue or story. In the first rank wherefof cometh, (as worthy the first place) the Ichneumon, or Pterodus-mouse, who rageth against their Eggs and their persons, for it is certain that it hunteth with all fanctity of fene, to finde out their nells, and having found them, it spoileth, scattereth, breaketh and empeth all their eggs. They also watch the old ones after, and finding their mouths open against the beams of the Sun suddenly enter into them, and being small, creep down the vast and large throats before they beware, and then putting the Crocodile to exquizes and intolerable torment, by eating their guts awannder, and to their profit belles, while the Crocodile tumbleth to and fro fighting and weeping, now in the depth of water, now on the land, never resting till strength of nature faileth. For the inceffant gnawing of the Ichneumon so provoketh her to seek her rell in the unriff of every part, herb, element, throws, thobs, rowlings, tossings, toffings, mournings, but all in vain, for the enemy within her breatheth through her breath, and sporteth her self in the consumption of those vital parts, which waits and wean away by yeelding to unsatillable teeth, one after another; till the that crept in by stealth at the mouth, like a puny thief, come out at the belly like a Conqueror, through a passage opened by her own labour and industry, as we have also shewed at large in the story of Ichneumon. But whether it be true or no, that the Trochili doth awake the sleeping Crocodile, when he seeth the Ichneumon lie in wait to enter into her, I leave it to the credit of Strabo the reporter, and to the defcretion of the indifferent Reader.

Monkeys are also the haters of Crocodiles, as is shewed in the story, and lie in wait to dis- cover, and if were in their power to destroy them. The Scorpion also and the Crocodile are enemies one to the other, and therefore when the Egyptians will describe the combat of two notable enemies, they paint a Crocodile and a Scorpion fighting together, for ever one of them killeth another: but if they will decipher a speedy overthrow to ones enemy, then they picture a Crocodile; if a flow and slack victorie, they picture a Scorpion. And as we have already shewed out of Abyanes, that out of the egges of Crocodiles, many times come Scorpions, which devoure and destroy them that lay them.

Fishes also in their kindes are enemies to Crocodiles, the first place whereof belongeth to the most noble Dolphin. Of these Dolphins it is thought there be two kindes, one bred in Nilus, the other forain and coming out of the Sea, both of them professed enemies to the Crocodile: for the first, it hath upon the back of it sharp thorny prickles or fins, as sharp as any spears point, which are well known to the fifth that beareth them, as her armour and weapons against all adversaries. In the truth and confidence of these prickles, the Dolphin will allure and draw out the Crocodile from his den or lodging place, into the depth of the River, and there fight with him hand to hand. For the Dolphin as it knoweth his own armour and defence, like other Beasts and Fishes, doth it know the weakest parts of his adversary, and where his advantage of wounding lyeth. Now, as we have said already, the belly of the Crocodile is weak, having but a thin skin, and penetrable with small force, wherefore when the Dolphin hath the Crocodile in the midst of the deep waters, like one afraid of the fight, underneath him he goeth, and with his sharp fins or prickles

prickles on his back, giveth his weak and tender belly mortal wounds, whereby his vital spirits, with his guts and entrails, are quickly evacuated. The other Dolphins of the Sea being greater, are likewise armed with these prickles, and of purpose come out of the Sea into Nile to bid battle to the Crocodiles.

When Bibilus (a worthy Roman) was Governor of Egypt, he affirmed that on a feaon the Dolphins and the Crocodiles met in the mouth of Nile, and bade battle the one to the other, as it were for the sovereignty of the waters, and after that sharp combat, it was seen how the Dolphins by diving in the waters, did avoid the biting of the Crocodiles, and the Crocodiles dyed by strokes received from the Dolphins upon their bellies. And when many of them were by this means as it were cut off, the residue betook themselves to flight, and ran away, giving way to the Dolphins. The Crocodiles do also fear to meddle with the Sea-hog, or Hog-fish, because of his bristles all about his head, which hurt him allo when he cometh nigh him: or rather I suppose, as it is friend to the Swan of the earth, and beketh with them a syney in nature, so it is unto the Swine of the water, and forbeareth one in the Sea, as it doth the other on the land.

There is likewise a certain wilde Ox or Bugil among the Pethiæus, which is an enemy to the Crocodile, for as Albermu writeth, if he finde or meet with a Crocodile out of the water, he is not only not afraid of him, but taketh heart and settheth upon him, and with the weight and violent agitation of his body, treadeth him all to pieces: and no marvail, for all Beasts are enemies to the Crocodiles on the land, even as the Crocodile lyeth in wait to destroy all them in the water. Hawks are also enemies to Crocodiles, and especially the Ibis bird, so that if but a feather of the Ibis come upon the Crocodile by chance, or by direction of a mans hand, it maketh it immovable and cannot stir. For which cause, when the Egyptians will write or decipher a ravening, greedy, idle-fellow, they paint a Crocodile, having an Ibis feather sticking in his head. And thus much for the enmity betwixt the Crocodiles and other living creatures.

It hath been seldom feen that Crocodiles were taken, yet it is said that men hunt them in the waters, for Fliny faith, that there is a fisured pervasion, that with the gal & fat of a Water-aider, men are wonderfully holpen, and that it was armed against Crocodiles, and by it enabled to take and destroy them, especially when they carry alfo about them the herb Paramegetum. There is also alio a kind of honry wilde Bean growing in Egypt, which hath many sharp prickles upon the stalks, this is a great terror to the Crocodile, for he is in great dread of his eyes, which are very tender and easie to be wounded. Therefore he avoideth their flight, being more unwilling to adventure upon a man that beseth them, or one of them, then he is to adventure upon a man in compleat Armour, and therefore all the people plant great store of these, and also bear them in their hands when they travail.

There be many who in the hunting and proseling of these Crocodiles, do neither give themselves to run away from them, nor once to turn aside out of their common path or road, but in a foolish hardinesse, give themselves to combat with the Beasts, when they might very well avoid the danger, but many times it happeneth that they pay dearly for their rashness, and repent too late the too much reputation of their own manhood: for whales with their spears and sharp weapons they think to pierce his sides, they are deceived, for there is no part of him penetrable except his belly, and that he keepeth safe enough from his enemies, blunting upon his scales (so lesse hard then plates of Iron) all the violence of their blows and sharpness of weapons, but clubs, beasts, and such like weapons are more irksome to him, when they be set on with strength, battering the scales to his body, and giving him such knocks as doth dismay and astonish him. Indeed there is no great use of the taking of this Serpent, nor profit of merchandize cloth whereby, his skin and fleshe yeelding no great resepct in the world.

In ancient time they took them with hooks baited with fleshe, or else inclofed them with nets as they do fishes, and now and then with a strong Iron instrument call out a boat down in the water upon the head of the Crocodile. And among all other there is this one worthy to be related. The Hunter would take of the skin from a Swines back, and therewithal cover his hook, whereby he allureth and inciteth the Serpent into the midilt of the River, and there making it fast, he went afterward to the next watering place, and there holding another Hog, did beat and strike him, till he cryed ardently, with which voice or cry, the Crocodile being moved goeth prettily to the bait and swalloweth it up, and maketh after the noise: at last, coming to the land, the Hunter with valiant courage and diligence, casteth mud and dirt into his eyes, and so blindeth him that he may opprefse and kill him with ease.

Les Afric. relate also this means or way to take Crocodiles: There be many Trees planted upon the banks of Nile, unto one of these there is a long and strong rope tied, and at the end of the same there is fastened a hook of a cubit long, and a finger in quantity: unto this hook: a bait is tyed a Ram or a Goat, which being fet close to the River, and tormenteth with the hook upon which it is fastened, cryeth out amain, by hearing of whose voice, the hunger-greedy Crocodile is raifed out of his den, and invited as he thinketh to a rich prey, so he cometh (although it self of a trecherous nature, yet lufpecteth not any other) and swalloweth the bait, in which he findeth a hook not to be digested. Then away he hurrieth to go, but the strength of the rope layeth his journey, for as fast as the bait was to the rope and hook, so fast is he also enfatished and tyed unto it, which while he waveth and strauneth to unloose and break, he weareth himself in vain. And to the intent that all his strength may be spent against the tree and the rope, the Hunters are at one end thereof, and cause
cause it to be cast to and fro, pulling it in, and now letting it go again, now terrifying the Beast with one noise and fear, and anon with another, so long as they perceive in him any spirit of moving or refusal: so being quieted, to him they come, and with clubs, spears, beetles, knives, and such manner of instruments, pierce through the most tender parts of his body and so destroy him.

Peter Martyr hath also other means of taking Crocodiles. Their nature is, that when they go to the land to forrage and feek after a prey, they cannot return back again but by the same footsteps of their own which they left imprinted in the land: whereupon, when the Country people perceive their footsteps, instantly with all the haft they can make, they come with spades and mattocks and make a great ditch, and with boughs cover the same, so as the Serpent may not espy it, and upon the boughs they also again lay sand to avoid all occasion of deceit or falsification of fraud at his return: then when all things are thus prepared, they hunt the Crocodile by the foot until they find him, then with nooses of bells, pans, kettles, and such like things, they terrifie and make him return as fast as a fear can make him run towards the waters again, and they follow him as near as they can, until he fall into the ditch, where they come all about him, and kill him with such instruments or weapons as they have prepared for him, and so being slain, they carry him to the great City Cairo, where for their reward they receive ten pieces of gold, which amounteth to the value of tens of thousands of our English coin.

There have been some brought into this City alive, as P. Martyr affirmeth, whereof one was as much as two Oxen and two Camels could bear and draw, and at the same time there was one taken by this device before expressed, which had entered into a Village in Saetum near Nilus, and swallowed up alive three young Infants sleeping in one Cradle, the said Infants scarcely dead were taken again out of his belly, and soon after when no more tokens of life appeared, they were all three buried in a better and more proper grave of the earth. Then also there was another slain, and out of his belly was taken a whole Ram not digested, nor any part of him consumed, and the hand of a woman which was bitten or torn off from her body above the wrist, for there was upon the same a Bracelet of Brass.

We do read that Crocodiles have been taken and brought alive to Rome. The first that ever brought them thither, was Marcus Scaurus, who in the games of his abidity, brought five forth and shewed them to the people in a great pond of water, (which he had provided only for that time) and afterward Heligabalus and Antoninus Pius. The Italians have a kind of Crocodile in Ganges, which hath a horn growing out of his nose like a Rhinoceros: unto this Beast they cast condemned men to be devoured, for in all their executions, they want not the help of men, seeing they are provided of Beasts to do the office of Hang-men.

Aurelius Fellinus writeth, that Firmus a Tyrant of Egypt, being condemned to Nilus to be devoured by Crocodiles, beforehand bought a great quantity of the fat of Crocodiles, and so stripping himself stark naked, laid the same over his body, so he went among the Crocodiles and escaped death: for this savage Beast being deceived with the favour of its own nature, spared the man that had but so cunningly carried it. And this is a wonderful work of Almighty GOD, that so ordereth his actions in the nature of this Beast, that he beguileth the cruel nature of the living, by the said favour and the grace of the dead: howbeit some think that the water Crocodile is daunted with the favour of the fat from the land Crocodile, and the land Crocodile by the water again.

And some again say, that all venomous Beasts run away from the favour of the fat thereof; and therefore no marvel if it also be afraid, being venomous as well as any other. Wherefore the saying of Firmus was not to be attributed to any indulgence of the Crocodile toward their own kind, but rather to a deadly antipathy reflecting themselves upon themselves, though not in shape and figure as the Cockatrice, yet in fenne, favour, and rankneffe of their peltiferous humor.

The use of Crocodiles taken, is for their skin, flesh, caul and medicine arising out of it. Their skin as it is exceeding hard upon their backs while they are alive, so is it also when they are dead, for with that the common people make them better armour than coats of Mail, against Darts, Spears, or Shield, as is well known in all Egypt at this day. For the flesh of Crocodiles, it is also eaten among those people that do not worship it: as namely the people about Ephesia (Antipatropolis). Notwithstanding by the Law of God, Levit. 11. it is accounted an unclean Beast, yet the tail thereof being found pleasant, and the relish good with respect of GOD or health, the common people make use thereof.

The medicines arising out of it are also many. The first place belongeth to the caul, which hath moe benefits or virtues in it then can be expressed. The blood of a Crocodile is held profitable for many things, and among other it is thought to cure the bitings of any Serpent. Also by anointing the eyes, it cures both the dregs or spots of blood in them, and also refores the soundness and clearness to the sight, taking away all dulness or deadness from the eyes. And it is said, that if a man take the liquor which cometh from a piece of a Crocodile fried, and anoint therewith his wound or harmed part, that then he shall be presently rid of all pain and torment. The skin both of the land and water Crocodile dried into powder, and the same powder with Vinegar or Oil, laid upon a part or member of the body, to be feared, cut off, or lanced, taketh away all sence and feeling of pain from the instrument in the action.
All the Egyptians do with the fat or lewet of a Crocodile anoint all them that be sick of Feavers; for it hath the same operation which the fat of a Sea-dog or Dog-fish hath, and if those parts of men and beasts which are hurt or wounded with Crocodiles teeth, be anointed with this fat, it also cureth them. Being concocted with water and Vinegar, and so rowled up and down in the mouth, it cureth the Tooth-ach: and also it is outwardly applied against the biting of Flies, Spiders, Worms, and such like, for this cause, as also because it is thought to cure Wens, bunches in the flesh, and old wounds. It is fold dear, and held precious in Alcair, Scaliger writeth, that it cureth the Gangren. The canine teeth which are hollow, filled with Frankincense, and tried to a man or woman which hath the Tooth-ach, cureth them, if the party know not of the carrying them about: And so they write, that if the little bones which are in their belly be taken forth and so used, they work the same effect against Feavers. The dung is profitable against the falling off of the hair, and many such other things.

The biting of a Crocodile is very sharp, deep, and deadly, so that whereforever he layeth his teeth, seldom or never followeth any cure. But yet the counsel of Physitians is, that so soon as the patient is wounded, he must be brought into a close chamber where are no windows, and there be kept without change of air, or admission of light, for the poisons of the Crocodile worketh by cold air and light; and therefore by the want of both is to be cured. But for remedy (if any be) they prescribe the same which is given for the cure of the biting of a mad Dog, or (as Avetin) the biting of a Dog not mad. But most proper is the dung of a man, the Fish Garum and Myss pounded together, and so applied, or else the broth of salt and flesh, and such other things as are vulgarly known to every Physitian: and therefore seeing we live in a country far from the annoyance of this Serpent, I shall not need to blot any paper to express the cure of this poiyon.

The Crocodile of Nilus only liveth on land and water, all other are contented with one element: the picture of the Crocodile was wont to be stamped upon coin, and the skin hanged up in many famous Cities of the world, for the admiration of the people, and there is one at this day at Paris in France.

Of the Arabian or Egyptian LAND CROCODILE.

The figure of this Crocodile sheweth evidently the difference betwixt him and the other of Nilus; and besides it is neither so tall or long as is the other, the which proportioned Beast is only particular to Egypt and Arabia, and some because of his scaly head, legs, articles, and claws, have observed another difference in it from the former: yet in his nature, manner of living and preying upon other cattel, it differeth not from that of the water. The tail of this Crocodile is very sharp, and flandeeth up like the edges of wedges in bunches above the ground, wherevithal when he hath mounted himself up upon the back of a Bealt, he beateth and finkeith the bealt most cruelly, to make him go with his Rider to the place of his most fit execution, free from all refuse of his Heard-man or Palfor, or annoyance of passengers, where in most cruel and favage manner he tear-eth the limbs and parts one from another till he be devoured. The Apotheories of Italy have this Bealt in their Shops to be seen, and they call it Caudivorbera, that is, a Tail-bearer, for the reason aforesaid. And thus there being nothing in this Beasts nature different from the former, besides his figure, and that which I have already expressed, I will not trouble the Reader with any more Narration about it.
THe figure and proportion of this Serpent was altogether unknown in this part of the world, till of late our discoverers and Navigators brought one of them out of Brefilia. The length of it is about a fathom, and the breadth as much as ten fingers broad: the fore-legs have ten claws, five upon a foot, the hinder-legs eight, and both before and behind they are of equal length. The tail exceeding long, far exceeding the quantity and proportion of his body, being marked all over with certain white and yellowish spots. The skin all covered with an equal, smooth and fine coloured scale, which in the midst of the belly are white, and greater than in other parts. It can abide no water, for a little poured into the mouth killed it, and after it had been two or three days dead, being brought to the fire, it moved and flirred again faintly, even as things do that lye a dying. It is not venomous nor hurtful to eat; and therefore is digged out of his cave by any body safely without danger.

Of the CROCODILE of the Earth called Scincus, a Skink.

There have been some that have reckoned Scinks and Lizards among Worms, but as the Greek words Erpete, and Scolax, differ in most apparent dialect, and significations, and therefore it is an opinion not worth the confuting, for there are no Worms of this quantity. But for the better explication of the nature of this Beast, because some have taken it for one kind, and some for another: some for a Crocodile, and others for a Beast like a Crocodile; we are to know that there are three kinds of Crocodiles: the first is a water Beast or Serpent, and vulgarly termed a Crocodile, the second is a Scink or a Crocodile of the earth, which is in all parts like that of the water, except in his colour and thickneffe of his skin: the third kind of Crocodile is unknown to us at this day, yet Pliny and others make mention of it, and describe it to be a beast having his scales like a Gorgon, growing or turning to his head from the tail, and not as others do, from the head to the tail.

The Greeks call this Beast Skigkse, and some unlearned Apothecaries Stincw, and Myresfus Skig. It is also called Kikire, and the Hebrew, Koseh, both more properly signifie this Beast, then any other Crocodile or Chameleon, or Lizard. Some of the Hebrews do expound Zab for a Scink; and from thence the Chaldees and the Arabians have their Död and Aldab, turning Z into D: So we read Guurit and Addaya, for a Scink or Crocodile of the earth: Alarbian is also for the same Serpent among the Arabians, Balalee, and Balalee Schambur, and Asfhanche, and Askicinc, and Scenurum, and Nalale, and Nalale, are all of them Synonymous, or rather corrupted words for this Crocodile of the earth. But there are at this day certain Fosegeflufy let out to be seen and fold by Apothecaries, that are nothing else but a kinde of water Lizard: but the true difference is between them, that these water Lizards are venomous but this is not, and neither living in the Northern parts of the world, nor yet in the water: and so much shall suffice for the name and first entrance into this Serpents History.
The History of Serpents.

They are brought out of the Eastern Countries, or out of Egypt: yet the Monks of Misraim affirm, that they had been seen or Crocodiles of the earth about Bome, 2 S. 23. and Plataeism in Africa. But howsoever their affections may lead them to conjecture of this Serpent, I rather believe, that it is an African beast, and seldom found in Asia or Europe. They love the banks of the Naius, although they dare not enter the water, and for this cause some have thought (but untruly) that when the Crocodile layeth her eggs in the water, the young is there engendered and bred, and is a Crocodile of the water, but if they lay their eggs on the dry land, from thence cometh the Snell or Crocodile of the earth. This folly is evidently refuted, because that they never lay eggs in the but all upon the dry land. They are found (as I have said before) in Egypt, and also in Africa, and among the Lydians of Mauritania, otherwise called Lydijs, or rather Lydia, among the Ptolemaic or Plow-men Africans, among the Arabians, and near the Red-Sea, for all those at this day fold at Venice, are brought from those parts: The greatest in the world are in India, (as Cardan teacheth) who are in all things like Lizards, saving in their excrements, which smell or favour more strongly, and generally the difference of their quantity ariseth from the country which they inhabit, for in the hotter and moister country they are smaller, and generally they exceed not two or three cubits in length, with an answerable proportionable body, which is thus described.

There be certain croote lines which come along the back one by one, somewhat white, and of a dusky colour, and those that be dusky have also in them some white spots. The upper part of the neck is very dusky, the head and the tail are more white, the feet and all the other parts of the breast and belly are white, with appearance upon them of some scales: or rather the skin figured in the proportion of scales: upon either feet they have five distinct fingers or claws; the length of their legs is a thumb and a half: that is, three inches, the tail two fingers long, the body six, to that the whole length from the head to the tip of the tail, (which is first thick, and then very small at the end) is about eight fingers. When they have taken them they boil them, and fill their bodies with Sugar, and Silk of Wood, and so they sell them for a reasonable price. That which I have written of their length of eight fingers, is not to be understood, as though they never exceeded or came short of that proportion: for sometimes they are brought into these parts of the World twenty or four and twenty fingers long, sometimes again not above five or six fingers long.

When they lay their Eggs, they commit them to the earth, even as the Crocodiles of the water do. They live upon the salt molt odoriferous flowers, and therefore is his flesh so sweet, and his dung of excruciating odoriferous. They are enemies to Bees, and they make Hives, in some fome have thought they did lay their Eggs in Hives, and there hath their young ones. But the occasion of this error was, that they saw young ones brought by their parents into some Hive, to feed upon the labouring Bee. For the compelling of their desire they make meal of any tree, which have ground in the Mill of their own mouths, and that they mix with black Hellebore juice, or with the liquor of Mallowes. This meal so tempered they lay before the Hives, whereof affion as the Bees came, they die, and then cometh the Crocodile with her young ones, and lick them up; and beside Bees, I do not read they are hurtful to any. The Indians have a little Beast about the quantity of a little Dog, which they call Pustage, very like to a Scinc or Crocodile of the earth, having sharp scales, as cutting as a saw.

There is some hurt by this beast unto men, for which cause I may justly reckon it among the venomous, for if it chance to bite any man, the wounded man falleth into a Fever before he make water, he dyeth for it, but if he first make water, the beast dyeth and the man eescapeth.

It is thought that it containeth a kind of natural magnet, witch-craft, or forcibly, and therefore they say hath a stupifying power, changing the mind from love to hatred, and from hatred to love again. The powder of this Serpent drunk in Wine, it hurseth the nerves and sense. There be certain magical devils raised out of this Serpent which are not worth the writing, as not having in them any dram of wit, learning, or earth, and therefore I will not trouble the Reader with them, but follow on the conclusion of this Crocodile Story in the Narration of the medicinal virtues, which are for use and more operative then thoes of the former Crocodile, for I think Almighty G O D blesteth meeknesse and innocency with excefl of grace in men and beasts, as may be seen in the twokinds of Crocodiles, the dung and excrement of the one, being more worth then the body of the other, through haughtie innocence.

The body of this Serpent to be dryed, after it hath lain long in Salt, and to be preserved in Nosewot, as Randle and Merceilles write it: (but truth is, there is no need of Salltwher Nosewot is applied, because the Acimony of this beast doth easily dry up the moisture of this beast, keeping Worms from breeding in it.) With the powder thus prepared, venomous men and women. The Mitchride is called Diaphor, because it is composed of the Snell or Crocodile of the earth: and it containeth in it a multiple Antidote against all poisons. Galen had an Antidote against Scorpions, which among other things containeth in it the flesh of a Crocodile of the earth, wherewithal he cured all them that had been stung with Scorpions in Lybia. It is also good against the bites of wild beasts, and pleuries against poisoned Honey, or the crudity and loathing that cometh in the mouth by eating of sound Honey: It is profitable against empoisoned Arrows or Darts, being taken immediately before or after the wound, as Apelle hath observed.
Scropio did make a medicine compounded of the dung of this Crocodile, and applied the same against the Falling-ficknefe. Of the body of this Sculp, except the head and feet being fof or roifed, and eaten by them that have the Stenitis, and old cough (efpecially children,) or the pain of the loins, giveth them much eafe. They are also mixed with medicines against the pain of the feet, as Gabin did for *Amerantus* the Grammarians. They are also good in medicine against the coldneffe of the finewes. This beaffe is very hot, and therefore increafeth the feed of man, and provoketh luft; and for this purpole the greateft and fattest, and fuch as one as is taken in the Spring time, when they burn in luft for copulation, is preferred. But this is not to be meant of the filthy parts, but only of those parts that are about the reins, if a man drink thereof the weight of a groat in Wine afterward, for the alaying of the heat thereof, the Physifians do preifecribe a decoction of Lentiles with Honey, and the seed of Lettice drunk in Water. The fnot of this Crocodile with the feet drunk in white Wine, hath the fame operation: but we have fhewed already, that these parts are to be cut off and thrown away, because if there be any venom in the beaffe it lyeth in them.

A perfume being made of the body and intrails of this Crocodile under the womb of a woman labouring with childe, is thought to yeld much help, for her safe, speedy, and caife travail, or flocks of Wool perfumed therewith, and laid to her belly. But it is the part of good Physifians to be wary in giving of medicines for ftringing up of luft in any, except in married perfons, and then also when they are young, to procure lawful issue and pofterity into the world: otherwife they fhall both decay the body, for all violent helps of carnal cohabitation, do in the end prove detrimental to nature, if they continue any time, and also they are hurtful to the Soul, when not only the unnatural desire of luft, but also the intemperate pleafure of fin is increafed thereby: and that is a merifable cure, which killeth the Soul to help one part of the body. Besides all kinds of medicines for this purpole, (among which this Crocodile is the chief) have their peculiar venom, and when they are miniftr'd, either they have no effect at all though age or overmuch impotency, or else they work too violently, which is most dangerous, or some one hurt or other followeth the poftion: and fo I will leave the prefection of this part.

The duff of the skin of this Crocodile being anointed with Vinegar or Oyl upon any part or member, which is to be cut off, taketh away the tenfe of pain in the time of execution. The blood is good for the eyes, and taketh away the filthy skin of the body, with the spots and burls in the face, reforing the first, true, native, and lively colour. The fat taketh away the pain in the reins, and caufeth a dilatation of the feed of man, yet this fat touching the hair of a man, maketh it to fall off; and a man anointed herewith, is free from the annoyance of Crocodiles, although they play with him. It alfo cureth the bites of Crocodiles; the infalillation of this Crocodile, folded up in the Wool of a black Sheep of the firft birth, and wherein is no other colour, hath power to drive a quarante Augue. And Rubbs faith, that it being hung over the head of a woman in travail, keepeth her from delivery. In the gall of this Serpent there is a power againft the falling off of the hair, especially if the medicine be made of the roots of Beets to neece withall; and besides, the eyes being anointed therewith, and with Honey, there is nothing more profitable againft suffocations. The flones and reins have power to provoke generation; and *Aelian* prefcribeth an Antidote to be made of the tail of this beaffe, againft the Gout.

Great is the vertue of the dung or excrement of this Serpent, if the fame could be easily found, but while it is fought for, it lofeth the vertue. It is called Crocoddilla, and is profitable to give a good colour to womens faces, that is the belt which is whitest, thort, and not heavy, feeling like leaven betwixt the fingers, that is, smelling somewhat sharp like leaven.

It is adulterated with meal, chalk, white-earth, or painting, but it is dfferenct by the heavineffe. The reason of the this is, because it feedeth upon the sweeteft and beef smellint herbs, whereby it commeth to paffe, that it doth not only smell fragrantly, but alfo contain in it many excellent vertues. First therefore it is good for the comelineffe of the face, to give colour to it, according to the faying of *Horace*: *Colorque fereore fucatus Crocoddil*: A colour in grained with the dung of a Crocodile: and for this caufe alfo is the verfe of Ovid, *Nigrior ad Pharis teneja picea opem*: That is, The black Woman goeth to crave help of the Fifth Pharis, to become more beautiful; for by the fifth Pharis, is understood a Crocodile. As some thinke eight grains of this dung, or rather the weight of eight groats, with half so much Multrard-feed and Vinegar, cureth the falling off of the hair. *Arnoldus* doth prefcribe a composition of the dung and Cantharides, for the regenerating and bringing again of hair that is decayed. If a perfume hereof be made and afflicted by a Tunnel into the holes of Serpents, it will drive them away, by reafon of the sharp and leavenfh favour thereof.

*Trudanus* makheth a medicine thereof for an Eye-salve against the whiteneffe and bloud-eyes. It is good alfo against dimneffe and suffocations, being anointed with the juice of Leeks: and to conclude, it is drunk in sweet Wine and Vinegar, against the Falling-ficknefe, and alfo being applied unto women, firreth up their monthly courtes. And thus much shall suffice for the story of the Crocodile.
A mong the divers kindes of Serpents, there is one of special note, which the Graciens call Acou-
via. The Latiens, Juculares, or Juculi, or Sagitta, a Dart or Arrow. The Graciens at this day
Scavia. The Turk, Oriboumen : In Calabria and Sicilia, Saettone, and of the Germans, Ein schofffer, oder
anfelf lang. The reason of this name is taken from his swift leaping upon a man to wound and kill
him; and therefore the Poets say, Juculi; volves; speaking of these kindes of Serpents. Al-
bertus and Aucren alfo; calleth them Cenexati, and Cenexavi, Albaratit, Asam, and Alcinati.

The manner of this Serpent is to get up into trees or hedges, and from thence to fly like an Ar-
row upon the upper parts of men, and fo to fling, bite, and kill them: and of this kindes it is thought
that was, which came upon the hand of the Apostle Paul, whereof the Poet writeth;

Ecco procini; vaeus steriles derobare trunci
Torfa, & immisit (Juculum vocat Africa) Serpents ;
Perque cupit Pauli transfusellaque tempora fugit.
In English thus;

Loe from afar, a cruel Serpent from an Oke
Come flying like a Dart, in Africa the same
A Dart is cold, the head and temples stroke
Of Paul, by winding spires to work, hit bone :
There is some difference among Authors about the nature of this Serpent: for **Elidanus** confoundeth it with the Snake of the Earth, called **Chepsiadus**, and faith it liveth sometime in the water, and sometime on the land, lying in wait to destroy all living creatures. And (he faith) it ueth this fraud, it ever lyeth hid in secret near the high-ways, and many times climbeth up into trees where it roundeth it self round into a circle, and hideth his head within the folds of his own body, so soon as ever it espieeth a Passenger, either a Man or Beast, it lepeth upon him as swift as a Dart guidance. For it is able to leap twenty cubits space, and so lighting upon the Man or Beast, ticketh far unto it without falling off of his own accord, until they fall down dead.

But herein **Elidanus** seemeth to be deceived, because he maketh but one Serpent of twain: namely, this Dart and the Land-snake, which are most apparently different in nature, kinde, and quality. **Actius** also confoundeth this Serpent with the Millet-serpents, called **Certrizies**, and faith it is of the quantity of two cubits, great on the head, and the fore-part smaller at the tail, being of a greenish colour. And he faith further, that at such time as the Millet-feed groweth and flourisheth, this Serpent is most strong and hurtful, and so with the residue he agreeeth with **Elidanus**, but herein he is also deceived, writing by hear-fay as himself confesseth, and therefore it is more safe for us to have recourse to some eye-witness for the description of this Serpent, then to stand upon the opinions of them which write by the relation of others.

**Bellomus** faith, that he saw one of these in Rhodes, being full of small round black spots, not greater then the seeds of Lentils, every one having a round circle about him like an eye, after such a fashion as is to be seen in the little Fish called the **Turpeas**. In length it exceedeth not three palms, and in bignesse no greater then the little finger. It was of an Ash-colour, coming near to the whitenesse of milk, but under the belly it was altogether white: upon the back it had scales, but upon the belly a thin skin, as in all other Serpents.

The upper part of the back was somewhat black, having two black lines in the middle, which begin at the head, and fo are drawn along the whole body to the tail. As for the **Cepazati**, and **Alter-axis** or **Altimyrius**, those are red Serpents, (as **Actius** faith) which are but small in quantity, yet as deep and deadly in poylon as in any other, for they hurt in the same manner that these Darts do. Some of them do fo wound with their poylon, as the afflicted perfon dyeth incessantly without sense or pain: Some again die by languishing pain after many hopes of recovery, losing life. Among all the people of the World, the **Sべべ** are most annoyed with this kinde of red Serpents; for they have many odorous and sweet smelling Woods, in the which these Serpents do abound, but such is their rage and hatred against men, that they leap upon them and wound them deadly, whensoever they come within their compass. And surely if it be lawful to conjecture what kinde of Serpents those were, which in the Scripture are called fiery Serpents, and did ring the **Israelites** to death in the Wilderness, until the Bharan Serpent was erected for their cure; among all the Serpents in the world, that kinde of pain and death can be ascribed to none more properly then to these **Cepazati**, or Red-dart-serpents.

For firft the Wilderness which was the place wherein they annoyed the people, doth very well agree to their habitation. Secondly, those fiery Serpents are so called by figure, not that they were fiery, but as all Writers do agree, either because they were red like fire; or else because the pain which they inflicted, did burn like fire, or rather for both these causes together which are joyntly and severally found in the red Serpents; and therefore I will conclude for my opinion, that these Serpents (as the highest poylon in nature) were sent by GOD to afflict the sinning Israelites, whose poylon was incurable, except by Divine miracle.

**Mattisius** also telleth a flory of a Shepheard which was slain in Italy by one of these, as he was sleeping in the heat of the day under the shadow of a tree, his fellow Shephards being not far off looking to their flocks, suddenly there came one of these Dart-serpents out of the tree, and wounded him upon his left pap, at the biting whereof the man awaked and cryed out, and so dyed incessantly: his fellow Shephards hearing this noise, came unto him to see what he ailed, and found him dead, with a Serpent upon his breast; now knowing what kinde of Serpent this was, they forsook their flocks and ran away for fear.

The curse of this Serpent bington, if there be any at all, is the fame which cureth the Vipers, as **Actius** and **Avius** write, and therefore I will not relate it in this place. The gall of this Beast mixed with the **Sevthian Stone**, yeeldeth a very good Eye-falve. The which gall lyeth betwixt the back and the liver: And thus much shall suffice for this Serpent.

**Vipers**

Of the **Dipsas**.

His Dipsas hath many names from many occasions: Firft **Dipsas** in Greek signifieth thrift, as **Stis** doth in Latin, and thereof also it is called **Stula**, because whosoever is wounded by this Serpent dyeth. It is also called by some **Prefer**; and by some **Caunion**, because it setteth the whole body on fire: but we shall shew afterwards, that the **Prefer** is a different Serpent from this. It is called likewise **Melanuras**, because of his black tail, and **Annaurus**, because it lyeth in the sand, and there hurketh a man. It is not therefore unifitly defined by **Avius**, to be
The History of Serpents.

Vipera sitim facient, that is, A Viper causing thirst, and therefore Ovid sporting at an old drunken woman named Lenæ, calleth her Dipfus in these verses;

Est quædam nomine Dipfas anus,
Ex re nomen habet, nigri non illa parentem
Memnonis in rebus ab artibus. equis.

In English thus;

There is a woman old, which Dipfas may be right,
And not without some cause: thirsty for ever is,
For never Memmons fire, all black and seldom bright,
Did she in water sweet beholdin soberness.

They live for the most part near the waters, and in said marshy places: whereupon Lucan said;

Stat in marginis fusc
Affides, et mediis stricteant Dipsades undis.

That is to say;

Upon pitt brink, dry Aths there flood,
And Dipsads thirst in midst of water flood.

It is called Torrida Dipsas, and Arida Dipsas, because of the perpetual thirst, and therefore the Egyptians when they will signify thirst, do picture a Dipsas: whereupon Lucianus relateth this story, there is (faith he) a statue or monument upon a Grave, right over against the great Syrtes between Silia and Egypt, with this Epigram:

Talus passus erat quoque Tantalus Aethiopi ortus,
Qui nulli petitus fonte leisure situm.
Tale nec Danae natam impulere puellas
Affidit undis van potissima tor.

That is to say;

Such Tantalus inducendus in Aethiopi bred,
Which never could by water quench his thirst,
Nor could the Grecian Maidis with water fed,
That with daily pourings till the vessel curst.

The statue was the picture of a man like unto Tantalus, standing in the midst of a water ready to drink, by drawing in of the water, about whole foot was folded a Dipsas: close by flood certain women bringing water, and pouring it into him to make it run into his mouth; besides, there were certain Egges as it were of Eftriches lay pictured beside them, such as the Caramans in Lybia seek after. For it is reported by Lucianus, that the people of that Country do earnestly seek after the Eftriches Egges upon the sands, not only to eat the meat that is in them, but also to make sundry vessels or instruments of the shell, and among other things they make Caps of them. Near unto those Egges do these treacherous Serpents lie in wait, and so while the poor Country man cometh to seek for meat, suddenly he leapteth upon him, and giveth him a mortal wound.

Aciatus hath an Embleme, which he semeth to have translated out of Greek from Antipater Sidonius, of a Falconer, which while he was looking after Birds for meat for his Hawks, suddenly a Dipsas came behind him and flung him to death. The title of his Embleme is, Qui alta contemplatione cedere, he that looketh high may fall, and the Embleme it self is this that followeth:

Dum turdes viso, pedica dum fallit alaudus,
Et jella altidam fugit a rundo grumem,
Dipsada non prudent asceptis pede percussi, utrinx
Illa malis, emissam virus ab ore jacit.
Sic obit, exento qui sidera repsectus arce,
Secums sita quod jacet ante pedes.

Which may be thus Englished;

While Thrush with line, and Lark deceived with net,
And Crane high flying pierced with force of steel,
By Falconer was beholden a Dipsas on the foot did sit,
As if it would revenge his bloudy foul inflicted,
For poynon out of mouth it cast, and bit his foot,
Whereof he dyed, like Birds by him deceived,
While bending bow aloft unto the stars did look,
Saw not his fate below, which him of life bereaved.

This Dipsas is inferior in quantity unto a Viper, but yet killeth by poynon, much more speedily, according to these verses;

Exigua simili spectatur Dipsas cebidna
Sed feutina magis moribus occupata egit
Parsa & horida cui circa ultima cande nigrefcit.
Of the Dipsas.

That is to say, 

2 bin. Dip as like unto the Viper small, 
But kills by bite with greater pain and speed,  
While tail at end is soft and black without, 
That at your death avoid, with careful heed. 

It is but a short Serpent, and so small (as Arnoldus writeth,) it killeth before it be espied, the length of it not yet a cubit, the fore-part being very thick, except the head which is small, and so backward it groweth smaller and smaller: the tail being exceeding little, the colour of the fore-part somewhat white, but yet over with black and yellow spots, the tail very black. Galen writeth, that the ancient Marphi which were appointed for hunting Serpents and Vipers about Rome, did tell them that there was no means outwardly to dilinguith betwixt the Viper and the Dipsas, except in the place of their abide, for the Dipsas (he faith) keepeth in the salt places; and therefore the nature thereof is more fiery, but the Vipers keep in the dryer Countries, wherefore there are not many of the Dipsades in Italy, because of the moistnesse of that Country, but in Lybia, where there are great store of salt marithes. As we have said already, a man or beast wounded with this Serpent, is afflicted with intolerable thirst, inomuch as it is easier for him to break his belly, then to quench his thirst with drinking, always gaping like a Bull, casteth himself down into the water, and maketh no space of the cold liquor, but continually sucketh it in till either the belly break, or the poison drive out the life, by overcoming the vital spirits. To conclude, besides all the symptoms which follow the biting of Vipers, which are common to this Serpent, this also followeth them, that the party afflicted cannot make water, vomit, nor sweat, so that they perish by one of these two ways; first either they are burned up by the heat of the poysion, if they come not at water to drink, or else if they come by water, they are so unfatiable, that their bellies first swell above measure, and soon break about their privy parts. To conclude, all the affections which the thick poysion of this Serpent are excellently described by Lucian in these verses following;

Signiferum juvenem Tyrhenni sanguinis Aulum  
Torta cupas tertii Dipas calciata monomorbi.  
Visc dolor aut enfuga densis fuit: ipsaque leti  
Frang certe invicida: nec quisqueum plagae minatur.  
Exe fubit virus tacitum, carique molestas  
Ignis edax, calidique incenditi uijera taceat.  
Exhibit humberem circum vitalis suam  
Fesia, & in facto linguam torrefa palato.  
Capit, des solit irrit qui suavum in artus  
Num fuit, atque ocular lebrymarum venas refugit.  
Non decem impetris, non maiori jura Catonis  
Ardenum tenet virum, quin jargarque signa

Tyrrhenian Aulum, the ancient beater young,  
Was bit by Dipsas, turning heed to heed,  
(Strong, No pain or sense of teeth appeared,) though poysion  
Death doth not frown, its man no harm did feel;  
But he, fles poysion takes the marrow, and eating fire  
Burning the bowels in the arm till all consumed,  
Drinking up the humor about the vital fire,  
And in dry palat was the tongue up burned.  
There was no sweat the finemis to reflesh,  
And tears flered from the vein that feeds the eyes,  
Then Catos law, nor Empires honor fete,  
This fiery youth could hold but down the firesteamer flies

Audaret, totisque fures exquereret agris,  
Quot pofoebat aquas, sitiens in corde venenum.  
Ite in Tanai mihius, Rhodanumque Fadameque,  
Arderet, Nilanque bibens per rara vagamem:  
Accepti morti Libye : fatique minorem  
Vam Dipas habet teria adjuta pulsus.  
Sornitur venas putreui fuidumis arenae:  
Nunc redit ad Syttes & flidus accepti are:  
Aquerosque placet, fed non & sufficiet humor.  
Ne sentit fatique genus, mortemque veneni:  
Sed putat effe jum: seraque operiere tumenter  
S u s u n i u m venas, atque impleire curare.  
Lucan. lib. 9.

In English thus;

And like a mad man about the fields he was,  
Poysons force in heart did waters crave:  
Though unto Tanair, Rhodanum, Paddus be comes,  
Or Nilus: yet all too little for his best to have.  
But dry was death, as though the Dipsas force  
Were not enough, but help by heat of earth,  
Then doth he search the sands; but no remorse,  
To Syttes floud be bier, his mouth of them he filleth,  
Salt water pleaseth, but it cannot suffice,  
Nor knew he fate, or this kind venenis death,  
But thought it thrist, and seeing his veins arise  
Them cut, which blood flipt mouth and breath.

The sigues of death following the biting of this Serpent, are extreme drought and inflammation both of the inward and outward parts, so that outwardly the parts are as dry as Parchment, or as a skin set against the fire, which cometh to paffe by addition and commutation of the blood, into the nature of the poyson. For this cause many of the ancients have thought it to be incurable; and therefore were ignorant of the proper medicins, practising only common medicines prescribed against Vipers: but this is generally observed, that if once the belly begin to break, there can be no cure but death. First therefore they use scarification, and make ulcer in the body, cutting off the member wounded. If it be in the extremity, they lay also plasters unto it, as Triacle, liquid Pith with Oyl, Hens cut afunder alive, and so laid to hot, or else the leaves of Purlain beaten in Vinegar, Barley meal, Bramble leaves pounded with Honey, also Plantain, Hytop, white Garlick, Leeks, Rue and Nettles. Then must the government of their body be no leffe looked unto; first, that they be kept from all sharp and salt meats, then, that they be made continually to drink Oyl, to procure vomit, and with their vomits which they cast out of their stomac, to give them glivers; so the waters may be drawn to their lower parts. Besides,
some take medicines out of Fifhes, especially such as are falt, and the leaves, bark, or fprings of Lau-
rel: and to conclude, there is nothing better then Triacle compounded of Vipers flefh. And thus
much for the Dipfas.

Of the DOUBLE-HEAD.

Beaute the Grecians call this Serpent Amphibiana, and the Latins from thence Amphibius, be-
caufe it goeth both ways, as if it had two heads and no tail: and for this purpose it is never
seen to turn his body, as it were turn about his head. When it hath a purpofe to avoid that thing
which he feareth, or wherewith it is offended, he doth but only change his course backward as he
went forward; fo that it was happy as Lynceus, whom the Poets faigne to be very quick-fighed, or as
thofe Monefrs which are faid to have eyes in their backs, or rather like to Jamus, which is faid to
have two faces, one forward, and another backward, and therefore I have called it Double-head, I
trull flily enough to exprefle the Greek word, althought compounded of two words together, for fo is
the Greek word alfo, which the French do exprefle by a like compounded word, Double-marche, that
is, going two ways. It is likewise called Alzofimne, Abibifimnus, and Amphifidnus. And thus much ma
fuffice for the name.

It is faid that this Serpent is found in the Island Lemnos, but among the Germans it is unknown.
There is some queftion whether it may be faid to have two heads or no. Galen afferteth, that it is like
a Ship having two fore-parts, that is, one behind, and another before. Pline alfo afcribes this hent
unto, and maketh it a very pleifant Serpent, Geminius habet caput Amphibiaum, tanquam param
efect, uno are fundi venenum, faith he. It hath a double-head, as though one mouth were not enough to
utter his poyfon, according to the faying of the Poet:

Est gravus in geminis surgitae caput Amphibius
Serpent qui viuus necet & fibilis

Which may be Englished thus:

This Serpent Double head, is grievous to be seen,
Whose cloven-head doth hold with fight and fifting keen.

Unto this alfo Ethimus subscribeth, that it is a true Serpent, and hath two heads, fo that when-
soever it is to go forward, one of them fiandeth in the place of the tail, but when it is to go backward,
then the head becometh the tail, and the tail the head. So alfo Mammalian faith it is a double-headed
Serpent, and a fearful linging Af. And fo generally all the Ancients, until Matthius and Grecinus
time, who firft of all began to contrary this opinion, affirmin it to be imposfible in nature, for one
Serpent to have two heads, except it be monfrours, and exceed the common course of nature.
Such a one was that Serpent with two heads that Arifotle fpakeoth of, which doth easily happen
to all thofe creatures which at one birth bring forth many young ones; fo for their bodies may be
conroyed into one, while their heads fiand afunder like twain. And they fay that this Serpent
doth reembe a Worm of the earth, whose head and tail is hard to be diftinguifhed afunder except you
fee it going. And they fay further, that this Serpent is like to the Sejui, of which we shall
fpake afterwards, differing from it in nothing except in going backward and forward, and this is
all that they can bring againft the opinion of the Ancients, whom I will not fland to confute, but
leave the Reader to believe one or other: for it fhall not bring to me any great disadvantage,
except the loffe of this new English name, for I have dealt faithfully with the Reader in fetting down
the opinion of both fides, and if I do fail in a fit name, yet will I not fweare from the fett deprefli-
on of his nature.

The whole proportion of his body is of equal magnitude or greatnefs, and the two extremities do
anfwer the middle. His eyes are for the moft part fubt, the colour like earth, not black, but tending
to blacknefe, the skin rough and hard, and fet over with divers spots: which all properties, or
rather parts are thus described by Neander.

Genius perpetuus eft cecum caliginos lumen,
Quod latus urgin, genas porrectat: menta,
Terres effe color, & densissimapellis
Plurima quam varii diftinguuntur signa figurant,
Plus alius also Serpentibus aggeretendas.

In English thus:

When eye is ever void of light, because
Two cheeks both broad and standing up it hides,
The colour earth, thick skin, with spots in rows,
Then other Serpents with greater bulk it glides.

Solini Polibifher affirmeth, that they ingender and bring egges forth of the mouth, that is, out
of that mouth which is toward the tail, if there be any fuch. There is no Serpent that doth more
boldly adventure to induce the cold then this doth, for it cometh out of his den not only before
other Serpents, but alfo before the Cuckoe flog, or the Grathopper cometh forth. They are

Said to exceed...
Of the Dragon.

exceeding careful of their egges, and therefore seldom depart from them until they be hatched, whereby also may be collected their great love to their young ones. And further, by their forward and timely coming out of their holes, Grevius makes it a good observation, that their temperament or constitution, is more hot then any other Serpent.

The Grevians have all observed, that this kind of Serpent is hard to be killed, except with a Vine-branch, which they say was demonstrated by Dionysius, who being turned by Juno into man and one day falling fast asleep, this Serpent leaped upon him and awaked him, whereas he being angry, presently killed it with a Vine-branch. Some have affirmed that a small rod or bat covered with the skin of this Serpent, and so laid beside a man, driveth away all manner of venomous Beasts. A wide Olive-branch or sprig wapped in this skin, doth cure the leprous and benumbed eftate of the fined, and also is good for many things, as Nicander expresseth in these verses:

Hec ubi jam crevies, cadentes figna coloni
Settandeglabrant deafril ex abore virgum,
Squalis polum, frigidae; prehensis pelibus Angis
Infeclam abolvant, quas certe deinde diebus
Exarctere sint, cantantes ante ovisad.

Which may be Englished thus;

When this is grown, the Peasants cutting wood,
Do peel a branch taken from Olive-wilde,
A foot in length, of strained Snakes-skin good,
Rowling it up bereaf, till days suffis,

Utile hic baculis frigentibus artibus esse,
Ferminibi ex animus digitus torpido fatigat,
Tunc quia confirrit, & corum vincula, nervos
Cufcius immiffio vnet extensitdty colore.

And let it dry before Grasshoppers grow:
Thus made, it is good for Sifews cold,
Or nummed fingers, whose face hath been
By heat extending what cold band did hold.

The wounds that come by the biting or flinging of this Serpent, are not great, but very small, and scarcely to be discerned outwardly, yet the accidents that follow, are like to those which ensue the bitings of Vipers, namely, inflammation, and a lingering death. The cure thereof must be the same which is applied unto the sting of Vipers. And particularly I finde not any medicine serving for the cure of this poison alone, except that which Plum speaketh of, namely Coriander drunk by the patient, or laid to the fore.

It is reported by Galden and Grevius, that if a woman with child do chance to go over one of these Double-headed Serpents dead, she shall suffer abortion, and yet that they may keep them in their pockets alive without danger in boxes. The reason of this is given by Grevius, because of the vapour ascending from the dead Serpent, by a secret antipathy against humane nature, which sufcocateth the child in the mothers womb. And thus much for this Serpent.

of the DRAGON.

A mong all the kindes of Serpents, there is none comparable to the Dragon, or that affordeth and yieldeth so much plentiful matter in History for the ample discovery of the nature thereof: and therefore herein I must borrow more time from the residue, then peradventure the Reader would
would be willing to spare from reading the particular stories of many other. But such is the necessity hereof, that I can omit nothing making to the purpose, either for the nature or morality of this Serpent, therefore I will strive to make the description pleasant, with variable histroy, seeing I may not avoid the lengththereof, that so the sweetneffe of the one, (if my pen could so express it) may counteract the tediousneffe of the other.

The Helbrus call it Ταμιν, and Wolphius translateth Oasch a Dragon, in his Commentaries upon Nehemias. The Chaldæer call it Darken, and it feemeth that the Greek word Draschin is derived of the Chaldæer. We read of Albedifimon, or Albedisimon, for a kinde of Dragon, and also Albaras, and Hauenth, Haren carnem, and such other terms, that may be referred to this place. The Grecians at this day call it Drakes; the German, Truch Lindaewarm; the French, Un Dragon; the Italian, Drago, and Dragons. The derivation of the Greek word, bevide the conjecture afore expressed, fome think to be derived from Derkein, because of their vigilant eye-fight, and therefore it is faigned that they had the custodty not only of the Golden-fleece, but also of many other treasuress. And among other things, Acis hath an emblem of their vigilancy standing by an unmarried Virgin.

Vera haec effigies immunda est Palladis: ejae
Draco, qui dominat constringit ante pedes.
Cur Draca temere hoc animal? custodia rerum
Which may be Engliſh thus:

His Dragon great which Lady Pallis stands before,
Is the true picture of unmarred Maids:
But why a comfor to the Goddes in this? and more
Then other beasts more meek, who never fades?

Because the safegard of all things belong to this,
Whereby his house in Graves and sacred Temples
Unmarried Maids of guards must never mife,
Which watchful are to void loves saecres and net.

For this caufe the Egyptian did picture Serapis their God with three heads, that is to fay, of a Lyon in the middle, on the right hand a meek fawning Dog, and on the left hand a raveng wolf, all which forms are joyned together by the winding body of a Dragon, turning his head to the right hand of the God; which three heads are interpreted to imagine three times; that is to fay, by the Lyon, the present time; by the Wolf, the time past; and by the fawning Dog, the time to come; all which are guarded by the vigilancy of the Dragon. For this caufe also among the fixed Stars of the North, there is one called Dracon, a Dragon, all of them ending their course with the Sun and Moone, and they are in the Sphere called by Astronomers the Inferences of the Circles, the superior of thefe ascending, is called the head of the Dragon, and the inferior descending, is called the tail of the Dragon. And some think that GOD in the 38. of Job, by the word Gniew, meaneth this Sign or Constellation.

To conclude, the ancient Romans (as Vegetius wrieth) carried in all their Bands the Eſcutcheon of a Dragon, to signify their fortitude and vigilancy, which were born up by certain men called for that purpose Draconii. And therefore when Constantius the Emperor entered into the City of Rome, his fouldiers are faid to bear upon the tops of their Spears, Dragons gaping with wide mouths, and made fast with golden chains and pearl, the winde whifling in their throats, as if they had been alive, threatening destruction, and their tails hanging loose in the air, were likewife by the winde toſte and fro, as though they strove to come off from the spears, but when the winde was laid, all their motion was ended, whereupon the Poet faith:

Manufactus varii vento cessante Dracones,
In English thus;

When whifling winde in air ceaseth,
The Dragon tamed then did reft.

The tale also of the Golden-fleece, if it be worth any place in this story, deserveth to be inferted here, as it is reported by Diodorus Siculus. When Aetes reigned in Pomus, he receiveth an answer from the Oracle, that he shou'd then dye when strangers should come richer with ships and fetch away the Golden-fleece. Upon which occasion he thwrew himself to be of a cruel nature, for he did not only make Proclamation that he would sacrifice all strangers which came within his Dominions, but did also perform the fame, that by the fame and report of fuch cruelty, he might terrifie all other Nations from having accesse unto that Temple. Not contented herewith, he raised a great strong wall round about the Temple wherein the Fleece was kept, and caused a fure watch or guard to attend the fame day and night, of whom the Grecians tell many strange fables. For they lay there were Bulls breathing out fire, and a Dragon warding the Temple and defending the Fleece, but the truth is that their watchmen because of their strength were called Bulls, because of their cruelty, were faid to breathe out fire, and because of their vigilance, cruelty, strength and terror, to be Dragons.

Some affirm again, that in the Gardens of Hesperides in Libya, there were golden Apples, which were kept by a terrible Dragon, which Dragon was afterward slain by Hercules, and the Apples taken away by him, and fo brought to Eurystheus. Others affirm that Hesperides had certain flocks of sheep, the colour of whose wool was like gold, and they were kept by a valiant shepheard called Draco: but I rather agree with Sothinus, who giveth a more true reflation of this fable, Ne fane licentia

vulnearing
they signify by were whereof, fure, lemphrum'. old phet appearance Temples. hath Son Verf. Verf. Earth, magnitude mentodeftroy therefore therefore knew of therefore Dragon, whereby neffe, Tranllators Hea ven, Serpents Terra rium, Dracones Temporum: that is to say, Snakes are of the water, Serpents of the earth, and Dragons of the Temples. And I think it was a juft judgement of God, that the ancient Temples of the Heathen Idolaters were annoyed with Dragons, that as the Devil was there worshipp'd, so there might be appearance of his person in the ugly form and nature of a Dragon. For God himself in holy Scripture, doth compare the Devil unto a Dragon, as Rev. 12. verf. 3. And there appeared another wonder in Heaven, for behold a great red Dragon, having ten heads, and ten horns, and seven crowns upon his head. Verf. 4. And his tail drew the third part of the stars of heaven, and did cast them to the earth: and the Dragon fixed before the Woman which was ready to be delivered, to devour her child the time when she was brought forth. Verf. 5. So she brought forth a man child, which should rule all Nations with a rod of Iron. And her Son was taken up unto God and to his throne. Verf. 6. And the Woman fled into the Wilderness, where she hath a place prepared of God, that they should feed her there 1260 days. Verf. 7. And there was a battail in heaven, Michael and his Angels fought against the Devil, and the Devil fought and his Angels. Verf. 8. But they prevailed not, neither was their place found any more in heaven. Verf. 9. And the great Dragon that old Satan called the Devil and Satan, was cast out, which deceiveth all the world, he was cast out unto the earth, and his Angels were cast out with him. Verf. 13. And when the Dragon saw that he was cast out unto the earth, he persecuted the Woman which had brought forth a man child: and so forth, as it followeth in the Text. Whereupon Saint Augustine writeth. Diabolus Dracon dicitur proprius infidibus, quia occulta insidiatque: that is, the Devil is called a Dragon because of his treachery, for he doth treacherously fet upon men to destroy them.

It was wont to be said, because Dragons are the greatest Serpents, that except a Dragon eat a Serpent, he shall never live a Dragon: for their opinion was, that they grew to great by devouring others of their kinde; and indeed in Ethiopia they grow to be thirty years old, neither have they any other name for those Dragons but Elephant-killers, and they live very long. Unjfectius writeth, that one Apifersas an Indian, did nourish two Serpents Dragons, whereof one was fix and forty cubits long, and the other fourcore: and for the more famous verification of the fact, he was a very earnest letter to Alexander the Great, when he was in India, to come and fee them, but the King being afraid, refused. The Chronicles of the affairs of Cosm do write, that in a certain Valley near to the foot of the Mountain Pellenaeus, was a Valley full of straight tall trees, wherein was bred a Dragon of wonderful magnitude or greatness, whose only povye or hisling, did terrifie all the Inhabitants of Chius, and therefore there was no man that durst come nigh unto him, to consider or to take a perfect view of his quantity, suspecting only his greatness by the loudness of his voice, until at length they knew him better by a singular accidental worthy of eternal memory. For it happened on a time that such a violent earthquake did shock all the trees in the Wood, by which violent collision the branches fell to be on fire, and so all the Wood was burned suddenly, compaßing the Dragon, whereby he had no means to escape alive, & so the trrees fell down upon him and burned him. Afterward, when the fire had made the place bare of wood, the Inhabitants might see the quantity of the Dragon, for they found divers of his bones and his head, which were of such unusual greatness, as did sufficiently confirm them in their former opinion: and thus by divine miracle was this monster confirmd, whom never any man durst behold being alive, & the Inhabitants of the Countrie safely delivered from their jux conceiv'd fear.

It is also reported, that Alexander among many other Beasts which he saw in India, did there finde in a certain den a Dragon of feavenity cubits long, which the Indians accounted a sacred Beast, and therefore intreated Alexander to do it no harm. When it uttered the voyse with full breath, it terrifi'd his whole Army: they could never fee the proportion of his body, but only the head; and by that they guessed the quantity of the whole body, for one of his eyes in their appearance seemed as great as a Macedonian buckler. Maximus Tyrius writeth that in the days of Alexander, there was likewise seen a Dragon in India, as long as five roods of lands are broad, which is incredible. For he
likewise faith that the inuest did feed him every day with many several Oxen and Sheep. It may be that it was the same spoken of before, which some ignorant men, and such as were given to let forth fables, ampliyd beyond measure and credit.

Whereas Dragons are bred in India and Africa, the greatest of all are in India, for in bibliothec, Nabban and Historia, the Daungs are confined within the length of five cubits and twenty cubits: for in thertime of Usert, there were three brought to Egypt, one was nine cubits long, which with great care was nourished in the Temple of Epsoluphe, the other two were leaven cubits long. About the place where once the Tower of Babel was built, are Dragons of great quantity, and under the Equ noctua, as N[e]cchonni Callistius writeth, there are Serpents as thick as beams, in testimony whereof their skins have been brought to Rome. And therefore it is no marvel, although S. Augtin writing upon the t.q.B. Palm, doth say, Dragons magna sudeum sunt animantis, majora non sunt super terram: Dragons are certain great beasts, and there are none greater upon the earth. Neither is it to be thought incredible, that the soildiers of Attiullus Regulus did kill a Dragon which was a hundred and twenty foot long, or that the Dragons in the dens of the Mountain Atlas, should grow to so great a size, that they can iracirr move the fore-parts of their body. I am yet therefore to speak of the Dragons in the Mountains Eumedit or of Asia, or of Diaumabades, or the Regions of the East, or of that which Augustus showed publiquely to the people of Rome, being-fifty cubits long; or of thole which be in the Aper, which are found in certain Caves of the South-fides of the hills, so that this which hath been laid, shall suffice for the quantity and Countries of Dragons. Besides, there are other kinde of Dragons which I must speak of in order: and first of all the Epidauran Dragons, which is bred no where but in that Country, being tame, and of yellow golden colour, wherefore they were dedicated to Epsoluphe, of whom Aeander writeth in this manner.

**Nunc viridem & temperamenti dixi venena Draconum**

Dacipis, quem patula fagi Phaloea proles
In gelida Pelii nitritur culmine, juxta
Levis Pelethnum. quondam decerrat valor.

In English thus:

After these venoms now behold the Dragon black and green,
Now nourished by Apollo under a Beech full broad,
On top of the cold Pelus, as often bath been seen,
By furtile vale of Pelusum us sliding road.

There are likewise other kinde of tame Dragons in Macedinis, where they are so meek, that women feed them, and suffer them to suck their breasts like little children; their Infants also play with them, riding upon them and pinching them, as they would do with Dogs, without any harm, and sleeping with them in their beds. But among all Dragons, there was none more famous than the Dragon Pythion or Python, as the Poets faigne, which was bred of the flame of the earth, after the flood of Deucelion, and flourished afterwards by Apollo, whereof there lyeth this tale: That when Latona was with child by Jupiter or Apollo and Diana, who resitified their birth but when they were born and laid in the Cradle, the fent the Dragon Python to devour them. Apollo being but a young infant, did kill the Dragon with a dart. But this tale seemeth too fabulous and incredible, and therefore they have mended the matter with another device; For they say that Python by the commandment of Juno, did perfecte Latona throughout all the world, seeking to devour her, so as she had no rest until she came unto her father Aferis, who received her into Delta, where she was safely delivered of Apollo and Diana. Afterward, when the child was grown up, he flew the Dragon in remembrance and revenge of the wrong done to his mother. But the true caue of this History is delivered by Pausanias and Macrofibius, to be thus: That Apollo killed one Python, a very wicked man in Pelopon, and that the Poets in excuse of the fact, did faigne him to be a Dragon, as aforesaid. And so I shall not need to say any more of Python, except these verses following out of Ovid about his generation:

**Sed e quos: maximia Python, sed eque:**

Tum genitus populis, nonas incognite Serpentes
Terror exo: tamquam精益 de monte tenebat.

Hunc Licr arcitium: et quamquam tebali armis
Aeol. nus in damis, caprisque scissibus usus:
Mille gravem telis tectum flebantem paterem:
Perditis effuso per valvulam nigra venena.

Note opus famosum pestis detrao velutlus,
Infinius favus celebris quintime nubes
Pythia perdicrina Serpentis nuncum dellos.
Caelum tall presfstram Apollino Python.

Which may be Englished thus:

But yet thou ugly Python was enraged by her, the
A terror to the new-made folk, which never erst had known,
So foul a Dragon in their life: so monstrously fore-growed,
So great a ground thy poison'd paunch did underneath the hide,
The God of floods, who no where before that present tide
Toose kinds of weapons put in me but at the sickled Deer,
Or at the Ross so light of foot, a thousand shafts well near
Of the Dragon.

Of the Indian Dragons there are also said to be two kinds, one of them fenny, and living in the marshes, which are low of pace and without combs on their heads like females: the other in the Mountains, which are more sharp and great, and have combs on their head, their backs being somewhat brown, and all their bodies little fally then the other. When they come down from the Mountains into the plain to hunt, they are neither afraid of marshes nor violent waters, but thrust themselves greedily into all hazards and dangers: and because they are of longer and stronger bodies than the Dragons of the fens, they beguile them of their meat, and take away from them their prepared booties. Some of them are of a yellowish fiery colour, having also sharp backs like faws; the other also have beards, and when they set up their scales they shine like silver. The apples of their eyes are precious fones, and as bright as fire, in which there is affirmed to be much virtue against many diseases, and therefore they bring unto the Hunters and killers of Dragons no small gain, besides the profit of their skin, and their teeth: and they are taken when they descend from the Mountains into the Valleys to hunt the Elephants, so as both of them are kill'd together by the Hunters.

Their members are very great, like unto the members of the greatest Swine, but their bodies are leaner, flexibly turning to every fide, according to the necessity of motion: Their fouts are very strong, resembling the greatest ravening Fihers; they have beards of a yellow golden colour, being full of brillities: and the Mountain-dragons commonly have more deep eye-lids then the Dragons of the Fens. Their fides are very fierce and grim, and whenever they move upon the earth, their eyes give a found from their eye-lids, much like unto the tinckling of Braffe, and sometimes they boldly venture into the Sea and take Fihers.

Of the WINGED DRAGON.

There be some Dragons which have wings and no feet, some again have both feet and wings, and some neither feet nor wings, but are only distinguished from the common fort of Serpents by the comb growing upon their heads, and the beard under their cheeks.

Saint Augustine faith, that Dragons abide in deep Caves and hollow places of the earth, and that sometimes when they perceive moistnes in the air, they come out of their holes, & beating the air with their wings, as it were with the strokes of Oars, they forfake the earth and fly aloft: which wings of theirs are of a skinny subfSANCE, and very volatile, and spreading themselves wide, according to the quantity and largeneffe of the Dragons body, which caused Lucan the Poet in his verses to write in this manner following:

`Vos queis qui canum innoxia memina terris
Serpitis, aurato niditi fulgore Dracones,
Pelliferos ardens facit Africa: ducentis alium
Aera cum pelmis, &c.——-

In English thus;

You shining Dragons creeping on the earth,
Which fiery Africk holds with skins like gold,
Yet pestilent by hot inflicting breath:
Mounted with wings in the air we do behold.

The Inhabitants of the Kingdom of Georgia, once called Medias, do say that in their Valleys there are divers Dragons which have both wings and feet, and that their feet are like unto the feet of Geese. Besides, there are Dragons of fundry colours, for some of them are black, some red, some of an ash-colour, some yellow, and their shape and outward appearance very beautiful, according to the verses of Naiunder.
The History of Serpents.

Gildas, Pliarius, and Grecius, following the authority of this Poet, do affirm, that a Dragon is of a black colour, the belly somewhat green, and very beautiful to behold, having a treble row of teeth in their mouths upon every jaw, and with most bright and clear seeing eyes, which caused the Poets to faign in their writings, that thee Dragons are the watchfull keepers of Treasures. They have also two dewlaps growing under their chin, and hanging down like a beard, which are of a red colour: their bodies are set all over with very sharp scales, and over their eyes stand certain flexible eye-lids. When they gape wide with their mouth, and thrust forth their tongue, their teeth seem very much to resemble the teeth of wild Swine: And their necks have many times groffe thick hair growing upon them, much like unto the briddles of a wilde Boar.

Their mouth, (especially of the most tameable Dragons) is but little, not much bigger then a pipe, through which they draw in their breath, for they would not with their mouth, but with their tails only beating with them when they are angry. But the Indian, Aspinius, and Persian Dragons, have very wide mouths, through which they often swallow in whole fowls and beasts. Their tongue is cloven as if it were double, and the Inquirers of nature do fay, that they have fifteen teeth of a side. The males have combs on their heads, but the females have none, and they are likewise diftinguished by their beards.

They have most excellent senses both of seeing and hearing, and for this cause their name Dracon- cometh of Derkens, and this was one cause why Jupiter the Heavens God, is said to be metamorphosed into a Dragon, whereof their flyech this tale: when he fell in love with Preripina, he ravished her in the likeness of a Dragon, for he came unto her and covered her with the spires of his body; and for this cause the people of Sabazii did observe in their mysteries or sacrifies the shape of a Dragon rowed up within the compasse of his spires: so that as he begot Ceres with child in the likeness of a Bull, he likewise deluded her daughter Preripina in the likeness of a Dragon; but of these transmutations we shall speak more afterwards, and I think the vanity of these took first ground from the Afcritos, who believe that the original of Dragons took beginning from the unnatural conjunction of an Eagle and a the Wolf. And fo they fay that the Wolf growing great by this conception, doth not bring forth as at other times, but her belly breaketh and the Dragon cometh out, who in his beak and wings resembleth the Dragon his father, and in his feet and tail, the Wolf his mother, but in the skin neither of them both: but this kinde of fabulous generation is already sufficiently confused. Their meats are fruits and herbs, or any venemous creature, therefore they live long without food, and when they eat, they are not eaily filled. They grow most fat by eating of eggs, in devouring whereof, they use this Art, if it be a great Dragon, he swollceth it up whole, and then rowleth himsef, whereby he crucifereth the eggge to pieces in his belly, and so nature caltheth out the hellis, and kepeth in the meat: But if it were a young Dragon, as if it be a Dragons whelp, he taketh the eggge within the spire of his tail, and so crucifereth it hard and holdeith it fast, until his scales open the shelle like a knife than fuccket he out of the place opened all the mest of the egg. In like sort do the young ones pull off the feathers from the fowles which they eate, and the old ones fswallow them whole, calling the feathers out of their bellies again.

The Dragons of Pergia when they are hungry, turn themselves towards the West, and gaping wide, with the force of their breath do draw the Birds that flie over their heads into their throats, which some have thought is but a voluntary lapfe of the Fowls, to be drawn by the breath of the Dragon, as by a thing they love, but it is more probable, that some vaporuous and venemous breath is sent up from the Dragon to them, that papooneth and infecteth the air about them, whereby their feathers are taken from them, and they astonifh fall down into his mouth. But if it fortune the Dragons finde not food enough to satisfie their hunger, then they hide themselves untill the people be returned from the market, or the heard-men bring home their flocks, and upon a sudden they devour either Men or Beasts, which come first to their mouths: then they go again and hide themselves in their dens and hollow Caves of the earth, for their bodies being exceeding hot, they very seldom come out of the cold earth, except to seek meat and nourishment. And because they live only in the hottest Countries, therefore they commonly make their lodgings neer unto the waters, or else in the coldeft places among the rocks and stones.

They greatly preferre their health (as Aristote affirmed) by eating of wilde Lattice, for that they make them to vomit, and call forth of their stomack whatsoever meat offendeth them, and they are most specially offended by eating of Apples, for their bodies are much subject to be filled with winde, and therefore they never eat Apples, but first they eat wilde Lattice. Their sight also (as Plutarch faith) doth many times grow weak and feeble, and therefore they renew and recover the fame again by rubbing their eyes against Fennel, or else by eating of it.

Their
Their age could never yet be certainly known, but it is conjectured that they live long, and in great health, like to all other Serpents, and therefore they grow so great. They do not only live on the land, as we have said already, but also swim in the water, for many times they take the Sea in Ethiopia, four or five of them together, folding their tails like hurdles, and holding up their heads, so swim they over to seek better food in Arabia.

We have said already, that when they set upon Elephants, they are taken and killed of men: now the manner how the Indians kill the Mountain Dragons is thus: they take a garment of Scarlets, and picture upon it a charm in golden letters, this they lay upon the mouth of the Dragons den; for with the red colour and the gold, the eyes of the Dragon are overcome, and he falleth asleep, the Indians in the mean season watching, and muttering secretly words of Incantation; when they perceive he is fast asleep, suddenly they strike off his neck with an Ax, and to take out the balls of his eyes, wherein are lodged those rare and precious stones which contain in them virtues immutable, as hath been evidently proved by one of them, that was included in the Ring of Gyges. Many times it felleth out, that the Dragon draweth in the Indian both with his Ax and Instruments into his den, and there devoureth him, in the rage whereof, he do beateth the Mountain that it shaketh. When the Dragon is killed, they make use of the skin, eyes, teeth, and flesh; as for the flesh, it is of a vitriall or glassic colour, and the Ethiopians do eat it very greedily, for they say it hath in it a refrigerative power. And there be some which by certain incanting verses do tame Dragons, and rideth upon their necks, as a man would ride upon a Horse, guiding and governing them with a bridle.

Now because we have already shewed, that some Dragons have wings, left it should seem uncreditable, as the foolish world is apt to believe no more then they see. I have therefore thought good to add in this place, a particular relation of the testimonies of sundry learned men, concerning these winged Serpents or Dragons.

First of all Mr. Agrippinus wrieth, that in India there be certain flying Serpents, which hurt not in the day, but in the night-time, and these do render or make a kind of urine, by the touching whereof, all the parts of mortal creatures do rot away. And there is a Mountain which divideth aunder the Kingdom of Narthaks from Aethiopia, wherein be many winged Serpents sitting upon trees, which they say annoy men with their breath. There be many peltillant winged Serpents which come out of Arabia every year by troops into Egypt, these are destroyed by a certain black Bird called Iblis, who fighteth with them in the defense of that Countrey where the liveth, so that there lie great heaps of them many times destroyed upon the earth by these Birds, whose bodies may be there visibly seen to have both wings and legs, and their bones being of great quantity and stature, remain unconfumed for many years after. These kindes of Serpents or Dragons, covet to keep about Trees of Frankincense which grow in Arabia, and when they are driven away from thence with the fume or smoke of Straex, then they fly (as is aforesaid) into Egypt, and this is to be considered, that if it were not for this Straex, all that Countrey would be confumed with Dragons.

Neither have we in Europe only heard of Dragons and never seen them, but also even in our own Country, there have (by the testimony of sundry Writers) divers been discovered and kill'd. And first of all, there was a Dragon or winged Serpent brought unto Francis the French King, when he lay at Sandun, by a certain Countreyman, who had lin'd the same Serpent himsell with a Spade, when it fell upon him in the fields to kill him. And this thing was witnessed by many learned and credibellc men which saw the same: and they thought it was not bred in that Countrey, but rather driven by the winde thither from some forain Nation. For France was never known to breed any such Monsters. Among the Tyrens also, there is a cruel kind of Serpent, not paft four foot long, and as thick as a mans arm, out of whose fides grow wings much like unto griffles.

Gjefir also faith, that in the year of our Lord 1543. there came many Serpents both with wings and legs into the parts of Germany near Stidrig, who did bite and wound many men incurably. Cardan, also describeth certain Serpents with wings, which he saw at Paris, whose dead bodies were in the hands of Guliemus Muscian, he faith that they had two legs and small wings, so that they could scarce fly, the head was little, and like to the head of a Serpent, their colour bright, and without hair or feathers, the quantity of that which was greatest, did not exceed the bignepse of a Cony, and it is faid they were brought out of India. Besides, a further confirmation of these Beasts, there have been noted in all ages; for it is written in the Roman Chronicles, the times of their apparition and manifellation.

When the River of Tiber over-flew above the banks, then were many Serpents discovered, and many Dragons, as in the time of Mauritius the Emperor, at what time a Dragon came along by the City of Rome, upon the waters in the fight of all men, and so paffed to the Sea: after which prodigy, there followed a great mortal pestilence. In the year 1499. the 26. day of May, there came a Dragon to the City of Lucerne, which came out of the Lake through Rafa, down along the River, many people of all forts beholding the same.

There have been also Dragons many times seen in Germany, flying in the air at mid-day, and signifying great and fearful fires to follow, as it happened near to the City called Nählerborge, near to the shore of the Rhine, in a marvellous clear Sun-shine, there came a Dragon three times succettively together in one day, and did ascend in the air over a Town called Sangiagarrina, shaking his head over that Town every time: it appeared visibly in the sight of many of the Inhabitants, and afterwards it came to paffe, that the said Town was three times burned with fire, to the great harm and undoing.
undoeing of all the people dwelling in the same: for they were not able to make any resistancce to quench the fire, with all the might, Art, and power that they could raise. And it was further observed, that about that time there were many Dragons seen washing themselves in a certain Fountain or Well near the Town, and if any of the people did chance to drink of the water of that Well, their bellies did instantly begin to swell, and they dyed as if they had been poison'd. Whereupon it was publicly decreed, that the said Well should be fill'd up with stones, to the intent that neither any man should afterwards be poison'd with that water; and so a memory thereof was continued, and these things are written by Justinus Goblenus, in an Epistle to Genser, affirming that he did not write fainaign things, but such things as were true, and as he had learned from men of great honesty and credit, whose eyes did fee and behold both the Dragons, and the mishaps that followed by fire.

When the body of Cleomenes was crucified, and hung upon the Cross, it is reported by them that were the watch-men about it, that there came a Dragon and did winde it fellow about his body, and with his head cover'd the face of the dead King, oftentimes licking the same, and not suffering any Bird to come neer and touch the carcasse. For which cause there began to be a reverent opinion of divinity attributed to the King, until fuch time as wife and prudent men, fluidious of the truth, found out the true cause hereof. For they lay that as Bees are generated out of the body of Oxen, and Drones of Horses, and Hornets of Affes: so do the bodies of men ingender out of their marrow a Serpent, and for this cause the Ancients were mov'd to confecrate the Dragon to Noble-spirited men, and therefore there was a monument kept of the firit Africiatus, because that under an Olive planted with his own hand, a Dragon was faid to profecrate the affass. But I will not mingle fables and truths together, and therefore I will reserve the moral discourse of this Beaf into another place, and this which I have written, may be fufficient to fatisfie any reasonable man, that there are winged Serpents and Dragons in the world. And I pray God that we never have better arguments to fatisfie us, by his corporal and lively presence in our Country, left some great calamity follow thereupon. Now therefore we will proceed to the love and hatred of this Beaf, that is observ'd with man and other creatures.

And first of all, that Dragons be natural enemies to men, like unto all other Serpents, yet many times (if there be any truth in story) they have been posseffed with extraordinary love, both to men, women and children, as may appear by these particulars following. There was one Attus a Teffalian Neatherd; which did keepe Oxen in Offa, hard by the Fountain Hemnins, there was a Dragon fell in love with this man, for his hair was as yellow as any gold, unto him for his hair did this Dragon often come, creeping closely as a Lover to his Love: and when he came unto him, he would lick his hair and face so gently, and in fo sweet a manner, as the man profecfled he never felt the like, fo as without all fear confedered with him, and as he came, fo would he go away again, never returning to him empty, but bringing some one gift or other, such as his nature and kinde could lay hold on.

There was a Dragon alfo which loved Pindus the fon of Macedo King of Emathia: This Pindus having many Brothers molt wicked and lewd persons, and he only being a valiant man of honest disipation, having likewise a comely and goodly perfonage, understanding the treachery of his Brethren against him, betook himself how to avoid their hands and tyranny. Now forasmuch as he knew that the Kingdom which he posseffed, was the only mark they all flot at, he thought it better to leave that to them, and fo to rid himfelf from envy, fear, and peril, then to embrow his hand in their blood, or to lose his life and Kingdom both together. Wherefore he renounced and gave over the government, and betook himself to the exercize of hunting, for he was a ftrong man, fit to combine with wild Beafs, by deftruction of whom, he made more room for many men upon the earth, fo that he pass'd all his days in that exercife. It hapned on a day that he was hunting of a Hind-calf, and spurring his Horfe with all his might and main in the eage perfuit thereof, he rode out of the light of all his company, and suddenly the Hind-calf leap'd into a very deep Cave, out of the light of Pindus the Hunter, and fo faved himfelf. Then he alighted from his Horfe, and tyed him to the next Tree, fecting out as diligently as he could for a way into the Cave, whereinto the Hind-calf had leap'd: and when he had look'd a good while about him, and could finde none, he heard a voyce speaking unto him, and forbidding him to touch the Hind-calf, which made him look about again, to fee if he could perceiue the perfon from whom the voyce proceeded; but eyping none, he grew to be afraid, and thought that the voyce proceeded from some other greater caufe, and fo leap'd upon his Horfe haftily, and departed again to his fellows. The day after he returned to the fame place, and when he came thither, being terrified with the remembrance of the former voyce, he durft not enter into the place, but flood there doubting and wondering with himself, what Shepheards or Hunters, or other men might be in that place to defpair him from his game, and therefore he went round about to feek for some, or to learn from whence the voyce proceeded. While he was thus feeking, there appeared unto him a Dragon of a great ftature, creeping upon the great part of his body, except his neck and head lifted up a little, and that little was as high as the ftature of any man can reach, and in this fashion he made toward Pindus, who at the firft light was not a little afraid of him, but yet did not run away, but rather gathering his wits together, remembered that he had about him Birds, and divers parts of Sacrifices, which instantly he gave unto the Dragon, and so mitigated his fury by these gifts, and as it were with a royall feast, changed the cruel nature of the Dragon into kinde ufage. For the Dragon being smooth'd over with thefe
Of the Dragon.

709

these gifts, &c. as it were overaken with the liberality of Pindus, was contented to forfake the old place of his habitation, and to go away with him. Pindus also being no less glad of the company of the Dragon, did daily give unto him the greatest part of his hunting, as a delvered price and ranfome of his life, and conquest of such a Beast. Neither was he unrequited for it, for Fortue fo favoured his game, that whether he hunted fowls of the air, or beasts of the earth, he still obtained and never miffed. So that his fame for hunting procured him more love and honor, than ever could the Imperial Crown of his Country. For all young men defired to follow him, admiring his goodly perfonage and strength, the Virgins and Maids falling in love, contended among themselves who fhould marry him: the wives forfaking their husbands, contrary to all womanly moityly, rather defired his company then the society of their husbands, or to be preferred among the number of the Goddefs. Only his Brethren inraged againſt him, fought all means to kill and destroy him. Therefore they watched all opportunities, lying in continual ambush where he hunted to accomplish their accursed enterprize, which at laft they obtained. For as he followed the game, they enclofed him in a narrow ftraight neer to a Rivers fide, where he had no means to avoid their hands, they and their company being many, and he alone, wherefore they drew out their fwords and flie him. When he faw no remedy but death, he cryed out aloud for help, whose voyce foon came to the ears of the watchfull Dragon, (for no Beast heareth or feets better) out he cometh from his den, and finding the murtherers flanding about the dead body, he prefently furprized and killed them, fo revenging the quarrel of Pindus, and then fell upon the dead body of his friend, never forfaking the cruelty thereof, until the neighbours adjoyning to the place, taking knowledge of the fate, came to bury the bodies. But when they came and faw the Dragon among them, they were afraid, and durft not come neer, but flold afar of, confulting what to do; till at laft they perceived that the Dragon began to take knowledge of their fear, who with an admirable curtefie of nature, perceiving their mourning and lamentation for their dead friend, and withall, their abifhine from approaching to execute his exequies, or funerals, began to think that he might be the caufe of this their terror, and far flanding off from the dead bodies, wherefore he departed, taking his farewell of the body which he loved, and fo gave them leave by his abience, to beftow upon him an honourable bu- rial, which they performed accordingly, and the River adjoyning, was named by the name of Pindus-death.

By which Rory may appear, that these favage Dragons are made loving and tame to men, by good turns and benefits beftowed upon them, for there is no nature which may not be overcome by kindneffe. And yet I may not leave this matter thus, nor from these examples alone, conclude the pratiſe and poſsibility of love betwixt Men and Dragons: I will therefore add some three or four examples more.

There was a Dragon the lover of Amtbus (as Plutarch writeth) who came unto her every night, and did her body no harm, but gently fliding over her, played with her till morning, then forth would he depart away affoon as light appeared, that he might not be fpyed. The Maidens friends came to the knowledge hereof, and fo removed her faraway, to the intent the Dragon might come no more at her: and thus they remained annuer a great while, the Dragon earnily seeking for the Maiden, wandered far and neer to finde her out. At laft he met with her, and not faluting her gently as he was wont, flew upon her, binding her hands down with the fpire of his body, hiffing foltly in her face, and beating gently with his tail her back-partes, as it were taking a moderate revenge upon her, for the neglect of his love by her long abience.

Another like story unto this is reported by Edianus, of a great Dragon which loved a fair Woman, beloved alfo of a fair Man, the Woman oftimes did fliep with this Dragon, but not fo willingly as with the Man: wherefore the forfook the habitation of her place for a month, and went away where the Dragon did not find her, thinking that her abience might quench his defire. But he came ofte to the place where he was wont to meet with the woman, and not finding her, returned quietly back again, and came again another time: at laft he grew fupercious, and like a lover failing in his expeation, grew very forrowful, and fo continued till the month was expired, every night vifiting the acculturled place. At laft the Woman returned, and the Dragon prefently met with her, and in an amorous fation, full of fupercious and jealoufie, vifiting about her body, did beat her as you have heard in the former Rory: and this (faid Edianus) happened in Judea, in the days of He- rod the King.

There was a little Dragon-whelp bred in Arcadia, and brought up familiarly with a little boy from his infancy, until the Boy became a young Man, and the Dragon alfo became of great nature, fo that one of them loved another so well as Man and Beast could love together, or rather two play- fellows from the Cradle. At laft the friends of the Boy feeing the Dragon grow fo great in fo fhort a space, began to be fupercious of him; whereupon they took the bed wherein the Boy and the Dragon were lodged, and carried the family into a far remote place of Woods and Wilderneffe, and there fet down the bed with the Boy and the Dragon together. The Boy after a little while returned, and came home again to his friends; the Dragon wandered up and down in the Woods, feeding upon herbs and poyfon, according to his nature, and never more cared for the habitation of men, but relift contented with a folytary life. In the length of time it came to paffe that the boy grew to be a perfeft man, and the Dragon alfo remained in the Wood, and although abfent one from the other, yet mutually loving as well as ever. It hapned that this young man travelled through that place where the Dragon was lodged, and fell among theenes, when the young man faw their fwords about his ears,
he cried out, and the Dragons den being not far off, his cry came to the Dragons ears, who instantly knowing the voice of his play-fellow, answered the same with another, at whose height the theeves grew afraid, and began to run away, but their legs could not carry them so fast, as to escape the Dragons teeth and claws; for he came speedily to releafe his friend, and all the theeves that he could find, he put to cruel death, then did he accompany his friend out of the place of peril, and returned back again to his den, neither remembering wrath, for that he was exposed to the Wilderneffe, and there left by his play-fellow, nor yet like perverse men, forfaking their old friend in danger.

They that desire to read more of this subject, shall finde th'oore of examples in Eliusius his first and thirteen Books. To conclude, when Missalina the wife of Claudius, did lend certain men to take away the life of Nero, who was a rival of Britannicus; it is said that when they had him in their hands to strangle him, a Dragon appeared out of the earth, or floor of the chamber, and did so terrifie these hangmen, that they ran away and spared Nero's life. By which example, another example of piety in Dragons is observed.

Again, Telephus ignorantly lying with his mother, had committed incest with her, had not a Dragon by divine providence come and parted them alounder: therefore Dragons familiis est virtus magica, quae diligenter omnia persequatur, remana: fides eius, the virtue of discretion or perfect knowledge, is like a Dragon, which diligently searcheth all things, and studiously looketh into every chink: to did this Dragon preserve the chastity of the mother and the son, when they ignorantly and in the dark had defiled each other, but for his appearance and demonstration. I will add but this one example more of their love of chastity in men and women.

In Lavinium there was a great holy Wood, nect unto which stood a Temple of Juno, in that wood there was a great deep den of a Dragon, unto the which Dragon the Virginis came every year being binded folded with cloaths, and carrying Marchpans in their hands: When they entred the Wood, there was a certain spirit (as it was said) without offence did lead them to the den of the Dragon, and so every one of the Virginis did severally offer up their Marchpans to the Dragon: The Dragon received the Marchpans at the hand of every pure Virgin and unpolluted, but if they were defiled, and held only the name of Virginis, then the Dragon refused the Marchpans, and therefore they were all examined at his coming forth, that those which had lost their Virginity might be punished by the Law. And by this story, (although none but Heathens will believe it to be true, because it is a fable meerly invented to defend Idolatry, which with my soul and spirit I do detest) yet I may collect this much as a moral out of a fable, that Dragons in ancient time did honor Virginity. And thus seeing they neither love, nor are beloved of any other creature, I will here leave to talk of their love and friendship, and passe onto their hatred and adversaries.

The examples before expressed being all extraordinary and beside nature, do not conclude, but that there is an ordinary hatred betwixt Men and Dragons, and therefore in the discourse of their enemies, Men must have the first place, as their most worthy adversary, for both Dragons have perished by Men, and Men by Dragons, as may appear by these stories following. When the Region of Helvetia began first to be purged from noyseome Beasts, there was a horible Dragon found near a Countrie Town called Wylfes, who did destroy all men and beasts that came within his danger in the time of his hunger, Infomuch that that Town and the fields there to adjoyning, was called Dedauiler, that is, a Village of the Wilderneffe, for all the people and Inhabitants had forfaken the same, and fled to other places.

There was a man of that Town whose name was Wincklebriedt, who was banished for man-slaughter, this man promised if he might have his pardon, and be restored again to his former Inheritance, that he would combine with that Dragon and by Gods help destroy him: which thing was granted unto him with great joyfulneffe. Wherefore he was recalled home, and in the presence of many people went forth to fight with the Dragon, whom he flew and overcame, whereat for joy he lifted up his sword imbrued in the Dragons blood, in token of victory, but the blood distilled down from his sword upon his body, and cauased him infantly to fall down dead. And thus this noble Conqueror, a man worthy to be remembred in all ages and Nations, who had strength to kill the Dragon being alive, yet had no power to resift the venom of his blood, he being dead. But had it not been that his hand had been before imbrrewed in the blood of a man, I do not believe that the blood of a Dragon could have fallen so heavy upon him. But this is the judgement of GOD, either to punish murder in the same kinde, or else to teach us, that we should not rejoyce in our own merities, but God see it and be angry. For our Saviour Christ forbade his Disciples that they should rejoyce that the Devils were subject to them; and therefore much leffe may we poor creatures rejoyce for overcoming men or beasts.

And yet one thing more is to be considered in the death of this man, who was banished for killing a man, and was pardoned for killing a Dragon, and yet killed by the Dragon after the Dragon was slain. Thus bloud was the sin because it brought death, & death again brought bloud to be the revenger of the first, that the bloud of man might be washed away with the bloud of man, and the bloud of a Serpent coming betwixt. And thus I may truly say as the Christian Poet faith in another cafe, "Sanquine faccruut, sanquine finis eit, as it grew, so shall it end in bloud.

In the days of Philip King of Macedon, there was a way into a Mountain of Armenia, over which the King had prayed, that never man might go but he might die: wherefore Socrates, to try the effect of the Kings prayer, set his Optick Philosophical glasse that he might see what was
Of the Dragon.

in that way, and pretently he perceived two great Dragons, who coming out of their dens, did in- fact the air thereabouts with a pestilential evaporation of their own breath. This he declared to the King, who for the recollection of his own prayer, armed divers men to go out against them and kill them: who like wise performed the same, and so cleared the way from that annoyance. And thus we fee another story of Dragons slain by men.

Hereunto may be added, how Hercules, when he was a child in his cradle, flew two Dragons, as Pindarus relates. And the Corcyreans did worship Dismedes for killing of a Dragon. Donatus a holy Bishop in Germany, finding a Dragon to lie secretly hid beside a bridge, killing Men, Oxen, Horfe, Sheep, and Goats, he came boldly unto him in the name of Christ, and when the Dragon opened his mouth to devour him, the holy Bishop spitting into his mouth killed him.

When Ophius was in hawking, and while he intended his sport, suddenly a Dragon set upon him, but his hawking Spaniels or Dogs released him of that danger, for they tore the Dragon in pieces. Many such stories it is true, but I spare them here, because I have handled them in the beginning of this story: and so I passe over the slaughter of Dragons by Men, and come to the slaughter of Men by Dragons, which are briefly these that follow.

Petru Damianus declareth of a certain husband-man, who rising early in the morning, and travelling by the way side, saw a great Dragon lie still upon the earth without motion, he being weary, thought him to be a trunk of some tree, wherefore he fell down upon him, & the beast endured him a little while, but at the last he turned his head in anger, and swallowed him up. After that the Gra-cians signified as though they would go away from Troy, and Simon the Traytor was received by the Trojans into the City, there were two Dragons which flew the fons of Lacon as they landed in the Island P Troy, Carthage, and Carthage, which is thus des cribed by Virgil:

At gemini lapsa delabra ad summa Dracones
Effugiant, lavaeque pterus Tritonidos aeternos.
Sub pedibusque Draconi sub atque regionum
Tutus sed tremens fata nova per terrae virtus.

Which may be Englished thus;

Two Dragons flew, and to the top of Temple rise, Making their way unto the fort of Triton force, Under the Goddesse feet and shield, in circle down they lie, What fear did mortal breast possess then cannot I re absolute ; For then Lacon did begin to think on his former sin, When he did burn the sacred thing, by thrufling fear within.

About the Temple of Jupiter Nemesis, there is a Grove of Cyprus trees, among which there is a place wherein a Dragon did destroy Ophelia, when he was laid under a green bush by his Nurse. There is a proverb, Bonus viros vel à mare molisc, non in Draconis dentes audire admonis : that is to say, every Mouse will bite a good man, but evil men are not touched with the teeth of Dragons.

Acius hath a pretty Emblem, whose title is, Ex arduis perpetuum nomen, from difficult things and great labours, arithet immortal fame: wherein he pictureth a Dragon following young Sparrows to take and eat them. His verses in Latine are these:

Crediderat pliianus ramis sua pigraur paffer,
Et bene, ni leuus vfae Draconis forest.
Cuihis bicullos omnes, miseramque parentem
Duxit uxor, quam statim mortuus.

Which may be thus Englished:

To Platains leaves the Sparrow did her young commit, And safe enough, had not the Dragon them effayed, He eat the young ones all, the dam with firs defforad.

Saxum & tali dignos obire neces.
Hec nifi montibus Colloris, monumenta laboris
Sunt longi, quae fama perennis est.

Well worthy such a death, of life to be destroyed: This is by Chalons said, a type of labour long, Whole fame eternal lives in every tongue.

There be certain beasts called Dracontopides, very great and potent Serpents, whose faces are like to the faces of Virgins, and the residive of their body like to Dragons. It is thought that such a one was the Serpent that deceived Eve, for Eden faith, it had a Virgins countenance, and therefore the woman seeing the likenesse of her own face, was the more easily drawn to believe it: into which when the Devil had entred, they saw he taught it to cover the body with leaves, and to chew nothing but the head and face. But this fable is not worthy to be refuted, because the Scripture it self doth directly gainfay every part of it. For first of all it is called a Serpent, and if it had been a Dragon, Moses would have faid fo, and therefore for ordinary punishment, God doth appoint it to creep upon the belly, wherefore it is not likely that it had either wings or feet. Secondly, it was impossible and unlikely, that any part of the body was covered or concealed from the sight of the woman, seeing the knew it directly to be a Serpent, as afterward the confessed before GOD and her husband.

There be also certain little Dragons called in Arabia, Vefa, and in Catalonia, Dragons of houfe, these when they bite, leave their teeth behind them, fo as the wound never ceaeth swelling as long as the teeth remain therin, and therefore for the better cure thereof, the teeth are drawn forth, and so the wound will soon be healed. And thus much for the hatred betwixt Men and Dragons, now we will proceed to other creatures.
The greatest discord is betwixt the Eagle and the Dragon, for the Vultures, Eagles, Swans and Dragons, are enemies one to another. The Eagles when they shake their wings, make the Dragons afraid with their rattling noise, then the Dragon hideth himself within his den, so that he never flieth but in the air, either when the Eagle hath taken away his young ones, and he to recover them flyeth aloft after her, or else when the Eagle meeteth him in her nest, destroying her Eagles and young ones: for the Eagle devoureth the Dragons and little Serpents upon earth, and the Dragons again and Serpents do the like against the Eagles in the air. Yea many times the Dragon attempteth to take away the prey out of the Eagles talons, both on the ground and in the air, so that there ariseth betwixt them a very hard and dangerous fight, which is in this manner described by Nicander.

\[
\begin{align*}
\text{Extrabit & ex rapidis vi fraudque fuerit unci.} \\
\text{Cumque genus parat acre juin ex aterna bellum:} \\
\text{Pacientem in silvis quam primem siderit illum,} \\
\text{Quod tota foris in ni nodor mittibus avis,} \\
\text{Et simul ipse terens, & vasigna pingora perad.} \\
\text{Non timent hos Serpentes, imb condam impe te dumis} \\
\text{Profident, ipsamque aquilam, lateremque terrulum} \\
\end{align*}
\]

Which may be Englished thus:

\[
\begin{align*}
\text{Whin at the Eagle, Jones great Bird, did see her enemy,} \\
\text{Sharp war in air with bow, she did prepare} \\
\text{Gainst Serpent feeding in the Wood, after eyfe} \\
\text{Cause it her Eagles and young fiercely in pieces rare.} \\
\text{The Serpent not afraid of this, leaps out of thorns} \\
\text{With force upon the Eagle, holding tender flake,} \\
\text{Out of her talons by fraud and force more strong,} \\
\text{That takes and snatches delight her enemies fear.} \\
\text{But why Bird avoids the force, and so they fight aneh,} \\
\text{That Valor one of them might joy the prey alone,} \\
\text{The flying soul by winding Snake is burst all in vain,} \\
\text{Though up and down his nimble eyes this and that way be gone.} \\
\end{align*}
\]

In the next place we are to consider the enmity that is betwixt Dragons and Elephants, for so great is their hatred one to the other, that in Ἐθείσπα the greatest Dragons have no other name but Elephant-killers. Among the Indians also the fame hatred remained, against whom the Dragons have many subtle inventions: for besides the great length of their bodies, wherewithall they clape and begirt the body of the Elephant, continually biting of him until he fall down dead, and in the which fall they are also bruised to pieces; for the safeguard of themselves they have this device. they get and hide themselves in trees, covering their head and letting the other part hang down like a rope: in those trees they watch until the Elephant come to eat and crop of the branches, then suddenly before he be aware, they leap into his face, and dig out his eyes, then do they clap themselves about his neck, and with their tails or hinder-parts, beat and vex the Elephant, until they have made him breathlefe, so they trangle him with their fore-parts, as they beat them with the hinder, so that in this combat they both perish: and this is the disposition of the Dragon, that he never feteth upon the Elephant, but with the advantage of the place, and namely from some high tree or rock.

Sometimes again a multitude of Dragons do together observe the paths of the Elephants, & crofs those paths they tie together, their tails as it were in knots, so that when the Elephant cometh along in them, they inflaie his legs, and suddenly leap up to his eyes, for that is the part they aim at above all other, which they speedily pull out, and so not being able to do him any harm, the poor beast delivereth himself from present death by his own strength, and yet through his blindnedece received in that combat, he perrieth by hunger, because he cannot choose his meat by imelling, but by his eye-sight.

There is no man living that is able to give a sufficient reason of this contrariety in nature betwixt the Elephant and the Dragon, although many men have laboured their wits, and strained their inventions to finde out the true causes thereof, but all in vain, except this be one that followeth. The Elephants bloud is said to be the coldest of all other Beasts, and for this cause it is thought by most Writers, that the Dragons in the Summer time do hide themselves in great plenty in the waters where the Elephant cometh to drink, and then suddenly they leap up upon his ears, because those places cannot be defended with his trunck, and there they hang fast, and suck out all the bloud of his body, until such a time as he poor beast through faintness fall down and die, and they being drunk with his bloud, do likewise perish in the fall.

The Gryffins are likewise fast to fight with the Dragons and overcome them. The Panther also is an enemy unto the Dragons, and driveth them many times into their dens. There is a little Bird called Capillus, by eating of which the Dragon refresheth himself when he is wearied in hunting of other beasts. And to conclude, he is an enemy unto all kinds of beasts, both wilde and tame, as may appear by these verses of Lucan, where he faith.
In the next place I will passe unto the poison and venom of Dragons, omitting all Poetical discussions about the worshipping and transmutation of Dragons from one kind to another, such as are the hairs of Orpheus, or the teeth of the Dragon which Cadmus flew, into armed men, and such like fables, which have no fme nor appearance of truth, but are only the inventions of men, to utter those things in obscure terms, which they were afraid to do in plain speeches.

It is a question whether Dragons have any venom or poison in them; for it is thought that he hurteth more by the wound of his teeth, than by his poison. Yet in Deut. 22. 

Apoet speaketh of them as if they had poison, saying: Their Wine is the poison of Dragons, and the cruel venom of Alps. So also Heliodorus speaketh of certain weapons dipped in the poison of Dragons. For which cause we are to consider, that they wanting poison in themselves, become venomous two manner of ways: First by the place wherein they live, for in the hotter Countries they are more apt to do harm then in the colder and more temperate, which causeth the Poet in his verses to write of them in this manner following;

\[
\begin{align*}
\text{Ven} & \quad \text{que} \quad \text{qui} \quad \text{vult} \quad \text{in} \quad \text{mundo} \quad \text{numina} \quad \text{terr} \quad \\
\text{Serpi} & \quad \text{et} \quad \text{volo} \quad \text{t} \quad \text{ven} \quad \text{dore} \quad \text{Draco} \\
\text{Pfis} & \quad \text{seris} \quad \text{ardent} \quad \text{faem} \quad \text{Africo} \quad \text{lu} \quad \text{t} \\
\text{A} & \quad \text{ea} \quad \text{cum} \quad \text{pennin}, \text{etc.}
\end{align*}
\]

Which may be Englished in this manner;

Let fomine Dragons creeping on the earth,
Which fiery Africk yields with skin like gold,
Test pestilence by hot inflaming breath,
Mounted with wings in the air we do behold.

So that which is spoken of the poison of Dragons infecting the air wherein they live, is to be understood of the Meteor called Dracon-volans: A Fire-drake, which doth many times destroy the fruits of the earth, seeming to be a certain burning fire in the air, sometime on the Sea, & sometime on the land, whereof I have heard this credible story from men of good worth and reputation, happening about some twelve years ago, upon the Western Seas, upon the Coasts of England, which because it is well worthy to be kept in remembrance of all posterity, and contained in a notable work of God, I have thought good to fer it down in this place.

There was an old Fisher-man, which with two hired servants went forth to take fishe, according to his accustomed manner and occupation, and having laid their nets, watched them earnestly to finde the bootie they came for, and so they continued in their labour until midnight or thereabouts, taking nothing. At last there came by them a Fire-drake, at the sight whereof the old man began to be much troubled and afraid, telling his servants, that those foms fledn portended any good, and therefore prayed God to turn away all evil from them, and withall, willed his servants to take up their Nets, lest they did all repent it afterward; for he said he had known much evil follow such apparitions. The young men his servants comforted him, telling him that there was no cause of fear, and that they had already committed themselves into the hands of Almighty God, under whose protection they would tarry until they had taken some fishe: the old man refel contented with their confidence, and rather yeelded unto them, then was pacified by them. A little while after the Fire-drake came again, and compassed round about the Boat, and ran over the Nets, so that new fishe, and more violent passions then before posseffed both the old man and his servants. Wherefore they then resolved to tarry no longer, but hasted to take up their Nets and be gone. And taking up their Nets, at one place they did hang fast, as without breaking they could not pull them out of the water, wherefore they fet their Grab-hooks unto them to loose them; for the day before they remembered that a Ship was cast away in the same place, and therefore they thought that it might be the Nets were hanged upon some of the harkings thereof; and wherein they were not much deceived, for it happened that finding the place whereupon the Net did lie, they pulled and found some difficulty to remove it, but at last they pulled it up, and found it to be a chair of beaten gold. At the sight hereof their spirits were a little revived, because they had attained so rich a bootie, and yet like men burdened with wealth, (especially the old man,) conceived new fears, and wished he were on land, lest some fome should fall, and lay both it and them the second time in the bottom of the Sea.

So great is the impression of fear, and the natural presage of evil, in men that know but little in things to come, that many times they prove true Prophets of their own destruction, although
they have little reason till the moment of peril come upon them: and so it fell out accordingly in this old man; for whilst he feared death by forms and tempests on the Sea, it came upon him, but by another way and means. For behold the Devil entered into the hearts of his two servants, and they confpired together to kill the old man their Master, that so between themselves they might be owners of that great rich chair, the value whereof (as they conceived) might make them Gentlemen, and maintain them in some other Country all the days of their life. For such was the resolution that they conceived upon the present, that it would not be safe for them to return home again after the fact committed, lest they should be apprehended for murder, as they justly deserved, their Master being so made away by them.

The Devil that had put this wicked motion into their minds, gave them likewise present opportunity to put the same in execution, depriving them of all grace, pity, and piety, thrilling them forward to perform the same. So that not giving him any warning of his death, one of them in most savage and cruel manner dashed out his brains, and the other speedily call'd him into the Sea. And thus the fear of this old man, conceived without all reason, except superstition for the flight of a Fiery-drake, came upon him in a more bloody manner than he expected: but life was suspected it felt, and rumors of peril unto guilty consciences, (such as all we mortal men bear) are many times as forcible as the sentence of a Judge to the heart of the condemned prisoner; and therefore it was happy that either we could not fear, except when the causes are certain; or else that we might never perish but upon premonition. And therefore I conclude with the example of this man, that it is not good to hold a superstitious fear, lest God see it, and be angry therewith, bring upon us the evil which we fear. But this is not the end of the story, for that Fiery-drake, (as by the sequel appear'd) proved as evil to the servants as he did to the Müller.

These two sons of the Devil, made thus rich by the death of their Master, forthwith they sailed towards the Coast of France, but first of all they broke the Chair in pieces, and wrapped it up in one of their Nets, making account that it was the best thing that ever was taken in that Net, and so they laid it in one end of their Bark or Fisher-boat. And thus they laboured all that night and the next day, till three or four of the clock, at what time they espied a Port of Britain, whereof they were exceeding glad, by reason that they were weary, hungry, and thirsty with long labour, always rich in their own conceit by the gold which they had gotten, which had drawn their hearts from God, as they could not fear any thought of his judgement; and finally it so blinded their eyes, and stopped their ears, that they did not see the vengeance that followed them, nor hear the cry of their Masters blood. Wherefore, as they were thus rejoicing at the sight of land, behold they suddenly espied a Man of War coming towards them, whereat they were appalled, and began to think with themselves that their rich hopes were now at an end, and they had laboured for other, but yet resolved to die rather than to suffer the booty to be taken away from them. And while they thus thought, the Man of War approached and hailed them, summoning them to come in and shew what they were; they refused, making forward as fast to the Land as they could. Wherefore the Man of War that certain Muskets at them, and not prevailing, sent after them his Long-boat, upon the entrance thereof they fought manfully against the assailants, until one of them was slain, and the other mortally wounded; who seeing his fellow kill'd, and himself not likely to live, yet in envy against his enemy, ran prently to the place where the Chair lay in the Net, and lifting the same up with all his might, cast it from him into the Sea, instantly falling down after that fact, as one not able through weeknese to stand any longer: whereupon he was taken and before his life left him he related the whole tale fully to them that took him, earnestly deeming them to signifie so much into England, which they did accordingly: and as I have heard, the whole story was printed, and so to this second History of the punishment of murder, I have related in this place, by occasion of the Fiery-drake, in the History of the Dragon.

A second caufe why poyson is supposed to be in Dragons, is for that they often feed upon many venomous roots, and therefore their poyson licketh in their teeth, whereupon many times the party bitten by them, feemeth to be poysoned; but this falleth out accidentally, not from the nature of the Dragon, but from the nature of the meat which the Dragon eateth. And this is it which Homer knew and affirmed in his verses, when he described a Dragon making his den neer unto the place where many venomous roots and herbs grew, and by eating whereof he greatly annoyeth mankinde when he biteth them.

Ot de Dragon efi. Xein orserfus andra meme
Bebroos kaka pharmake.
Which may be thus English'd,
And the Dragon which by men remain,
Eatth evil herbs without deadly pain.

Vincenetus Salinus.

And therefore Elianus faith well, that when the Dragon meaneth to do most harm to men, he eateth deadly poysonful herbs, so that if he bite after them, many not knowing the cause of the poyson, and seeing or feeling venom by it, do attribute that to his nature which doth pro-ceed from his meat. Besides his teeth which bite deep; he also killeth with his tail, for he will fo begirt and pinch in the body, that he doth gripe it to death; and also the strokes of it are so strong, that either they kill thereby forthwith, or else wound greatly with the same, fo that
Of the Dragon.

that the strokes of his tail, are more deadly then the biting of his teeth; which caused Nicander to write thus;

\[\textit{Nec tanum illae graves, ut cetera turba, dolors}\]
\[\textit{Si velis, infina cun forse memerevit ore,}\]
\[\textit{Suffixit: exignus non nuxia vulnera puniit}\]

Which may be thus Englished;

Nor yet be when bite angry mouth
Doth bite, such pains and torment bringeth
At other Serpents, if Ancients tell the truth,
When with his teeth and fear be fingeth:

Their mouth is small, and by reason thereof they cannot open it wide to bite deep, so as their biting maketh no great pain; and those kinds of Dragons which do principally fight with Eagles, are defended more with their tails then with their teeth; but yet there are some other kinds of Dragons, whose teeth are like the teeth of Bears, biting deep, and opening their mouth wide, wherewith all they break bones, and make many bruises in the body, and the males of this kind bite deeper then the females, yet there followeth no great pain upon the wound.

The cure hereof is like to the cure for the bites of any other Beast wherein there is no venom, and for this cause there must be nothing applied thereunto which cureth venomous bitings, but rather such things as are ordinary in the cure of every Ulcer.

The feed of graffe, commonly called Hay-duff, is prescribed against the biting of Dragons. The Barbtle being graffed upon the place where a Scorpion of the earth, a Spider, a Sea or Land-dragon biteth, doth perfectly cure the lame. Also the head of a Dog or Dragon which hath bitten any one, being cut off and flayed, and applied to the wound with a little Eupharbium is said to cure the wound speedily.

And if \\

Albathophon be the same that is a Dragon, then according to the opinion of \\

Aetius, the cure of it must be very present, as in the cure of Ulcers. And if \\

Albatros and Hadem be of the kindes of \\

Dragons, then after their biting there follow great coldness and flatulency; and the cure thereof must be the same means which is observed in cold poisons. For which cause the wound or place bitten, must be embrewed or washed with lique-ward Vinegar, and emplaiated with the leaves of Bay, anointed with the Oyl of herb-Marj, and the Oyl of Wilde-pellitory, or such things as are drawn out of thole Oyles, wherein is the virtue of Nettrill, or Sea-onions.

But those things which are given unto the patient to drink, must be the joyce of Bay-leaves in Vinegar, or else equal parts of Myrthe, Pepper, and Rew in Wine, the powder or dust whereof must be the full weight of a golden groat, or as we say a French Crown.

In the next place, for the conclusion of the History of the Dragon, we will take our farewell of him in the recital of his medicinal virtues, which are briefly these that follow.

First, the fat of a Dragon dried in the Sunis good against creeping Ulcers: and the fame mingled with Honey and Oyl, helpeth the dimnesse of the eyes at the beginning. The head of a Dragon keepeth one from looking afoam: and if it be set up at the gates and doors, it hath been thought in ancient time to be very fortunate to the sincere worshippers of GOD. The eyes being kept till they be itale, and afterwards cast into an Oyl with Honey made into Ointment, keep any one that uelth it from the terror of night-visions and apparitions.

The fat of a Hart in the skin of a Roe, bound with the nerves of a Hart unto the shoulder, was thought to have a vertue to foere-thew the judgement of victories to come. The first spindle by bearing of it, procureth an easy passage for the pacification of higher powers. His teeth bound unto the feet of a Roe, with the nerves of a Hart, have the same power. But of all other, there is no folly componement which the Magicians draw out of a Dragon to make one invincible, and that is thus: They take the head and tail of a Dragon, with the hairs out of the fore-head of a Lyon, and the marrow of a Lyon; the pume or white mouth of a conquering Horse, bound up in a Harts skin, together with a claw of a Dog, and fainted with the croffe nerves or fine of a Hart, or of a Roe; they say that this hath as much power to make one invincible, as hath any medicine or remedy whatsoeuer.

The fat of Dragons is of such vertue that it driveth away venomous beastes. It is also reported, that by the tongue or gill of a Dragon sod in Wine, men are delivered from the spirits of the night, called Incubi and Succub, or else Night-mares. But above all other parts, the ufe of their blood is accounted most notable. But whether the Cynnabaru be the same with which is made of the blood of the Dragons and Elephants, collected from the earth when the Dragon and Elephant fall down dead together, according as Pliny delivereth, I will not here dispute, seeing it is already done in the story of the Elephant: neither will I write any more of this matter in this place, but only refer the Reader unto that which he shall finde written thereof in the History of our former Book of Four-footed Beasts.

And if that satisfie him not, let him read Langiim in the first book of his Epillices; and sixty five Epilites, where that learned man doth abundantly satisfie all men concerning this question, that are judicious of the truth, and not prone to contention. And to conclude, Andrea Balzacensis writeth, that the Bloud-stone called the Hematite, is made of the Dragons blood: and thus I will conclude.
The History of Serpents.

include the History of the Dragon, with this story following out of Porphyrus, concerning the good successe which hath been signified unto men and women, either by the dreams or sight of Dragons.

Memnon the Mother of Alexander Severus the Emperor, the night before his birth, dreamed that she brought forth a little Dragon, so also did Olympia the Mother of Alexander the Great, and Pompeia the Mother of Scipio Africanus. The like prodigy gave Augustus hope that he should be Emperor. For when his Mother Aenia came in the night time unto the Temple of Apollo, and had let down her bed or couch in the Temple among other Mictans, suddenly the fell asleep, and in her sleep she dreamed that a Dragon came to her, and clasped about her body, and so departed without doing her any harm. Afterwards the print of a Dragon remained perpetually upon her belly, so as she never durst any more be seen in any bath.

The Emperor Tiberius Cæsar, had a Dragon which he daily fed with his own hands, and nourished like good fortune, as at the last it happened that this Dragon was defaced with the biting of Emmer, and the former beauty of his body much obscured: Wherefore the Emperor grew greatly amazed thereat, and demanding a reason thereof of the Wisemen, hwas by them admonished to beware the intestine of the common people. And thus with these stories representing good and evil by the Dragon, I will take my leave of this good and evil Serpent.

of the DRYNE.

THERE be some that confound this Serpent with the Water-snake, and say it is none other then that which of ancient time was called Hydres, for so long as they live in the water, they are called Hydri, that is, Snakes of the water, but when once they come to the land, they are called Chelydri, and Cherfydrus: but it is certain that the Chelydrius, is different from the Cherfydrus, by the strong smell and favour which it carryeth with it whersoever it goeth, according to these verses made of Umb's the Priest in Virgil.

Viperis generi & graviter spirantibus Hydrias,
Spargere qui somnov cantus; manus solbat.
Which may be Englished thus;
Who could by song and bend bring into deadly slip
All kinds of Vipers, with Snakes smelling strong and deep.

Which being compared with that instruction which he giveth to Shepherds, teaching them how to drive away the strong smelling Serpents from the folds, he calleth them Chelydri, when he writeth in this manner;

Diffe & odoratum stahulis ascendere Cedrus,
Galbanum, et grave momore Chelydros.
That is to say in English thus;
Learn how to drive away strong smelling Cheleyns
From folds, by Galbanum and favour Cedars.

So that it is clear that these Drynes are the same which are called Chelydri, who do slink on the face of the earth, whereby they are oftentimes disclosed although they be not seen: howbeit, some think that this filthy favour doth not proceed from any fume or smoak coming out of their bodies, but rather from their motion, according to the opinion of Maier in the following verses.

Sa tergo scopiant spumantia Virus
Sa terra sumam quattuor habebat arguin
Which may be Englished in this manner;
Whether their fuming backs that smell
Do send abroad such poison pestilent,
Or whether 't earth wherein this Snake full seeth
Doubt slide, yeilds that unwholesome sort.
It is said that these Dryines do live in the bottom or roots of Oaks, where they make their nests, for which cause they are called Querculi, as if they were derived from an Oak, which caused the Countrymen to call it Dendraquile, which signifies the male and female in this kind: being bred only in one part of Africa, and in Hellepos, and there be of them two kindes, one of the length of two cubits, being very fat and round, and very sharp scales over the back; and they are called Dryine of Drus, that signifies an Oak, because they live in bottom of Oaks: and they are also called Chelydra, because of their sharp scales or scales, for it is the manner of the Latines and the Greeks, to call the hard and rough skin of the body of man and beast, by the name of Chelydra: and I make the Serpents Chelydra, to be the same that the Dryines be. Within the scales of this Serpent there are bred certain Flies with yellow wings, as yellow as any Bratfe, the which Flies at length do eat and destroy the Serpent that breedeth them. The colour of their back is blackish, and not white: as some have thought, and the favour or smell coming from them like to the smell of a Horses hide, wet as it cometh out of the pit, to be shaven by the hand of a Tawyer or Glover. And Bellumus writeth, that he never saw any Serpent greater then this Dryine, which he calleth Dendrocatta, nor any that hisseth stronger: for he affirmeth, that one of these, put into a fack, was more then a strong Countryman could carry two miles together without letting it down and reeling. And likewise he faith, that he saw a skin of one of these flufhed with hair, which did equal in quantity the leg of a great man. The head of this Beast is broad and flat: and Olaus Magnus writeth, that many times, and in many places of the North, about the beginning of Summer these Serpents are found in great companies under Oaks, one of them being their head or Captain, who is known by a white crest or comb on the top of his crown, whom all the residue do follow, as the Bees do their King and Captain. And these by the relation of old men are thought to beger a certain stone, by their mutable breathing upon some venomous matter, found in the trees leaves, or earth where they abide: for they abide not only in the roots, but in the hollow bodies of the trees, and sometimes for their meat and food, they leave their habitation, and descend into the Fens and Marishes to hunt Frogs: and if at any time they be assaulted with the Horse-flie, they instantly return back again into their former habitation. When they go upon the earth, they go directly or straight, for if they should winde themselves to run, they would make an offensive noise, or rather yield a more offensive smell: according to those verses of the Poet Lucan;

Natrix & ambigua colorat qui Syrtidos aura
Chersidas, trahit; via famante Chelydra.

In English thus;

The Snake which hath the doubtful Syrtes sandy,
And Chelydra by sliding, flame on land.

Georgius Fabricius writeth, that he saw in the Temple of Bacchus at Rome, a company of drunken men dancing, leading a male Goat for sacrifice, having Snakes in their mouths, which Snakes Prudentius the Christian poet calleth Chelydra, that is, Dryines in these verses following;

--- Baccho caper omnibus aris
Caditur, & visseris disidentur ore Chelydros,
Qui Bromwem placere volunt, quod et ebria jam tum
Anse osulos regis Sytvarum insania ficit.

In English thus;

A Goat to Bacchus on every altar list,
While sacrificers tear Dryines in pieces small;
By force of teeth, and that before the eyes
Of Satyres King, mad drunk they fall.

The nature of this Serpent is very venomous and hot, and therefore it is worthily placed among the first degree or rank of Serpents, for the smell thereof doth so stupefy a man, as it doth near flange him, for nature refuseth to breath, rather then to draw in such a filthy air. And so pestilent is the nature of this Beast, that it maketh the skin of the body of a man hurt by it, loofe, flinking, and rotten, the eyes to be blinde and full of pain, it refraine and keepe the urine, and if it come upon a man sleeping, it caufeth often neezing, and maketh to vomit bloody matter. If a man treads upon it unaware, although it neither flinge nor bite him, yet it caufeth his legs to swell, and his foot to lose the skin thereof: and that which is more strange, it is reported, that when a Physician cured the hand of one bitten by this Serpent, the skin of his hand alfo came off, and whatsoever killeth one of these, if once he smelle the favour of it, whatsoever he smelleth afterwards, he will thinke it smelleth of the Dryine. And therefore most pestilent mult this Serpent needs be, which killeth both touching and smelling.

When it hath wounded or bitten, there followed a black or red swelling about the fore, also a vehement pain over all the body through the speedy dispersing of the poiyn; also Fustules or little wheals, mademe, drinke of the body, and intolerable thirst, trembling and mortification of the members wounded, whereof many die. The cure is like to the cure of Vipers, and besides
besides it is good to take Hart-wort drunk in Wine, or Trifoly, or the roots of Daffadil. Acorns of all kinde of Oaks, are profitable against this poison, being beaten to powder and drunk. And thus much shall suffice for this Serpent.

**Of the Serpents called ELEPHANTS.**

Here be also Serpents called Elephants, because whomsoever they bite, they infect with a kinde of leprosie, and I know not whether the Serpent Elops, Elpis, and Laphiati be the same, but because I finde no matter worthy in them to be spoken of, and they are strangers in our Country, the Reader must be contented with their bare names without further description.

**Of FROGS.**

Frogs are called by the Hebrews, Zab, Zephardas, Undesma, and Undea Azyrui, and Marker; by the Arabians, Hardum, Dif lub, Dipbosa, Diflabo, Alahaul; by the Grecians, Brachatus; whereas cometh the corrupted word Bratetas, and Garacias. Lages and Rembros, signifieth green Frogs; the Italianans and Spaniards call it Rana, by the Latine word; the French, Grenouille, the Germans, Froch; and Froche, and Graßflock, for a green Frog. The Flemings, Urofch, and Urunfch, and Prins; the Ilyrians and Polonians, Zabai, by a word derived from the Hebrew. It is some quefition from whence the word Rana is derived, and because of much controversy whether it hath received name, because it liveth on the land and in the water, or from the crossing voyage which it useth: I will not trouble the English Reader with that discourse, only I am assured, that the word Frog in English, is derived from the German word Froch, as many other English words are derived besides the common name of many Frogs. Homer in his Comedy of the fight betwixt Frogs and Mice called Brachomopomaria, hath devised many proper names for Frogs, such as these are; Limmachius, Graufchott, Plaus, Duff-liver; Hydrodwyfe, Water-hunter; Phinychathos, Nature-cryer; Hyphasis, Loud-cryer: Levabaios, Love-liver; Peloponos, great Libourer; Krambophagos, Brasil-eater; Lynnesos, Pool-keeper; Kalamithos, Mict-eater; Hyrachbairius, Water-childe; Borbookitis, Noise-maker; Philaphagos, Grafs-eater; Plonos, dult-creeper; Pelobates, dull-lesper; Kragues, dought-hater; Pfaffeis, Graffe-green; and such other like, according to the witty invention of the Author, all which I thought good to name in this place, as belonging to this History.

In the next place we are to consider the diversitie and kindes of Frogs, as they are distinguished by the place of their abode: for the greatest difference is drawn from thence; some of them therefore are Water-frogs, and some are Frogs of the land: the Water-frogs live both in the water and on the land, in marshes, flanding pools, running streams, and banks of Rivers, but never in the Sea; and therefore Rana Marina is to be understood of a Fish, and not a Frog, as Maffarius hath learnedly proved against Marcellis. The Frogs of the land are distinguished by their living in Gardens, in Meddows in hollow Rocks, and among fruits: all which several differences shall be afterward expressed, with their pictures in their due places: here only I purpose to talk of the vulgar and common Frog, whose picture with her young one is formerly expressed. Beside, these differ in generation: for some of them are engendered by carnal copulation, and of the slime and rottenness of the earth. Some are of a green colour, and those are eaten in Germany and in Flanders; some again are yellow, and some of an Ash-colour, some spotted, and some black, and in outward form and lathion they resemble a Toad, but yet they are without venom, and the female is always greater then the male: when the Egyptians will signify an impudent man, and yet one that hath a good quick sight, they picture a Frog, because he liveth continually in the mire, and hath no bloud in his body, but above his eyes.

The tongue is proper to this kinde, for the fore-part thereof cleaveth to the mouth, as in a fish, and the hinder part to the throat, by which he feedeth forth his voyces: and this is to be understood, that all Frogs are mute and dumb, except the green Frogs, and the Frogs of the water, for these have voyces. And many times the voyces of Frogs proceedeth from the nature of the Countries wherein they
they live: for once all the Frogs in Macedonia and Cyrenia, were dung, until there were some brought thither out of some other Countries, as at this day the Frogs of Seriphium are all dung, whereupon came the Proverb, *Baractos et Seriphius, A Frog of Seriphium*, because the Frogs of that Country do never croak, although you carry them into any other Country.

This *Seriphium* is one of the Islands of the *Sporades* in Greece, wherein is the lake called *Pieria*, which doth not run in the Summer, but only in the Winter, and all the Frogs which are cast into that lake, are perpetually silent, and never utter their voice; whereof there are signified two causes, one fabulous, and the other true and natural. The first, the *Seriphiam* lay, that when *Perseus* returned with the head of *Medusa*, having gone very far till he was weary, laid him down beside that lake to sleep, but the croaking Frogs made such a noise, as he could take no rest: Whereat *Perseus* was much offended; and therefore prayed *Jupiter* to forbid the Frogs from crying, who instantly heard his prayer, and in joyful perpetual silence to the Frogs in that water: and this is the fabulous reason, being a mere fiction of the Poets.

The second and more true reason is that of *Theophrastus*, who faith, that for the coldness of the water, the Frogs are not able to cry in that place. The voice of Frogs is said by the *Latins* to be *Cacoxare*, and by the *Greeks*, *Oloagen*: peculiar words to set forth this crying: now because their tongue cleaveth to the palate of their mouth, and their voice proceedeth but from their throat to their mouth, and the spirit is hindered by the tongue, so it cannot proceed directly: therefore it hath two bladders upon either side of the mouth, one which it filleth with wind, and from thence proceedeth the voice. Now when it croaketh, it puttheth his head out of the water, holding the other lip even with the water, and the upper lip above the water: and this is the voice of the male provoking the female to carnal copulation.

They have but very small lungs, and those without bloud, full of froth like to all other creatures of the water, which do lay eggs, and for this cause they do never thirst: wherefore also Sea-calves and Frogs are able to live long under the water. They have a double Liver, and a very small Mil, their legs behind are long, which maketh them apt to leap; before they are shorter, having divided claws which are joynd together with a thin broad skin, that maketh them more apt to swim. The molt place of their abode is in fens, or in warm waters, or in fishy-pools: but yellow and ash-coloured Frogs abide in Rivers, Lakes, and Standing Pools, but in the Winter time they all hide themselves in the earth. And therefore it is not true that *Pliny* faith, that in the Winter time they are resolved into lime, and in Summer they resume again their firit bodies, for they are to be seen many times in the Winter; especially in those waters that are neuer frozen, as *Agricola* *Aegina* hath soundly observed, and they have been seen in certain running streams, holding small fishes in their mouths, as it were fucking meat out of them.

Sometimes they enter into their holes in Autumn before Winter, and in the Spring time come out again. When with their croaking voices the male provoketh the female to carnal copulation, which he performeth not by the mouth (as some have thought) but by covering her back: the institution of generation meeting in the hinder parts, and this they perform in the night season, nature teaching them the modesty or shamefulness of this action: And besides in that time they have more security to give themselves to mutual imbraces, because of a general quietness, for men and all other their adversaries are then at sleep and rest. After their copulation in the waters, there appeareth a thick jelly, out of which the young one is found. But the land Frogs are ingendered out of Eggs, of whom we discoursse at this prenten: and therefore they both fuffer copulation, lay their Eggs and bring forth young ones on the land. When the Ege breaketh or is hatched, there cometh forth a little black thing like a piece of flesh, which the *Latin* call *Gyrinid*, from the *Greek* word *Gy-рин*, having no visible part of a living creature upon them, besides their eyes and their tails, and within short space after their feet are formed, and their tail divided into two parts, which tail becometh their hinder-legs: wherefore when the *Egyptians* would defcribe a man that cannot move himself, and afterwards recovereth his motion, they decipher him by a Frog, having his hinder-legs. The heads of these young Gyrinid, which we call in English Horse-nails; because they re semble a Horse-nail in their similitude, whose head is great, and that other part small, for with his tail he swimmeth. After May they grow to have feet, and if before that time they be taken out of the water, they die, when they begin to have four feet.

And first of all they are of a black colour and round, and hereof came the Proverb, *Rana Gyrina *septembris*, witer then a Horse-nail; because through the roundnesse and volubility of his body, it curseth it fell with wonderful celerity, which way forever it pleaseth. These young ones are also called by the *Greeks*, *Miliaria*, *Boattoid*, and *Baracthidae*, but the *Latin* have no name for it, except *Ranunculus*, or *Rana aegripus*. And it is to be remembered, that one Frog layeth an incomparably number of Eggs, which cleave together in the water, in the middle whereof the fef lodgeth. And thus much may suffice for the ordinary procreation of Frogs by generation. To this end the Eggs. In the next place I must also shew how they are likewise engendered out of the duih of the earth, by warm, zlive, and Summer showers, whose life is short, and there is no ute of them.

*Elamius* faith, that, as he travailed out of Italy into Naples, he faw divers Frogs by the way near *Puteoli*, whose fore-part and head did move and creep, but their hinder-part was unformed and like to the limne of the earth, which caused Ovid to write thus;
And of these Frogs it is that Pliny was to be under flood, when he faith, that Frogs in the Winter time are resolved into slime, and in the Summer they recover their life and substance again. It is cer-
tain also, that sometime it raineth Frogs, as may appear by Plinarchus and Lembus, for Lembus writeth thus: Once about Daradania, and Paeonia, it rained Frogs in such plentiful measure, or rather prodi-
gious manner, that all the houfes and high ways were filled with them, and the Inhabitants did flait of all kill them, but afterwards perceiving no benefit thereby, they shut their doores against them, and stopped up all their lights to exclude them out of their houfes, leaving no passage open, so much as a Frog might creep into, and yet notwithstanding all this diligence, their meat feething on the fire, or let on the table, could not be free from them, but continually they found Frogs in it, fo as at lat-
time they were inforced to forfaie that Country. It was likewise reported, that certain Indians and peo-
ple of Arabia, were inforced to forfaie their Countries through the multitude of Frogs.

Cardan feemeth to finde a reason in nature for this raining of Frogs, the which for the better satis-
faction of the Reader, I will here expresse as followeth: 

Plin. hast omia venturam irre, and fo forword in his 16. Book De Subtilitate, that is to say: these prodigious rains of Frogs and Mice, little fishes and flones, and fuch like things is not to be wondered at: for it cometh to paffe by the rage of the windes in the tops of the Mountains, or the uppermoft part of the Seas, which many times taketh up the dust of the earth and congealeth them into flones in the air, which afterwards fall down in rain; fo alfo doth it take up Frogs and Fishes, who being above in the air, must needs fall down again. Sometimes alfo it taketh up the egges of Frogs and Fishes, which being kept aloft in the air, among the whirl-windes, and storms of thowers, do there engender and bring forth young ones, which afterwards fall down upon the earth, there being no pool for them in the air. These and fuch like reasons are approved among the learned for natural caufes of the prodigious raining of Frogs.

But wete read in holy Scripture among the plagues of Egypt, that Frogs were sent by God to annoy them; and therefore whatsoever is the matierial caufe, it is most certain, that the wrath of God and his Almighty hand, is the making or efficient caufe, and for the wortheffe of that divine sto-
ry, how God maketh and take away Frogs, I will expresse it as it is left by the holy Ghoft, in ch.8.

Exod. vers. 5. The Lord said unto Moses, Say thou unto Aaron, stretch thou out thy hand with thy rod upon the streams, upon the rivers, and upon the pondis, and cause Frogs to come upon the land of Egypt. Ver. 6. Then Aaron stretched out his hand upon the waters of Egypt, and the Frogs came up and covered the land of Egypt. Ver. 7. And the Servantes did likewise with their Servantes, and brought Frogs upon the land of Egypt. Ver. 8. Then Pharaoh called for Moses and Aaron, and said; Pray ye unto the Lord, that he may take away the Frogs from me, and from my people, and I will let the people go, that they may do sacrifice to the Lord. Ver. 9. And Moses said unto Pharaoh, concerning me, Command when I shall pray for thee and thy Servantes, and thy people, to destroy the Frogs from thee, and from thy houses, that they may remain in the River only. Ver. 10. Then be it known unto thee and thy Servantes, and thy people, that from the day that I came into Egypt, and till this day, that there was none like the Lord our God. Ver. 11. So the Frogs shall depart from thee, and from thy houses, and from thy people, and from thy Servantes, and they shall remain in the River. Ver. 12. Then Moses and Aaron went out from Pharaoh, and Moses cried unto the Lord concerning the Frogs which he had sent unto Pharaoh. Ver. 13. And he said according to the saying of Moses, so the Frogs died in the houses, and in the Towns, and in the fields. Ver. 14. And they gathered them together by heaps, and the land stank of them, &c.

And this was the second plague of Egypt, wherein the Lord turned all the Fishes into Frogs: as the Book of Wildom faith, and the Frogs assambled in the Kings chamber: and notwithstanding this great judgemen of God for the present, Pharaoh would not let the people go, and afterwards that blinde superflitious Nation became worhippurers of Frogs, (as Plinarchus writeth) thinking by this devotion, or rather wickedneffe in this obsevant manner, to pacifie the wrath of God, choosing their own ways before the word of Almighty God: But vain is that worship which is invented without heavenly warrant, and better it is to be obedient to the will of God, then go about to please him with the cogitations of men, although in their pretended holinesse we spend much time, wealth, and bloud.

There was one Cyphlus, the father of Periander, who by his mother was hid in a Chett called Kyale,
le, to be preferred from the hands of certain murtherers, which were fent to kill him. Wherefore afterwards the said Cyphlus confeocrated a house at Delbros to Apollo, because he heard his crying when he was hid in a chett, and preferred him. In the bottom of that house, was the trunk of a Palm-tree and certain Frogs pictured running out of the fame: but what was meant thereby is not certainly known, for neither Plinarchus which writeth the story, nor Gershom which relateth it, giveth any sig-
nification.
Of the Frog.

nification thereof: but in another place where he enquired the reason why the Oracle of Pythia gave no answer, he conjectured because it was that the accursed thing brought out of the Temple of Apollo from Delphi, into the Gerontian house, had been graven underneath the Brazen Palm, Snakes, and Frogs, or else the prefiguration of the Sun rising.

The meat of Frogs thus brought forth are green herbs and Humble-bees, or Shorn-bugs, which they devour or catch when they come to the water to drink: sometime also they are said to eat earth, but as well Frogs as Toads do eat the dead Moie, for the Moie devoureth them being alive. In Albertus, in the month of August, they never open their mouths, either to take in meat or drink, or to utter any voice, and their chaps are so fast joyne, or closed together, that you can hardly open them with your finger, or with a stick. The young ones of this kind are killed by calling Long-wort, or the leaves of Sea-lettice, as Alcimus and Suidas write: and thus much for the description of their parts, generation, and futurition of these common Frogs.

The widow or disposition of the Egyptian Frogs is much commended, for they save themselves from their enemies with singular dexterity. If they fall at any time upon a Water-snake, which they know is their mortal enemy, they take in their mouths a round Reed, which with an invincible strength they hold fast, never letting go, although the Snake have gotten her into her mouth, for by this means the Snake cannot swallow her, and so she is preserved alive.

There is a pretty fable of a great Bull which came to the water to quench his thirst, and whilst the Beaf came running greedily into the water, he trod in pieces two or three young Frogs; then one of them which escaped with life, went and told his mother the miserable misfortune and chance of his fellows: the asked who it was that had so killed her young ones, to whom he answered: It was a great one, but how great he could not tell; the foolish Mother-Bear desirous to have seen some body in the eyes of her son, began to swell with holding in of her breath, and then asked the young one if the Bear was so big as she? And he answered much greater, at which words she began to swell more, and asked him again if the Bear were so big? To whom the young one answered, Mother leave your swelling, for though you break your self, you will never be so big as he: and I think from this fable came the Proverb, Rana Cyrena lapientem, uterit after the young Frog. This is excellently describ'd by Horace in his third Satyres, as followeth;

Absens rana pulsit vituli pede premit
Dum ubi effugit mater denerrat, ut ingent
Belia cognata elserit, iba rogere,
Quanti aedem? Nam tandem si inflant, sic magna suisset?

Which may be Englished thus;

In old Frogs absence, the young were press to death
By feet of a great Calf, drinking in the water,
To tell the dam, one ran that scap't with life and breath,
How a great beast her young to death did matter.
How great she? so big? and then she did swell.
Greater by half, said she; then she full more, and said
Tell big? but he: cease flowering dam, for I thee tell,
Though breath thy self, like him thou never canst be made.

There is another pretty fable in Esop, tasking discontented persons under the name of Frogs, according to the old verse:

Et vetroenum in limo rana ovimere querelam,
Nam neque fisca placet, neque flagnata palude
Perpetuus, querule semper commita rane.

Which may be Englished in this manner;

The Frogs amidst the earthy slime,
Their old complaints do daily sing:
Not pleas'd with pools, nor land that drinks,
But new displeasures daily bring.

When Ceres went about seeking Proserpina, she came to a certain Fountain in Lydia to quench her thirst, the uncivil Lyceans hindered her from drinking, both by troubling the water with their feet, and also by fending into the water a great company of croaking Frogs; whereas the Goddeſſe being angry, turned all those Country people into Frogs. But Ovid doth ascribe this tranſmutation of the Lyceans, to the prayer of Latones, when she came to drink of the Fountain to increafe the milk in her breasts, at such a time as the nourfed Apollo and Diana, which Metamorphoſis or tranſmutation, is thus excellently described by Ovid;

Ætentum flago (dixit) vitavit in isto.
Æwentium optato deus, quot esfer sub unda,
Et modo nata cava fummargeta membra palude,
Nunc preferea caput, summo modo gurgite natum.

Saepe super ripam flagni consipit, sape
Da gelidos resipire lanceis, sed nunc quoque turpes
Lithus extorem lingua, palato pudore
Quamvis fint sub aqua, sub aqua male diverse tentant.

Q. 99

Von
Vox quaque jam rauca est insitalis, colla tumescunt : 
Ipsa dilatant patulas, convulsit ridicus.
Terga caput turgente, colla intercutita videntur.

In English thus, 

For ever mought you dwell
In this same pond she said: her wits did take off, did with speed,
For underneath the water they delight to be indeed:
Now dive they to the bottom down, now up their heads they pop,
Another while with sprawling legs they swim upon the top,
And oftentimes upon the banks they have a minde to land,
And oftentimes from thence again to leap into the pond:
And there they now do practice still their filthy tongues to fecd,
And shamefully, though underneath the water they do hold
Their former wont of sprawling, still avoid the water cold:
Their voices still are hoarse and harsh, their throats have puffed goaws,
Their chops with sprawling widened are, their hammer headed jawwes,
Are joined to their shoulders just: the neck of them do seem
Cut off: the ridge bone of their back sticks up with colour green.
Their parish which is the greatest part of all their trunk, is gray,
And so they up and down the pond made newly Frogs do play.

Whatsoever the wisdom of Frogs is, according to the understanding of the Poets, this is certain,
that they signify impudent and contentious persons, for this cause there is a pretty fiction in Hell
between the two Poets, Enipides and Aesop: for the ending of which controversy, Bacchus was sent
down to take the worthyeft of them out of Hell into Heaven: and as he went over Clarius Ferry,
he heard nothing but the croaking of Frogs, for such contentious spirits do befit Hell. And thus
much shall suffice to have spoken of the wisdom of Frogs.

Their common enemies are the Weasels, Poul-cats, and Ferrets, for these do gather them together,
and lay of them great heaps within their dens: whereupon they feed in Winter. The Hare
also and Bittern, is a common destroyer of Frogs, and so likewise are some kindes of Kites.
The Night-birds, Gimus and Gimeta, the Water-snake (at whose presence in token of extreme terror)
the Frog betreth up her voyce in lamentable manner. The Moles are also enemies to Frogs, and it is
further said: that if a burning Candle be set by the water side, during the croaking of Frogs,
it will make them hold their peace. Men do also take Frogs, for they were wont to boit a hook
with a little red wooll, or a piece of red cloth, also the gall of a Goat put into a vefell, and let in
the earth, will quickly draw unto it all the Frogs that be near it, as if it were unto them a very
grateful thing: And thus much shall suffice to have spoken of the enemies of Frogs. Now in the
next place we are to consider the several uses, both Natural, Medicinal, and Magical, which men do
make of Frogs.

And first of all the green Frogs, and some of the yellow which live in Flouds, Rivers, Lakes, and
Fifh-pools, are eaten by men; although in ancient time they were not eaten, but only for Phytick,
for the broth wherein they were foul, and the flesh also, was thought to have vertue in it to cure
them which were stricken by any venomous creeping Beasts, especially mixed with Salt and Oyl: but
since that time Aetius discommendeth the eating of Frogs, proving that some of them are venomous,
and that by eating thereof, extream vomites have followed, and they can never be good, except
when they are newly taken, and their skins diligently flayed off, and those also out of pure running
waters and not out of muddy thinking puddles: and therefore adviseeth to for bear in plenty of other
meat, this wanton eating of Frogs, as things perillous to life and health, and those Frogs also which
are most white when the skin is taken off, are most dangerous and fullst of venom, according to the
counsel of Fiera, saying:

Utima, sed nostros non accedenslebetes,
Noliimus, saci ex pluvii & limata maligni.
Nir fallis, putris rana para quam potes.
Datum est & adhuc rauca cum aquae.

In English thus:
We will not deesse a Frog unless the last of all to eat,
Because the voyce thereof is muddy and of vain content,
Except it go on earth, prepared way to rep.
For, asgyt it ever is, and bath hoarse voyce amide the stream.

They which use to eat Frogs, fall to have a colour like lead, and the hotter the Countries are,
the more venomous are the Frogs; in colder Countries, as in Germany they are not so harmful,
especially after the Spring of the year, and their time of copulation pasado. Besides, with the fifh
of Frogs, they were wont in ancient time to bait their hooks, wherewithal they did take purple Fishes,
and they did burn the young Frogs, putting the powder thereof into a Car: whose bowels was taken
out, then rolling the Car, and after she was roasted, they anointed her all over with Honey, then
laid,
Of the Frog.

Laid her by a Wood side, by the odour and favour whereof, all the Wolves and Foxes lodging in the said Wood were allureth to come to it, and then the Hunters lying ready in wait, did take, destroy, and kill them. When Frogs do croak above their usual custom, either more often, or more thrill then they were wont to do, they do forebode rain and tempestuous weather.

Wherefore Tully faith in his first Book of Divination, who is it that can suspect, or once think that the little Frog should know thus much, but there is in them an admirable understanding nature, conflant and open to it self, but more secret and obscure to the knowledge of men; and therefore speaking to the Frogs, he citizen these veris;

Vet quosq. signa videtis aqual dulcis alumnæ,
Cum clamore paratis inuentur sordere voce,
Absurdos non vates & flagna cietis.

In English thus;

And you O Water-birds which dwell in streams so sweet,
Do see the signs whereby the weather is foretold,
Your crying voices whereas with the waters are repeat,
Vain founds, absurdly moving 'oats and Fountains cold.

And thus much for the natural life of Frogs. Now followeth the Magical. It is said that if a man take the tongue of a Water-frog, and lay it upon the head of one that is asleep, he shall speak in his sleep, and reveal the secrets of his heart: but if he will know the secrets of a woman, then must he cut it out of the Frog alive, and turn the Frog away again, making certain characters upon the Frogs tongue, and so lay the same upon the panting of a woman's heart, and let him ask her what questions he will, she shall answer unto him all the truth, and reveal all the secret faults that ever the hath committed. Now if this magical follyere were true, we had more need of Frogs then of Jurites of Peace, or Magistrates in the Common-wealth.

But to proceed a little further, and to detect the vanity of these men; they also say, that the tongue wherewithal a Frog is struck out of a Snakes mouth, laid upon a woman in travail, shall cause an easy delivery: and if a Man cut off a foot of a Frog is he swims in the water, and unde the fame to one that hath the Gout, it will cure him. And this is as true as a shoulder of Mutton worn in ones Hat healeth the Tooth-sach.

Some again do write, that if a woman take a Frog, and spit three times in her mouth, the shall not conceive with child that year. Also if Dogs eat the pottage wherein a Frog hath been sod, it maketh him dum and cannot bark. And if a Man eat a sod Frog at a Dog, which is ready to fault him, it will make him run away, (I think as fast as an old hungry Horee from a bottle of Hay.) These, and such like vanities have the ancient Heathens (ignorant of GOD) firmly believed, till either experience disapproved their inventions, or the sincere knowledge of Religion enlightning their darknesse, made them to forfake their former vain errors, which I would to GOD had come sooner unto them, that so they might never have sinned: or else being now come unto us their children, I pray GOD that it may never be removed, left by trudding in lying vanities, we forsoake our own mercy. And so an end of the Magical Uses. Now we proceed to the Medicinal, in the biting of every venomous creature. Frogs sod or roasted, are profitable, especially the broth, if it be given to the fick peron without his knowledge, mixed with Oyl and Salt, as we have said already. The flesh of Water-frogs is good against the biting of the Sea-hare, the Scorpion, and all kinds of Serpents; against Leprofie and scabs, and rubbed upon the body, it doth cure the same.

The broth taken into the body with roots of Sea-holm, expelleth the Salamander: so also the Eggs of the Frog, and the Eggs of the Tortoise, hath the same operation, being sod with Camomith. The little Frogs are an antidote against the Toads and great Frogs. Albertus also among other remedies, prefecteth a Frog to be given to fick Faulions or Hawks: It is also good for cricks in the neck, or the Cramp. The same sod with Oyl, eateth the pains and hardneffe of the joynts and finews: they are likewise given against an old Cough, and with old Wine and sod Corn drunk out of the Vesell wherein they are sod, they are profitable against the Dropifie, but with the sharpst Vinegar, Oyl, and Ipume of Niter sod together, by rubbing and anointing, cureth all scabs in Hories, and pellent tumors.

There is an Oyl likewise made out of Frogs, which is made in this manner; they take a pound of Frogs, and put them into a veffel or glasse, and upon them they pour a pinte of Oyl, so flopping the mouth of the glasse, they feethe it: as they do the Oyl of Serpents, with this they cure the shrinking of the finews, and the hot Gout, they provoke sleep, and heal the inflammations in Fevers, by anointing the Temples. The effect of this Oyl is thus described by Serenus:

Sape ita per vadit vitis frigiris, ac tenet artus,
Ut vise quosq. medicamine pulsa recedat.
Si ramam ex olae decocietis, abjice carnem,
Membra sove.

Laid her by a Wood side, by the odour and favour whereof, all the Wolfs and Foxes lodging in the said Wood were allureth to come to it, and then the Hunters lying ready in wait, did take, destroy, and kill them. When Frogs do croak above their usual custom, either more often, or more thrill then they were wont to do: they do forebode rain and tempestuous weather.
The History of Serpents.

That is to say;

*often are the sinews held by force invading cold,*

which scarce can be repelled back by medicines tried might,

Then sicken a Frog in purges Oyl, as Ancients have told,

So bathe the members sick therein, Frogs flesh call out of sight.

And again in another place he speaking of the cure of the Fever, writeth thus;

 sensual of oleo partum serpentes Rana,

In trivio, idque artiperducere facis.

In English thus;

But first let Oyl make hot young, Frogs new found.

In ways, therewith bring sinews weak, to well full found.

To conclude, it were infinite and needless to express all that the Physicians have observed about the Medicines rising out of the blood, fat, flesh, eyes, heart, liver, gall, reins, legs, and sperm of Frogs, besides powder, and distillations; therefore I will not weary the Reader, nor give occasion to ignorant men, to be more bold upon my writing of Physick then is reason, left that be said against me which proverbially is said of unnecessary things, *Rana vitium ministrat,* you give Wine to Frogs, which have neither need nor nature to drink it, for they delight much in water. And so I conclude the History of this vulgar Frog.

Of the Green Frog.

This Frog is called Calamites, and Dryophytes, and Menops, and Rana vires. In Arabie blepharicon, and Cucumites, and Cucumones, Etruscan, Rana, Bzeoxanes, of Bres-ein, to rain, and thereof cometh the signified word of Arisiphates, Brekekekox Knox; but I think that our English word Frog is derived from the German word Frofs, so the German Frofs from the Greek word Bres. It is called also Zamia, that is, Domums, lofe, hurt or damage, because they live in trees, and many times harm Men and Cattle underneath the trees; and therefore called Zamia, of the Greek word Zemla. The Italians call it Racola, Ranocchia, Lo Rosono, Ranocchia de rubetto. The French, *Croisette,* and sometimes Graiffet, Verdet; in Savoy, Renpele. In Germany, Lotsfrofs. In Poland, Zaba Trauma. Some of the Latins for difference, to call it Rana Rubetia, because it liveth in trees and bushes: and for the same caufe it is called Calamites, because it liveth among reeds, and Dryophytes, because it fulleth sometimes out of trees.

It is the leaf of all other Frogs, and liveth in trees, or among fruits and trees, especially in the Woods of Hafels, or Vines, for with its short legs it climbeth the highest trees: informeth that some have thought it had wings. It is green all over the body, except the feet and the fingers, which are of duny or reddish colour, and the tops of his nails or claws are blunt and round: In the distillation thereof there was bloud found in every part of the body, and yet but little. The heart of it is white, the liver black, mixed with the gall. It hath also a moist, and in the end of July it layeth eggs.

It is a venomous Beast, for sometimes Cattle as they broufe upon trees, do swallow down one of these upon the leaves not discerning it, because it is of the same colour: but presently after they have eaten it their Bellies begin to swell, which must needs proceed from the poysoned Frog.

A second reason proving it to be venomous, is for that many Authors do affirm, that hereof is made the *Fisitotriterum,* for the drawing out of teeth by the roots, and for this caufe is concluded to be venomous, because this cannot be performed without strong poyson. But for the cure of the poyson of this Frog, we shall expresse it afterward in the history of the Toad, and therefore the Reader must not expect it in this place. Always before rain they climb upon the trees, and there cry after a hoarse manner very much, which caueth the Poet Serenus to call it *Ruco garrula quefia,* at other times it is mute, and hath no voice: wherefore it is more truly called *Menops,* that is, a Prophet or a Diviner, then any other kind of Frog; because other Frogs which are not altogether mute, do cry both for fear, and also for desire of carnal copulation, but this never cryth but before rain.

Some have been of opinion, that this is a dum Frog; and therefore *Vincentius Bellucentis* faith, that it is called a mute Frog from the effect: for there is an opinion, that this put into the mouth of a Dog, maketh him dum, which if it be true; it is an argument of the extreme poyson therein contained, overcoming the nature of the Dog, whose chiefest senses are his taste and his smelling. And thus much shall suffice for the description of this Frog.
The medicinal vertues observed herein are these that follow, 1st, if a man which hath a cough, do spit into the mouth of this Frog, it is thought that it doth deliver him from his cough, and being bound in a Crane's skin unto a man's thigh, procureth venereous desires: but these are but magical devises, and such as have no apparent reason in nature, wherefore I will omit them, and proceed to them that are more reasonable and natural. 2nd, for the Oyl of Frogs, that is the belt which is made out of the green Frogs, as it is observed by Sibthorpe; and if they are held between a man's hands, in the fit of hot burning Ague, do much refresh nature, and eafe the pain. For Fever-hecticks they prepare them thus: they take such Frogs as have white bellies, then cut off their heads and pull out their bowels, afterwards they feethe them in water, until the flesh fall from the bones: then they mingle the said flesh with Barley meal, made into pate, wherewithal they cram and feed Pullen with that pate, upon which the fick man must be fed, and in default of Frogs they do the like with Eels, and other like Fishes. But there is not part of the Frog so medicinable as is the blood, called also the matter or the juice, and the humor of the Frog, although some of them write, that there is no blood but in the eyes of a Frog: First therefore with this they kill hair, for upon the place where the hair was pul'd off, they pour this blood, and then it never groweth more: And this as I have said already, is an argument of the venom of this Frog; and it hath been proved by experience, that a man holding one of these Frogs in his hand, his hands have begun to swell, and to break out into blisters.

Of this vertue Serenus the Poet writeth thus;

Fratera quaeque singulare volat aurea tincta,
Alisque in perpetuum reditiva occidere tela,
Corporibus sublimis sanguine perdurant rane,
Sed que parva sinn el, & rana garrula quies.

That is to say;
Beside's, from whatsoever bodies hair thou wilt
Be clean destroy'd, and never grow again
Oh them, the matterly blood of Frogs, all bread and still,
I mean the little Frog qesiting hoarse voyce amain.

The same also being made into a Verdigras, and drunk the weight of a Crown, stoppeth the continual running of the urine. The humor which cometh out of the Frog, being alive when the skin is scraped off from her back, cleareth the eyes by an Ointment: and the flesh laid upon them, causeth their pains; the flesh and fat pulleth out teeth. The powder made of this Frog being drunk, flayeth bleeding, and also expelleth spots of blood dried in the body. The same being mingled with Pitch, causeth the falling off of the hair. And thus much shall suffice for the demonstration of the nature of this little green Frog.

Of the Padock or Crooked back F R O G.

It is apparent that there be three kindes of Frogs of the earth, the first is the little green Frog: the second is this Padock, having a crook back, called in Latin, Ranae Gibbosa; and the third is the Toad, commonly called Bufo, Bufo. This second kinde is mute and dumb, as there be many kinde of mute Frogs, such as is that which the Germans call Feurkrott, and our late Alchy. mists Purpurbrunnen, that is, a Fire-frog, because it is of the colour of fire: This is found deep in the earth, in the midst of Rocks and stones when they are clest auffer, and amongst metals, whereinto there is no hole or passage, and therefore the wit of man cannot devise how it should enter therein, only there they finde them when they cleave those stones in sunder with their wedges and other instrumens. Such as these are, are found near Tour in France, among a red handy stone, whereof they make the Milkstones, and therefore they break that stone all in pieces before they make the Milkstone up, left while the Padock is included in the middle, and the Milkstone going in the mill, the heat should make the Padock swell, and so the Milkstone breaking, the corn should be poysoned. Afoon as these Padocks come once into the air, out of their close places of generation and habituation, they swell and fo die.

This crook-backed Padock is called by the Germans, Gartenstob, that is, a Frog of the Garden, and Grasfröch, that is, a Frog of the grass. It is not altogether mute, for in time of peril, when they are chased by men, or by Snakes, they have a crying voyce, which I have oftentimes proved by experien-ence, and all Snakes and Serpents do very much hunt and desire to destroy these: also I have seen a
Snake hold one of them by the leg, for because it was great the could not easily devour it, and during that time it made a pitiful lamentation.

These Padocks have as it were two little horns or bunches in the middle of the back, and their colour is between green and yellow, on the sides they have red spots, and the feet are of the same colour, their belly is white, and that part of their back which is directly over their breast, is distinguished with a few black spots. And thus much may serve for the particular description of the Padock, not differing in any other thing that I can read of from the former Frogs, it being venomous as they are, and therefore the cure is to be expected hereafter, in the next History of the Toad.

of the TOAD.

To conclude the story of Frogs, we are now to make description and narration of the Toad, which is the most noble kind of Frog, most venomous and remarkable for courage and strength. This is called in Hebrew by some Cosh; the Grecians call it Phuron; the Arabians, Myllus; the Germans, Krak: the Saxons, Gasp; the Flemings, Padde; the Ilyrians, Zeba; the French, Crapsul; the Italians, Ruspo, Botta, Buffo, Chiatto, Zato, Buffo, Buffa, Buffone, and Ramarzo; the Spaniards, Supo esco, eco, the Latinus, Rubeta, because it liveth among bushes, and Buso, because it swelleth when it is angry.

Now I finde of these Toads two kindes, the one called Rubeta paluisiris, a Toad of the fens, or of the waters; the other Rubeta terresbris, a Toad of the earth: And these in Authors are sometimes confounded, one taken for another. The greatest difference that I can learn, is their fear or place of habitation, for they live both of them in the land and in the water. And of them that be in the water, some of them be smaller then the other, and are therefore called Rubetula, that is, little Toads: and I think they be the same which are called by some Authors Lame Simulaua.

Near unto Zurich there are Toads not half so big as the vulgar Toads, at a place called Kiriburg, being of a durt colour on the back, and sharp boned, the belly white and yellow, or rather betwixt both, the eyes of a gold flaming colour, the buttocks and hinder-legs hairy, and besides that place, these kindes of Toads are no where found. They have a very shrill voice, so as they are heard a great way off, like a small bell or trumpet, and they never utter their voice but in the Spring, and the fore-part of the Summer; for about September they hide themselves in trees, neither do they live among the waters, but on the dry land; when they cry, it is certain that the night following will bring forth no froth.

Like unto this there is a Toad in France called Bufo cornutus, a horned Toad, not because it hath horns, for that is most apparently false, but for that the voice thereof is like to the sound of a Corne, or rather (as I think) like to a Raven called Cornix, and by a kinde of Barbarism called Bufo cornutus. The voice of this Toad is like Saffron on the one part, and like filthy dirt on the other; besides, there are other venomous Toads living in sinks, privies, and under the roots of plants.

There is another kind also, like to the Toad of the water, but in stead of bones it hath only griftles, and it is bigger then the Toad of the fen, living in hot places. There is another also, which although be a Toad of the water, yet hath it been eaten for meat not many years since: the mouth of it is very great, but yet without teeth, which he doth many times put out of the water like a Tortoise to take breath, and in taking of his meat, which are flies Locusts, Caterpillers, Gnats and small creeping things, it imitate the Chamaleon, for it puteth out the tongue, and licketh in his meat by the space of three fingers, in the top whereof there is a soft place, having in it viscous humor, which caueth all things to cleave fall unto it which it toucheth, by vertue whereof it devoureth great flies. And therefore the said tongue is said to have two little bones growing at the root thereof, which by the wonderful work of Nature, doth guide, fortified and strengthen it. And thus much may serve as a sufficient relation unto the Reader for the diversity of Toads.

Now we will proceed to the common description of both kindes together. This Toad is in all outward parts like unto a Frog, the fore-feet being short, and the hinder-feet long, but the body more heavy and swelling, the colour of a blackish colour, the skin rough, viscous, and very hard, so as it is not easy to be broken with the blow of a staff. It hath many deformed spots upon it, especially black on the sides, the belly exceeding all other parts of the body, standing out in such manner, that being smitten with a staffe, it yieldeth a sound as it were from a vault or hollow place. The head is broad and thick, and the colour thereof on the neather part about the neck is white, that is, somewhat pale, the back plain without bunches, and it is said, that there is a little bone growing in their sides, that hath a vertue to drive away Dogs from him that beareth it about him, and is therefore called
called *Apoquin*. The whole aspect of this Toad is ugly and unpleasant. Some Authors affirm that it carryeth the heart in the neck, and therefore it cannot easily be killed, except the throat thereof be cut in the middle. Their liver is very vicious, and causeth the whole body to be of ill temperament: And some say they have two livers. Their milk is very small; and as for their copulation and eggs, they differ nothing from Frogs.

There be many late Writers, which do affirm that there is a precious stone in the head of a Toad, whose opinions (because they attribute much to the vertue of this stone) it is good to examine in this place, that to the Reader may be satisfied whether to hold it as a fable or a true matter, exemplifying the powerful working of Almighty God in nature, for there be many that wear these stones in Rings, being verily persuaded, that they keep them from all manner of gripings and pains of the belly and the small guts. But the Lord (as they term it) is in appearing oft out, for they say it must be taken out of the head alive, before the Toad be dead, with a piece of clothe of the colour of red Scarlet, wherewithal they are much delighted, so that while they stretch out themselves as it were in sport upon that cloth, they call out the stone of their head, but infantly they lift it up again, unleffe it be taken from them through some secret hole in the said cloth, whereby it falleth into a cistern or vessel of water, into which the Toad dureth not enter, by reason of the coldneffe of the water. These things writeth *Maffarins*.

*Braspopulus* faith, that he found such a thing in the head of a Toad, but he rather took it to be a bone then a stone, the colour whereof was brown, inclining to blackneffe. Some say it is double, namely outwardly a hollow bone, and inwardly a stone contained therein, the vertue whereof is said to break, prevent, or cure the stone in the bladder. Now how this stone should be there ingendered, there are divers opinions also; and they say that stones are ingendered in living creatures two manner of ways, either through heat or extreme cold, as in the Snail, Porch, Crab, *Indian Tortoyles* and Toads; so that by extremity of cold this stone should be gotten.

Against this opinion of the vertue of this stone is objected, which is sometimes white, sometimes brown, or blackneffe, having a citrine or blew spot in the middle, sometimes all green, whereupon is naturally engraven the figure of a Toad, and this stone is sometimes called *Burax*, sometimes *Crepusene*, and sometimes *Nife*, or *Nofe*, and *Cleboines*. Others do make two kinds of these two stones, one resembing a great deal of milk mixed with a little blood, so that the white exceedeth the red, and yet both are apparent and visible; the other all black, wherein they say is the picture of a Toad, with her legs spread before and behind. And it is further affirmed, that if both these stones be held in hands in the presence of poiyfon, it will burn him. The probation of this stone is by laying of it to a live Toad, and if the life up her head against it, it is good, but if the run away from it, it is a counterfeit.

*Geor. Agricola* calleth the greater kindes of these stones, *Bronta*, and the lesser and smoother sort of stones, *Ceramiae*, although some contrary this opinion, saying that these stones *Brontia*, and *Ceramiae*, are bred on the earth by thundering and lightning. Whereas it is laid before, that the generation of this stone in the Toad procedeth of cold, that is utterly impossible, for it is described to be so solid and firm, as nothing can be more hard, and therefore I cannot assent unto that opinion; for unto hard and solid things, is required abundance of heat; and again, it is unlikely, that whatsoever this Toad stone be, that there should be any stone of them in the world as are everywhere visible, if they were to be taken out of the Toads alive, and therefore I rather agree with *Sahuddenfis* a *Spaniard*, who thinketh that it is begotten by a certain vicious spume, breeched out upon the head of some Toad, by her fellows in the Spring time.

This stone is that which in ancient time was called *Batraebites*, and they attribute unto it a vertue besides the former, namely, for the breaking of the stone in the Bladder, and against the Falling-fickneffe. And they further write, that it is a discoverer of present poiyfon, for in the presence of poiyfon it will change the colour. And this is the substance of that which is written about this stone. Now for my part I dare not conclude either with it, or against it, for *Pernolau*, *Maffarins*, *Albertus*, *Sylvanus*, and others are directly for this stone ingendered in the brain, or head of the Toad; on the other side, *Cardan* and *Geoffre* confesse such a stone by name and nature, but they make doubt of the generation of it, as others have delivered; and therefore they being in sundry opinions, the hearing whereof might confound the Reader, I will refer him for his satisfaction unto a Toad, which he may easily every day kill: For although when the Toad is dead, the vertue thereof be lost, which consifted in the eye, or blew spot in the middle, yet the subtance remaineth, and if the stone be found there in substance, then is the question at an end, but if it be not, then muft the generation of it be sought for in some other place.

Thus leaving the stone of the Toad, we must proceed to the other parts of the story, and first of all their place of habitation, which for them of the water, is near the water-side, and for them of the earth, in bushes, hedges, rocks, and holes of the earth, never coming abroad while the Sun shinet, for they hate the Sun-shine, and their nature cannot endure it, for which cause they keep close in their holes in the day time, and in the night they come abroad. Yet sometimes in rainy weather, and in solitarie places, they come abroad in the day time. All the Winter time they live under the earth, feeding upon earth, herbs, and worms, and it is said, they eat earth by measure, for they eat so much every day as they can grip in their foot, as it were fixing themselves, left the whoe earth should not serve them till the Spring. Refembling herein great rich covetous men, who ever spare to spend for fear they shall want before they die, and for this cause in ancient time the wise *Painters* of
Germany, did picture a woman sitting upon a Toad, to signify covetousness. They also love to eat Sage, and yet the root of Sage is to them deadly poison; They destroy Bees, without all danger to themselves, for they will creep to the holes of their Hives, and there blow in upon the Bees, by which breath they draw them out of the Hive, and so destroy them as they come out: for this cause also at the Water-sides they lie in wait to catch them. When they come to drink in the day time they see little or nothing, but in the night time they see perfectly, and therefore they come then abroad.

About their generation there are many worthy observations in nature, sometimes they are bred out of the putrefaction and corruption of the earth; it hath also been seen that out of the ashes of a Toad burnt, not only one, but many Toads have been regenerated the year following. In the New World there is a Province called Darie is, the air whereof is wonderful unwholesome, because all the Country handeth upon rotten marshes. It is there observed, that when the flames or fervants water the pavements of the dores, from the drops of water which fall on the right hand, are instantly many Toads ingendered, as in other places such drops of water are turned into Gnats. It hath also been seen, that women conceiving with childe, have likewise conceived at the same times, Frogs, or a Toad, or a Lizard, and therefore Platerius faith, that those things which are medicines to provoke the mensitious course of women, do also bring forth the Secondines. And some have called Bufudem frater Salernitans, & laterum fratrem Lombardorum: that is, a Toad the Brother of the Salernitan, and the Lizard the Brother of the Lombard, for it hath been seen that a woman of Salernum, hath at one time brought forth a Boy, and a Toad, and therefore he calleth the Toad his Brother; so likewise a woman of Lombardy, and therefore he calleth the Lizard the Lombards Brother. And for this cause, the women of those Countries, at such time as their childe beginneth to quicken in their womb, do drink the juice of Parsley and Leeks, to kill such conceptions if any be.

There was a woman newly married, and when in the opinion of all she was with childe, in stead of a childe she brought forth four little living creatures like Frogs, & yet the remained in good health, but a little while after she felt some pain about the rim of her belly, which afterward was eased by applying a few remedies. Also there was another woman, which together with a Man childe, in her Secondines did bring forth such another Beast; and after that a Merchants wife did like the in Anonytum. But what should be the reason of these so strange and unnatural conceptions, I will not take upon me to decide in nature, left the Omnipotent hand of God should be wronged, and his most secret and just counsel presumptuously judged and called into question. This we know, that it was prophesied in the Revelation, that Frogs and Locusts should come out of the Whore of Babylon, and the bottomless pit, and therefore seeing the feast of the Whore of Babylon is in Italy, it may be that God would have manifested the depravation of Christian Religion, beginning among the Italians, and there continued in the conjointed birth of Men and Serpents: for surely, none but Devils incarnate, or men conceived of Serpents brood, would so visibly stand in Roman error as the Italians do, and therefore they seem to be more addicted to the errors of their Fathers, (which they say is the Religion wherein they were born) then unto the truth of Jesus Christ, which doth unanswerably detect the pride and vanity of the Roman faith.

But to leave speaking of the conception of Toads in Women, we will proceed further unto their generation in the flomachs and bellies of men, whereas there may more easily a reason be given then of the former. Now although that in the earth Toads are generated of the putrefied earth and waters, yet such a generation cannot be in the body of man, for although there be much putrefaction in us, yet not so much to induce bones and other organs, such as are in Toads; as for Worms they are all flesh, and may more easily be conceived of the putrefaction in our flomachs. But then you will say, how comes it to passe, that in mens flomachs there are found Frogs and Toads? I answer, that this evil hapneth unto such men as drink water, for by drinking of water, a Toads egge may easily flipp into the stomach, and there being of a vicious nature, cleaveth fast to the rough parts of the ventricle, and it being of a contrary nature to man, can never be digested or avoided, and for that cause the venom that is in it, never goeth out of the Egge either in operation or in sublimate, to poyson the other parts of the body, but there remaineth until the Egge be form'd into a Toad, without doing further harm: and from hence it cometh that Toads are bred in the bodies of men, where they may as well live without air, as they do in the midst of trees and rocks, and yet afterwards, these Toads do kill the bodies they are bred in. For the venom is so temper'd, that at first it worketh when it is come to ripeness, even as we see it is almost an ufnal thing, to take a poyson, whose operation shall not be perceived, till many days, weeks, or months after.

For the caighting out of such a Toad bred in the body, this medicine is prescribed: They take a Serpent and bowell him, then they cut off the head and the tail, the residue of the body they likewise part into small pieces, which they leethe in water, and take off the fat which swimmeth at the top, which the sick perfon drinketh, until by vomiting he avoid all the Toads in his stomach, afterwards he must use reformatio and aromatical medicines. And thus much may suffice for the ordinary and extraordinary generation of Toads.

These Toads do not leap as Frogs do, but because of their swelling bodies and short legs, their pace is a soft creeping pace, yet sometimes in anger they lift up themselves, endeavouring to do harm, for great is their wrath, obstinacy, and desire to be revenged upon their adversaries, especially the red Toad; for look how much her colour inclineth to rubefcency, so much is her wrath and venom more vehement. If she take hold of any thing in her mouth, she will never let it go till
the dye, and many times the fenteth forth poynson out of her buttocks or backer parts, wherewithal the infecteth the air, for revenge of them that do annoy her: and it is well observed that the know-ledge the weakness of her teeth, and therefore for her defence the first of all gathereth abundance of air into her body, wherewithal the greely swelleth, and then by sighing uttereth that infected air as near the person that offendeth her as she can, and thus she worketh her revenge, killing by the poyn-
son of her breath. The colour of this poynson is like milk, of which I will speak afterward par-
icularly by it self.

A Toad is of a moft cold temperament, and bad constitution of nature, and if hath one certain herb wherewithal it preferve the sight, and alfo refileth the poynson of Spydiers, whereof I have heard this credible History related, from the mouth of a true honourable man, and one of the moft charitable Peers of England, namely, the good Earl of Befford, and I was requeried to fet it down for truth, for it may be juftified by many now alive that saw the fame.

It was fortunat as the said Earl travelled in Bedfordshire, neer unto a Market-town called Oxfoord, some of his company eyespied a Toad fighting with a Spyder, under a hedge in a bottom, by the high-way-side, wherewithal they stood still, until the Earl ther Lord and Master came also to behold the same; and there he saw how the Spyder stiil kept her standing, and the Toad divers times went back from the Spyder, and did eat a piece of an herb, which to his judgement was like a Plantain. At the last, the Earl having seen the Toad do it often, and still return to the combate against the Spyder, he com-
manded one of his men to go, and with his dagger to cut off that herb, which he performed and brought it away. Preently after the Toad returned to seek it, and not finding it according to her expectations swelled and broke in pieces: but having received poynson from the Spyder in the com-
 battlefield, nature turneth her that true herb to devour, and thus wanting the herb, the poynson did infinitely work and destroy her. And this (as I am informed) was oftentimes related by the Earl of Bedford himself upon fundry occasions, and therefore I am the bolster to infect it into this story.

I do the more easily believe it, because of another like story related by Erasme in his Book of Friendship, hapning likewise in England, in manner as followeth. There was a Monk who had in his chamber divers bundles of green rufhes, wherewithal he toof to throw his chamber at his pleasure, it hapned on a day after dinner, that he fell asleep upon one of those bundles of rufhes, with his face upward, and while he there slept, a great Toad came and fate upon his lips, ballriding him in such manner as his whole mouth was covered. Now when his fellows saw it, they were at their wits end, for to pull away the Toad was an unavoidable death, but to suffer her to stand still upon his mouth, was a thing more cruel then death: and therefore one of them eyespied a Spiders web in the window, wherein was a great Spyder, he did advise that the Monk should be carryed to that window, and laid with his face upward right underneath the Spiders web, which was preently accomplished. And assoone as the Spyder saw her adversary the Toad, she preently wove her thread, and defended down upon the Toad, at the first meeting whereof the Spyder wounded the Toad, so that it swelled, and at the second meeting it swelled more, but at the third time the Spyder kyd the Toad, and so became grateful to her Host which did nourish her in his Chamber; for at the third time the Toad leaped off from the muns mouth, and swelled to death; but the man was preferred whole and alive. And thus much may suffice for the antipathie of nature betwixt the Toad and the Spyder.

The Mole is also an enemy to the Toad, for as Atherinus writeth, he himself saw a Toad crying above the earth very bitterly, for a Mole did hold her hart by the leg within the earth, labouring to pull her in again, while the other torove to get out of her teeth, and so on the other side, the Toads do eat the Moles when they be dead. They are alsoe at variance with the Lizard, and all kindes of Serpents, and whenever it receiveth any wound by them, it cureth it self by eating of Plantain.

The Cat doth also kill Serpents and Toads, but eateeth them not, and unlesse the pretently drink the dyeth for it. The Buzzard and the Hawk are destroyers of Toads, but the Stork never destroyeth a Toad to eat it, except in extremity of famine, whereby is gathered the venomous nature of the Toad.

- Now to conclude, the premises considered which have been said of the Toad, the uses that are to follow are not many, except those which are already related in the Frog. When the Spaniards were in Bragia, an Island of the New-found-world, they were brought to such extremity of famine, that a sick man amongst them was forced to eat two Toads, which he bought for two pieces of gold-lace, vorth in Spanish money six Ducats. I dare marvel why in ancient time the Kings of France gave in their Arms the three Toads in a yellow field, the which were afterwards changed by Clodoveus into three Flower-de-luces in a field Azure, as Arms sent unto him from Heaven.

When the Trojans dwelt neer Macedon, after the destruction of Troy, they were very much annoyed by the Galleys, wherefore Marcemirus their King, determined to leave that Country, and to seek some where else a more quiet habitation. Being thus minded, he was admonished by an Oracle that he should go and dwell in that Country where the River Rhene falleth into the Sea, and he was also threeth red to take upon him that journey, by a certain Magician-woman, called Anahuna, for this cunning Woman caueth in the nightime a deformed apparition to come unto him having three heads, one of an Eagle, another of a Toad, and the third of a Lyon, and the Eagles head did speake unto him in this manner, Germanuszm & Marcemirus orint me, & concupisit Lemum, & interiect abundam; that is to say, Thy stock or povertie, O Marcemirus, shall oppresse me, it shall tread the Lyon under foot, and kill the Toad: By which words he gathered, that his povertie shoulde rule over the Roman,
signified by the Eagle; and over the Germans, signified by the Lyon; and over the French, signified by the Toad, because the Toad, as we have said, was the ancient Arms of France.

It is an opinion held by some Writers, that the Weasels of the water do engender in copulation with the Toads of the water, for their mouths, and feet of their belly, they do resemble them; Whereupon these veries were made;

    Busfons gigas patrida tellure sepulta,
    Flumores pluvii forte quadro amo Juno,
    Humor is & friget, mens sic vis bunet & diges,
    Cum peper in terra qui primum ignis erat.

Which may be Engli{h}ed thus;

    Buried in rotten earth, forth Toads I bring,
    Perhaps because we both are made of rain,
    That's moist and cold, moist I and ever freezing,
    When in the earth, that force from fire came.

And thus we will defend to discourse of the Toads poiyon, and of the special remedies appointed for the same. First therefore, all manner of Toads, both of the earth and of the water are venemous, although it be held that the Toads of the earth are more poiyonful than the Toads of the water, except those Toads of the water which do receive infection or poiyon from the water, for some waters are venemous. But the Toads of the land, which do descend into the marishes, and so live in both elements, are most venemous, and the hotter the Country is, the more full are they of poiyon.

The Women-witches of ancient time which killed by poiyonning, did much ufe Toads in their confeotions, which caused the Poet in his verses to write as followeth.

Occurrerit Martion potens, qua male Calenum
Porcellurá vitro, millet ficiente subiactam.

Which may be Engli{h}ed thus;

There came a rich Matron, who mixed Calem Wine,
With poiyon of Toads to kill her Spoufe, O deadly crime.

And again in another place,

    Femur promittere patris
    Nec volo nec poiyum ranarum, in victrix nunquam
    Infecri.

In Engli{h} thus;

    I can nor will of Fathers death a promise make,
    For of Toads poiyon I never yet a view did take.

When an Afp hath eaten a Toad, their biting is incurable, and the Bears of Pamphilia and Cylicia, being killed by men after that they have eaten Salamanders or Toads, do poiyon their eaters. We have said already, that a Toad hath two livers, and although both of them are corrupted, yet the one of them is said to be full of poiyon, and the other to refiit poiyon. The biting of a Toad, although it be feldom, yet it is venemous, and caufeth the body to fwell and to break, either by Impeffation, or otherwife, againft which is to be applied common Antidotés, as womens Milk, Triaule, roots of Sea-holm, and fuch other things. The fpitte alfo of Toads is venemous, for if it fall upon a man, it caufeth all his hair to fall off from his head; againft this evil Paracel{sus} prefcribeth a plaifter of earth, mixed with the fpittle of a man.

The common people do call that humor which cometh out of the buttocks of a Toad when the feeleth, the urine of a Toad, and a man moistned with the fame, be-pi{fed} with a Toad; but the beft remedy for this evil, is the milk of a woman, for as it emblemeth the poiyon in colour, fo doth it refiit it in nature. The bodies of Toads dryed, and fo drunk in Wine after they be eaten to powders, are a moft strong poiyon, againft which and all other fuch poiyon of Toads, it is good to take Plantain and black Hellebore, Sea-crabs dryed to powder and drank, the fballs of Dogs-tongue, the powder of the right horn of a Hart, the milt, spleen, and heart of a Toad. Alfo certain fihes called Shel-crabs, the blood of the Sea-tortoife mixed with Wine, Cummin, and the rennet of a Hare. Alfo the bloud of the Tortoife of the land mixed with Barclay-meal, and the quinellefence of Triacle and Oyl of Scorpions, all these things are very preci{ous} against the poiyon of Serpents and Toads.

We have promis{ed} in the history of the Frog, to exprefse in this place fuch remedies, as the learned Phy{itian}s have ob{erved} for the cure of the poiyon of Frogs. First therefore the poiyon of the Frog caufeth swelling in the body, depelleth the colour, bringeth difficulty of breathing, maketh the breath strong, and an involuntary profu{ion} of feed, with a general dullneffe and rellineffe of body: for remedy whereof, let the party be inforced to vomit by drinking sweet Wine, and two draams of the powder of the root of Reeds or Cypr{e}f{e}. Alfo he muft be inforced to walking and running, besides daily wa{the}. But if a Fever follow the poiyon or burning in the extremities, let the vomit be of water and Oyl, or Wine and Pitch; or let him drink the blood of a Sea-tortoife, mixed with Cummine, and the rennet of a Hare, or else sweat in a Furnace or Hot-hou{se} a long time: besides many other fuch like remedies, which every Phy{itian}, both by experience and reading, is able to minifter in cafes of nece{city}, and therefore I will spare my further pains from expressing.
Of the Hemorrhe.

expressing them in this place, and passe on to the medicinal vertues of the Toad, and fo conclude this history.

We have shewed already that the Toad is a cold creature, and therefore the same sod in water, and the body anointed therewith, caufeth hair to fall off from the members fo anointed. There is a medicine much commended against the Gout, which is this: Take fix pound of the roots of Wilde Cucumber, fix pound of sweet Oyl, of the marrow of Harts, Turpentine, and Wax, of either fix ounces, and fix Toads alive; the which Toads muft be bored through the foot, and hanged by a thred in the Oyl until they grow yellow, then take them out of the Oyl by the threds, and put into the said Oyl the liced root of a Cucumber, and there let it seethe until all the vertue be left in the Oyl. Afterwards melt the Wax and Turpentine, and then put them all together in a glaffe, and use them morning and evening against the Gout, Staticca, and pains of the finews, and it hath been feen that they which have yien long fick, have been cured thereof, and grown perfectly well and able to walk. Some have added unto this medicine Oyl of Saffron, Opobalsamum, blood of Tortoifes, Oyl of Sabine, Swines greafe, Quicksilver, and Oyl of Bays.

For the scabs of Horfes, they take a Toad killed in wine and water, and fo sod in a brazen vefsel, and afterwards anoint the Horfe with the liquor thereof. It is also said that Toads dryed in fmoak, or any piece of them carried about one in a linnen cloth, do lay the bleeding at the nofe. And this Frederick the Duke of Saxony, was wont to practice in this manner; he had ever a Toad pierced through with a piece of wood, which Toad was dryed in the fmoak or thwood, this he rowled in a linnen cloth; and when he came to a man bleeding at the nofe, he caufed him to hold it fift in his hand until it waxed hot, and then would the bloud be flayed. Whereof the Physicians could never give any reafon, except horror and fear constrained the bloud to run into his proper place, through fear of a Beafe fo contrary to humane nature. The powder alfo of a Toad is faid to have the fame vertue, according to this verfe;

Betta usus fitrit natura date curnam.

In English thus;

A Toad that is burned to ashes and duff,
Stays bleeding by gift of Nature just.

The skin of a Toad, and shell of a Tortoyfe, either burned or dryed to powder, cureth the Fiufu-fes: Some add hereunto the root of Laurel and Hen-dung, Salt, and Oyl of Mallows. The eyes of the Toad are received in Ointment againft the Worms of the belly. And thus much fhall fuffice to have spoken of the history of the Toad and Frogs.

Of the GREEN SERPENTS.

In Valois there are certain Green-serpents, which of their color are called Grayling, and I take them to be the fame which Helichius called Saurite, and Pliny by a kinde of excellency, Snakes, of whom we fhall speak afterwards, for I have no more to lay of them at this preffent, but that they are very venomous. And it may be that of thefe came the common proverb, Latet anguis sub herba, under the green herb lyeth the Green-snake, for it is a friendly admonifion unto us to beware of a falshood covered with a truth like unto it.

Of the HÆMORRHE.

This Serpent hath fuch a name given unto it, as the effect of his biting worketh in the bodies of men, for it is called in Latine, Hemorrhow, to signifie unto us the male, and Hemorrhoh, to signifie the female; both of them being derived from the Greek word Alima, which fignifieth bloud, and Res, which fignifieth to flow, because whomsoever it biteth, it maketh in a continual bleeding sweat, with extremity of pain until it die. It is also called Affidium, and Asafidum, Sabrina, and Hafurdium, or Alfordum, which are but corrupted barbarous names from the true and firft word Hæmorrhous.

It is doubtful whether this be to be ascribed to the Asps or to the Vipers, for Isidorus faith it is Pliny, a kinde Asp, and Aelianus, a kinde of Viper. They are of a fandy colour, and in length not palf one foot, or three handfulls, whose tail is very sharp or small, their eyes are of a fiery-flaming colour, their
The History of Serpents.

their head small, but hath upon it the appearance of horns. When they goe, they goe straight and slowly, as it were halting and wearily, whose pace is thus described by Nicander:

- Et infer

In English thus:

The scales of this Serpent are rough and sharp, for which cause they make a noyse when they goe on the earth; the female refteth her self upon her lower part neer her tayl, creeping altogether upon her belly, and never holdeth up her head, but the male when he goeth holdeth up his head; their bodies are all set over with black spots, and themselves are thus paraphrastically described by Nicander:

Unum longa pedem, totoque grex illima tractis,
Ligna quaedoque eff, quaedaque eff candida forma,
Constrilluamque setis collum, et tensissima cauda.
Mina super gelidos ocularis forint corum profert.

Which may be Englisht in this manner following:

On foot in length, and slender all along,
Some time of fiery hue, sometime milk-white it is,
The neck bound in, and tayl most thin and strong,
Wbos fore-head hath two horns above cold eyes:

They keep in rocks, and floney places of the houfes and earth, making their dens winding and hanging, according to thefe Verfes:

Rimfes colit illa Petras, fubique alpere tella,
Et modice pendens facit, inflexumque cubile.

In English thus:

The thongs of Rocks and passages in fome
They dwell, wherein their lodgings bare,
A little hanging mode for every one,
And bending too their fhyry harbours are.

It is faid that Canopus the Governour of Memelae, chanced to fall upon this Serpent, in revenge whereof Helen his charge, the wife of Memelae broke his back-bone, and that ever since that time they creep lamely, and as it were without loyts; which fable is excellently thus described by Nicander:

Quadem animosa Helen, cygni Jovis inclyta proles
Eo vero redimus Traia (afit vana tujas).
Huic inducita eft generi, Pariam ut ad oras
Venit, & aduersi declinans flamina venti,
Fulguravagam futum Nili aitna classem.
Namque ubi Nauclerus Jovis filicem furtit Canopus
Sterneret, et bibulis fulus dormin et arenis:
Leta venenatia Hemonboris impulita illis.

Which may be Englished thus:

Once noble Helen, Jove's child by Swan-like fpace,
Returning back from Troy, destroyed by Grecian war,
(If that our ancients do not with fables us belaph)
This rece was envied by Pharias anger farse,
When to his fores for safety they did come,
Declining rage of blufhing windy seas,
Water-biding-Navy at Nili mouth gan run,
Where Canopus all tyed, taintet for some cafe:
For there this Pife, or Master of the Fleet,
Dilhaff from beato to deep in drear funk,

Where he did feel the teeth of Hemonborc deep,
Wounding his body with pofton, death's own hand,
But when ege-breeding Ledaes wench eyfted
This ban, he pref't the Serpents back with stroke,
Whereby the bands thereof were all united,
Which in juft wrath for juft revenge his broke,
So ever fince out of this Serpents frame
And body they are taken, which is the caufe
That Cerafis and fem Hemonborae are ever lame,
Drawing their parts on earth by nature lowes.

They which are fung with thefe Hemonborae, do suffer very intolerable torments, for out of the wound continually floweth blood, and the excrements also that cometh out of the belly are bloody, or sometimes little rous of blood in head of excrements. The colour of the place bitten is black,
of the Horncd Serpent.

or of a dead bloody colour, out of which nothing floweth at the beginning but a certain watery humour, then followeth pain in the stomack, and difficulty of breathing. Lastly, the powers of the body are broken, and opened, so that out of the mouth, gums, ears, eyes, fingers ends, nails of the feet, and privy parts, continually issue blood, until a cramp alfo come, and then followeth death, as we read in Lucan of one Telum a young noble man, slain by this Serpent, described as followeth;

Impreffit dentes Hemorrhoeis aspera Tubo
Magnanimo juventi, ministratorique Catonis :
Uique folet partis totis ce-fundens siges
Corycis praefura crescit: sic omnia membra
Emifere fimul rutilam pro fanguine vitam.

Sanguis erat lacryma : quemunque foramina visuit
Humor, ab his languis manat cruor, oro redundat,
Est patula naves, fulor rubet, omnia plenit,
Membrana fluent ventus: tota eft pro vulnera corpus.

In English thus:
The Hemorrhoe fierce, in noble Tubus fastened teeth
That valiant youth, great Catetus scholar dear:
And at when Saffron by Corycians whelk
Is prest, and in his colour on them all appear:
So all his parts sent forth a poison red.

The cure of this Serpent, in the opinion of the Ancients, was thought impossible, as writeth Di-
sorides, and thereof they complain very much, using only common remedies, as scarification, ulcions, sharp meats, and such things as are already remembered in the cure of the Diphas. But besides these they use Vine-leaves, first bruised and then sod with Honey: they take also the head of this Serpent and burn it to powder, and so drink it, or else Garlick with Oyl of Flower-de-luce, they give them also to eat Reifsins of the Sun. And besides, they reftift the eruption of the blood, with plaiters laid to the place bitten, made of Vine-leaves and Honey, or the leaves of Purlfane and Barley-meal. But before their urine turn bloody, let them eat much Garlick stamped, and mixed with Oyl to caufe them to vomit, and drink wine delayed with water, then let the wound be washed with cold water, and the bladder continually fomented with hot Spunges. Some do make the cure of it like the cure of the Viper, and they prefer the Serpent to eat hard Egges with Salt fift, and besides, the feed of Radifh, the juice of Poppy, with the roots of Lilly, alfo Daffadil, and Rue, Trefolie, Caflia, Oppononax, and Cinnamon in potion: and to conclude, the flowers and buds of the buft are very profitable againft the biting of the Hemorrhoe, and fo I end the history of this Serpent.

Of the Horncd SERPENT.

His Serpent becaufe of his Horns (although it be a kind of Viper) is called in Greek Ké-
erfer, and from thence cometh the Latine word Cerfs, and the Arabiam Cerf, and Cer-
fras. It is called alfo in Latine, Cerfalia, Cerfalia, Sirtalia, and Trifalia. All which are cor-
rupted words, derived from Cerf, or else from one another, and therefore I think it not fit to stand upon them. The Hebrewes call it Schepibphon, the Italians, Cerfus, the Germans, En geburne schlang; the French, Un Cerfs, un Cerfus Cornu, that is, a horncd Serpent; and therefore I have so called it in English, imitating herein both the French and Germans.

I will not stand about the difference of Authors, whether this Serpent be to be referred to the Afps or to the Vipers, for it is not a point material, and therefore I will proceed to the description of his nature, that by his whole history, the Reader may choofe whether he will account him a subordinate kind unto others, or else a principal of himself. It is an Africau Serpent, bred in the Lybian sandy seas, places not inhabited by men, for the huge Mountains of lands are so often moved by the windes, that it is not only impossible for men to dwell there, but alfo very dange-
rous and perilous to travel through them, for that many times whole troops of men and cat-
tail, are in an infant overwhelmed and buryed in those sands. And this is a wonderful work

R r
The History of Serpents.

of God, that those places which are least habitable for man, are most of all annoyed with the most dangerous bitting Serpents.

It is also said, that once these Horned Serpents departed out of Libya into Egypt, where they depopulated all the Country. Their habituation is near the high-ways, in the sands, and under Cart-wheels: and when they goe, they make both a loud with their motion, and also a furrow in the earth, according to the saying of Nicander:

Ex in alter ecibis velocibus obsita fenis,
Redescite facibus prolixius tandem deducit,
Sed medio diffusus hic cerastes fo corpore voluit:
Carum errans per terrae, evanescit aera nemus.

Which may be Englished thus:

Of these the Viper with swift bones thee meetes,
Traveling her back, in path direct and strait,
The Cerastes more diffus'd in way thee greetes
With crooked turning, on scales make sounds full great.

The quantity of this horned Serpent is not great, it exceedeth not two cubits in length; the colour of the body is branded like sand, yet mingled with another pale white colour, as is to be seen in a Hares skin. Upon the head there are two horns, and sometimes four, for which occasion it hath received the name Cerastes, and with these horns they deceive Birds; for when they are hungry, they cover their bodies in sand, and only leave their horns uncovered to move above the earth, which when the Birds see, taking them to be Worms, they light upon them, and so are devoured by the Serpent. The teeth of this Serpent are like the teeth of a Viper, and they stand equal, and not crooked: In stead of a back-bone they have a griffle throughout their body, which maketh them more flexible and apt to bend every way: for indeed they are more flexible than any other Serpent. They have certain red brakkes cross their back, like a Crocodile of the earth, and the skins of such as are bred in Egypt are very soft, shriveling like a Cheverell-glove, both in length and breadth, as it did appear by a certain skin taken off from one being dead; for being fluff'd with Hay, it sheweth much greater then it was being alive, but in other Countreys the skins are not so.

I have heard this History of three of these Serpents brought out of Turkey, and given to a Noble man of Venice alive, who preferred them alive in a great Glass (made of purpose) upon sand, in that Glass near the fire: The description as it here followeth, was taken by John Baltoner, an English Travailer, saying They were three in number, whereof one was thrice so big as the other two, and that was a female, and she was said to be their Mother: she had laid at that time in the sands four or five Eggs, about the bignesse of Pigeons Eggs. She was in length three foot, but in breadth or quantity almost so big as a mans Arm: her head was flat, and broad as two fingers, the apple of the eye black, all the other part being white.

Out of her eye-lids grew two horns, but they were short ones, and those were truly Horns, and not fleeth. The neck compared with the body was very long and small, all the upper part of the skin was covered with scales, of ashy colour, and yet mixed with black. The tail is at it was brown when it was shrutched out. And this was the description of the old one: the other two being like to her in all things, except in their horns, for being small, they were not yet grown. Generally, all these horned Serpents have hard dry scales upon their belly, wherewithall they make a noyse when they goe themselves, and it is thus described by Nicander:

Nunc paves elatum, insulatooremag Cerastes
Nofere, viperum veluti genus, bute qua diupar
Non in corpis habit, sed grantus aut duo profert

In English thus:

Now we may know the treacher Cerastes noyse,
A Viper kind, whose bodies much agree,
Yet these four bays and brandy colour, poys,
Where Viper none, but forehead plain we fee.

There is no Serpent except the Viper that can so long indure thirst as this horned Serpent, for they feldome or never drink; and therefore I think they are of a Vipers kinde: for besides this also it is observed, that their young ones do come in and out of their bellies as Vipers doe: They live in hatred with all kinde of Serpents, and especially with Spiders. The Hawes of Egypt also do destroy horned Serpents and Scorpions: but about thebes in Egypt there are certain faced Snakes (as they are termed) which have horns on their head, and these are harmless unto men and beasts, otherwise all these Serpents are virulent and violent against all creatures, especially men: yet there be certain men in Libya called Pfilli, which are in a league, or rather in a natural concord with horned Serpents. For if they be bitten by them at any time, they receive no hurt at all: and besides, if they be brought unto any man that is bitten with one of these Serpents, before the poyson be spread all over his body, they help and cure him, for if they finde him but lightly hurt, they only spit upon the wound, and so mitigate the pain, but if they finde him more deeply hurt, then
then they take much water within their teeth, and first wash their own mouth with it, then spit out the water into a pot, and make the sick man to drink it up. Lastly, if the poison be yet strong, they lay their naked bodies upon the naked poiyoned body, and so break the force of the poison.

And this is thus described by the Poet, saying,

\[\text{Audrei} \text{Lybici} \text{Pfllar, quis atfera Sir is}
\text{Serpentumque ferae partis alit poniatos,}
\text{Non iatu infidiam dire, non facer venenum}
\]

That is to say,

\*[The Lybian Pfeal, which Serpent-breeding Syttes dwell]

\*[As I have heard, no cure poiyon, flings, and bites,]

\*[Nor hurt themselves, but in other quall:]

\*[By no want force, but joining bodies quites.]

When a horned Serpent hath bitten a man or beast, first about the wound there groweth hard-ninfe, and then putiles. Lastly, black, earthy and pale matter: the genital member fandereth out straighth and never falleth, he falleth mad, his eyes grow dim, and his nerves immemorable, and upon the head of the wound groweth a feab like the head of a Nail, and continually pricketh, like the prickings of Needles: And because this Serpent is immediaterely dry, therefore the poiyon is most pernicious for if it be not holpen within nine days, the patient cannot escape death. The cure must be first by cutting away the feffion unto the bone, where the wound is, or else the whole member if it can be, then lay upon the wound Goats dung fod with Vinegar or Garlike, and Vinegar or Barley-meal, or the juice of Cedar, Rue, or Nep, with Salt and Honey, or Pitch and Barley-meal, and fuch-like things outwardly: inwardly Daffadil and Rue in drink, Raddic-ferd, Indian Cammin, with wine and Celofium, and also Calamin, and every thing that procureth vomit. And thus much for the description of the Horned Serpent.

**Of the Hyrena.**

There be some that make question whether there be any such Serpent as this or no, for it is not very like that there is any such, and that this Hyrena is the self same which is described to be a Four-footed Beast, for that which is said of that, is likewise attributed to this: namely, that it changeth sex, being one yeer a male, another yeer a female, and that the couple which seem to be married together, do by continuall entercourse, bring forth their young ones, so that the male this yeer is the female next yeer, and the female this yeer is the male next yeer. And this is all that is said of this Serpent.

**Of the Hydra, supposed to be killed by Hercules.**

The Poets do fain, that near to the Fountain Amyon, there grew a Plantain, under which was bred a Hydra which had seven heads: whereof one of these heads was said to be immortal: with this Hydra Hercules did fight, for there was in that immortall head such a poiyon as was uncurable: wherewithall Hercules mouthened the head of his Darts after he had killed it: and they say, that while Hercules struck off one of these heads, there ever arose two or three more in the room thereof, until the number of fifty, or as some say, fourscore and ten heads were strucken off: and because this was done in the fennce of Larus, therefore there grew a Proverb of Lerna malorum, to fignifie a multitude of unrefillable evils.

And some ignorant men of late days at Venice, did picture this Hydra with wonderfull Art, and let it forth to the people to be feen, as though it had been a true carkafe, with this inscription. In the year of Chrifs incarnation, 550, about the moneth of January, this monstrous Serpent was brought out of Turkey to Venice, and afterwards given to the French King; it was esteemed to be worth 6000 Ducats. These Monsters fignifie the mutation or change of worldly affairs, but (I trust) said the Author of the inscriptions, who seemed to be a German) the whole Christian World is so affifted, that there is no more evil that can happen to the Christian World, except destruction; and therefore I hope that these Monsters do not forebrow any evil to the Christians. Therefore seeing the Turkish Empire is grown to that height, in which elate all other former Kingdomes fell, I may divine and prophesie that the danger threatened hereby, belongeth to the Turk, and not unto us, in whose Government this Monifer was found to be bred: and the hinder part of his head feemeth to reftible a Turkie Cap. Thus far this incribing Diviner. But this fellow ought first of all to have enquired about the truth of this Picture, whether it were sincere or counterfeit, before he had given his judgement upon it: For that there should be such a Serpent with seven heads, I think it unpoiffible, and no more to be beheved and credited, than that Cufier and Pelorus were conceived in an Egg, or that Pluto is the G O D of Hell, or that armed men were created out of Dragons teeth, or that Vulcan made Achilles his Armour, or that Venus was wounded by, Dianes; or that Ulysses was carried in Bottles, so true I think is the shape of this Monifer: For the
The History of Serpents.

the head, ears, tongue, nose, and face of this Monster, do altogether degenerate from all kinds of Serpents, which is not usual in Monsters, but the fore-parts do at most times resemble the kind to which it belongeth; and therefore if it had not been an unskilfull Painters device, he might have framed it in a better fasion, and more credible to the world. But let it be as it is, how doth he know that this evil doth more belong to the Turks then to the Christians? For shall we be so blinde and flatter our selves so far, as not to acknowledge our sins, but to lay all the tokens of judgement upon our adversaries? But if there appeared in us any repentance or amendment of those sins, for which God hath suffered in his justice, that impious Tyrant and Tyrannicall Government to prevail against Christians, then we might think that GOD would look mercifully upon us, and avert his wrath from us upon our enemies. But with sorrow and grief be it spoken, all the Kings and people of Christendome, do directly go forward without stumbling in those vile courses, and odious crying sins, for which God hath set up the Turks against former ages, and therefore we have no caufe to hope that ever this rod shall be call into the fire, until the chastisement of Gods children have procured their amendment, and if no amendment, then all the powers of heaven (the blefled Trinity excepted) cannot keep Christendome from ruin and destruction, which God of his infinite mercy turn away from us.

To turn again to the story of the Hydra, I have also heard, that in Venice in the Dukes treasury, among the rare Monuments of that City, there is preferred a Serpent with seven heads, which if it be true, it is the more probable that there is a Hydra, and then the Poets were not altogether deceived, that say, Hercules killed such a one. This Hydra which Hercules slew, they say was engendred between Echidna and Tiphaoa, and nourished by Juno in Lerna, in hatred of Hercules: and they say further, that when he came to kill it, there came a Crab or Cancer to help the Hydra against Hercules, who infantly called upon Isaias for help, and so Isaias flew the Crab, and Hercules the Hydra.

Phaedrus makes the story of Hercules by killing the Hydra, to be a mere allegory, saying, that the Hydra was a Castle kept by fifty men, the King whereof was called Lerus, who was afloat by a Noble man (called Cancer) against the assailants of Hercules, and that Hercules by the help of Isaias, King of the Hybsous, overcame that King and Castle. Other say, that Lerna and Hydra signify the two kinds of Envy, distinguished by Invidia, and Insidia, in himself, which arise out of the monstrous filthy fenne of humane corruption, like a monstrous hideous Dragon, with whom he frove, and as he struck off one head or temptation, so two or three other continually arose in the room thereof. And thus much for the Hydra, whether it be true or fabulous.
Of the Lizard.

\textbf{Of innocent SERPENTS.}

I do read of two kinde of innocent Serpents, one called \textit{Lykis}, because they are only in Affric, and never do hurt unto men, and therefore \textit{Nicaner} was deceived, which maketh this kinde of Serpent to be the same with the \textit{Amyste}, whose sting or teeth are very mortall and deadly. There be also other kinde of harmleff Serpents, as that called \textit{Mularus}, \textit{Molusca}, and \textit{Mylocon}, which is said to go upon the tail, and it hath no notable property, except that one thing which giveth it the name, for \textit{Mularus} is derived from \textit{Mol Ouen}, that is hardly making water.

There be also domesticall innocent Serpents, \textit{Mangres}, \textit{Othophis}, and \textit{Spithecus}, which whether they be one kinde or not, I will not stand upon, for they are all termed by the \textit{German}, \textit{Huffjack}, and \textit{Hulsebg}, that is, a House-snake. They live by hunting of Mice, and Weasels, and upon their heads they have two little ears, like to the ears of a Mouse, and because they be as black as coals, the Italians call them \textit{Serce nero}, and \textit{Carbon}, and \textit{Gardenazzo}, and the French-men, \textit{Anguille de Hoy}, that is, a Snake of hedges. There be some that furnish them in Glasses with branne, and when they are at liberty they live in Dung-hills also, wherein they breed sometimes, they have been seen to suck a Cow, for they do bite the tails about the Cowes legs. \textit{Matthiolus} wroteth, that the flesh of this Snake when the head, the tail, intrails, fat, and gall are cut off and cast away, to be a speciall remedy against the French-pox.

There are also other kinde of Innocent Serpents, as that called \textit{Parea}, and in \textit{Italy Baresi}, and \textit{Pargarina}, which are brought out of the East, where these are bred. There be no other harmfull Serpents in that Country. They are of a yellow colour like Gold, and about four fpaus long; upon either side they have two lines or strakes, which begin about a hand breadth from their neck, and end at their tail. They are without poiyon as may appear by the report of Gifner, for he did se a man hold the head alive in his hand. And thus much shall suffice to have spokenn of Innocent Serpents.

\textbf{Of the LIZARD.}

\textit{Althoogh there be many kinds of Lizards, yet in this place I will intrett first of the vulgar Lizard, called in the Hebrew \textit{Lezach}, \textit{Langermiha}, \textit{Lyndia}, \textit{Carbo}, \textit{Peipab}, and \textit{Eglis}; the \textit{Chaldeans}, \textit{Halbeha}, and \textit{Honetta}; the \textit{Arabians}, \textit{Atas}, \textit{Albanaia}, or \textit{Albadaia}, \textit{Haridan}, \textit{Arab}, \textit{Samabra}, \textit{Samhbra}; the \textit{Grecians} in ancient time \textit{Saros}, and \textit{Sura}, and vulgarly at this day \textit{Kallifara}; the \textit{Italians} in some places, \textit{Liguro}, \textit{Legaro}, \textit{Lucerta}, and \textit{Lucretula}; about \textit{Trent}, \textit{Rasani}, and \textit{Ramarri}, and yet \textit{Ramarrois} also used for a \textit{Toad}; the \textit{Spaniards}, \textit{Lagarto}, \textit{Lacerta}, \textit{Lagaris}, and \textit{Lagardtis}; the \textit{French}, \textit{Lizardes}; the \textit{German}, \textit{Adex}, and when they differeth the male from the female, they expressse the male, \textit{Eus Egerbi}, and the female, \textit{Egtes}; in \textit{Hufflia}, \textit{Lydefsch}; in \textit{Flanders} and \textit{Illyria}, \textit{Gjefirka}, and \textit{Giffier}; the \textit{Latines}, \textit{Laocrus}, and \textit{Laetra}, because it hath arms and shoulers like a man, and for this cause also the \textit{Salamanler}, the \textit{Stellion}, the \textit{Crocodile}, and \textit{Scorpions} are also called sometimes \textit{Lacerti}, \textit{Lizards}. And thus much shall suffice for the name.}

The vulgar Lizard is described on this sort; the skin is hard and full of scales, according to the saying of \textit{Virgil};

\begin{quote}
\textit{Absint et pisii squalemia terra Lacerti.}
\end{quote}

\textit{In English thus;}

\textit{Those put away}

\textit{And painted Lizards with their scale back.}

The colour of it is pale, and distinguisht with certain rusty spots, as \textit{Pliny} wroteth, with long strakes or lines to the tail; but generally they are of many colours, but the green with the white belly living in bushes, hedges, and is the most beautifull, and most respected; and of this we shall peculiarly intrett hereafter. There have been some Lizards taken in the beginning of September, whole
Thefe little Lizards do differ from the Stheniions in this, that they have blood in their veins, and they are covered with a hard skin winking with the upper eye-lid. All manner of Lizards have a cloven tongue, and the top thereof is somewhat hairy, or at the leafe divided like the feather and figure of their hair. Their teeth are also as small as hair, being black, and very sharp, and it seemeth also they are very weak, because when they bite, they leave them in the wound. Their lungs are small and dry, yet apt to swell and receive wind by inflammation: their belly is uniform and simple, their intrails long, their Milt round and small, and their tongues cleave inwardly to their loyans; their tail is like the tail of a Serpent; and it is the opinion of Aesop, that the same being cut, growth again. The reason whereof is given by Cardan, because imperfect creatures are full of moistnesse; and therefore the parts cut off do easily grow again. And Pliny reporteth that in his days he saw Lizards with double tails, whereunto Americus Vespucius agreeth, for he faith, that he saw in a certain Illand not far from Lipob, a Lizard with a double tail. They have four feet, two behind and two before, and the former feet bend backward, and the hinder feet forward, like to the knees of a man.

Now concerning the different kinds of Lizards, I must speake as briefly as I can in this place, wherein I shall comprehend both the Countreys wherein they breed, and also the severall sorts, with some other accidents necessary to be known. There is a kind of Lizard called Gallur, or Uel, and Aquaril, with the dung whereof the Persians do cure little pimples and spots in the face, and yet Belwomis maketh a quedinon, whether this be to be referred to the Lizards or not, because Lizards are not found but in the Countrey, out of Cities, and there are found every where.

There is also another kind of Lizard called Lacertum Muralinis, which being salted, with the head and purple Wool, Oyl of Cedar, and the powder of burnt Paper, do put into a llench cloth, and rubbed upon a bald place, do cause the hair that is fallen off to come again. There be other Lizards, called by the Crecianes Amea, and by the Latinnes, Lacertio Fimbriae, which continually abode in green corn; these burned to powder, and the same mixed with the bell wine and honey, do cure blinded eyes by an ointment.

Alcucrum writeth, that a friend of his worthy of credit, did tell him that he had seen in Providence, a part of France, and also in Spain, Lizards as big as a mans fist, thick, but not very long, and these did inhabit hollow places of the earth, and that many times when they perceived a man or beast pass by them, they would suddenly leap up to his face, and at one blow pull off his cheeks. The like also is reported of Persians in France, where there be Lizards as great as little Puppres, and that the people of the Country do seek after their dung, or excrements, for the sweetnesse and other vertues thereof.

In Lybia there are Lizards two cubits long, and in one of the Fortunate Islands called Capetia, there are also exceeding great Lizards.

In the Illand of Difforites, near to Arabja the leffer, there are very great Lizards, the flesh whereof the people eat, and the fat they seethe, and use in stead of Oyl; these are two cubits long, and Rama know not whether they be the same which the Ancientes call Taby, and live in the deferts of Lybia. They drink nothing at all, for water is present death unto them, so that a man would think that this Serpent were made all of fire, because it is so perfectly driued with water. Being killed they contain no blood out of it, neither hath it any poynon but in the head and tail. This the people hunt after to eat, for the tale of the flefe is like the tale of Frogs flefe, and when it win the hole or den, it is very hardly drawn forth, except with spades and mattocks, whereby the passages are opened, and being abroad it is swift of foot.

The Lizards of Indja, especially about the Mountain Nila, are 24 feet in length, their colour variable, for their skin seethe to be flourished with certain pictures, fote and tender to be handled. I have heard that there hangeth a Lizard in the Kings house at Paris, whose body is as thick as a mans body, and his length or stature little leffe; it is said it was taken in a prison or common Gaole, being found sueting the legs of prisoners: and I do the rather belieue this, because I remember such a thing recorded in the Chronicles of France, and also of another somewhat leffer, preferred in the same City, in a Church called Saint Antionies. And to the intent that this may seeme no strange nor incredible thing, it is reported by Velatianus, that when the King of Portugal had conquered certain Illands in Ethiopia, in one of them they flew a Lizard, which had devoured or swallowed down a whole infant, so great and wide was the mouth thereof: it was eight cubits long, and for a rare miracle it was hanged up at the gate Flamentanus in Rome, in the roof, and dedicated to the Virgin Mary. Besides thefe, there are other kinds of Lizards, as that called Lacerta vermicularis, because it lieth upon Worms and Spiders, in the narrow walls of old buildings. Also a silver-colored Lizard, called Lacson, living in dry and fun-thining places. Another kind called Sendrom, and Aletes, and Sennecia. Seen is a red Lizard, as Sibuation writeth, but I rather take it to be the Scink, or Crocodile of the earth, which abound near the red Sea.

There whole colour was like Brass, yet dark and dusky, and their belly partly white, and partly of an earthly colour, but upon either side they had certain little pricks or spots like printed Starees: their length was not pass four fingers, their eyes looked backward and the holes and passages of their ears were round, the fingers of their feet were very small, being five in number, both before and behind, with small nails, and behind that was the longest which flanched in the place of a man fore-finger, and one of them flanched different from the other, as the thumb doth upon a mans hand, but on the forefeet all of them flanked equally, not one behind or before another.

Thefe little Lizards do differ from the Stheniions in this; that they have blood in their veins, and they are covered with a hard skin winking with the upper eye-lid. All manner of Lizards have a cloven tongue, and the top thereof is somewhat hairy, or at the leafe divided like the feather and figure of their hair. Their teeth are also as small as hair, being black, and very sharp, and it seemeth also they are very weak, because when they bite, they leave them in the wound. Their lungs are small and dry, yet apt to swell and receive wind by inflammation: their belly is uniform and simple, their intrails long, their Milt round and small, and their tongues cleave inwardly to their loyans; their tail is like the tail of a Serpent; and it is the opinion of Aesop, that the same being cut, growth again. The reason whereof is given by Cardan, because imperfect creatures are full of moistnesse; and therefore the parts cut off do easily grow again. And Pliny reporteth that in his days he saw Lizards with double tails, whereunto Americus Vespucius agreeth, for he faith, that he saw in a certain Illand not far from Lipob, a Lizard with a double tail. They have four feet, two behind and two before, and the former feet bend backward, and the hinder feet forward, like to the knees of a man.
Of the Lizard.

There is also another kind of Lizard called Lacertus Solaris, a Lizard of the Sun, to whom Epiphanus compreareth certain Hereticks called Sampels, because they perceive their eye-fight to be dim and dull. They turn themselves falling in their Caves to the East, or Sun-rising, whereby they recover their eye-fight again.

The picture of the Lizard with the belly upward.

In Sarmatia, a Country of the Rutens, there is a Province called Samogitia, wherein the Lizards are very thick, black, and great, which the foolish Country people do worship very familiarly, as the Gods of good fortune; for when any good befalleth them, they entertain them with plentiful banquets and liberal cheer: but if any harm or mischief happen unto them, then they withdraw that liberality, and intreat them more courtely, and fo these Lizards people think to make these Lizards by this means, more attentive and vigilant for their welfare and prosperity.

In the Province of Cataia, subject to the Tartars, there are very great Lizards, (or at least wife Serpents like Lizards) bred, containing in length ten yards, with an answerable and correspondent compass and thicknesse.

Some of these want their fore-legs, in place whereof they have claws like the claws of a Lyon, or talons of a Falcon. Their head is great, and their eyes are like two great loaves. Their mouth and the opening thereof is wide, as it may swallow down a whole man armed, with great, long, and sharp teeth, fo as never any man or other creature durt without terror look upon that Serpent. Wherefore they have invented this art or way to take them.

The Serpent useth in the day time to lie in the Caves of the earth, or else in hollow places of Rocks and Mountains. In the night time it cometh forth to feed, ranging up and down seeking what it may devour, neither sparing Lyon, Bear, nor Bull, or smaller beast, but eateth all he meeteth with until he be satisfied, and returneth again to his den. Now for as much as that Country is very soft and miry: the great and heavy Buik of this Serpent maketh as it were a Ditch by his weight in the sand or mire, so as where you fee the trailing of his body, you would think there had been rowled some great vessel full of Wine, because of the round and deep impression it leaveth in the earth.

Now the Hunters which watch to destroy this beast, do in the day time slaine sharp flakes in the earth, in the path and passage of the Serpent especially near to his hole or lodging, and these flakes are pointed with sharp Iron, and are covered in the earth or sand, whereby it cometh to paife, that when in his worsted manner he cometh forth in the night: because (as the ancients say) man is a beast, he unawares fetteth his beasts, or else mortally woundeth his belly upon one of those sharp-pointed flakes. Which thing the Hunters lying in wait observing do presently upon the firft noise with their swords kill him if he be alive, and so take out his gall which they fell for a great price, for therewithal the biting of a mad Dog is cured, and a woman in labor failing but a little of it, is quickly discharged of her burthen. It is good also against the Hemroids and Piles. Furthermore, the flesh of this Serpent is good to be eaten, and these things are reported by Pausanias Venetus, and this story following.

As Americus Vespucius layed in his Journey from the Fortunate Islands, he came unto a Country where he found the people to feed upon foeflike the flesh of a Serpent; & afterwards they found this beast to be in all things like a Serpent without wings, for they few divers of them alive, taken and kept by the people to kill at their own pleasure. The mouths whereof were fast tied with ropes, so as they could not open them to bite either man or beast, and their bodies were tied by the legs. The aspect of these beasts was fearful to his company, and the strangers which did behold it, for they took them to be Serpents, being in quantity as big as Roe-bucks, having long feet and strong claws, a speckled skin, and a face like a Serpent: from the nose to the tip of his tail, all along the back there grew a bristle, as it were the bristle of a Bore, and yet the said Nation feedeath upon them, and because of their similitude with Lizards, I have thought good to infer their relation among the Lizards in this place, leaving it to the further judgement of the Reader, whether they be of this kind or not.

In Carebut there are Serpents also, or rather beasts remaining in the fenny places of the Countrey, whose bodies are all pild without hair like Serpents: also in their mouth, eyes, and tail they resemble them, and in their feet Lizards, being as great as Boars, and although they want poyson, yet are their...
their teeth very hurtful where they fallen them. Like unto these are certain others bred in *Hispaniola*, in an Island called *Hyuana*, having prickles on their back, and a comb on their head, but without voice having four feet, and a tail like Lizards, with very sharp teeth. They are not much greater then Hares or Conies, yet they live indifferently in trees, and on the earth, being very patient, and inducing tamine many days. Their skin smooth and speckled like a Serpent, and they have a crop on the belly from the chin to the breast, like the crop of a Bird.

Beside these, there are also some called *Ba-bati*, about the bignesse of Conies, and of a white aht colour, yet their skin and tail like a Snake, and they resemblé trapped Horres. They have four feet, and with the foremost they dig them holes in the earth, out of which they are drawn again like Conies to be eaten of men, for they have a pleasant tall. To conclude, we do read that in the year 1543 there came many winged serpents and Lizards into Germany, neer Syria, and did bite many mortally: And in the year 1551 there were such bred in the bodies of men and women, as we have heared already in the general discouer of Serpents, first of all recorded in the beginning.

In all the nature of Lizards, there is nothing more admirable then that which is reported of them by *Elius* of his own knowledge. When a certain man had taken a great fat Lizard, he did put out her eyes with an Infrument of Brass, and fo put her into a new earthen pot, which had in it two small holes or passages, big enough to take breath at, but too little to creep out at, and with her moist earth and a certain hearb, the name whereof he doth not express; and furthermore, he took an Iron Ring, wherein was set an *Engagatus* Stone, with the Picture of a Lizard ingraven upon it. And besides, upon the Ring he made nine several marks, whereof he put out every day one until at the last he came at the ninth, and then he opened the pot again, and the Lizard did fee as perfectly as ever he did before they were put out: whereof *Albttus* enquiring the reason, could give none, but having read in *Isidow*, that when the Lizards grow old and their sight dim or thick, they enter into some narrow hole of a Wall, and so fet their heads therein, directly looking towards the East or Sun rising, and so they recover their sight again. Of this *Albttus* giveth good reason, because he faith, the occasion of their blindness cometh from frigidity congeiating the humor in their eyes, which is afterward attenuated and dissolved by the heat and heat of the Sun. The voyage of the Lizard is like the voyage of other Serpents, and if it happen that any man by chance do cut the body of the Lizard alundur, so as one part falleth from another, yet neither part dyeth, but goeth away upon the two legs that are left, and live apart for a little space, and if it happen that they meet again, they are so firmly and naturally conjoynd by the secre Operation of nature, as if they had never been lacerated, only the scar remaneth.

They live in caves of the earth, and in graves, and the green Lizards in the fields and Gardens, but the yellowish or earthy brown Lizard aniong hedges and thorns. They devour any thing that comes to their mouth, especially Bees, Emmets, Palmer-worms, Greathoppers, Locusts, and such like things, and four months of the year they lie in the earth and eat nothing.

In the beginning of the year about *March*, they come out again of their holes, and give them selves to generation, which they perform by joyning their bellies together, wreathing their tails together, and other parts of their bodies; afterwards the female bringeth forth Eggs, which the commuteth to the earth, never sitting upon them, but forgereth in what place they were laid (for the hast of her memory.) The young ones are conceived of themselves by the help of the Sun. Some there be which affirm that the old one devoureth the young ones aflfo as they be hatched, except one which the sufereth to live, and this one is the baftel and moft dullard, having in it least spirit of all the rest: yet notwithstanding, afterwards it devoureth both his parents, which thing is proved faile by *Albttus*, for seeing they want memory to finde out their own Eggs, it is not likely that they have so much understanding as to discern their own young ones, nor yet so unnatural as to destroy the noblest of their brood, but rather they shoule imitate the Crocodile, which killeth the baftel and spareth the rest spirits.

It is affirmed, that they live but half a year or six months, but it is also faile, for they hide themselves the four coldest moneths; and therefore it is likely that they live more then fix, for else what time should they have for generation? Twice a year they change their skin, that is in the Spring and Autumn, like other Serpents that have a soft skin, and not hard like the Tortoises. Their place of conception and emission of their Eggs is like to Birds: and therefore it is a needhee quetition to enquire whether they bring egges forth of their mouth or not, as some have foolishly affirmed, but without all warrant of truth or nature.

They live by couples together, and when one of them is taken, the other waxeth mad, and ragesh upon him that took it, whether it be male or female: In the Old Testament Lizards, Weasels, and Mice are accounted impure beasts, and therefore forbidden to be eaten, not only because they live in Graves and defign incontinency of life, but also thieves and treacherous perons. They are afraid of every noise, they are enemies to Bees, for they live upon them; and therefore in ancient time they mixed Meal and Joyce of Mallows together, and laid the fame before the Hives, to drive away Lizards and Crocodiles. They fight with all kinde of Serpents; also they devour Snails, and contend with Toads and Scorpions. The Night-owls and Spiders do destroy the little Lizards, for the Spider doth so long wind the third about the jaws of the Lizard, that he is not able to open his mouth, and then she fatteneth her flings in her braces. The Toads are also enemies to Lizards, according to this saying of the Poet;
Of the green Lizard.

Serpentes eicona pullus
Nutrit & inventus per deviatur lucetas.

In English thus;
With Lizards young and Serpents breed,
The Stork seeketh her young ones to feed.

Notwithstanding, that by the law of God, men were forbidden to eat the Lizard, yet the Troglodytes, Ethiopians, did eat Serpents and Lizards, and the Amazons did eat Lizards and Tortoises, for indeed those women did use a very thin and flender diet; and therefore Calum doth probably conjecture, that they were called Amazons, because Marathon natura, that is, they wanted all manner of delicate fare. We have also heard already, that the Inhabitants of Dioscurides Illy, do eat the flesh of Lizards, and the fat after it is boiled, they use in Reid of Oyl.

Concerning the venom or poison of Lizards, I have not much to say, because there is not much thereof written: yet they are to be reprehended which deny they have any poison at all, for it is manifest, that the flesh of Lizards eaten, (I mean of such Lizards as are in Italy,) do cause an inflammation and apoplexyation, the heat of the head-ache, and blindness of the eyes. And the Eggs of Lizards do kill speedily, except there come a remedy from Faulkons dunse and pure Wine. Also when the Lizard bite, he leaveth his teeth in the place, which continualy atheth, until the teeth be taken out: the cure of which wound is first to suck the place, then to put into cold water, and afterward to make a plaster of Oyl and Ashes, and apply the same thereunto. And thus much for the natural description of the Lizard.

The medicines arising out of the Lizard, are the same which are in the Crocodile, and the flesh thereof is very hot: wherefore it hath vertue to make fat, for if the fat of a Lizard be mixed with Wheat-white, Halimitre, and Cumin, it maketh Hens very fat, and they that eat them much fatter: for Cardan faith, that their bellies will break with fatness, and the same given unto Hawks, maketh them to change their feathers.

A Lizard dissected, or the head thereof being very well beaten with Salt, draweth out Iron points of nails, and splents out of the flesh or body of man, if it be well applied thereunto, and it is also said, that if it be mingled with Oyl, it caueth hair to grow again upon the head of a man, where an Ulcer made it fall off. Likewise a Lizard cut afunder hot, and so applied, cureth the itching of Scorpions, and taketh away Wens.

In ancient time with a field-lizard dried and cut afunder, and so bruised in pieces, they did draw out teeth without pain; and with one of these sod and stamped, and applied with Meal or Frankencife to the fore-head, did cure the watering of the eyes.

The same burned to powder, and mixed with Cretick Honey by an Ointment, cureth blindness. The Oyl of a Lizard put into the ear, helpeath deafneffe, and driveth out Worms if there be any thereini. If children are anointed with the blood falling, it keepesth them from fwellings in the belly and legs: also the liver and blood lapped up in Wooll, draweth out nails and thorns from the flesh, and cureth all kinde of freckles, according to this verle of Serenm:

Versus componerit sagus curare Lacota.
That is to say;
The blood of Lizards can,
Cure freckles in a man.

The urine (if there be any at all,) helpeath the Rupture in Infants. The bones taken out of the Lizards head in the full Moon, do scarifie the teeth, and the brain is profitable for suffusions: The liver laid to the gums, or to hollow teeth, eache all pain in them. The dung purgeth wounds, and also taketh away the whiteneffe and itching of the eyes, and so sharpeneth the sight, and the same with water, is used for a salve. Arnilium doth much commend the dung of Lizards mixed with Meal, the black thereof being call out, and so dryed in a furnace, and softned again with water of Nitre, and froth of the Sea, afterwards applied to the eyes in a cloth, is very profitable against all the former evils. And thus much shall suffice to have spoken of the first and vulgar kinde of Lizards: for killing of whom Apollo was in ancient time called Sauloius.

of the GREEN LIZARD.

The greater Lizard which is called Lacota Viridis, the green Lizard, by the Grecians, Chlorosaura; by the Italian, Gre, and by the German, Gruner Haylix, is the same which is called Opikomas-cbus, because it fighteth with Serpents in the defence of man. They are of colour green, from whence they are named, and yet sometimes in the Summer they are also found pale. They are twice so big as the former Lizard, and come not neer houses, but keep in Medows and green fields. They only abound in Italy, and it is a beast very loving and friendly unto man, and an enemy to all other Serpents. For if at any time they see a man, they instantly gather about him, and laying their heads at the one side, with great admiration behold his face: and if it chance a man do spitt, they lick up the spittle
The History of Serpents.

Spittle joyfully, and it hath been seen that they have done the like to the urine of children, and they are also handled of children without danger gently licking moisture from their mouths. And if at any time three or four of them be taken, and so let together to fight, it is a wonder to see how eagerly they wound one another, and yet never let upon the man that put them together.

If one walk in the fields by hollow ways, bushes, and green places, he shall hear a noise, and see a motion as if Serpents were about him, but when he looketh earnestly upon them, they are Lizards wagging their heads, and beholding his person: and so if he go forward they follow him, if he stand still they play about him. One day (as Brafimus writeth) there was a Lizard seen to fight with a Serpent in the mouth of his own Cave, and whilst certain men beheld the same, the Lizard received a wound upon her cheek by the Serpent, who of green, made it all red, and had almost torn it all off, and so hid herself again in her den. The poor Lizard came running unto the beholders, and showed her bloody side, as it were desiring help and commiseration, standing still when they stood still, and following when they went forward, so that it acknowledged the sovereignty of man, appealing unto him as the chief Justice, against all his enemies and oppressors.

It is reported by the Iturims, that many times while men fall asleep in the fields, Serpents come creeping unto them, and finding their mouths open, do slide down into their stomachs: Wherefore, when the Lizard feeth a Serpent coming toward a man so sleeping, she waketh him, by gently scratching his hands and face, whereby he escapeth death and deadly poyson.

The use of these green Lizards, is by their skin and gait to keep apples from rotting, and also to drive away Caterpillars, by hanging up the skin on the tops of trees, and by touching the apples with the said gall: also when the head, feet or inwards are taken away, the flesh of the green Lizard is given in meat to one that hath the Sciatica, and thus much for the natural uses of the green Lizard.

The remedies arising out of this Lizard, are briefly these: First it is used to be given to Hawks, and to be eaten in small pieces, provided so as it be not touched with their talons, for it will hurt their feet, and draw their claws together; also they feed it in water, then beat it in a mortar. Lastly, when they have poured warm water upon it, they let the Hawk wash her feet in it, and so causteth her to cast off her old feathers and coat, and bringeth a new in the room thereof. This Lizard eaten with juices to take away the loathing thereof, is good for the Falling-evil: and being sod in three pints of Wine, until it be but one cup full, and thereof taken every day a spoonful, is good for them that have a disease in the lungs. It is also profitable for them that have pain in the loins. And there are many ways to prepare it for the eyes, which I will not here to relate in this place, because they are superfluous, and therefore likely to do more harm then good to the English Reader.

There is an Oyl made of Lizards, which is very precious: and therefore I will describe it as I finde it in Brafiumus. Take seven green Lizards, and strangle them in two pounds of common Oyl, therein let them take three days, and then take them out, and afterwards use this Oyl to anoint your face every day, but one little drop at once, and it shall wonderfully amend the same. The reason hereof is, because it is taken from the operation of the dung or excrements, because that hath vertue to make the face white, and to take away the spots.

If the upper part in the pattern of a Horſe be broken, put thereto this Oyl with a little Vinegar, then rub the hoof about therewith, so shall it increafe and grow again, and all the pain thereof shall passe away. The making of the medicine is this: Take a new earthen pot, put thereto into three pints of Oyl, wherein you must drown your Lizards, and so feethe them till they are burned away, then take out the bones, and put in soft Limes half a pound, liquid Pitch a pint, of Swines grease two pound; then let them be allfod together again afterwars prepared, and used upon the hoof as need shall require: for it shall soften and harden the Horſes hoof, and there is nothing better for this purpose then this Oyl. The ashes of a green Lizard do reduce stars in the body to their own colour.

The bones of a green Lizard are good against the Falling-evil, if they be prepared in this manner following: Put your green Lizard alive into a vessel full of Salt, and there shut it in safe, so in few days it will consume all the flesh and inwards from the bones, and so the bones may be taken and used in this case like the hoof of Elk, which are very precious for this sicknesse, and no lesse precious are these bones. The bleed doth cure the beating, bruises, and thick skins in the feet of men and beasts, being applied in flocks of Wooll.
Of the Cenchrine.

The eye is superstitiously given to be bound to ones arm on a quartane Ague, and the eyes pressed out alive, and to included in golden buttons or bullets, and carried about, do also help the pain of the eyes, and in default hereof the blood taken out of the eyes in a piece of Purple wool, hath the fame operation. The heart of a Lizard is also very good against the exuberations of the King's evil, if it be but carried about in the boosome in some small silver vessel. The gall taketh away the hairs upon the eye-lids that are unequely, if it be dryed in the fame to the thicknesse of Honey, especially in the Dog-days, and mixed with White-wine, then being anointed upon the place, it never suffereth the hairs to grow again. And thus much for the History of the green Lizard.

**of the Millet or Cenchrine.**

This Serpent called by the Grecians Cenchros, Cenchribes, Cenchidion, and Cenchrites; is by the Latines called Cenchris, Cenchrus, and Millesio: because it cometh abroad at the time that Millet-feed flourith, and is ready to ripe, or else because it hath certain little spots upon it like Millet-feed, and is also of the fame colour. It is likewise barbarously called Famuls, Aracis, and Faltisia. The Germans of all others have a name for it, for they call it Funten-februn and Beeg-februn. Other Nations not knowing it cannot have any name for it, and therefore I cannot assign any thereof, except I should lie grossily in the beginning of the History. This Serpent is only bred in Lemno and Samebra, and it is there called a Lyon, either because it is of very great quantity and bignesse, or else because the scales thereof are spotted and speckled like the Lysiion Lyon, or because when it fighteth the tail is turned upward like a Lyon's tail, and as a Lyon doth. But it is agreed at all hands, that Gillius, it is called Millesio, a Millet, because in the spots of his skin and colour it resembleth a Millet-feed, Lucian, which causeth the Poet to write on this manner;

Platibis ille notis variatim tingitur alvum,
Quam parvis tinctum maculis Thebamnse Ophis.

In English thus;

**With many notes and spots, his belly is bedded.**

Like Tethamn her, Ophites sightly tried.

But not only his belly, for his back and whole skin is of the same fashion and colour. The length of this Serpent is about two cubits, and the thick body is attenuated toward the end, being sharp at the tail. The colour is dusky and dark like the Millet, and it is then most ireful and full of wrath or courage, when this herb or seed is at the hight. The pace of this Serpent is not winding or travelling, but upright, and directed without bending to and fro: and therefore faith Lucian: Ex forem reflato lapsum limite Cenchris; that is, And the Millet always standing in a straight and right line, and for this cause when a man flyeth away from it, he must not run directly forward, but winde to and fro, crooking like an Indenture, for by reason thereof this Serpents large body cannot so easilie and with the like speed turn to follow and perfue, as it can directly forward.

It is a very dangerous Serpent to meet withal, and therefore not only the valiantest man, but also the strongest beast, is, and ought judiciously to be afraid thereof, for his treacherous deceit and strength of body, for when it hath gotten the prey or booby, he beclapeth it with his tail, and giveth it fearful blows, in the mean time fallenneth his jaws or claps to the man or beast, and tucketh out all the blood till it be fully satisfied; and like a Lyon lie besteth also his own sides, setting up the spires of his body when he affalthe any adversary, or taketh any repulsing booby. I taketh this to be the same called in Sicilia, Serpa fera, which is sometimes as long as a man, and as great as the arm about the
The History of Serpents.

Of the NEVTE or WATER-LIZARD.

This is a little black Lizard, called Watermell, Wateradder, that is a Lizard of the Water. In French, Taille; and in Italian Marasoldo, which word is derived from Marsa, a Viper, because the poyson hereof is like the poyson of Vipers, and in the Greek it may be termed Eundros Savari. They live in standing waters or pools, as in ditches of Towns and Hedges. The colour as we have said is black, and the length about two fingers, or scarfe so long. Under the belly

it is white, or at least hath some white small spots on the sides and belly: yet sometimes there are of them that are of a dully earthy colour, and towards the tail yellowish. The skin is strong and hard, so as a knife can scarce cut the same, and being cut, there issueth out a kinde of white matterly liqur, like as is in Salamanders.

Being taken, it suffeth the mouth so hard as it cannot be easily opened, neither doth it endure to bite, although it be plucked and provoked. The tongue is very short and broad, and the teeth so short and small, as they are scarcely visible within the lips. Upon the fore-feet it hath four fingers or claws, but upon the hinder-feet it hath five. The tail standeth out betwixt the hinder-legs in the middle, like the figure of a wheel-whirl, or rather so contracted, as if many of them were conjoin'd together, and the void or empty places in the conjonctions were filled. The tail being cut off, liveth longer then the body, as may be seen in every days experience, that is, by motion giveth longer signes and token of life.

This Serpent is bred in fat waters and foils, and sometimes in the ruines of old walls, especially they delight in white muddy waters, hiding themselves under stones in the same water if there be any, and if not, then under the banks side of the earth, for they seldom come to the land. They swim underneath the water, and are rarely seen at the top. Their eggs are not so big as peafe, and they are found hanging together in clutters. One of these being put alive into a glasse of water, did continually hold his head above the water like as Frogs do, so that thereby it may be conjectured it doth often need respiration, and keepeth not under water except in fear, and seeking after meate.

There is nothing in nature that so much offendeth it as Salt, for so soon as it is laid upon Salts, it endeavoureth with all might and main to run away, for it biteth and stingeth the little beasts above measure, so that it dyeth sooner by lying in Salt where it cannot avoid, then it would by suffering many tippes, for being beaten it liveth long, and dyeth very hardly. It doth not like to be without water, for if you try one of them, and keep it out of water but one day, it will be found to be much the worse.

Being moved to anger, it standeth upon the hinder-legs, and looketh diretly in the face of him that hath flirred it, & so continueth til all the body be white, through a kind of white humor or poyson, that it swelleth outward, to harn (if it were possible) the perfon that did provoke it. And by this is their venemous nature observed to be like the Salamander, although their continual abode in the water, maketh their poyson the more weak.

Some say that if in France a Hog do eat one of thefe, he dyeth thereof, and yet doth more safely eat the Salamander. But in England it is otherwise, for I have seen a Hog without all harm carry in his mouth a Newt, and after ward eat it. There be some Apothecaries which do use this Newt in head
Of the Pelias.

Aetius making mention of the Elytra and Pelias, two kinds of Serpents, doth jointly speak of them in this sort, saying that the signes of these Serpents were so common and vulgarly known, that there was no descriptions of them among the ancient Writers. But the Pelias biting caufeth putrefaction about the wound or bitten place, but yet not very dangerous, and it bring-eth obfufcation or dimneffe to the eyes, by reason that as the poyfon is universally diſtributed over all the body, fo it hath most power over the tenderest part, namely the eyes. It is cured by a Pri-fine with Oyl in drink, and a decoction of such Docks as grow in ditches, and other simple medi-cines, such as are applyed to the curing of the Yellow-jaundife. The eyes muft be wafted with the urine of a childe or young man which never knew any woman carnally, and this may be applyed either simply and alone, or elfe by Brine and Pickle, fo alfo muft the head. After that the body is purged, anoint it with Ballamum and Honey, and take an Eye-falve to fharpem again and reco-ver the light, and for this caufe it is very good to weep, for by evacuation of tears, the venom alfo will be expellèd. But if the eyes grow to pain, then let their Eye-falve be made more temperate and gentle, to keep the head and brain from putrefaction. And thus much for the Pelias out of Aetius.

Of the Porphyre.

Here is among the Indias a Serpent about the bignefse of a span or more, which in outward aspect is like to the most beautiful and well coloured Purple, the head hereof is exceeding white, and the Serpent is fought for in the highest Mountains, for out of him they take the Sardius Stone. And although he cannot bite because he wanteth teeth, yet in his rage when he is perfected, he caufeth a certain poyfon by vomit, which caufeth putrefaction where ever it lighteth. But if it be taken alive and be hanged up by the tail, it rendereth a double, one whiles it is alive, the other when it is dead, both of them black in colour, but the firft reftemblèth black Amber. And if a man take but so much of the firft black venom as is the quantity of a Sema-fine seed, it killeth him prefently, making his brains to fall out at his noftrels, but the other worketh neither fo speedily, nor after the fame manner; for it caufeth one into a Conufption, and killeth within the compaffe of a year. But I finde Pelias, Volateran, and Textor to differ from this relation of Ctesias, for they fay, that the firft poyfon is like to the drops of Almond trees, which are conteined into a gum, and the other which cometh from it when he is dead, is like to thin matte-ry water. Unto this Porphyre I may add the Palmer Serpent, which Strabo wrieth doth kill with an unrecoverable poyfon, and it is alfo of a Scarlet colour, to the loyins or hinder-parts.

Of the Prester.

Although there be many Writers which confound together the Prester & the Diplas, and make of them but one kinde, or Serpent of divers names, yet feeing on the contrary there he as many or more which do diſtinguish or divide them, and make them two in nature different, one from another, the Diplas killing by thief, and the Prester by heat, as their very names do signifie, therefore I will alfo trace the feeps of this latter opinion, as of that which is more probable and confor-mant to truth.

The Grecians call it Prester of Prethias, which signifieh to burn or inflame, and Tremellina and Iovius think, that the Serpents called fiery Serpents, which did fhing the Iovius in the Wilde-nergy, were Presters. We finde in Suidas, Prester for the fire of Heaven, or for a cloud of fire carried about with a vehement strong winde, and sometimes lightenings. And it feemeth that this is indeed a fiery kinde of Serpent, for he himself always goeth about with open mouth, panting and brea-thing as the Poet wrieth:

Oraque defiderant amorum fumantia Prester,
Ieficat ut fera tumida membra graet.  
Which may be Englifhed thus;

The greedy Presters wide-open foming mouth  
Ieficat, and swelleth, making the members by heat unweal.

When this Serpent hath truch or wounded, there followeth an immeasurable swelling, diffra- 
ction,conversion of the blood to matter, and corrupt inflammation taking away freedom or catineffe of
The History of Serpents.

of aspiration, likewise dimming the sight, or making the hair to fall off from the head; at last suffocation as it were by fire, which is thus described by Montanus upon the person of one Narfudus, saying as followeth;

Which may be thus Englished;

Lo suddenly a divers fate the joyful current fayed,
Narfidus, which Marsfinius mirror did adore,
By burning finge of fcoroping Preder dead was laid,
For fiery colour his face enfamed, not at before.
The first appearing vifage faid, alt was out-fietcht,
Swelling cover'd all, and bodies groffiffe doubled
Surpassing humane bounds and members all are reache,
Affright venum spreades matter blown in caraffe troubled.
The man lyeth down within fouthe bodies bankes,
No girdle can his monftrous growth contain,
Not fo are waters swain with rage of fandy flanks,
Nor falls bend down to blufpering Corus main.
Now can it not the swelling fines keep in bold,
Deformed globe it is in, and trunk ore-come with weight,
Untouched of flying Fowles, no beaks of young or old.
Do him dare eat, or beaks full wide upon the body bait,
But that they die. No men to bury in earth or fire.
Durst once come nigh, nor fain'd to look upon that bafphes cafe,
For never ceased the beat of corps though dead to fell,
Therefore afraid they ran away with bodey pace.

The cure of the poyfon of this Serpent, is by the Phystians found out to be wilde Pur flain, also the flowers and italk of the busb, the Beavers bone called Cofterum, drunk with Oppoponax and Rew in Wine, and the little Sprat-fish in diet. And thus much of this fire-burning venemous Serpent,

Of the RED SERPENT.

His kinde of Serpent being a Serpent of the Sea, was first of all found out by Pellicarius Bishop of Montpelier, as Randelius writeth, and although some have taken the name for the Myrus or Barrs, of which we have spoken already, yet is it manifest that they are deceived; for in both gills covered with a bony covering, and also fins to swim withal, much greater then those of the Myrus, which we have shewed already to be the male Lamprey. This Serpent therefore for the outward proportion thereof, is like to the Serpents of the land, but of a red or purphflh colour, being full of crooked or oblique lines, depending from the back to the belly, and dividing or breaking that long line of the back, which beginneth at the head, and so fietcheth forth to the tail.

The opening of his mouthe is not very great, his teeth are very sharp and like a saw; his gill like scaly fishes, and upon the ridge of his back, all along to the tail, and underneath upon the rise or brim of his belly are certain Limitis growing, or at the least thin small things like hairs, the tail being cut up in one undivided fine. Of this kind no doubt are those which Bellonius faith he saw by the lake Abydos, which live in the waters, and come not to the land but for sheep, for he affirmed that they are like land Serpents, but in their colour they are red spotted, with some small and dusky spots. Gillius also faith, that among the multitude of Sea Serpents, some are like Congers, and I cannot tell whether that of Virgil be of this kinde or not, spoken of by Lucan the Priest of Neptune.

Solemus taurum ingentem malis at ad avarat.
Ecce autem gemini & Teneo triangulam per alta
(Harrijcoseferent) immensis orbibus angues
Incumbens pelago; paraque, ad littera tendunt.

Peletra quem inter philus arcella, jubaque
Sanguine excuruant undas: pars caetera potum
Pone leges, junq鲭que immensa volumina tergo.

Fis sonans lusammenti solo, Gro.

Which
I will not contrary their opinion which reckon the Salamander among the kindes of Lizards, but leave the assurance as somewhat tolerable: yet they are not to be followed, or to be believed, which would make it a kinde of Worm, for there is not in that opinion either reason or resemblance. What this Beast is called among the Hebrews I cannot learn, and therefore I judge that the Jews (like many other Nations) did not acknowledge that there was any such kinde of creature, for ignorance bringeth infidelity in strange things and propositions.

The Greekes call it Salamandra, which word or term is retained almoft in all languages, especially in the Latine, and therefore Isidore had more boldnesse and wit, then reaion, to derive the Latine Salamandra, quos Poliocondrhum, refiling burning, for being a Greek word, it needeth not a Latine notation. The Arabianes call it Sazambras, and Samebras, which may well be thought to be derived or rather corrupted, from the former word Salamandres, or elle from the Hebrew word Sememit, which signifies a Stellion. Among the Italianes and Rhetians it retaineth the Latine word; and sometimes in Rhetius it is called Rerada. In the Dukedom of Savoy, Pluviana. In France, Saurd, Blaude, Albenne, and Arroisade, according to the divers Provinces in that Kingdom. In Spain it is called Salamandra; in Germany it is called by divers names, as Maal, and Pantier maal, Oim, Moll, and Mosh, because of a kinde of liquor in it like milk, as the Greek word Mophe, from amelgaio to suck milk. Some in the Country of Helenia do call it Quettettub. And in Albertus it is likewise called Rimatrix. And thus much may suffice for the name thereof.

The description of their several parts followeth, which as Avien and other Authors write, is very like a small and vulgar Lizard, except in their quantity, which is greater; their leggs taller, and their tail longer. They are also thicker and fuller then a Lizard, having a pale white belly, and one part of their skin exceeding black, the other yellow like Verdigreese, both of them very splendent and glittering, with a black line going all along their back, having upon it many little spots like eyes: And from hence it cometh to be called a Stellion, or Animalpallitum, a creature full of flars; and the skin is rough and bald, especially upon the back where those spots are, out of which as writeth the Schoelast, infueth a certain liquor or humor, which quencheth the heat of the fire when it is in the flame.

This Salamander is also four-footed like a Lizard, and all the body over it is fet with spots of black and yellow, yet is the flight of it abominable and fearful to man. The head of it is great, and sometimes they have yellowish bellies and tails, and sometimes earthy. It is some question among the learned, whether there have any disposition of sex, as whether there be in this kinde a male and a female. Pline affirmeth that they never engender, and that there is not among them either male or female, no more then there are among Eels. But this thing is jutly crossed, both by Belliumius and Agricola, for they affirm upon their own knowledge, that the Salamander engendereth her young ones in her belly like unto the Viper, but first conceiveth eggs, and the bringeth forth forty and fifty at a time, which are fully perfected in her womb, and are able to run or go loo soon as ever they be littered: and therefore there must be among them both male and female.

The Countries wherein are found Salamanders, are the Region about Trent, and in the Alpes, and sometime also in Germany. They most commonly frequent the coldest and moistest places, as in the shadow of Woods, in hedges neer Fountains and Rivers, and sometimes they are found among Corn and Thorns, and among Rocks. They are seldom seen except in either in the Springtime, or against rain, and for this cause it is called Animalverrata, and Paludiferum, a Spring or rainy creature. And yet there were many of them found together, in a hole neer unto the City Schnberg in Germany, in the month of February, for they love to live in rocks and troops together,
together, and at another time in November, a living Salamander was found in a Fountain. Howbeit, if at any time it be seen foraging out of his den or lodging place, it is held for an affured presage of rain. But if the Spring-time fortune to be cold or frosty, then they keep home, and go not visibly abroad.

Some do affirm that it is as cold as Ice, and that it therefore quencheth heat or fire like a piece of Ice, which if it be true, then is the old Philosophical Maxime utterly false, namely, that all living creatures are hot and moist, being compared to creatures without life and sense, for there is not any dead or fenelefe body that do quencheth fire as Ice doth. But the truth is, that the Salamander is cold, and colder then any Serpent, yet not without his natural heat, which being compared to Armans, may truly be said to be hot, and therefore the venom of the Salamander is reckoned among Septicks, or corroding things.

In naturally leathwet, and therefore some times in the Woods or near hedges, it sucketh a Cow that is laid, but afterwards that Cows udder or flock dryeth up, and never more yeeldeth anymore milk. It also greatly leathwet the Honey-combe, and some Authors have affirmed, that they life to gape after air or breath, like the Chameleon, yet they which have kept Salamanders in glasses, never perceived by them any such thing. They are blow of pace, and void ground very sluggishly, and therefore it is justly termed a heavy and slothful Beast.

But the greatest matter in the Salamander to be enquired after, is whether it can live and be nourished by and in the fire, or whether it can passe through the fire without any harm, or quench and put out the fame. Which opinions in the very relation and first hearing, do croffe one another, for how can that either be nourished or live in the fire, which quencheth the fame being put into it? *Artifalae* that never saw a Salamander himself, but wrote thereof by hear-say, hath given some colour to this opinion, because he writeth, *Nonnulla corpora esse animalium que igne non absamani Ser- mandrae documento eis: que (ut aiunt) ignem inamabilis eum exexituit.* That is to say, the Salamander is an evidence, that the bodies of some creatures are not wafted or consumed in the fire, for (as some say) it walketh in the fire and extinguisheth the fame.

Now whether this beexperimented so great a Philosopher, to write upon hear-say, who took upon him to gather all natural learning into his own Graunge or fore-house, and out of the fame to furnish both the present and all future ages, I leave it to the consideration of every indifferent Reader that shall peruse this story. I for mine own part, rather judge it to be lightneffe in him, to infer a matter of this consequence in the discourse of this Beau, without either Authors, or experience gathered by himself. This one thing I marvail at, why the Egyptians, when they will express or signific a Man burnt, do in their Hieroglyphicks paint a Salamander, except either fire can burn a Salamander, or else contrary to all their custom, they demontrate one contrary by another.

*Nicander* plainly affirmeth, that the Salamander doth without all harm passe through the fire, and the Scholastick addeth, that there are certain passages in the skin, out of which is issueth a kind of liquor that quencheth the fire: And he relateth a story of one *Andreas*, who did dip a piece of cloth in the bloud of a Salamander, and tried afterward whether it would burn or not, but did not finde that it would burn, wherefore he put it upon his hand, and thrust that into the fire, and then also he felt no manner of pain. And therefore the said *Nicander* calleth this creature *Copernum*, because of a certain fat humour which issueth out of it, quenching the fire, but I rather think that this fat humor maketh the skin to glistren, for if it were properly fat, it would rather kindle and increase the fire then quench or extinguish the fame.

*Snuder* followeth the common received opinion, that the Salamander quencheth the fire, (although it be not bred of the fire as Krickets are) like Ice: and when the fire is so quenched, it is in vain to blow or kindle the fame again with any bellows, as they fay have been tryed in the Forges of Smiths. And this also caused *Serenus* to write, *Secu Salamandra potent, nullis obvius flamme* : the potent Salamander is never hurt by flames. *Seneca* confeneth hereunto, and *Zosarmet*: and so great hath been the doatage about this opinion, that none have written that it ascendeth up to the fire near the Moon, far above the reach of the Eagles or wifcril Fowls. Thus fay they that write, and maintain the Salamanders abiding in the fire without harm. Now on the contrary, let us also hear their opinions, which deny this natural operation in the Salamander.

*Pliny* affirmeth, that in his own experience he found that a Salamander was consumed in the fire, and not the fire by it, for he faith he burned one to powder, and used the fame powder in medicines.

*Senec* also denyeth that it quencheth the fire, and unto this opinion agreeeth *Diocles*. *Aetius* writeth, that when it is first put into the fire, it divideth the flame, and passeth through speedily without harm, but if it tarry long therein it is burned and consumed, because the liquor or humidity thereof is wasted. And this also granted by *Galen*, *Theophrastus*, and *Nepetrus*. And *Matthais* affirmeth that he tryed the fame, and found that if burning coals were laid upon it, then it burned like unto any other raw flesh, but being cast into the fire, it burneth not speedily.

*Albertus* writeth, that there were some which brought to him a certain thing which they called Wool, and said that it would not burn, but he found it not *Lana*, Wool, but *Lampe*, that is, a vapoury adherency of a thing which flyeth from the stokes of hammers upon hot burning Iron, and being collected upon cloth, or cleaving to any part of the Forge, it there becometh in fiew like yellow with pale Wool.
The said Author affirmeth, that he took a Spider, and laid the same upon a hot burning Iron, where it continued unburned and unharmed without motion a great while, by reason of his thick skin and coldnefe, and unto another he suffer'd a little candle to be put, which infantly put it out. And for the fame caufes, that is to fay, both the thicknefe of the skin, and cold conftitution, com- pels it to pledge, that a Salamander can live fo long in the fire without burning or confufing to ashes: for indeed the skin thereof is fo hard, that it is cut or pierced with a knife with great difficulty; and fo when the force of the fire hath broken the skin, then alfo it fheweth forth a cold humor, which for a feaon keepeth the heat out. For this Earth is said to be very full of humor, and the certainty thereof may most manifestly appear by his full and groffe body, and alfo by this, that it is seldom feen to issue or come forth of his den, except it be againft rainy weather: and yet as the egges of other Serpents being call'd into a hot burning furnance, do for a feaon rest in the fame unburned, and yet are afterward consumed, fo is it with the Salamander.

There be fome that have found a web out of the hair growing upon Salamanders, which can by no means be fet on fire, but this is very fally, because the Salamander hath no hair upon it at all. And this kind of web rather cometh of a kind of flax that Pliny writeth of, or rather of the Amittus-flax, called the Abifis, which is foun'd in Cyprus, whereof they need to make coverings for the Thea- tres. This being call'd into a fire, seems to be fortheath withall in a flame, but being taken out again, it fhineith the more gloriously.

Some alfo do affirm, that fuch a piece of cloth or web, may be wrought out of the Salamanders skin, but Brofuius denyeth both the vertue of the flone, and of the Salamanders hide or shell, for he faith he tried the flone, and it would not be wrought into wooll or spun into thread, and when he call'd the Salamander's shell or hide into the fire, it burned, and the matterly cold liquor thereof did almoft flie into his face.

But fome then will demand, where had Pope Alexander that coat, which could not be purged but by fire, which made it alway as white as Snow, or that map or net at Rome, whereon (it is faid) the Napkin of our Saviour Christ is preferved, which men faie is not wafhed but in the fire, which thing was fent to a Bishop of Rome for a prefent from the King of Tartar. Unto whom I answer out of Paulus Venetus as followeth. There is a Province in Tartaria called Chinemiana, wherein a Mountain abounding with Mines of Steel and Copper; now in this Mountain there is a kind of earth digged up, which yeeldeth a thred like the thred of Wool. After the digging of it up they dry it in the Sun, and then beat it in a brazen mortar, afterward they spin it and weave it; in the same manner that they spin and weave other woollen cloth. After it is made, they have no means to purge it from spots or from filthinefs, but to call it into the fire for the space of an hour, and then it is taken forth again as white as any snow.

There is alfo an Allum called Alumen Scolae, and it is the fame which among the Ancients is called After fanum, out of which alfo is made cloth that cannot burn, by reaon of a certain Oyl that it containeth or yeeldeth to reflit the fire. So out of the flone Pyritis found in Kifbeha, there cometh out a green liquor prefied with dead coals, and after that, no fire can burn that cloth. There are alfo certain Mantles in Bohemia, (as witnefeth Agricola) which could never be burned. And out of Magnesita a fally flone in Boldercana, they make tables, which cannot be clenfed but by fire. It is alfo recorded, that the fore-named After fanum, and pitch quenched in the juice of Mallows or Mercury, being anointed upon a mans hand, doth keep them from burning, or fene of extraordinary heat. So Albertus writeth of a flone which he calleth Toulus, or Tofus, which I take to be a kind of the Arbifis or Amittus. And this flone is foun'd (as the fame Author writeth) in the farthest parts of Spain, near the Straights and Hercules-pilars.

And this thing femeth the leffe strange, because they which are anointed with Bird-lime, or elfe with Vinegar and the white of an egg, do not fo quickly feel the ftrength of fire and heat, when they thrust their hands into the midit of it. It is alfo found, that the hearts of them that die Zed, of the heart-burning difeafe, or elfe are killed by poyfon, cannot be burned with fire. And therefore when Germanicus Cæsar was dead, it being suspected that he was poyfoned by Pifio, they caft his heart into the fire and it would not burn, which thing was alledged againft him by Vitellius the Orator. And one Arriatius in an Epiffle which he wrote to Oflianus Augustus, faith, that there is a poyfon fo extreme cold, that it keepeth the heart of a man poyfoned therewith from burning, and if it lie long in the fire, it waxeth as hard as a flone, which fo concreted is calld Prodi- lus, from the force of the fire, and from the matter whereof it confifteth it is called an humane flone. He alfo faith, that this is red in colour, mixed with fome white, and is accounted precious, becaufe both it maketh a man that weareth it to be a Conqueror, and alfo preferveth him from all manner of poyfon.

When the Salamander is provoked, it callet forth a white matterly liquor or humer, and it is an audacious and bold creature, ftedling to his adversary, and not flying the fight of a man; and fo much the leffe, if it perceive that a man profeueth and follow it, to harm and kil it. The biting of it is very exeul and deadly, and therefore the French men use this fpice upon the biting of a Sa- lamander;

Si mordu'ta une oreilade, Fresun linteul & la fassade.

That
That is, if a Salamander bite you, then betake you to the coffin and winding sheet. The Ithetians do ordinarily affirm, that when a man is bitten by a Salamander, he hath need of as many Physitians as the Salamander hath spots. And Arnoldus faith, that it hath in it as many venoms and means of hurting, as it hath colours distinguished one from another. For when it once bite and fallenteth teeth, it never letteth go, and being pulled off, it leaveth the teeth behind, and then there never can be any remedy, and therefore it must be suffered to hang upon the wound until it fall off, either willingly or wearied, or else compelled by the medicines that the wounded patient receiveth. For by this means only is the patient kept alive; yet this is a way to be remembered, that the Salamander doth not always bite, although provoked, for Gemenz affirmeth, that he having two of them, could never by beating make them open their mouth, nor that in all his life did he ever hear of any man bitten by them.

And of this thing he not only gathereth the difference of time, wherein their rage floweth it self by biting, and when not, but also the difference of place and region, for that they bite in some Countries, and not in other. When they have bitten, there followeth a vehement pain and seach upon the place, for the cure whereof there must be taken a decoction of Frogs, and the breath must be drunk, and the flesh applied to the fore; or else other common remedies against the poyzon prescribed in the Treatise following.

The poyzon hereof is great, and not inferior to the poyzon of any other Serpent, for some times by creeping upon Apple-trees, it infecteth and poyzoneth all the fruit, so that those which eat the same, die and languish they know not whereof; and if the heel of a man do but touch any small part or portion of the pittle of a Salamander, it maketh all the hair of the body to fall off. The poyzon it self is not cold, as some have thought, but hot, like to the poyzon of Cantharides, and therefore to be cured by the same means, as by vomits, Glysters, Ephemeron, and such like. Only Swine do eat Salamanders without harm or damage, for there is in them a kind of resitance in nature, and yet if Man or Dog do chance to eat of that Swine that hath eaten a Salamander, it hath been observed that they perished by the same. And this poyzon spreadeth it self further the while it is dead, because it is strengthened by putrefaction, and Wine and Water wherein one of these lyeth dead, is empoyzoned and made mortal thereby to others. But in our days Salamanders are not so venomous, if there be any credit in Brafavolu, howbeit I have heard and read, that if at this day a Salamander get into a heap of corn, the so infecteth it, that whatsoever eateth of that corn, dyeth as it were of poyzon, and the King of Helvetia, which are sucked by Salamanders, do ever after remain barren, and without milk, and sometime also die they of that evil.

And as Arnoldus writeth, it causeth forth a certain matter white humor like milk out of the mouth, whereupon if a man of any other living creature do but tread, he is poyzoned thereby, and at the leaf, all the hair of their body falleth off, and in like fort they infect herbs and plants of the earth by their poyzon.

Sometimes it happeneth that beast or men have swallowed Salamanders, and then the tongue is inflamed, and all the body falleth into grievous torment, by cold corruption and putrefaction, part after part, and also pains in the fundament and in the stomach, likewise Dropsties, and Impfungation in the bladder, of the guts, and retention of the urine. For the cure whereof they give sweet water, Calamints, Saint Johns Wort, sod with the flesh of Pine-apples, leaves of Cyprifelle, Galbanus, and Honey or Rozen, Ammoniack, and Strias, New Cow-milk, the meal made of Flax-feed with sweet water, sweet Wine and Oyl to caufe vomits; Scammony, and a decoction of Calamints and Figs, cut Bacon or Hogs-fleth, and also the Eggies of a Tortoise, with the flesh thereof; besides infinite other remedies, ordained by the goodness of Almighty God, as Physitians know by their own studies and daily experiments. And therefore I hold it sufficient for me to have lightly touched them, referring those that are defirous to know more, unto the learned collection of Carromus.

Out of the Salamander it self ariseth also some medicines, for it hath a sepulchre power to ease and corrodce to take away hairs, and the powder thereof cureth cornes and hardnette in the feet. The hear tyed to the writh in a black skin, taketh away a quarten Ague; and also Kirsntides writeth, that being bound unto a womens thigh, it theyeth her monethly flowers, and keepeth her barren: But this is worthily reproved for untruth, and therefore I will not commend it to the Reader. And thus much for the Salamander.

Of the -SCORPION.

Scorpius in Greek is attributed both to the Scorpion of the Land and of the Sea, although sometimess for difference sake, the Scorpion of the earth be called Scorpius cephalius. The derivation is manifold according to some Writers, either of Scorpigen von lion, that is, dispersing his poyzon, or of Serenous erpin, because the motion of it is oblique, inconstant and uncertain, like as the flame of fire beaten with a small winde. The Greeks also use for a Scorpion Blessas, because it causeth poyzon, and O(n)spus from the number of his eight feet. And in Ethiopia there is a kind of Scorpion which the Greeks call Sybra. The Latines doe use indifferently Scorpius, Scorpio nepas, and Cancer allo Vinula and Geptarias, as we finde in Ponzettus. The Arabian have many words, as Harab, Acerb, Acharbe, and Satoracon, Macbarab, Algezart, Algeterat, and Algenat and Alkatarari, for little Scorpions which draw their tails after them.
The Countries which breed Scorpions, are these that follow. In Egypt, near the City Captis, are very many great & pestilent stingings Scorpions, who kill as soon as they omit. Alfo Aethiopia and Numidia abound with Scorpions, especially the latter, wherein (as writeth Led Afric.) are every year found very many that die of their wounds. Tenos one of the Cyclades Islands, is called Ophielis, because it yeilds many Serpents and Scorpions. Alfo in that part of Mauritania which is next the Weft, are Scorpions with

wings and without wings: likewise in Iberia, Caria, and Lydia. And it is also said, that once there were many Scorpions brought into India, into that part of the Country where the Ebitophagi dwell. By the way be it wise in Persia and Media, there were wont to abound Scorpions under every stone and turf, for which cause, when the King of Persia was wont to go into Media, he gave commandment unto his people to scour the way, by using all means to kill them, giving gifts to them that killed the greatest number of Scorpions. There is an ancient Town in Aethiop called Pefcura, whereof the abundance of Scorpions do so much harm, that they drive away the inhabitants all the Summer-time every year untill November following. And in like fort Dinortus declareth of many other places utterly forfaken to avoid the multitude of Scorpions, as namely, one part of Arabia, and the Region of India about Arbatian, or the river Eilamnum, likewise near the Gymnolgi in Ethiopia. There is also a City called Alabanda, standing betwixt two hills or mountains, like as a Chief turned inward, which Apollonius calleth Cilium inverfum Scorpionibus plenus; a Chief turned inward full of Scorpions. In an Island of Canaria also are many Scorpions, and those most pestilent, which the Turks gather as often as they may to make Oyl of Scorpions. In Italy, especially in the Mount Telascim in Rame, are also Scorpions, although not so hurtful as in Africa, and other places, and it is thought that Puffi, whose nature cureth all kindes of venemous Serpents harms, did only for lucres fake bring Serpents and Scorpions into Italy, and there left them, whereby they encreaseth to that number and multitude, which now we fee them have. And thus much may suffice to have spoken of the Countries of Scorpions.

The kindes of Scorpions I finde alfo to be many, but generally they may be referred unto twain, whereof one is called the Scorpion of the earth, and the other the Scorpion of the water or of the Sea, whose discourse or history is to be found among the fishes, for we in this place doe only write of the Scorpion of the earth, which is also called by Aesopus a wilde Scorpion. Of this kind there are many differences. First they differ in sex, for there are males and females, and the female is greater then the male, being alfo fat, having a groffer body, and a greater and sharper sting, but the male is more fierce then the female. Again, some of these have wings, and some are without wings, and some are in quantity greater then a Bean, as in Helotia, near Rapinfull by Zurich. The Scorpions called VinMike, are of a reddish colour, as it were Rose-water and Wine mixed together; and from thence it is probable that they took their name, and from their colour, the Authors have observed seven severall kindes.

The first is white, and the biting of this is not deadly. The second is reddish, like fire flamant, and this when it hath wounded caueth thirst. The third is of a pale colour, and therefore called by the Greces, Zopborides, and these when they have wounded a man, caueth him to live in continuall motion and agitation of his body, so as he cannot stand still, but remaineth distract and without wit, alway laughing, like a fool. The fourth kindes is greenish, and therefore termed Chelos, which having wounded, caueth intolerable trembling, shakings, and quivering, and cold, so that if the patient be laid in the hot sun, yet he thinketh that he freezeeth like hyl, or rather seeleth hyl to fall upon him. The fifth kindes is blackish pale, and it is called Empelios, it hath a great belly and broad, whereof the poyson is great, and caueth after stinging and admirable heaviness, and sorrowfull spirit. This kind is called by Gessian, Ventriculos, because of the large belly, by the Arabians, Algedaras, and by Pomsetas, Geptarias. It eateth herbs, and the bodies of men, and yet remaineth infaitle, it hath a bunch on the back, and a tail longer then other Scorpions. The
The History of Serpents.

The sixth is like a Crab, and this is called by **Helianus** a flamant Scorpion, it is of a great body, and hath togs and takers very solid and strong, like the Gramuel or Crevish, and is therefore thought to take the beginning from that Fifth.

The sixth is called **Melittoborus**, because of the Honey-colour thereof, or rather Waxe-colour, and the wings it hath on the back, are like the wings of a Locust.

Alfo Scorpions do differ among themselves in regard of their outward parts, for some of them have wings, as those in India, which are spoken of by Strabo, Nicander, and others, and therefore many times when they little themselves to flie, they are transported by the winde from one Country to another.

There is also another difference oberved in their tayls, and in their flings, for some of them have six knots on their tayls, and some of them feven, and those which have feven, are more hardy and fierce, but this flieeth not very feldome of the felfe, but the Scorpions have feven knots in their tayl, and therefore much feldomer to have beene, as writeth **Apoloborus**. For if any have feven, then there liueth in them a double fling, for there is also another difference, some of them having a fingle, and fome a double fling, yea, fometime a treble one, and the fling of the male is more thick and strong then the fling of the female.

And to conclude, there is also a difference in motion, for some of them hold up their tayls from the earth, and therefe are not much venemous, others again draw them along upon the earth, a little rowed together, and therefe are moft deadly and poyonfull, fome of them alfo flie from one Regi on to another, as we have feen already.

Again, there is nothing that giveth a man a more lively difference, than the consideration of their poysion, for the Scorpions of Phebro, and that part of the Alpis near Noticum, do never harm any living Creature, and therefore are they fuffered to abound, fo as they live under every fcone.

In like fort in the Iles Symyola, the Scorpions are like unto thofe that are in Caftilla or Span, for there the fling of the Scorpion doth not bring death, yet they caufe a smarting pain, like the pain that cometh by the flinging of a Wafp, differing herein, that the Scorpions flinging is more lafting, and continueth longer then the flinging of a Wafp, it fettit on the face, and by the biting thereof all are not pained alike, for fome more, and fome leffe pain.

Contrary to thofe are the Scorpions of Pefiar in Afrik, who ever with their tails wound mortally.

And thofe in Sybylia, which are great, and hurtful unto man and beafts, killing Swine, who do not much care for any other Serpent, especially the black Swine, who do alfo die the fooner, if they drink immediately after the wound received. The like may be faid of the Scorpions of Egypt. And thus much for the different kinds of Scorpions, wherein nature produceth a notable variety, as may appear by all that hath beene faid. Now it followeth that we likewife make fome relation of their congruity one with another.

They are all little living Creatures, not much differing in proportion from the great Scarabe or Horfe-fly, except in the fashion of their tails. Their back is broad and flat, dillignifhed by certain knots or teams, fuch as may be feen in Sea-Crabs, yet their head differeth, and hath no reffemblance with the Crab, becaufe it is longer, and hangeth farre out from the body, the Countenance whereof is frowning, and Virgin-like, and all the colour a bright brown. But whilf the face, it beareth a thick fling in the tail, which tail is full of knots, wherewithall it priceth and hurteth that which it toucheth. And this fling is fayn affirmeth to be proper to this Infeft, to have a fling in the tail, and to have arms: For by arms he meaneth the two croffes or tongues which come from it on both fides, in the top whereof are little things like pinrons, to detain and hold faft, that which it apprehendeth, whiles it woundeth with the fling in the tail.

It hath eight feet, four on the one fide, and four on the other, from whence, as we have feen already, it is called Olgias. For the feet and arms thereof is very much like unto the Sea-crab, and therefore may not unftily be called either the mother or the daughter thereof. They have alfo tongues, wherewithall they use often to lick and smooth over their own bodies. And feeding of all other things they love freh and clean linen, whereinto they infinuate, and wrap themſelves when they can come unto it, then alfo firft of all they cleanse their whole bodies all over with their tongues, and next to their fleſh put on this clean linen, as a man would put on a shirt.

As we have faid already it hath a tayl, wherein the fling thereof is placed, but what this fling is, divers Authors are of divers opinions concerning the fame, fome affirming it to be hollow, others denying it, finding in it no passage at all to contain or convey poysion. **Helianus** again faith, that there must needs be in it a passage or cavity, although it be fo small as by no means it can be perceived with the eyes of any mortall man, and in that fling is the poysion leffe visible, which when it flriketh, difperfeith it feftantly into the wound. But what should this poysion be? whether a fubftance or spiritual humour; furely a fubftance, which although it be mole minima, yet fubtiler maxima, that is, of great power, although of fmall quantity. And therefore another Author (namely **Gerardus**) writeth hereof after this manner; *Scorpius cetero quadam effer crudatiam emittit humorem venefcum*: That is to fay, The Scorpion out of a hollow center, fennent forth a venemous humour. And of this venem we will afterwards difcours more at large. Thus much in this place may ferve to make known the feweral parts and members of this Serpent.

Now then it followeth that we inquire about the manner of their breed or generation, which I find to be double, as divers Authors have obserued, one way is by putrefaction, and the other by laying of eggs, and both these ways are confonant to nature; for Latinus writeth, that fome creatures are
are generated only by propagation of feed, such are men, Vipers, Whales, and the Palm-tree, some again only by putrefaction, as the louie, fly, gaffe, and such like imperfect things, and some both ways, as Misc. Scorpions, Emmes, Spiders, Purflam, which first of all were produced by putrefaction: and since their generation are conserved by the feed and eggs of their own kind. Now therefore we will first of all speak of the generation of Scorpions by putrefaction, and afterward by propagation.

Pliny faith, that when Sea-crabs dye, and their bodies are dried upon the earth, when the Sun enthrall into Cancer and Scorpion, out of the putrefaction thereof ariseth a Scorpion; and so out of the putrefied body of the Crofthburned, arife Scorpions, which caused Ovid thus to write;

Congno littero, si demas brachis cancro,
Cetera supponi terre, de parts sepulta
Scorpius exquis, caudaque minutitum unca.

And again;

Obstitus exemplis Cancer tellure lucetinis,
Scorpius exiguo tempore fadus erit.

In English thus;

If that the arth you take from Sea-crab-sifts,
And put the rest in earth till all consumed be,
Out of the buried part a Scorpion will arise;
With hooked tayl doth threaten to hurt thee.

And therefore it is reported by Aristoteles, that about Eflamnu in India, there are abundance of Scorpions generated, only by corrupt rain-water standing in that place. Alto out of the Batilisk beaten into pieces and so putrefied, are Scorpions engendered. And when as one had planted the herb Baffilis on a wall, in the room or place thereof he found two Scorpions. And some say that if a man chew in his mouth falting this herb Baffil before he wath, and afterward lay the same abroad uncovered where no fun cometh at it for the space of seven nights, taking it all the day time, he shall at length finde it transmuted into a Scorpion, with a tayl of seven knots.

Hollerius, to take away all scruple of this thing, writeth that in India in his dayes, there was a man thare had a Scorpion bred in his brain, by continuall smelting to this herb Baffil, and Gifier by relation of an Apothecary in France, writeth likewise a story of a young maid, who by smelting to Baffil, fell into an exceeding head-ache, whereof the dyed without cure, and after her death being opened, there were found little Scorpions in her brain.

Aristotele remembreth an herb which he calleth Siflimbris, out of which putrefied Scorpions are engendered, as he writeth. And we have shewed already in the history of the Crocodile, that out of the Crocodiles egges do many times come Scorpions, which at their first egression do kill their Dam that hatched them, which causef Archelam which wrote Epigrams of wonders unto Epimenius, to sing of Scorpions in this manner;

In vas diffiluit morte, et redigit Crocodilum
Natura extinctum, Scorpi omnipotens.

Which may be Englithed thus;

To you by Scorpions death the omnipotent
Ruins the Crocodil in natures life extinct.

And thus much for the generation of Scorpions out of putrefaction. Now we will proceed to the second manner of their generation, which is by propagation of feed: for although Ponzettus make some question about their copulation, yet he himselfe inclineth to that opinion, as neerer unto truth, which attributeth carnall copulation unto them, and therefore he alledged the example of flies, which admit copulation although they engender not thereby. Wherefore we will take it for granted, that Scorpions lay egges after copulation, which happeneth both in the Spring and Autumne.

And these are for the most part in number eleven, upon which they sit and hatch their young ones, and when once they are perfected within, those egges (which are in fight like the little worms out of which Spyders are engendred) then do they break their egges, and drive the young out. For as Ifiborus writeth, otherwise the old should be destroyed of the young, even as are the Pliny Crocodiles. Some again say, that the old Scorpions do devour their young ones.

Being thus produced by generation, they live upon the earth, and those which are bred of the Sea-crab, do feed upon the foam of the Sea-water, and a continuall white mould or chalk near the Sea. But the Scorpions of Ethiopia do eat all kinde of worms, flies, and small Serpents. Ye all those Serpents whove very dung being troden upon by man, bringeth exaceruations. And a trystall that Scorpions eat flies, was made by Wolphius at Montever, for having a young one in a boxe, for one whole moneth together it lived upon flies, and grew by the devouring of them bigger, being put into the Glafe unto him.

They live among tiles and bricks very willingly, and for this cause they abound in Rome in the hill called Toflacum. They are also in Bononia found in the walls of old houses, by twisting the
flones and the mortar. They love also clean clothes, as we have said already, and yet they abhor all places where the Sun shineth. And it seems that the Sun is utterly against their nature, for the same Scorpion which Wolphius had at Mangelien, lived in the Gruze until one day he set it in the Sun, and then prettily after it dyed.

To conclude, they love hollow places of the earth near gutters, and sometimes they creep into men's beds, where unawares they do much harm: and for this cause the Lylian, who among other Nations be most of all troubled with Scorpions, do use to set their beds far from any wall, and very high also from the floor, to keep the Scorpions from ascending up into them. And yet leaning all devices should be too little to secure them against this evil, they also set the feet of their beds in vessels of water, that so the Scorpion may not attempt so much as to climb up into them for fear of drowning. And also for their further safeguard, they were socks and hose in their beds to clutch as the Scorpion cannot easily fling through them.

And if the bed be so placed that they cannot get any hold thereof beneath, then they climb up to the sieing, or cover of the house, and if there they finde any hold for their pinching legs to apprehend and fallen upon, then in their hatred to man-kinde, they use this policy to come unto him. First one of them (as I have said) taketh hold upon that place in the house or sieing over the bed wherein they finde the man asleep, and so hangeth thereby, putting out and freshing his fling to hurt him, but finding it too short, and not being able to reach him, he suffereth another of his fellows to come and hang as fast by him as he doth upon his hold, and so that second giveth the wound: and if that second be not able likewise, because of the distance, to come to the man, then they both admit a third to hang upon them, and so a fourth upon the third, and a fifth upon the fourth, until they have made themselves like a chain, to defend from the top to the floor, wherein the man sleepeth, and the last striketh him: after which stroke he first of all runneth away by the back of his fellow; and every one again in order, till all of them have withdrawn themselves.

By this may be collected the crafty disposition of this Scorpion, and the great subtily and malice that is enuied withall in nature, and feeing they can thus accord together in harming a man, it argueth their great mutuall love and concord one with another, wherefore I cannot but marvell at them who have written that the old ones destroy the young, all but one, which they set upon their owne buttocks, that so the Dam may be secured from the fling and bitings of her fon. For seeing they can thus hang upon one another, without harm, favouring their own kinde, I see no cause but that nature hath granted much more love betwixt the old and the young ones, fo as neither the old do first destroy the young, nor afterward, that young one preferred, in revenge of his fellows quarrell, killett his Parentes.

It is reported by Aristole, that there is a hill in Caria, wherein the Scorpions do never fling any strangers that lodge there, but only the natural born people of that Countrie: And hereunto Pliny and Ælius seem to subscribe, when they write that Serpentes ab omnibus liberiores mordit, that is, Scorpions bite strangers but gently. And hereby it may be collected, that they are alike by nature very fagacious: and can discern betwixt nature and nature; yea the particular differences in one and the same nature. To conclude, Scorpions have no power to hurt where there is no blood.

The natural amity and enmity they observe with other creatures commeth now to be handled, and I finde that it wanteth not adversaries, nor it again hath no defect of poysyn or malice to make resistance and opposition, and to take vengeance on such as it meeteth withall. The principal of all other subjects of their hatred, are Virgins and Women, whom they do not only desire to harm, but also when they have harmed, are never perfectly recovered. And this is at all times of the day, but unto men they are most dangerous in the morning fasting, before they have vseth their poysyn, and this is to be observed, that their tayls are never unprovided of fings, and sufficient store of venom to hurt upon all occasions.

The Lyon is by the Scorpion put to flight wherefoever he feel thet, for he fereth it as the enemy of his life, and therefore writeth S. Ambrose, Venio Scorpion aculo exequatur Leo, the Lion is much moved at the small sting of a Scorpion. Scorpions do also destroy other Serpents, and are likewise destroyed by them. There was one Celerinus a Physitian in Pudues, who put together into one Viall, a Viper and a Scorpion, where they continually fought together, untill they had killed one another. The Swine ofrebias, which do safely eat all other kindes of Serpents and venomous beasts, without all harm, yet are destroyed by eating of Scorpions, and so great is the poysyn of the Siberit Scorpion, that the dungh thereof being trode upon breedeth ulceres.

And in this manner we see the virulence, and naturally evil of Scorpions against other living creatures, so now we are to consider the terrors of the Scorpion, for God in nature hath likewise ordained some bodies, whereby the Scorpion should be, and is driven away, feared and destroyed.

First of all these men, which are the chief, and head of all living Creatures, do by natural instinct, kill and destroy Scorpions, and therefore Gaian writeth thus. Let us (faith he) kill Scorpions, Spiders, and Vipers, not because they are evil in themselves, but because it is ingrafted in us by nature, to love that which is good unto us, but to hate and avert from that which is evil unto us, Non conferemus genitum ne ita fit an fem, not considering whether it were so bred or not. As we have shewed their generation out of putrefaction to be by heat, so also is their destruction by heat: for they are not able to abide the heat of the Sun, and therefore, although they cannot live in cold Northern Countries, but in the hotter, yet in the hotter they choose shadows, holes of the earth, coverture of houes, and such like vile and obscure places, to succour and secure themselves in.
Of the Scorpion.

It is also reported, that if Scorpions do at any time behold a Stellion, they stand amazed and wonderfully aloofish. The Viper also having killed a Scorpion, becometh more venemous, and the His of Egypt destroyeth Scorpions. There are a little kind of Emmets, called by the Arabians, Geratans, which are eaters of Scorpions. The quick-fighted Hawks also, from whose piercing eye no Serpent can be hid, when he seeth a Scorpion, he neither seeth nor fighteth with it. It is also thought the Hares are never molested by Scorpions, because if a man or beast be anointed with the rennet of a Hare, there is no Scorpion or Spider that will hurt him. Wilde Goats are also said to live without fear of Scorpions, even at the Africanni of whom we have often spoken.

Now this vertue against Scorpions is not only in living things, but also in the Plants of the earth, and therefore Seftin writeth, that the seed of Nofe-wort burned or scourced doth drive away Serpents, and refhit Scorpions and doth the root of the Mant-tree, and the seed of Violets, and the same vertue is ascribed to the herb Libris, which is Englished Calves-foot, and also to the seed of wilde Parsnip.

The smell of Garlick and wilde Mints set on fire, or stirred on the ground, and Dittany have the same operation: and above all other, one of these Scorpions burned, driveth away all his fellows which are within the smell thereof, and therefore this is a most ufuall thing in Aias and Africk, to perfume their houses with Scorpions burned, and in read thereof they make as it were little pills of Galbanum sandaraka, with butter, and the fat of Goats, and thereof altogether make their perfumes: also Betony, and wilde Pellitory with Bromeone. They use also to cover pans with certain things called by them Altiron and Aias, and with these they compasse the place wherein the Scorpion lodgeth, and then it is found that they can never any more from that place. And some in read thereof, powr Oyl into their holes after them for the same effect. And the Husband-men of Marfania doe vs and fallen to their bedhide, sprigs of white thorn, and Hellebore, wherevithail by a seeret antipathy in nature, they drive away and keep themselves safe in their beds from the annoyance of Scorpions.

By touching of Henbane they die dead and overcome, but if one touch them again with white Ellebore, they revive, and are releazed from their former stupesfaction. It is also said that the leaves of water-mallows do also affoamish Scorpions, and so affo doth the Radish-root. The Sea-crab with Basil in their mouth destroyeth the Scorpion, and do thoth Tunique and Myrhum of trees.

To conclude, the spittle of a man is death unto Scorpions: and therefore when a certain fellow took upon him to be a cunning Charmer, and by incantation to kill a Scorpion, he added to the words of his Charm a treble prizing in the mouth of the Serpent, and so it dyed: whereupon Wephus which was preserf, and saw this Charmer, did afterward by himself alone at home, make trall of spittle without a Charm, and so found that it alone killeth Scorpions, especially the spittle of a man falling, or very stringy. Moreover, there be certain Lands wherein no Scorpions will live, as that about Cyprus in Africk, and the duct of the Island Gaulus near Cecina, being sprinkled upon a Scorpion, doth incontinently kill it. And so much also writeth Hermolaus, of the Region Galata.

These and such like things are observed by our painful and industrious Ancelors about the nature of Scorpions, as well that which is hurful unto them, and they are afraid of, as those to which they are enemies in nature, and wound mortall when they light upon them. It is remembred by textor that Orion was slain by a Scorpion, whereupon the Poets have made many tales. They say, that when he was grown to be a man he was a great hunter, and a continuall companion of Diana, who glorifying much in his strong, boasted that he was able to overcome any Serpent or other wild beast, whereas the God beong angry, for revenge, and taking down the pride of this young man, causeth the earth to bring forth a Scorpion, who killed Orion. Whereat Diana was very sorry, and therefore in lamentation of her champion, and for the good deeds he had done unto her, tranflated him into heaven, close by the constellation of the Bull. Lævæ on the other side faith, that Diana sent this Scorpion to kill him, envying his famous face in hunting, and that afterward the Goddes taking pity on him, translated him into heaven. Others write again, that he had his eyes put out by Oemepion, and that he came blind into the Island Lemnos, where he received a horse of Panoptut, on which he rode to the Sun-rising, in which journey, he recovered again his eye-light, and so returning, he first determined to take revenge upon Oemepion for his former crueltie. Wherefore he came into Oret, and seeking Oemepion, could not finde him; but being he was hid in the earth by his Citizens, but at last coming to him, there came a Scorpion and killed him for his malice, refusing Oemepion. These and such like fables are there about the death of Orion, but all of themjoyntly agree in this, that Orion was slain by a Scorpion: And so faith Anthologus was one Panoptut a Hunter.

There is a common adage, Conic Scopium, a Raven to a Scorpion, and it is used against them that perish by their own inventions: when they set upon others, they meet with their matches, as a Raven did: when it preyed upon a Scorpion; thus described by Alcimus, under his title Jusa videt, just revenge, saying as followeth.

| Raptorem in sfigas compellit ulter aquas. |
| O risis dignas alio qui sita parabas. |
| Vide perit, propius jucundique dolet. |
| Which may be Englished thus; |
| Scowen in the Stygian Lake did die. | (did kill, O'forfull game! that he would other for bellies sake |
| By his own death should fall into deaths will. |

There
The History of Serpents.

There be some learned Writers, who have compared a Scorpion to an Epigram, or rather an Epigram to a Scorpion, because as the stings of the Scorpion lyeth in the tail, so the force and virtue of an Epigram is in the conclusion, for vere accitter et falsa mordat, vel juvente & dulcius deleat, that is, either let it bite sharply at the end, or else delight pleasingly. There be many ways of bringing Scorpions out of their holes, and so to destroy and take them, as we have already touched in part, unto which I may add these that follow: A perfume made of Oxe-dung, also Storax, and Arsenic: And Piny writeth, that ten Water-crabs beaten with Bifil is an excellent perfume for this purpose, and so is the ashes of Scorpions. And in Pindus they use this art, with small sticks or straw they touch and make a noyle upon the fones and morter wherein they have their nests, and then they thinking them to be some flies for their meat, instantly leap out, and so the man that deluded them is ready with a pair of tongs or other instrument to lay hold upon them and take them, by which means they take many, and of them they make, Oyl of Scorpions. And Con-

stantius writeth, that if a mans hand be well annoyed with juice of Radish, he may take them without danger in his bare hand.

In the next place we are to proceed to the venom and poyfon of Scorpions, the instrument or sting whereof, lyeth not only in the tail, but also in the feet, for as Ponzatius writeth, Lactis scor-

pionis venus et illu, the Scorpion harmeth both with teeth and tail, that is, although the greatest harm do come by the sting in the tail, yet is there also some that cometh by their biting. This poyfon of Scorpions, (as Piny out of Apollodorus writeth) is white, and in the heat of the day is very fer-

vent and plentiful, so as at that time they are inattractible and unquenchably thirsty, for not only the wide wood Scorpion, but also all other are of a hot nature, and the symptoms of their bitings are such as follow the effects of hot poysons: and therefore faith Rafis, all their remedies are of a cold quality. Yet Gelen thinketh otherwise, and that the poyson is cold, and the effects thereof are also cold. For which cause Bondeletus prefcribeth Oyl of Scorpions to expell the fone, and also the cure of the poyfon is by strong Garlick and the blet Wine, which are hot things. And therefore I conclude, that although Scorpions be most hot, yet is their poyson of a cold nature.

In the next place, I think it is needful to express the symtomes following the stinging or stinging of these venemous Scorpions, and they are (as Actium writeth) the very same which follow the biting or poyson of that kind of great Pbalina Spider, called also Taraxanum, and that is, they are in such fache as those perfons be which are smitten with the Falling sickness.

He which is stung by a Scorpion, thinketh that he is presse with the fall of great and cold hayl, being so cold, as if he were continually in a cold sweat, and so in short space the poyson disperseth itself within the skin, and runneth all over the body, never ceasing untill it come to perforfe some predominant or principally vital part, and then followeth death. For as the skin is small and thin, so the sting pierceth to the bottom thereof, and so into the flesh, where it woundeth and corrupteth either some vein, or arterie or sinew, and the more harmed tweltheth immediately into an exceeding great bulk and quantity and aking, with unsufferable torment. But yet (as we have already laid) there is a difference of the pain, according to the difference of the Scorpion that stings. If a man be stung in the lower part of his body, instantely followeth the extenfion of his vitile member, and the swelling thereof: but if in the upper part, then is the person affected with cold, and also the place smitten is as if it were burned, his countenance or face distorteth: I gleweth spots about the eyes, and the tears vifious and flimy, hardneffe of the articles, falling down of the fundament, and a continual desire to egeftion, foaming at the mouth, coughing, convulsions of the brain, and drawing the face backward, the hair standes upright, paleness goeth over all the body, and a continual prickling like the pricking of needles.

Also, Cardanus writeth, that if the prick fall upon an artery, there followeth swelling, but if on a nerve, there speedily followeth putrefaction and rottenneffe. And those Scorpions which have wings, make wounds with a compasse like a bow, whose succeeding symtomes are both heat and cold, and if they hurt about the canicular days, their wounds are very feldom recovered.

The Indian Scorpions caufe death three moneths after their wounds. But moft wonderfull is that which Strabo relateth of the Albenian Scorpions and Spiders, whereof he faith are two kindes, and one kinde killeth by laughing, the other by weeping. And if any Scorpion hurt a vein in the head, it caueth death by madneffe, as writeth Paracelus. When an Oxe or other beast is stricken with a Scorpion, his knees are drawn together, and he haliteth, refusing meat; out of his nose floweth a green humour, and when he is laid, he careth not for riling again.

These and such like are the symtomes that follow the bitings and stings of Scorpions, for the cure whereof I will remit the Reader to that excellent discourse written by Wolfpinus, wherein are largely and learnedly expresse, whatsoever Art could collect out of nature. And seeing we in our Country are free from Scorpions, and therefore shall have no need to fear their poyson, it shall not I truft offend my Reader, if I cut off the relation of Scorpions cures, as a thing which cannot benefit either the English Reader, or else much adorn this History, and fo I will proceed to the medicines drawn out of Scorpions.

The application or use of Scorpions in medicine, is either by powder or by Oyl, or by applying them bruised to their own wounds, wherefore every one of these are to be handled particularly: and first of all for the powder, it is made by uflon or burning in this manner. They take ten Scorpions and put them alive into a new earthen pot, whose mouth is to be dammed up with loam or such like fluffe, then must it be set upon a fire of Vine-tree-shreds, and therein must the pot stand
flend day and night until all within it be confumed to powder, and you shall know by their white colour when they be enough; otherwise, if they be brown or burned, they must be continued longer, and the use of this powder is to expel the stone.

Again, they use to make this powder another way, they take twenty Scorpions, and put them in a little earthen pot with a narrow mouth, which mouth must be stopped, and then the pot put into a Furnace by the space of six hours, which Furnace must also be kept close within, and with a gentle fire; then after six hours take off the pot, and bruise the Scorpions into powder, and keep that powder for the use aforesaid. There are other ways also to prepare this powder, but in all preparations the attendant and assistant must take heed of the flame or smock that cometh from it, for that is very venemous and contagious.

But besides, there are many things to be observed herein, as first, that the Scorpions be alive, and that they be killed in Oyl, then, that they be put in whole, with every member, without mutilation, and that the Scorpions appointed for this confection, be of the strongest poison, and the time of their collection to be when the Sun is in Leo, and not in Scorpion, as some without reason have imagined.

The Oyl so made, is distinguished into two kindes, one simple, and the other compound. The simple is made of a convenient number of Scorpions, (as it were twenty if they be great, and more if they be little) and they being put into a glasse vessel, Oyl of bitter-Almonds must be powdered upon them, and so the vessel stopped close and set in the Sun by the space of thirty days, and then shivered and used. Yet the women of Ferrara use Oyl-olive in stead of Oyl of bitter Almonds, and also observe no quantity of Oyl, but fill the pot full, and likewise no order in the number of the Scorpions, putting one day to another and to morrow, and so more the next week or month, as they can finde them.

The compound-Oyl is thus made, they take round Aistrologe, Cypreffe, and Gentian, the roots of Capsars, and upon these they pour Oyl of bitter Almonds, and soak the roots in the Oyl in the hot sun for the space of twenty days, then take they a complete number of Scorpions, from betwixt fifteen to sixteen, these they put again to the Oyl, and so itop up the mouth again, and set it the second time in the sun thirty days, and afterward strain it and use it. This compound-Oyl is not so much approved by Brasavolus, as the former simple, because the fire hath more Scorpions, and the second is huffed or leavened with spices.

The green Scorpion which is bred of Bafil, having seven knots in the tayl, being beaten and pounded with the herb Scorpion, and so made into pills, then dried and put into a glasse, are very profitable to him that hath the Falling-fickneffe, if he take of them three every morning falling in temperate Wine, but these being given to a found man put them clean out of his wits. If a man take a vulgar Scorpion and draw the same in a porringer of Oyl in the wave of the Moon, and therewithall afterward anoint the back from the shoulders to the hips, and also the head and forehead, with the tips of the fingers and toes of one that is a demonick or a lunaticke person, it is reported, that he shall eafe and cure him in short time. And the like is reported of the Scorpions being joyned with the top of Basil wherein is feed, and with the heart of a Swallow, all included in a piece of Harts skin.

The Oyl of Scorpions made of common Oyl-olive, is good for the pain in the ears infuffed by distillation; also it cureth a Pleurisie in this manner. They take meal out of a Windmill, and make thereof with water, pate, or little cakes, in quantity like a French Crown, these must be sod in a frying-pan in Oyl of Scorpions, and so applied as hot as can be to the place where the pricking is, and be kept to the same very hot, and when it beginneth to be cold, let new be applied till, nine times together, succesively one time after another. Scorpions bruised in new sweet Wine, do cure the Kings-evil. The ashes of a Scorpion infused by the yard into the bladder, breaketh and dispereth both the stone of the bladder and the reynes. And the like operation hath a vulgar Scorpion eaten with vinegar and Rose-cakes applied to the gowy members, it many times easeth the inflaming pains thereof.

The Oyl of Scorpions is very available in the time of Plague, both by Oyntment and also in potion: wherewithall one did affirm to Wohblius that he gained a great spinne of money, which he prepared in this manner. He took a hundred Scorpions, and sod them in the oldesl Oyl-olive he could get, until such time as the Scorpions were confumed, then did he strain them through a linen cloth, adding unto it an ounce of Rubarb, and so shutting it close in a glasse bottle, he let it forty days together in the sun, and afterward he gave of it to be used in time of infection, advising those that had it to apply it in oyntment to the pule, heart, hinder part of the head, neck and noetris. And if a man began to be sick, within twelve hours after the first scene of his pain, he was annoyed herewith about the tumour, and then was it launced. This oyntment is also commended against all manner of poiyon, not onely of other Serpents and venemous beasts, but also of the Scorpion it fell. And thus much for the history of the Scorpion.
of the S C Y T A L E.

This Serpent called by the Grecians Scytale, is likewise termed by the Latiinis, Scytalis, and by some Scytalis, Picalis, Scifetaliis, and Scyfetaliis, and by Albertus, Situla, which we have already interpreted a Diplas, but all of them are most manifestly corrupted from Scytale, the first Grecian word. And therefore I will not stand to confute them that call it also Caecilla, a blinde worm, because (after the manner of other Serpents) it eateth no Fennell, but this Cecilia or blinde Worm, we shall afterward demonstrate to be our English Slow-worm. This Scytalis is very full of marks or spots upon the back, so variable and delectable, that it possesseth the beholders with admiration, and almost bringeth them asleep looking thereon: for it is also slow, and moveth softly, wherefore it cannot pursue where it would do harm; in head therefore of celerity, these natural spots doe hold them that it doth desire to harm, like as they were ituped and atones. And in this brightnesse of the scales, first of all it mult lay aside the winter-skin, or else there appeareth not any splendour at all. And it is also said to be so hot and fervide, that it calleth skin in the Winter, according to this saying of Lycus?

Et Scytale parctis etiam nunc sola pruinis
Excuse posturis subus:
That is in English thus;
None but the Scytall while Winter-frofts abide,
Out of his spotted skin and Scares doth glide.

The outward form or visible proportion of this Serpent, is like that which we have already called a Double-head, and the Latines, Amphibione, except that the tayl hereof is flatter and thicker. The length of this Serpent is like the longest Worms of the earth, and the thicknesse like the helve or handle of a fpaide. And the greatest difference betwixt this and the Double-head, is that this goeth but one way, and the Double-head goeth as well one way as another: and the colour hereof is like the colour of the other. The generall description of this Serpent is thus expressed by Nicander;

Bifronti similem reperis Scytalam Amphibione
Fingueri eft temen, & cauda, que multa fere exit,
Crassa ut quantum fortit eft comprehenderi lignum,
Curae mensis Tiritium quaeties tenei fuf lignum.
Tum proficx, vagans pluox quam repiti cycle,
Quod facunda grum fucit digni vifera tellus,
Nec pofficxam juvenis venitenti tempore veris,
Magni Deum quando pretftri ferpentina mater.

Liquetis obfcuram confueta cubilia potram,
Et nitidos tepido fub sole cruturum artus,
Pandentes fo faniellati tenebris exedit cornam,
Sed per opaca moram ini declivis montis
Se tenei, & multo graviter later abrupta sone,
Eque altera fua conquirit fibi palabur terra
Ne fletet id magnum curpia, fitandique labor
Arsentef situm potis ejf depelleire fauce.

Which may be Englished thus;
The Scytall like the Double-head thou shalt in feature fain
Yet it is fatter, and tayl that hath no end much thicker is,
As big as crooked hand is wonted for to winde
The hiefs and below of digging fpade the earth that ruifts
As long as that thin crawling worm which heaven's rain
Begins on fruitfull earth, when beawes warmly moftened are,
And when the Mother-goddess great fends forth her creeping train,
Which is Lees-youth, frefh-time of Spring, both calm and faire.
Then leaveth it off his wonted bed in rock obscure,
And in what fub be stretcheth out his limbs and finewes all,
Eating the new sprung blades of Fenell-herbs, fo putting teeth in ure,
In holes of the declining hills so keepeth both great and small,
Where time in deepfe fleece of buried nature it doth paff,
And being hungry, the earth in top of hole it eat,
Quenching the thirst by force of dryes chapper or graffe,
Though without pain, desearele it seeks these drinks and meat.

The biting of this Serpent is like the biting of the Double-head, and therefore the cure is in the same manner, wherefore I shall not need to repeat the signs thereof, or the cure in this place. And so I will conclude the story of this Serpent.

Of
Of the Sea-Serpents.

Among the manifold kinds of Sea-serpents, as well known as unknown, (whereof some are like the Lamprey, some like the Myrus, and many other like the Serpents of the earth, except in their head, as Aristotle writeth, for that is more like the head of a Conger then a Serpent) it peculiarly hath one kinde, in colour and form not unlike an Eel, in length about three cubits, in the gills and finnes resembing a Conger, but it hath a longer front or beak, which is also forrowed inwardly with very many small sharp teeth, the eyes not so great, a smooth or pfeld skin and hanging over at the back, having no scales, so as it may easilie be fleyed. The belly of it is bewixt red and white, and all the body over is fet with spires, so as being alive it is not handled without danger. And this is by Pliny called the Dragon of the Sea, which cometh out of the Sea into the lands, and therein with an admirable celerity and dexterity maketh his lodging place. For the snout thereof is sharper then the Serpents of the earth, therefore therewith it diggeth and hideth itself in the hole or hollow place which it hath made. This is also called by Pliny Opbis taballatar, a Sea-serpent, the colour whereof is blacker or dimmer then the Conger.

There be also Vipers of the Sea, which are in fewe little fishes, about a cubit long, having a little horn in their forehead, the biting or sting whereof is very deadly, and therefore when the Fisher-men have taken any of these, they instantly cut off the head and bury it in the sand, but the body they eat for good meat: yet these Serpents are thought to be none other then the fish called Aranei, or Spider-fishes, savoring that they are said to have a sharp sting in their head, & this a horn, for all Water or Sea-serpents have harder and lefs heads then the Serpents of the land.

In the Germane Ocean there is found a Serpent about the bignesse of a man's leg, which in the tayl carryeth a fting as hard as any horn, this haunteth only the deepst part of the Sea, yet is it sometime taken by the Fisher-men, and then they cut off the tayl, and eat the residue of the body. Yet I will not professely whether this may be called a Sea-Serpent, or a Serpentine: it may be it is the fame that is a Fork-fish, or Ray, which by reason of the tayl thereof, it might give occasion to Alberthus to call it a Serpent of the Sea.

There be also Snakes or Hydres in the Sea, for although all Water-serpents, as well of the frefh, salt, and sweet waters may be called Hyders, or Snakes, yet there be some peculiar Snakes, such are the of the Indies Sea, where they have broad tayls, and they harm more by biting with the sharpnffe of their teeth, then by any venom that is contained in them; and therefore in this they somewhat resemble the Snakes of the earth. And Pliny writeth, that once before Perseus, upon the coasts of certain Islands, there were seen of these Sea-hyders very many, of the length of twenty cubits, wherewithall a whole Navy or fleet of ships were mightily affrighted. And the like is reported of three other Islands, lying betwixt the promontory of Carmania and Arabia; and such were those also in the African Sea, who are said by Pliny not to be afraid of a Gally, but will set upon the men therein, and over-turn it. And he himselfe saw many bones of great wilde Oxen, who had been destroyed by these kinde of Sea-snakes or Hyders.

The greatest River that falleth into the red Sea, is called Singibum, the fall whereof afar off seemeth to the beholders to be like winding Snakes, as though they were coming against the passengers, to lay them from entrance into that Land; and there is not only a sight or resembance of Serpents there, but also the very truth of it, for all the Sea-men know when they are upon these coasts, by the multitude of Serpents that meet them. And so do the Serpents called Grae about Persia. And the Coast of Baracia hath the fame noyforme premonition, by occurrence of many odious, black, and very great Sea-serpents. But about Baryaza they are leffe, and of yellow earthly colour; their eyes bloody, or fiery red, and their heads like Dragons. Keramides writeth of a Sea-Dragon, in this manner, saying: The Dragon of the Sea is a fith without scales, and when this is grown to a great and large proportion, whereby it doth great harm to other creatures, the winds or clouds take him up suddeynly into the air, and there by violent agitation, shake his body to pieces: the parcels whereof so mangled & torn alonder, have been often found in the tops of the Mountains. And if this be true (as it may well be) I cannot tell whether there be in the world a more noble part of Divine providence, and sign of the love of God to his creatures, who armeth the clouds of heaven to venture the perills of their destroyers. The tongue of this Sea-Dragon (as he is) is like a Horfes tayl, two foot in length, the which tongue preferred in Oyl, and carried about by a man, safeguardeth him from lungiuiling in firlnties, and the fat thereof, with the herb Dragon annointed on the head or fiek parts, eureth the head-ache, and driveth away the Leprotie, and all kinde of scabs in the skin.

Here is also the picture of another Sea-serpent, very like to the Serpent of the earth, being three or four cubits long, having a rounder belly then an Eel, but a head like a Conger, and the upper chap is longer, and standeth our further then the nether chap; the teeth grow therein as they do in Lampreys, but they are not so thick, and it hath two small finnes neer the gills like an Eel. The colour of it is yellow, but the back and belly is of Ash-colour, the eyes yellow, and in all the inward parts it doth not differ from a Lampreys, and there is no man of any understandeing, (as writeth Bontelettum) but at the very first sight, will judge the same to be a Serpent although the fith thereof.
Of the Seps or Sepedon.

be no more harmful than the Conger or Lamprey; yet for similitude with other Serpents, I could not chuse but express the same in this place.

There be also in the Swedish Ocean or Balbick sea, Serpents of thirty or forty foot in length, whose picture is thus described, as it was taken by Olav Magnus, and he further writeth, that these do never harm any man until they be provoked.

The same Author also expresseth likewise the figure of another Serpent, of a hundred and twenty foot long, appearing now and then upon the coasts of Norway, very dangerous and hurtful to the Sea-men in calms and still weather, for they lift up themselves above the hatches, and suddenly catch a man in their mouths, and to draw him into the sea out of the Ship; and many times they overthrow in the waters a laden Vessel of great quantity, with all the wares therein contained. And sometimes also they set up such a spire above the water, that a Boat or little Bark without sail may passe through the same. And thus much for the Sea-Serpents.

Of the SEPS or SEPEDON.

A lthough I am not ignorant that there be some which make two kinds of those Serpents, because of the two names rehearsed in the title, yet when they have laboured to describe them severally, they can bring nothing or very little wherein their story doth not agree, so as to make twain of them, or to handle them at random, were but to take occasion to tautologize, or to speak one thing twice. Wherefore Gericke wisely pondering both parts, and after him Carranus, deliver their opinions, that both these names doth but one Serpent, yet according to their manner, they express them as if they were two. For all their writings do but minister occasion to the Readers to collect the truth out of their labours, wherefore I will follow their opinion, and not their example. Sepedon and Seps cometh of Sepen, because it roteth the body that it biteth; in colour it nearly resembleth the Haemorrhe, yet it usually goeth by spires and half-hoops, for which cause as it goeth, the quantity cannot be well discerned, the pace of it being much swifter than the Haemorrhe. The wound that it giveth is smarting, entering deep and bringing putrefaction, for by an inexplicable celerity, the poison passeth over all the body, the hair roteth and falleth from all parts, darkness and dimness is in the eyes, and spots upon the body, like as if a man had been burned in the Sun. And this Serpent is thus described unto us by Nicander.
The History of Serpents.

Jam que Sepedon est species in, qualque corpus
Excitans, interims quis speandis & ipsi venenum,
Scio fato marcentes tabes depicitur artus,
Indirect fuscum refolubat pele capitum.
Sanguis, & voluitis venustus papus achante,
Pratece fadum turpis vitiligine corpus,
Et volatari arenit muscos a fe tenebroso.

Which may be Englished thus;
Sepedon shape now take, and what his form of body is,
I doth not go at Hemorrh ob, but traileth diversly.
His poulled head of Hemorrhps born full happily doth misse,
And colours are as manifold as works of Tapestry:
Great is his head, but running seems the tail but small,
Which windings, it in greater path draws after to and fro,
But where it wounds, by pains and torments great it dist appall,
Killing the wounded, infusing poyson in,
Whereby consumed are the lean and slender sinews,
And dryed skin lets hair fall off space,
Like as the windes drive white from top of tithe Cordus,
B jites the body fitth, as with Sun parched, losteth grace.

Thus doth Nicander describe the Sepedon: now also we will likewise relate that which another Poet faith of the Septs, that both compared together, may appear but one, therefore thus writeth Lucan, upon occasion of one Sabellus wounded by this Serpent.

Miserere in crure Sabelli

Vincula mororum, & laterum textura, carunculae
Pellis, & astrignum fibras vitalibus omane,
Sciucund hunc est, operis pestis: mater praefana
Morte parte: manum humeri, fertife, lacerti:
Cola equitis; flamunt, calidae non opus Aftro
Nix refoluta cadit, nec sol cera sequatur.

Parus haptor, corpus siemus filiisse periculum:
Hic & fiamma poyto, fed qua ruris abhisuit offa,
Hic quoque defendens, propef, fecta medullis,
Nella manere famus rapidis vestige fati,
Cyniphs inter pestes tubus palpae necundi est:
Eripiens omnes animam, tu sola cadaver.

Mole brevis sept, pese ingens, nec vifera solum,
Sed fimul efferat tabicibus Sept.

Which is to be Englished thus;

On wretched Sabellus leg a little Septs bang fast,
With which his band from hold of teeth beplucked away
From wounded place, and on a pite the Serpent all agast
He staked in bands, to him O woful wretched day,
To kill this Serpent is but small, yet none more power bath,
For after wound falls off the skin, and bones appear full bare,
As in an open boeme, the heart whole body gnaweth,
Then all his members swarm in filth: corruption did prepare
To make his shanks fall off, uncovered were knee-bone,
And every muscle of his thigh refolved, no more did bold,
His secrets black, to look upon, distilld all Conjunctions,
The rim of belly brake out fierce, which bowels did inflould,
Out fell his guts on earth, and all that corpus contain,
The raging venem full heating members all,
So doth it contradir all by little poyns main,
Unloosing, nerves, and making sides on ground to fall:
This plague the hollow breath and every vital part
Abstruited, where the fibres keep the life in ure,
Did ope, unto death: The life, the lungs, the heart,
O death profane, and enemy unto nature.
Out flow the shoulders great, and arm-blades strong,
Both neck and head gulfed in matter, all about run,
No snow doth melt so soon the Southern heat among,
Nor wax so fast dissolve by heat of shining Sun.
These things which now I speak, I do account but small,
That corps should run with filthy core, may coudful be by flame!?
Thus you hear that more largely expressed by Lucan of the Sephs, which was more briefly touched by Nicander of the Sepedon, and all come to one end, that both kill by putrefaction. The length of this Serpent is about two cubits, being thick toward the head, but thin and slender toward the tail. The head thereof is broad, and the mouth sharp, it is of many colours, so as some have thought that it could change colour like a Chameleon. The four under teeth are hollow, and in them lyeth the poylon, which are covered over with a little skin.

Pausanias affirmeth that he himself saw one of them, and that Egyptus the son of Elatus, a King of Arcadia was slain by one of these. They live in Rocks in hollow places of the Valleys, and under Stones, and they fear no Winter, according to this verie of Viriur.

Hec byhemis calidus frigora nulla timent.
Which may be Englished thus;

Of Winter's cold it bath no fear,
For warm it is throughout the year.

First of all after the wound appeareth some blood, but that symptom lasteth not long, for by and by followeth matter smelldg very strong, swelling tumor, and languishing pain, and all the parts of the body affected herewith become white, and when the hair falleth off, the patient seldom liveth above three or four days. The cure hereof is by the same means that the poylon of the Viper, the Ammodyte and Horned-ferpent is cured withal. And particularly Aetius prescribeth a sponge wet in warm Vinegar to be applied to the wound, or else to lay the ashes of chaffe with the earth upon which they are burned, to the place, and to anoint it with Butter and Honey, or else lay unto it Millet and Honey, likewise Bay Sprigs, Oxymel, Parflain, and in their dyet felt fish.

Arifile woreteth of a little Serpent, which by some are called a facred and holy Serpent, and he faith that all other Serpents do avoid it, and flee from it, because whatsoever is bitten by it, presently roteth. It is in length as he faith) a cubit, and it is rough all over, and therefore I take this Serpent to be a kind of Sepedon. Als° Ariflexenus faith, that he knew a man by touching this Serpent to die, and afterward that the garment which he wore at the time of the touching of the Serpent, did likewise rot away. And thus much for the Sephs and Sepedon.

**Of the SLOW-WORM.**

His Serpent was called in ancient time among the Grecians Typhlop and Typhlyes, and Copia, because of the dimnesse of the fight thereof, and the deafness of the ears and hearing, and vulgarly at this day it is called in Grecce, Tephlot, Teftis, and Tephlin, and from hence the Latines have taken their word, Cecilia, que coccus Serpens, a blinde Serpent, and it is also called Cerula, Cacula, and Coriella, as witnecsseth Alberius, because the eyes thereof are none at all, or very small. The Indians call it Bifa orbala; and the Florentines, Lucignola; the Germans, Byndersfleber; the Helveticus, En viens, al annoiles, and the people of Narbon, Naules.

It being most evident that it receiveth name from the blindnesse and deafnesse thereof, for I have often proved, that it neither heareth nor seeth here in England, or at the most it seeth no better then a Mole. The teeth are fastned in the mouth, like the teeth of a Chameleon, the skin is very thick, and therefore when the skin is broken by a hard blow, the whole body doth also break and part alunder. The colour is a pale blew, or sky-colour, with some blackish spots, intermixed at the sides. There is some question whether it hath one or two rims on the belly, for seeing they conceive their young ones in their womb, they have such a belly by nature, as may be diffendled and stretched out accordingly as the young ones grow in their womb. It hath a smooth skin without all scales. The neither eye-lid covereth all the eye it hath, which is very small: about the head they are more light coloured, then about the other parts of the body: The tongue is cloven, and the top thereof very black. They are in length about a span, and as thick as a mans finger, except toward the tail which
which is more flender, and the female is more black than the male. The passage or place of excres-
ments or conception is transverse. If they be killed with the young in their belly, the little ones will
instantly creep out at their dams mouth, and sometimes (as witnesseth Bellonius) in this little Ser-
pent are found forty little young ones. They are in Greece and England, and come not abroad till
July, and they go into the earth in April, and do abide abroad all harvet, and they love to hide
themselves in Corn-fields under the ripe corn when it is cut down. It is harmless except being pro-
voked, yet many times when an Ox or a Cow lyeth down in the pasture, if it chance to lie upon
one of these Slow-worms, it biteth the Beast, and if remedy be not had, there followeth mortality
or death, for the poyson thereof is very strong. If it sweat, it is good to prick the place with a
brazen bodkin, and then apply unto it Fullers-earth and Vinegar. There is a Triacle made of the
Slow-worm, which filmelleth like Aqua-vita; with this some men are cured of the Plague. And thus
much of this little Serpent.

Of the SNAKE.

Here is no reasonable learned man that maketh question, that Anguis in Latin is a general word
for all kind of Snakes and Serpents, and therefore when Virgil writeth of the fury Alecto, how she
cast a Snake into the bosome of Aranea, be first of all calleth it Anguis, a Snake, and presently
after Coluber & Vipera, a Serpent, as appeareth by these verses following. "Eneid. 7.

Haie dea caruile unum de crinibus angue
Conjicis, ing; suma precordia ad intima fabrit:
Vipeream insinans animam, fit tortile collo
Arsuin ingens Coluber.——

Which may be Englished thus;

To her the Goddess a Snake made of the Gorgons hairs,
Which to the bottom of her breast and entrails made to slide,
Insinuing to her a Vipers soul though she were fair,
For chain of gold an Adder but her neck did glide.

And this is the leffe to be admired or doubted, seeing the very word Anguis seemeth to be derived
of Angularis, winding or turning, for every kind of Serpent may be folded or winded up together
almoft in every fashion. Yet sometimes, as the Grecians use Opis for one kind, as Hernostis or Eter,
for Afp, so also is the word Anguis used for one kind, which we call a Snake, that is, a little Serpent
living both in the water and on the earth. Howbeit, as we shall fiew afterward, when it is in the wa-
ter it is called Epydra and Naeris, and when it is on the land, it is called Chrysus.

Among the ancient Pagans, Snakes were accounted the gods of the Woods, and this caused Fer-
fas to write these verse following;

Pungite duas angus, pueri, facer st locus.

That is, O ye children, draw the figure of two Snakes, for this place, (meaning the grove of Wood)
is a holy place, and facred to the Gods. And in like fort, the Snake in ancient time was fac-
cred to Asculapius, becaufe it was thought to be without venom, and to contain in it many excellent
medicines or remedies against other evils, and also a kind of divine power or help to drive away ca-
lamities, whereof I remember that I have read this story in Valerius Maximus.

Rome (faith he) our City was for three years together continually vexed with Peltilene, so as
neither the mercy of God could be obtained for the release of this evil, nor all wit, power, or in-
dustry of man put an end unto it. At laft by the care and travell of the Priests, it was found in the
writing and Books of Sibyl, that unless they could obtain of the Epidaurus the holy Snake of Ascu-
apius, there should be no end of that peltilene.

For which cause there were Ambassadors sent to the City of Epidaurus to entreat at the hands of
the Citizens and Priests, that holy Beall or Snake (as was prophaneily supposeth) and they attained
the end of their journey, for the Epidaurians did kindely entreat them, and sent the Snake of Ascu-
apius, and then (faith he) "Jam promptum Epidauriorum indulgentiam nomen Ipsius Dei sanctum,
verba mortalium cœleste oblivia comprevit: That is, The very grace and power of God seconed that
favourable indulgence of the Epidaurians, and with an heavenly obelquouinefhe allowed and per-
formed the words and writings of mortall creatures, (meaning the Sibyl writings aforesaid.) For
that Snake (which the Epidaurians never fee but they worship, with as great reverence as they would
Asculapius himself; for it never appeareth but for their exceeding good and commodity) be-
"gan to glide about the broadel streets and nobel part of the City, gently looking upon every body,
and licking the earth, and fo continued three days, to the religious admiration of all the beholders,
bearing an undoubt MSD fpect and alacrity, for the obtaining and affiring a more beautiful habi-
tation: so at laft it came to the Ille neer Rome, called Trevis, whereinto in the fight of all the Mar-
ners it did ascend and enter, and lodged it felf round in that place, where flaneth the houfe of Quin-
tus Opulonis: which story is thus molt excellently followed by Ovid in his Metamorphose.

The
The folk of Rome came hither all by beasts, both men and women,
And eke the Nuns that keep the fire of Vesta as their lives
To meet the God, and welcome him with joyful noise: and as
The gallery rowed up the stream, great store of incense was
On altars burnt on both the banks, so that on either side,
The flaming of the Frankincense, the very air did hide,
And also stain in Sacrifice full many cattled died.

Anon he come to Rome, the head of all the world: and there
The Serpent lifting up himself began his head to bear
Right up along the mast, upon the top whereof on bite,
He looked round about a meet abiding place to spie:
The Tyber doth divide it self in twain, and doth embrace
A little Sfe Triremis, for so the people term the place.
From either side whereof, the banks are distant equal space:
Apollo's Snake descending from the mast, conveyed him thither,
And taking off his brazenly shape, as one repairing hither,
To bring our City beautyfulness, did end our sorrow quite.

Thus faith Ovid: But the truth is, that the Poet did butaigne this thing for the excitement and stirring up of the minds of men to Religion and religious worship of the Heathen Gods; and therefore this Snake of Epidaurus was but a fiction, and therefore in the beginning of the History he makest it to be 
Aesculapius: a wise and skilful of a Snake, for in a vision he reweth how that Aesculapius appeared to the Roman Ambassador, and told him that he would appear in that form, saying;

Pare metus, veniam, simulacraq; nostra vestigium,
Hunc modo Serpentem, baculumque, nesibus ambit,
Preverse & uiji; nota, quidam ut cognoscere possit;
Virtue in hunc, sed major evo, tantumq; videtbor,
In quantum veste vestia corpora possint.

Which may be Englished thus;
Fear not, for I will come and leave my sire.
This Serpent which doth wreathe with knots about this staffe of mine,
Mark well, and take good heed thereof, for into it transformed will I be,
But big too I will be, for I will seem of such a size,
As wherein may celestial bodies turn suffice.

But all Poets are so addicted to faigning, that I myself may also seem while I imitate them, to set down fables for truth: and if ever there were such a Snake as this, it was Diabolical, and therefore in nature nothing to be concluded from it, and in that place of Rome called Biremis and Triremis, was Aesculapius worshipped. And at this day in the Gardens called S. Bartholomew's Gardens, there is a Marbleship, on the side whereof is the figure of a creeping Snake, for the memory of this fact, as writeth Gryalus.

But in the Emblems and documents of the ancient Heathen, it is certain that Aesculapius, and the Snake and the Dragon, did signifie health, and from hence it came to have the name of the Holy-snake, and also to be accounted full of medicine. The true occasion in nature, was for that about the Countries of Bonna and Rudes, they have a Snake which they call Biffe, and Biffe-anque sancta, and about Rudes, Antea, which they say is harmlesse. And as well children as men, do often take up the fame into their hands, with no more fear and dread then they would do a Coney, or any other tame and meek creature.

By the relation of Pallinus, it is in length five spans and five fingers, the head also compared with the body, is long, and in the neck thereof are two blanches, and betwixt them a hollow place, the back part whereof is attenuated into a thin and sharp tail, and upon either chap they have many teeth, which are sharp, and without poysion; for when they bite, they do no more harm then fetch blood only, and these men for ostentation, fake wear about their necks; and women are much terrified by them in the hands of wanton young boys. The back of this Snake, (as writeth Ersafium) is blackish, and the other parts green, like unto Leeks, yet mixed with some whiteneesse, for by reason it feedeth upon herb, it beareth that colour. They are also carried in mens bosomes, and with them they will make knots. For the fame Ersafium affirmeth, that he saw a Fryer knit one of them up together like a garter, but when he pulled it harder then the Snake could bear, it turned the head about and bit him by the hand, so as the blood followed, yet there came no more harm, for it was cured without any medicine, and therefore is not venemous.

In the Mountain of Mountains called Ziel, the Snakes are so familiar with men, that they wait up Leo Asiatic on them at dinner time like Cats and little Dogs, and they never offer any harm to any living thing, except they be first of all provoked. Among the Bigeromi inhabiting the Pyrenees, there be Snakes four foot long, and as thick as a mans arm, which likewise live continually in the houses, and not only come peaceably to their table, but also sleep in their beds without any harm, in the night-time.
time they hisse, but seldom in the day time, and pick up the crumbs which fall from their tables.

Among the Northern people they have household Snakes, as it were household Gods, and they suffer them both to eat and to play with their Infants, lodging them in the Cradles with them, as if they were faithful Keepers about them, and if they harm any body at any time, they account it Pium pisculum, a very divine and happy mishance. But after they had received the Christian faith, they put away all these superstitions, and did no more bother the Serpents brood, in detestation of the Devil, who beguiled our first Parents in the similitude of a Serpent. Yet if it happen at any time that a houfe be burned, all the Snakes hide themselves in their holes in the earth, and there in short space they so encreafe, that when the people come to re-ediﬁe, they can very hardly displant their number. Plautus in his Amphitryon, maketh mention of two named Snakes, which descended from the clouds in a shower; but this opinion grew from the fiction of the Epidaurean Snake, which only by the Poets is described with a mane and a comb, and therefore I will not express the Snakes to have a mane.

There is no cause why we should think all Snakes to be without potion; for the Poet hath not warned us in vain, where he faith;

Friedum, & pueri fugite hinc, latet Anguis sub herba:
Which may be Englished thus;
Fly hence you boys as far as feet can bear,
Under this herb a Snake shall coldly leer.

For this cause we will leave the discourse of the harmefle Snake, and come to those which are no way inferior to any other Serpent, their quantity and spirit being considered; wherefore we are to consider, that of Snakes which are venomous and hurtful, there are two kinds, one called the Water-snake, the other the Land-snake. The Water-snake is called in Greek, Hydra, Hydros, Hydrela, Karatus, and Enhydris, in Latin, Natric, and Lutra. Münfler calleth it in Hebrew, Zephad, and Aviem relateth certain barbarous names of it, as Händrius, Andria, and Abidet, and Kedafuderus, Echydra, and Aspisichum. The Germans call it Natr, Waßer-nat, and Waßer-schlang: and they de-)

For this cause we will leave the discourse of the harmfeful Snake, and come to those which are no way inferior to any other Serpent, their quantity and spirit being considered; wherefore we are to consider, that of Snakes which are venomous and hurtful, there are two kinds, one called the Water-snake, the other the Land-snake. The Water-snake is called in Greek, Hydra, Hydros, Hydrela, Karatus, and Enhydris, in Latin, Natric, and Lutra. Münfler calleth it in Hebrew, Zephad, and Aviem relateth certain barbarous names of it, as Händrius, Andria, and Abidet, and Kedafuderus, Echydra, and Aspisichum. The Germans call it Natr, Waßer-nat, and Waßer-schlang: and they describe it in the manner as it is found in their Country, which doth not very far differ from them of our Countrie here in England. It is (as they say) in thicknesse like the arm of a man or child, the belly thereof yellow, and of a golden colour, and the back blackish-green, and the very breath of it is so venomous, that if a man hold to it a rod newly cut off from the tree, it will so infect it, that upon it shall appear certain little bags of gall or poyson. And the like effect it worketh upon a bright naked sword, if it do but touch it with the tongue; for the poyson runneth from one end to the other, as if it were quick, and leaveth behind a line or scorched path, as if it had been burned in the fire.

And if this Serpent fortunate to bite a man in the foot, then is the poyson presently difpersed all over the body, for it hath a ﬁery quality, and therefore it continually ascendeth, but when once it cometh to the heart, the man falleth down & dyeth. And therefore the meetest cure is to hang the party so wounded up by the heels, or else speedily to cut off the member that is bitten. And that which is here said of the Water-snake, doth also as properly belong the Land-snake, seeing there is no difference betwixt thefe, but that at certain times of the year they forake the water when it draweth or falleth low, and so betake themselves to the land.

They live in the water and in the earth, (but they lay their egges on the land in hedges or in dung-hills) and especially in those waters which are most corrupt, as in pools where there is store of Frogs, Leaches, and Newts, and but few ﬁshes, as in the Lakes about Patoilio, and Naples, and in England all over the Fens, as Brome, Holand, Lyb, and other such like places, and when they swim they bear their breath above the water. They abound also in Coreya, and about Tartaria in India, and in the Lake Dylæs, and especially in Galabria, as the Poet writeth:

Effetiam ille malum Calabris in salibus Anguis, Squammosa convolvem sulata pediore terga,
Atque notis longam maculeum granumibus abolum,
Qui dunn ameturi uti tumidus fronsibus, et dunn
Veres mandu soto terra ac pluviulis australis.

Stagnus colit, ripisque habitans his picaulibus stræm
Impropus ingluviem, vanilique lucubus explet.
Pifquam exhausta palus terrella ardeo dehiscuit,
Exilis in fossam & flammatia lumina torquet
Savit agris, aequesque sitis, atque externiis aequo.

Which may be thus Englished:

That evil Snake in the Calabrian coasts abides,
Rowling his scaly back by holding up the breaf,
And with great spots upon large belly glides,
When its Rivers streams in Fountains all are cast.
For whiles the mild-temper'd Spring with rain from South wind falls,
It haunts the Pools, and in the water all black it feeds,
In ravening wife both Fish and Frogs do still his gall,
For why, when Summers drought enforce, then must it needs
Fly to dry land, rowling its flaming eye,
Rage in the fields to quench his thirst full dry.

There
There be some Writers that affirm, that there is a certain stone in a Water-Snakes head, which it saileth or vomiteth up when the skin thereof is flayed from the body, and after it is so cast up, it must be received into a piece of silk, the vertue whereof is to be proved after this manner; fill a brause Caldron or Kettle full of water, and about the same veasel lo filled, binde this stone fast, as it were to the handle or baul thereof, and you shall finde that every day this stone so remaineth bound to the Kettle, that the water will decrease eighteen ounces. And this Kirandier affirmeth that he bound to a woman that had the Dropifie, and she was thereby delivered from her disfe; for every day he found that her belly did fall the quantity of four fingers, until it came to the natural bignesse, and then he took it off, for he faith, that if he had not then taken it off, it would also have dryed up the native humidity.

In like fort, the vertue of this stone is appliied against the rheume in the legs, or any flux of the eyes, ears or head, but the use of it must not exceed the quantity of three hours at a time. It also drieth out of the body all venomous Worms, and is a special remedy against their biting and ringing. This stone is also called Serpentium and Droscontes, but it is questionable whether it be generated in the head of the Snake, or by their vaporous breath, concurring together in the Spring or Winter feason. Some of these stones are found to be of a blew with green colour, and the form thereof pyramidal: Albertus faith, he hath seen one of them that was black, and not lightsome, only about the edges of it there was some paleisse apparent, and in the superficies or upper part thereof, there was (as he writeth) a beautiful picture of a Snakes proportion, and the vertue thereof did put to flight venomous Beasts, and also cure their harmful poynons.

Such is this, things we have already shewed to be in the stone which the Toad is said to have, but this stone is more likely to be the Ophtes, for in the Caille of Tangere, once the seat or habitation of Charles the fourth, there is a Chappel wherein are many precious stones, wrought in the walls and doors, and among divers other these Ophtes. But whereas there is a pyramidal form attributed to these stones, I take it therefore that it is the fame which Pliny calleth Goggapetra, for in fowre it remembreth the tongue of a Snake, and the tongue of a Snake being great or broad at the root, and smaller toward the end or thereof, is rightly said to be of a pyramidal form: and among the Germans it is called by a peculiar word Natterzungen, that is, Snakes-tongue.

And such a kind of stone as this Snakes-tongue, (as Agricola and some other Authors write) is found in a certain earth near Linburgh in Saxony. And Conradus Gys fairmeth, that there is a certain Town in Germany called Antipon, where there is one of these stones half a cubit long, and therefore it feemeth that they are not all generated in Serpents or Snakes heads. Among the French-men this stone is called Suge, because there be Serpents seen in it twyning their tails together, or folding them one within another.

There was wont to be a superflitious way to extract or exprese this stone from out of the Snake, which was done in this manner; First, when they had taken the Snake alive, they did prefently hang her up by the tail, then jult underneath her they did make a suffumigation of Laurel, and so did conjure the Snake, saying; Per Dominum qui te creavit, lapidem tuum quem in capite tenes te infantar ejusre jubes: This kind of enchanting charm, I hold not worthy to be tranlated, and yet let me not be blamed for the relation of it, seeing it is pertinent to this story to know all the good and evil about these Serpents. And therefore, not to expresse the fame at all, might argue in me, either ignorance, or folly precisione: and again on the other side, to make it vulgar, might bring me into unfition of some approbation: therefore let the Reader know it from me, but understand it from some other.

And for mine own opinion, I account no better of these Snake-stones then I do of the Toad-stones, concerning which I have already given my opinion in another place. And therefore what here is related of this stone, let it be examined, and then be either received or refuted.

Many, and almost infinite are the Epithers which are given to Snakes, whereby their nature is expressed, as Aliger aquis, the winged Snake, black, fierce, bely, greedy, wide, cold, Gorgonean, wreathen, flinding, deadly, lightsome spotted, martial, threatening, purple, wholesome, curly, terrible, winding, grim, swelling, fearful, venomous, green, inflamed or implicit, horrible, hissing, Maritan, Murian, petilent, retorted, and such other like, as it hath pleased the several Authors writing hereof to ascribe and attribute unto them. Which will not profecute with any explication, but only leave them to the Readers pleasure, being only content to nominate them.

There is great account or reckoning made of their egges, which they lay in the Summer time, for first of all they are so glewed and conjouyned together, partly with the spettle and moistneffe which proceedeth from their mouths, and partly with the spume and froath of their own body, that a man feeing their heaps, would judge them to be coupled together by some artificial device. These egges thus knotted together in bunches, the Latines call Anguines. The Druides or ancient Wifers of England and Scotland, have delivered, that if the Snake hisse, these will of their own accord fly up into the air, and then if some wife man take them by prevention, before they touch the ground again, the Snakes will follow him as fast as any Horfe, until he come to some River, into the which they dare not enter.

And the folly of these also proceeded so far, that they were not ashamed to report, that if one of these Anguines or bunches of egges, were tied to a piece of gold, it would swim in a River against the stream. Thre they commended unto Princes and Great men to carry about with them in the time of wars and other contentions, and that therefore when a Roman Knight of Volunti, was
The History of Serpents.

was found by Claudius to carry one of these about him, he was by the Emperors commandment put to death.

But to leave vanities, we will proseute the true and natural description of their eggs in this manner: They are round and soft, in colour white, cleaving (as we have already said) together in great bunches forty, or fifty, or a hundred in a cluster, without, they are covered with a skin or crust, much harder and whiter then the substance contained within it, which is like matter, or the rotten Eggs of a Hen or Duck, in quantity as big as Bullies, Plums, and seldom bigger, being most commonly very round and orbicular. Yet Gesner reporteth, that he had one sent him of the proportion of a Lentil, and as great as the fill of a Man, and within every egg appear certain small things, like the tails of Serpents, or Leaches, being in number ten, five greater and five smaller, one folded or lapp'd within another. And these have also little pulpfules upon the skin or crusts, whereby one doth not touch the other.

Out of these Eggs come the young ones, but I cannot affirm what great affection the old ones bear unto them, or that when many Snakes lay their eggs together, every one in that multitude hath skill to discern her own Eggs from the other. For I have been with other my Colleagues or School-fellows when I was young, at the destruction of many thousands of them, and never perceived that the old Snake did with any extraordinary affection fight for their eggs, but rather forsook them, and suffered us to do with them what we pleased: which sometimes we brake, sometimes scattered abroad upon the dunghill out of which we digg'd them, and sometimes we cast them into the next River we came at, but never saw any of them recollected again to their former place by the Snakes, although the place were very full of them, and therefore I conclude for mine own experience, that Snakes cannot be perceived to bear any exceeding love in nature to their eggs or young ones.

Their ordinary food for the most part, is earth, Frogs, Worms, Toads, and especially Paddocks, or crook-backed Frogs, News, and small fishes. The Foxes and Snakes which are about the River Nilus are at continual variance, and besides, the Harts are by nature common enemies to all Serpents.

They are not in venom inferior to other Serpents, for they infect the waters neer to houses and are many times the causes of diseases and death, whereof the Phylians cannot discern. When they bite or sting, there followeth extreme pain, inflammation, greenness or blackness of the wound, dizziness in the head, and death within three days. Whereof dyed Phyllester, General of the Fleet of Greece, in Lemsus, Dadeius and Manilipmus.

The cure of this evil must be by Origan stamped and laid to the fore with Lie and Oyl, or ashes of the root of an Oak with Pitch, or Barley-meal mixed with Honey and Water, and sod at the fire. And in drink take wilder Nofworts, Daffald flowers, and Fennel-feed in Wine. And it is also said, that a man carrying about him the Liver of a Snake, shall never be bitten by any of that kind. And this Liver is also prescribed against the Stone in the Bladder, being drunk in strong drink. And thus much for this Serpent.

Of Spiders and their several sorts.

And first of those that are commonly called PHAOLANGIES.

Doctor Fournier discourse of Spiders.

This kind of venomous creature, of the Latins is called Araneus, or Aranea, and of Cicer in his Books De natura Deorum, Araneida, and Araneida. Of the Greeks, Aranea and Arachne. Hesiodus termeth it Stry; the Hebrews name it Acalipa, Acal, Acabith, and Semathan; the Arabian, Sibib, and Pubib; in the German tongue Spin, and Bander; in English, Aracop, Spider, and Spinner; of the Grækiders, Spine; in France, Aragne; in Italy, Ragme, and Ragane; in Spain, Arane or Taranoe; of the Tyrians it is called Sparwane; of the Polians, Pejak, and Passejce; of the Hungarians, Pej; of the Barbarians, Bute, and Kerseen. That in his twelfth Book faith, that the Spider is termed Araneus, because the is both bred and fed in the air; but herein he hath fallen into a double error. For if they lived only in the air, and by the air, as he would seem to enforce, I marvel to what end and purpose they should so fully make and pitch their nets for the ensnaring of flies? And if they receive their first being and breeding in the air, I cannot fee to what purpose they do either lay eggs, or exclude small little Worms after their coupling together.

But we will easilie pardon this presumptuous Etymologist, and diver deep into Interpretations, with others also of the fame humor, whose ordinary cultum thus to to daily and play with words, is with them esteemed as good as Statute-law, for the moft part. There are many forts of Spiders, and all of them have three joynts a piece in their legs.

Efei; caput minimum toto quos; corpus parvum est,
In latere exiles digitii pro crutibus lactent,
Lata verter habet, de quo tamen illa remittet
Stamina.
Of the Spider.

Which may be Englished thus;

Little is their head, likewise the body small,
All over is, and fingers thin upon the sides,
In head of legs, out of the belly flank do fall:
Let out of which she makes her web to slide.

All Spiders are venomous, but yet some more, and some leffes. Of Spiders that neither do nor can do much harm, some of them are tame, familiar, and domestical, and these be commonly the greatest among the whole pack of them. Others again be more wilde, living without the house abroad in the open air, which by reason of their ravenous gut, and greedy devouring, have purchased to themselves the names of Wolves, and hunting Spiders. The least fort of these weave no webs at all, but the greater beginneth to make a small and harth web about hedges nigh unto the earth, spreading and setting the same abroad in the very entry, and in void places near their lurking holes, their deceitful nets, observing very diligently the thriring of their deceitful webs, and perceiving them moving, though never so lightly, the makest no stay, but with all speed possible hatheneth her self to the place, and whatsoever she there findeth, the feizeth upon as her lawful prize.

The most dangerous and hurtful Spiders are called Phalangius, if they bite any one, (for they never strike) their poyson is by experience found to be so perillous, as that there will a notable great swelling immediately follow thereupon. These kinde of venomous Spiders, are of two lundry sorts, for some of them be leffer, and some greater. The leffer fort are very unlike one to another, and of changeable colours, violent, libidinous, hot, thriring, sharp-toped, holding on their pace and way, as it were in jumping manner or leaping-wife: and these I finde to be called by Aristotile in his 11. Book De Animal, Phalus, or Pulico, and Pitheoi or Simili. Of some they are called Oribater, because they are usually found among Trees that grow upon Mountains. They are also called Hypodromi, because they live under the leaves.

The Phalangium or Phalax Spider, is unknown in Italy (as Pliny faith) and there are found many sorts of them. One sort of them is very like unto a great Pismire, but much bigger, having also a red head, but all other parts are black, speckled, and garnished with many white spots running all along their bodies. This formicarian or Pismire-like Phalax, of Aristoi is described to have a body most resembling foot in colour, his neck sith-coloured, and his back glittering, as it were with many stars on it. Nicander calleth it Argojet, and Actius, Lucas. The Latines term it Venusat, that is, the Hunter. This thinteth but weakly, without any pain at all, but yet it is somewhat venomous, though not very much. This kinde of Phalax is often found among Spiders webs, where (after the fashion of some Hunters) they beguile and intrap Flies, Grats, and Bees, Gad-flies and Wasps. And (if Lonicerus write no more then may be warranted for truth,) thofe great Horse-flies or Ox-flies and Bremfles, that in Summer seafon vex Cattie, and whatsoever they lay their clawthes on, that they hold fast and destroy; and thus live they by taking of booties and preys.

There is no man (I think) so ill advised, that will confesse this to be the same creature which Aristotile calleth Pulax, for the body of that by his description is broad, rowling, round, and the parts about the neck have certain lines or cuts; and besides, about the mouth there appear and teem to bud forth three eminencies or standings out.

There is another sort of Phalanguem, called by Nicander, Bux, of Actius, Region, of Elianus, Bux (because it is so like to the kernel or stone that is found in Grapes,) and this kinde of Spider is of a round figure, black in colour, the body glittering, and round as a ball with very short plumbed feet, yet nevertheless of a very swift pace. They have teeth, and their mouth is nigh their belly, and when they stir, they gather up their feet very round. In the description of this Spider, Actius, Elianus and Pliny do wholly consent and agree in opinion, and yet Elianus was a little beffes the way, when he set down poda macruse, for micrure, long feet for short feet; and that this kinde of Spider was only found in Libya, and not elsewhere.

That kinde of Spider termed of Pliny, Aferion, feemeth to be all one with the former, saying that this is more known by his little white spots made star-wise, and the glittering irizes or rays where-with his body feemeth to be over-sprinkled. Pliny only mentioneth this, as if Aristotile, Actius, Celen and Avcien, had never heard of it.

The most venomous and hurtful of all these, is that which Nicander calleth Pedoros, of colour azure, or bright blew, which hath long, high, and lofty feet on both sides of the body. The Scholast addeth Dafu and Meteorus, that is, lanigerius and sublime, soft like cotton or Wool, and lofty or high, and not sublume lanigerius, as Lonicerus translacteth it. Pliny faith, that this Spider hath a black moflinefe or foot down, although it will rune sink into my head, that any Spider that is of an azure or blew colour, hath any foot hair, or woolly substance of a black colour.

There is another kinde of Phalangium Spider called of Nicander, Dyferi, which name is neither to be found in Aristotile, Pliny, nor Actius, nor yet in any other ancient Author that ever I could read, which some others call, and that very properly, Sphexion, quasi vepirmeus, because it is so like a red Wasp, saving that it lacketh wings, and this Wasp-like Spider is of a pailing deep red colour, and counted far worser then the blw Spider, although the azure or blew Spider only by
touching doth infect with poyson, and will break any Crystral glasse, if it run over it though never so speedily, or do but touch it in glancing wise, as Scaliger beareth witness.

There are two forts of Phalangie Spiders called Tetragaitha and the worser is that which hath half of his head divided with one white line, and another white line running croftwise. There is another of these not so hurtful as the former, and this is of an ash-colour, and very white in the hinder-parts. There is also a Spider coloured as this, that maketh her web by walls sides for the taking of Flies, which as some affirm, hath little or no venom in it at all. Actin faith, that the Tetragaitha is a kind of balangium, having a broad and whitish body, rough footed, with two swelling or luscious bunches hanging out in the head, the one somewhat broad, the other standing right forth. That at the first, one would imagine that it had two mouths, and four jaws.

Actin in his xvii. Book, chap. 40. faith, that there is great store of these to be found in India about the River Arbrata, where their multitude is so dangerous and mischiefous, as that they bring death and destruction to the Citizens and people bordering nigh those places. And Strabo the Geographer, in his xv. Book telleth us, that beyond the Lybiens and on the Western side of Africa, there is a Country left delitute of Inhabitants, having goodly large fields and pastures, being unhabitable by reason of the multitude of Scorpions there bred, and of the Spiders called Tetragaithoi.

There is to be found in Harveit-time amongst Pea, Beans, and other forts of pulse, (when they are gathered and reaped by the hand,) certain small Spiders called Kunhariides Eikela, in which like unto Cantharides or Spanish-flies, of a very red and fiery colour, such as we Englishmen call Twinges, by eating or licking up of which, both Oxen and other Beasts do many times die. There is another kind of Phalangit that breedeth altogether in the pulse, called Erunion, which is like unto Tares, and likewise in the Peach tree, which Acinander and Actin teemr Grunec laps, and Dioscorides nameth it Kaphalbroughi because it is so preumpituous bold as to strike at the hands of travellers by the High-ways, when as either it pafteth down in gliding manner by her fine thread, or that the tumblith down without any flay of thread or other support. It is a small creature to see to, keeping on the nose very fearfully, and when it staggereth, being great and heavy in the belly, somewhat long of body, and of a greenish colour. It carryth a fling in the top of her neck, and firking at any, the commonly aimeth at those parts which are about the head. And as Actin faith, En toro phalangis per sechus trepethis, kai ta echei homos aia ta etai kai xulon phaloi: That is, they are nourished in Peach-tree leaves, and they have wings like unto Butter-fies that are found amongst Birley.

Whereupon the Scholastia feemeth to insinuate to us, that this kind of Spider is winged, which no man (as I judge) hath hitherto observed. Pselezimus and ArgyImus do take the Cramnec laps to be a Tarantula, but herein they are both mistaken, as was Rabbi Meijer before them. The Spider called Scleophalangia, in form differeth but little from the former. It hath a head as hard as a stone, and the lineaments and proportion of the body do much resemble those small creatures which are seen about Lamps lights, or candles in the night time.

There cometh in the last place to be described, the Phalangie Spider of Aquilia, commonly known by the name of Tarantula, taking his denomination from the Country of Tarentum, where there are found great store and plenty of them. Ferdinandus Ponzetius imagineth, that it hath but only six feet, and ArgyImus is of the same judgement, and further faigneth, that it hath a stretched out tail. Kafis calleth a Tarantula, by the name of Spits, Albuscias, Allari, Rabbi Meijer, Agonyphs, Avi- con, Sebgi, Doctor Gilbert, Taranta, therein following ArgyImus, which maketh two forts of Tarantules, the one of a brown, the other of a yellow colour and clear shining, such as are to be found in Egypt. Pley (as you read a little before) said that the Phalangium was not known in Italy, but in these days they are found throughout all the Southern parts of that Country, especially nigh the Sea-shore, as both Harveit-men and Hunters can well tellifie by their own woull experience.

Ponzetius was much deceived, when in his third Book and xv. chapter entreating of the Scorpion, he expressly affirmeth the Phalangia to be such a venemous flye. It is a credible and cruel creature (as Alexander ab Alexandria faith) and to be touched, horrible, venemous and peliuent: and most epeeialy their biting is exceeding venemous in the parching heat of the Summer, but at other feasons of the yeare not so great. There be many forts of Spiders found in very cold Countries, but no Pha- langies at all; or if there be any, yet have they very little poyson in them, and nothing comparable to them of hotter Climates.

All the forts of Phalangies do lay their Eggs in a net or web, (which for the purpose they make very strong and thick:) and fit upon them in very great number, and when their brood is increased to some growth, they kill their dam by their hard embracements, and flinge her clean away; and further, calling off all fatherly affection, they very many times serve the male with the same sauce, if they can come hand to hand by him, for he is a helper to the female in fitting of them and their eggs. They hatch at one time three hundred, and been seen by the testimony of Bellenius, in his Book Singul, observat. chap 68. The Tarantules lie commonly lurking in holes, chinks, and chaps of the earth, and with their teeth they bite and wound at unawares, incircumscript Mowers, and harveit-folkes, and rash Huntsmen, who think of no such matter: and therefore they that are acquainted with their fleights, do wear Boots and Gloves on their hands and legs, for their further defence, so often as they go forth either to hawking, hunting, or to reaping and mowing, or any such like labour in the common fields.

All
Of the Spider.

All these Spiders are venomous even naturally, for that is so settled and deeply fastened in them, as it can by no means be eradicated or taken away. Neither suck they this venom and poisonous quality from plants or herbs, as many men think, which in very truth they never so much as taft of, neither do they purchase this venomous complexion and nature from any noxious, hurtful, and malignant quality that is in their meat, by reason their chief food and sustenance is Flies, Gnats, and Bees: and without question they can suck and draw no such cacochymical juice from their bodies. If the Formicarian (which I call the Pifmire-like) Philange do bite any man, there will presently follow most fearful accidents; for it bringeth an exceeding great tumor upon the wounded place, the knees are loose and feble, trembling of the heart; and decay of strength do succeed, and sometimes it induceth death it self.

Nicerander faith, that they are bitten of this kind of Spider, do fall into such a profound sleep, as that they will never be awakened, for they have and fuffer that which Hittorpe report of Cleopatra Queen of Egypt, who to escape the fingers of Augustus, because she would not be brought to Rome in triumph, caused two Serpents called Aips, to be set to her breaths, which did fling her to death, whose nature is to give a heaviness and sleep, without any shrinking or mark in the skin, only putting forth a gentle sweat out of the face, as if one were in a trance and hard to be awakened.

The Spider called _Agrolis_, maketh but a small wound with her biting, and in a manner without any pain at all, and no ways deadly, unlesse it be but slightly regarded, or that no care be had for the cure in the beginning. The _Philange_ that is called _Dulferus_, which is fashioned like a Wasp, if he hurt any one by his biting, it cauffeth the fame accidents that the azure or blew-coloured Spider doth, but yet not altogether so terrible and vehement. And besides, the Dufder spider with her poyfon, bringeth a wailing and pinning away of the whole body by degrees, without any great fene.

If a man be poyfoned with that kind of Spider which is found among pulfe, and is (as I said before) like unto Spanish Flies, there will presently arise certain pultules, rifings or swellings, much like unto blisters, as if one were scalded with hot water, in which swellings there will commonly be much yellowish matter; besides, the patient is much disquieted, vexed, and too much out of order; the eyes seem to be writhed, deformed, looking a squint on the one side, the tongue faltereth and flammeth, not being able to found their words, or to pronounce directly: their talk is idie, they wander and rove up and down in great perplexity; their heart being tormented, toffed and turmoilled with an extraordinary kind of furious passion.

The Spider that is found in the pulfe, called _Erasam_, which is very like to Tares or Vetches, produced by his venom the same evil effects that the former doth: and if Hornets or other beasts do by chance devour any of them, their bodies are so inflamed by means of their unquenchable thirft, the poyfon cauffeth, that many times they burst and sunder in the midst. If the _Cranocalitis_ wound any man (as _Flis_ affirreth us) it is not long before death it self do succeed. And yet Nicerander and Aetius hold the contrary, and would make us believe that his hurt is soon remedied, without any great ado: yet herein they do confent, that if any be hurt with any Spider of this kind, there will follow a great pain of the head, coldneffe, swimming and giddineffe of the brain, much disquietedness of the whole body, and prickings pains of the stomac; but notwithstanding all this (faith Nicerander) the patient is soon remedied, and all these above rehearsed passions quickly appeased and brought to an end.

The _Sclerechepalus_, as it much remembereth the _Cranocalitis_ Spider in form and proportion, so in his force, effect and violence they are much alike, caufing the fame symptomes, accidents and passions as the former. The wound that the Spider called _Rajin_ incfeteth, is very small, so that a man can hardly discern it with his eyes; but yet if one be hurt therewith, the lower part of the eyes, and the eye-lids wax very red. Besides, the patient feeth a shivering cold or chineffe in his loins, with weakneffe and feeblenesse in the knees, yea the whole body is taken with a great quaking cold, and the fweats by means of the violence and ranckneffe of the poyfon, fuffer a Convulsion. The parts serving to generation, are made fo impotent and weak, as that they are not able to retain the seed, nor yet to contain their urine, which they void forth much like in colour to a Spider's web, and they feel the like pain as they do which are flung with Scorpions.

Of the the wounding of the Star-spider feeblenesse and weakneffe followeth, so that one cannot stand upright, the knees buckle, sleep and flaeking droufineffe feizeth upon the hurt parts: and yet the word of all is the blewifh Spider, for this bringeth dinnere of the eye-fight, and vomiting, much like unto Spiders and cobwebes in colour, fainting and fouldring, weakneffe of the knees, heavy fleeps, and death it self.

If a man be wounded of the _Tetragmathian_ Spider, the place waxeth whithe, with an intolerable, very violent and contrary pain in it, and the member it self withereth and pineth away even to the very joints. Finally, the whole body by receiving any wholesome sustenance, is nothing at all relieved thereby, yea and after a man hath recovered his health, yet is he,nvertheleffe disquieted by much watching for a long time after, (as Aetius writeth,) Nicerander in expressse words confefeth, that the Ah-coloured _Tetragmath_, doth not by his biting infine any venom or like hurt.

If the speckled _Philange_ of _Apliea_, which is usuallly known by the name of _Tetaules_, do bite any one, there will follow divers and contrary accidents and symptomes, according to the various constitution, different complexion, and disposition of the party wounded. For after they are hurt.
by the Tarantula, you shall see some of them laugh, others contrariwise to weep, some will clatter out of measure, so that you shall never get them to hold their tongues, and otherfome again you shall obferve to be as mute as fishes: this man sleepeth continually, and another cannot be brought to any reft at all, but runneth up and down, raging and raving like a mad man.

They be fome that imagine themselves to be fome great Lords or Kings, and that their authority, Empire and signory, extended it felf far and wide; and for that caufe they will feem to charge others by vertue of their absolute and Kingly authority, and as they tender their favours, and will avoid their difpleafure, to fee this or that bufinesfe dispatched; and with others again the contrary conceit, so much prevaleth, as by a strong imagination they cannot be otherwise diffuaded but that they are taken prifoners, that they lie in fome deep dungeon or prifon, with bolts and fhales about their feet, fo many as their legs can bear, or that their neck and feet lie continually in the flocks. You fhall fee fome of them to be cheerful, quick of spirit, and lively, with dancing, swinging and faking themfelves. With others again you fhall have nothing but fadnefe, and heavynefe of minde, brown-flydes, unaptnefe to do any thing, as if one were allonyed, fo that nothing but numnefe, and dulnefe of moving and feeling, feemeath to pinch them, being to fee to very fenefeffe.

In conclusion, as drunkennefe to fundry perfons is not all one, but much different, according to the diverfity of complexions, and natural constitution of the brain: fo neither is the madnefe or frenzy fits of these perfons all one that be infected with a Tarantulae poiyon: but fome of them are fearful, silent, ever trembling and quaking; and others again are more fool-hardy, rath, pre-fumptuous clamorous, full of noife, doing nothing elfe but call and cry out; and fome few feem to be very grave, conftant and fefead, that will not alter their purpofes for a world of wealth. But let them be affected either with this or that paffion, yet this is common to them all, as well to one as to another, that they are generally delighted with musical Infruments; and at their found or noife will fo trip it on the toes dancer-like, applying both their minde and bodies to dancing and frisking up and down, that during the time of any musicalharmony, they will never leave moving their members and limbs, like a Jackanapes that cannot fland flill. And which is more iftrange, they will use thefe motions and gullures when they are ready to depart this life, through the lingering flay and vehement cruelty of the poiyons operation: and yet for all this, though they be fo neer unto death, yet if they hear any muffick, they come again to theirfelves, newly gathering their spirits and strength, and with a greater alacrity, promptnefe of minde and cheer, they foot it as frolickly as ever they had done aforehand.

And thus doing and dancing both day and night, without any notorious intermiffion, and by their continued sweating, the poiyon being difperfed into the pores of the skin, and evaporated by infe{lable tranpiration or breathing out, are at length by this means recovered to their former health and flate of body. And if the Pipers and Fidlers ceafe playing with their muffick, though never fo little a while, before the matter of the poiyon bein some part exhausted, then will they make a recivation and returning to their former paffions and griefs, with which they were at firft tormented and difquieted. But yet this is the moft iftrange, deferving the graetefl admiration of all, that all thofe perfons which are bitten or wounded by any Tarantula, they will dance so well, with fuch good grafit and meafe, and fing so sweetly, and withall defant it fo finely and tunably, as though they had fpent all their life time in fome dancing and finging-school.

Yet; notwithstanding, Cardan, contrary to all authority and experience, calleth in doubt and quellion this point, and at laft conclufeth that they cannot be reftored to health again by muffick. Wherein he doth marvelously repugn and contrary, both Falci, Paterus, Theodorus, Zwingrus, Andreas, Matthiolius, Bellumewifus, Fontenetus, Paracelius, and many other famous learned men. Truly, a bare contradiction againft fo great authorities, is far unworthy and unbecoming a man any thing (though never fo little) fere or exercized in Philosophy: much more fo great a Philofopher and Physitian as Cardan was. Yet fure I am of the opinion, that Cardan did not erre in Philofophy through ignorance, but having a defire to appear more learned, he did ever bend him- felf to impugn that, which he knew the founded and fett part of men did hold and maintain. But this little which I have here fpoken, fhall ferue sufficiently for the difcufling of Cardan's opinion.

And furely, if the harmonical sound and melody of warlike drums and trumpets, hath cured furious, mad, and enraged Horbies, and mitigated the pain of their legs and hips, as Meflepides hath written, I fee nothing to the contrary, but that it may help thofe perfons that are wounded of any Tarantula. The Pope with his Piff-horn generation, have meffured divers of the Saints together, and have alligned and appointed to each his fundry charge and feverall office apt, for the cure of fundry difeafe. As for example, S. Anthony can heal the burning; S. Roeb the Pellenfe, notwithstanding that S. Scobfian hath some fkill in it alfo. Saint Cofmus and Damian are good for all bile and fwellings and difeafe. S. Thob for the pocks. S. Apollin for the tooth-ach. S. Petronuha can drive away all manner of Agues. And S. Vitius or Vitalius (we may well call him S. Calf) that in times past excelled in the musical Art, doth direct all Dancers, or fuch as will leap or vault: So that if this Saint be invocated and pacified with muffical harmony and melodious and found Infruments, he will be an excellent Apothecary and Doctor for the cureati of any that are wounded with a Tarantula. Superfitious people fondly imputing that to the Patron and Proctor sometimes of Musick, which ought rather to be attributed to Musick it felf, and motion of the body.
Of the Spider.

Dioscorides concerning the common bitings of hurtful Spiders or Psalanges, writeth thus: The accidents (faith he) that do accompany the bitings of Spiders, are these that follow: The wounded place waxeth red, yet doth it not swell nor grow very hot, but it is somewhat moist. If the body become cold, there will follow trembling and shaking, the groin and hams do much froth out, and are exceeding distended; there is great provocation to make water, and striving to exonerate nature, they sweat with much difficulty, labour and pain. Besides, the hurt perssons are all of a cold sweat, and tears distill from their eyes that they grow dim-fighted therewith. Actius further addeth, that they can take no rest or sleep, sometimes they have erection of the yard, and the head itcheth, other whites the eyes and calfs of the legs grow hollow and lank, the belly is stretched by out means of windes, the whole body is puffed up, but in especial the face, they make a maffeling with their mouth, and flammer, so that they cannot distinctly be understood.

Sometimes they can hardly void urine, they have great pain in the lower parts; the urine that they make is waterish, and as it were full of Spiders webs, the part affected hath a great pricking and swelling, which Dioscorides (as you read a little before) will by no means yeeld to, and it is a little red. Thus far Actius from whom Paulus Aegineta, Aeluaris, Arigynus and some others differ but a little. In Zucyndus an ill in the Ionian Sea, on the West of Peloponnesus, if any there be hurt of a Phalangium, they are otherwise and more grievously tormented then in any other place, for there the body grows white and bennummed; besides, it is very weak, trembling and exceeding cold. They suffer also vomiting with a span or cramp, and inflamation of the virge, besides an intolerable pain in the ears and foals of their feet. The people there doe cure themselves by bathes, into which if any found man after that do enter to wash himself, or be drawn into the fame by any guile or deceitful means, he will forth-with fall into the same griefs and passions, that the other sick patient endured before he received remedy. And the like to this writeth Dioscorides, in his Chapter of Trifodium apothecies, in these words following: The decoction (faith he) of the whole plant being used by was of fomentation, bathing or foking the body, caueth all those pains which are cau’d by the biting or flinging of any venomous Serpent: and with the fame bathing or fomenting whatsoever ulcerous persons shall use or wash himself withall he will be affected and have the same accidents, as he that hath been bitten of a Serpent.

Galen in his Book De terroribus ad Pisanum, ascribeth this to miracle, accounting it a thing exceeding common reason and nature: but I stand in doubt that that Book was never Galens, but rather fathered upon him by some other man. And yet Elitamus writeth more miraculously, when he affirmeth that this hapneth to some healthy persons, and such as be in good plight and state of body, never so much as making any mention of ulcer or sore. Thus much of the symptomes, accidents, paines, or effects which tick and wait upon those that are hurt by Spiders. And now I come the cure.

The general cure, according to the opinion of Dioscorides, is, that first there must be scarification made upon the wounded place, and that often, and cupping glasses must be applied and fastened with very much flame to the part affected. Abfutus counsel is to make a fumigation with Egg-shell first steeped in water, and then being call on the coals with Harts-horn or Galbanum, to perfume the venomed part therewith. After that to use Scarifications, to let bloud, or to fuck the place; or to draw out the venom with Cupping-glases: or (which is the safest courfe of them all) to apply an actual Cautery, except the place affected be full of sinews. Lastly, to provoke sweat well, either in bed, covering the patient well with cloathes, or it is better by long and easie walking to procure sweating. In some to attain to the perfect cureation, you must work both with inward and outward means, such as here shall be prescribed and let before your eyes: whereof the most choice and approved I have left down for the benefit of the Reader; and first I will begin with Dioscorides.

Inward Medicines out of Dioscorides.

Take of the seeds of Southern-wood, Anife, Dill, the wilde Cicer, of the fruit of the Cedar tree, Plantain and Triply, of each a like quantity; beat them to powder by themselves, before you do mix them: The dose is two dramis to be taken in Wine. Likewise one dram of the seeds of Tamarisk drunk in Wine, is very effectual. Some use decoction of Chamomilla, and the green Nuts of the Cypress tree in Wine. There be some which praine the tree of Gray-fishes, to be taken with ashes, milk, and Smallege seed; and this medicine experience hath approved and confirmed, for the ceasing of all pains. Lye made of Fig-leaves is drunk with good successe against all bitings of Spiders.

It is good also to take the fruit of the Turpentine tree, Bay-berries, leaves of the balm, and the seeds of all forts of Carrots: or to drink the juice of Mistle-berries, of the Berries of Iry, or Mulberries, the juice of Colewort leaves, and of Clives or Goose-grease with Wine or Vinegar. A dram of the leaves of Been-triploly drunk in Wine, the decoction of a Spargus, juice of Sen-green, or any opening juices is good for the same. Some use with very good successe, the leaves of the herb called Balm with Nitre, and Mallows, boyled both leaf and root, and so taken often in a potion. The leaves of the herb called Phelangium, with his flowers and seeds. The seeds of Nigella also serve to the same end.
The History of Serpents.

Medicines out of Galen.

Take of Aristolechis, of Opium, of either alike much, four drams, of the roots of Pellitory of Spain three drams. Make thereof Trochifces, to the quantity of a Bean. The dose is two Trochifces, with three ounces of pure Wine. The ashes of a Rams hoof tempered with Honey, and drunk with Wine. Remedies of Diophantes against the bitings of Vblangiers. Take of Altrologe or Hartwort four drams, of Pellitory of Spain as much, Pepper two drams, Opium one dram, make thereof Trochifces to the quantity of a Bean, and take two of them in a good draught of pure Wine. Another more excellent: Take of the seeds of wild Rue, Rocket-feed, Styrrax, Sulphur vitum, of either alike much six drams, of Castorium two drams, commix them to make Trochifces, as before, with the blood of a Crevis. The Dose is one scruple and a half in Wine. Another: Take of Myrrhe, Castreum and Styrrax, of either one dram, Opium two drams, of Galbanum three drams, Smallage-feeds and Anife-feeds, of either alike two ounces and a half, Pepper thirty grains; make them up with Wine so much as is sufficient. Another: Take of Myrrhe five ounces, of Spikenard six drams, of the flower of Junius rotundus two drams and a half, Coffa four drams, Cinamon three drams, white Pepper one dram and a half, Frankincence one dram and half a scruple, Celium one dram, make them up with Attick Honey: The dose is the quantity of a Hafel nut, to be taken either in Male or water.

Remedies out of Apollodorus.

Take of Wilde Cummin two ounces and a half, the blood of a Sea Tortoise four drams, the rennet of a Fawn or Hare three drams, the blood of a Kid four drams; make them up with the best Wine, and reserve it to your use: The dose is the quantity of an Olive, in a draught of the best and purest Wine. Another: Take of the seeds of Trifolium Bituminosem, of round Altrologe, the seeds of wild Rue, the seeds of Erum dryed in the Sun, of each alike six drams; work them with Wine and make Trochifces thereof, every one of them weighing four drams: The dose is one Trochifice. Read more in Galen, in his second Book De Antid. where any man may find many for the same purpoze, which he had gathered and selected from divers Authors.

Out of Actius, and Paulus Aegineta.

Take of Sulphur Vivum, and of Galbanum, of either four drams, of bitter Almonds excorticated one dram, of the Gum called Benzoin four drams, temper them in Wine, and after their maceration, work them up with some Honey to be taken inwardly. Being thus prepared, it may likewise be applied outwardly. Another: Take of Amos two drams, roots of Flowre-de-luce one dram, or else of Saint Johns-wort, or Trifolium Bituminosem, drink them out of Wine. Or take of Anife-feeds, wild Carrets, Cummin, Nigella Romana, Pepper and Agarick, of either one dram, and drink them. Or take the leaves of the Cypress tree, or the Nuts beaten in Wine, and three quarters of a pinte of the best Oyl, and give it to drink. And to this end they do preferibe Bay-berries, Scorpion-grasse, Wilde Thyme, Calamint, Chamepitys, either to be taken by themselves alone, or with Rew and Pepper. Afterneade used thefe that follow: Take of the seeds of Angelica and Calamint, of either alike much, and powdered together, to be taken in six ounces of Wine oftentimes in a day. Another: Take of Benzoin, the seeds of the wild Carret, of dry Mints and Spikenard a little quantity, temper them up with Vinegar: The dose is one dram, with pure water and Vinegar mixed together about five or six ounces. Another more excellent: Take Garlick and eat it, and a bath made of the fame with Wine, and likewise all those medicines which do heal the bitings of Vipers, are notable in those cafes. Paulus Aegineta commendeth all thefe very highly, and doth he the seeds of Aegum Coffin, or the leaves of the white Popler.

Out of Nicander.

Take of the purest Turpentine that diftillet out of the Pine-tree, and eat or drink it: for this is a very effectual medicine, which, as Bellonius reporteth, he hath found to be true by experience.

Out of Avicenna.

The fruit of the Myrtle tree, D Loroncum, Mallick, Afla Fatid, Dedder, With-winde and his root, the Nut of India, and white Beulium drunk with Wine. Take of the roots of Aristolochy, roots of Flowre-de-luce, of Spike, Pellitory of Spain, the seeds of wild Carrot, black Hellebore, Cummin, the roots of the true Daffadil, of the fruit of the Carob-tree, the leaves of Dates, tops of Pomgranates, Cinamon, of the jayce of Rue, Cray-fifhes, Styrrax, Opium, and Carphalafa-mum, of either alike, one ounce, all these being powdered, make thereof Trochifces the weight of one dram or four Scruples, which is their dose: Take also in Wine the decoction of the
Of the Spider.

The seeds of Trifolium Bituminosum, Cypresse-nuts, and the seeds of Smallage. Besides let him drink the grains or fruit of the Pine-tree, Cumin of Anthobia, the leaves and rinde of the Palme-tree, the seeds of Silur Montanum, black and white Citers, the seeds of Nigella, Southern-wood and Dill, Althrolege or Hartwort, the fruit of the Tamarisk-tree: for all these are very effectual to cure the hurts that come by biting of any venomous Spider.

The juice also of wilde Lettice and Houle-leek is excellent. The decoction of Cypresse-nuts being boiled, especially with Cynamon, the broth of Cray-fishes, and of Goole-flesh, and likewise the decoction of the roots of Abjascum in wine and water. Another. Take of Althrolege and Cumin of each three drams to be drunk in warm water: an excellent and approved Antidote. Take of the seeds of Gir or Nigella ten drams, Cumin-feed, Duscaret-feed (or wilde Carret) of either five drams, Spikenard, Bay-berries, round Aristolochie, Carpholismum, Cynamon, roots of Gentian, seeds of the Mountain-Siler, and Smallage, of every one alike two drams, make a Confection with Honey. The dose is the quantity of a Nut with old Wine. A confecion of Afa. Take of Afa Satia, Myrrhe, and leaves of Rue, of every one alike quantity, temper them together with Honey. The common dose is one dram, or two at the most in Wine.

Certain other selected Medicines out of Abytirus, Albucasus, Lullus, Rhazes and Ponzettus.

Take of white Pepper thirty grains, drink it often in a draught of old Wine. Give also the herb Thyme in Wine. Abfrusus. Let him drink after it a spoonfull of Wine distilled with Balm. Lutus. Take of drye Rue, of Celus, Horsement, Pellitory of Spain, Cardamomum, of each alike, of Afa Satia a fourth part, Honey so much as is sufficient, commixe them. The dose is the quantity of a Hafel-nut in drink. Albusgar. The brain of a Hen drunk with a little Pepper out of Sweet Wine or Vinegar and water mixed together.

A notable Tarelee or Anitdote against the bitings of Phalangiers or venomous Spiders. Take of Tartariam six drams, of yellow Sulphur eight drams, Rue-feeds three drams, Catusveum and Rocket-feed, of either two drams, with the bloud of a Sea-tortoife, make an Opiate. The dose is two drams to be taken in Wine. Another. Take of Pellitory of Spain, and the root of the round Aristolochie of each one part, of white Pepper half a part, Horehound four parts, temper them up with Honey, the dose that is to be given is one dram. Another. Take of the roots of Capers, the roots of long Aristolochie or Hartwort, Bay-berries, roots of Gentian, of each a like quantity to be taken in Wine, or let him drink Diafla with sweet strong Wine, Cumin, and the seeds of Agamus Catus. Another. Take of the seeds of Nigella ten drams, of Duscaret and Cumin-feeds, of each alike five drams, seeds of wilde Rue, and Cypresse-nuts, of either three drams, Spikenard, Bay-berries, round Althrolege, Carpholismum, Cynamon, the root of Gentian, seeds of Trisfotium Bituminosum, and of Smallage-feed, of either two drams, make a Confection with Honey so much as is sufficient. Give the quantity of a Nut with old Wine. Rheses.

Out of Pliny, Celus, and Scaliger.

"It is good to give five Pimicre to them that are bitten of any Phalangium, or the seeds of Nigella Romanus one dram, or Mulberries with Hypocillus and Honey. There is a secret vertue and hidden quality in the root of Parsley, and of wilde Rue, peculiarly against those hurts that Spiders infect by their venom. The bloud of a Land-tortoife, the juice of Orangeum, the root of Bohem Album, Verwain, Cinquefoil, all the sorts of Sengreen, Cypresse-roots, the Ivy, of Ivy-roots being taken with some sweet Wine, or water and Vinegar mixed and boiled together, are very Speciell in this grief. Likewise two drams of Catusveum to provoke vomiting being relented in some mufle, Apollodorus one of the Diiciples of Democritus, faith, there is an herb called Crocides, which if any Phalangium or other poysonous Spider do but touch, prefently they fall down dead, and their poyson is so dulle and weakened as it can do no hurt. The leaves of the Bul-ruth or Mat-ruth which are next to the root being eaten, are found to give much help. Pliny. Take of Myrrhe, of Una Tami-ness, which is the berry of the herb called Ampeles Agria, being a kinde of Bryony, which windeth it self about trees and hedges like a vine, of some called our Ladies feal, of either alike, and drink them in three quarters of a pint of fowd Wine. Item, the roots of Radifh or of Daarrell taken in Wine is very effectual. Catus. But the excellentef Antidote of all other is that which Scaliger de
dicibeth, whom for his singular learning and deep conceit, I may teame Noflri arbi et feculi ornamen
tum : The form whereof in this place I will prefigure you. Take of the true and round Aristolochia, and of the bett Michriate, tof either one ounce, Terra Sigillata half an ounce, of thofe Flues which are found to live in the flower of the herb called Nepelus, in number eighteen, juice of Citrons to much as is sufficient, mix them all together. For againft this mischief of Spiders, or against any other threed turns, grievances, or bitings of any Serpents whatsoever Art, as yet never found out to effectuall a remedy, or to notable an Alexipharmacall. Thus far Scaliger. The juice of Apples being drunk, and Endive, are the proper Bezoez against the venom of a Phalanges Petrus de Alhans. Thus much of inward : Now will I proceed to generall outward medicaments and applications. Five Spiders putrefied in common Oyl, and applied outwardly to the affected place, are very good. Athes made of the dung of draught beafles tempered with Vinegar, and used as an oyntment; or in head of Vinegar, water and Vinegar boiled together, and applied as before, are proved to be fingo-
singular. Take of Vinegar three pints and a half, Succus vinaris two ounces, mix them, and form it, bath, or foake the wounded part with a Spunge dipped in the liquor, or if the pain be a little allayed with the ointment, then wash the place with a good quantity of Sea-water.

Some hold opinion that Achatias (which is a precious stone, wherein are represented divers forms, whereof some have the nine tails, some of Venus, &c. will heal all bitings of Phalanges, and for this cause being brought out of India is held at a very dear rate in this Country. Pliny. Aches made of fig-tree-leaves, adding to them some salt and wine. The roots of the wilden Panax being beaten to powder, Aristolochie, and Barley-meal kneaded together and wrought up with Vinegar. Water with Honey and salt applied outwardly for a Fomentation. The decoction of the hearth Balm, or the leaves of it being brought to the form of a Pulte, and applied: but we must not forget to use warm baths, and sometimes to the place agrieved. Pliny. Cut the veins that appear under the tongue, rubbing and chasing the swelled places with salt and good store of Vinegar: then cause the patient to sweat carefully and warmly for fear of cold. Végétus. Theophrastus, that practitioners do highly commend the root of Panax Chironis, Moyten the wound with Oyl, Garlic bruised, Knot-graffe or Barley-meal, and Bay-leaves with Wine, or with the dregs or Lees of wine, or wilde Rue applied in manner of a Cataplasm to the wounded place. Note. Take of Salbeius Vium, Galbanum, of each alike, four drams and a half of Eufur小微企业 a dram, Hafel-nuts excoriated two drams, disolve them, and with wine make towards the curation. Flies beaten to powder and applied upon the place affected. The fish called a Barbie cureth the bitings of any venemous Spider, if being raw it be flit asunder in the middlet, and so applied (as Galen faith) Anoint the whole body with a liquid Cerote, and foment the place affected with Oyl wherein Tefulion Btuturnifom hath been infused, or bathe it often with Sponges foked in warm Vinegar: then prepare and make ready Cataplasmes of these Ingredients following: that is, of Knot-graffe, Salvia Calis, called Salomonis feal, Leeks. Cheeffill or Bran decocted in Vinegar, Barley-meal and Bay-berrys, and the leaves boyled in Wine and Honey. Some do also make Cataplasmes of Rye or herbage, and Goats-dung tempered with Wine, Cypres, Marjoram and wilde Rue with Vinegar. An emplater of Acidulades. Take of the seeds of wilde Rye, and Rocket-seeds, Stavesakre, Rolemary seeds, Aquos Gajus, Apples and Nuts, or in Read of these two, of the leaves of the Cypres-tree, of each alike, beat and temper them all together with Vinegar and Honey. Aetius. Apply the decoction of Lupines upon the affected place, the echar being first removed, then anoint it in the warm Sun-shine, or against the fire with the fat of a Goole tempered with wilde Rue and Oyl, or else of the pap of Barley, and the broth of Lupines make a Cataplasm. Oribius. The Fulber-nut that growth in India, healeth the bitings of the Phalanges, Anicenna. Goats dung diffolved with other convenient Cataplasmes, and Oyl of Worm-wood, and the juice of Figs helpeth much Rhenetia. Apply oftentimes a cold piece of iron to the place. Petrus de Albano. Foment the place very often with the juice of the herb Plantane. Hevedgardia.

The artificiall Oyl of Balm is singular. Eunymus. A fomentation made of the leaves and thalls of Imperatoria called Misterwort, and continued a good space: or else Versan bruised and flampd, the juice being taken in wine, and further, the herb outwardly applied, is much commended of Turneifer. Beat and flample herb grace with Garlic and some Oyl, and apply it outwardly. Celus. There be but a few particular cures for the bitings of Spiders that Phyfiatans mention: yet some they doe, although the generall be most effectuall. Pliny against the biting of the Formicarius or Pilmiere-like Phalangie, that hath a red head, commendeth much another Phalangie of the same kinde, only to be shewed to the wounded patient to look upon, and to be kept for the same purpose, though the Spider be founde a little. Also a young Weafe dried, and the belly thereof stuffed with Coriander-seed, and fo kept till it be very old and flaked, and drunk in Wine, being first beaten to powder, is likewise good for the same intention.

There is a certain little beast called Ichneumon, of some it is called Mus Phareanous, Phares Moufe, and for the enmity unto Serpents, it is called Ophiomachus, (as Bellinius reporteth) being bruised and applied to the bitting of any Wasp-like Phalangie, doth utterly take away the venom of them. It often entreat and searcheth out the feats and holes of venemous Spiders and Phalangies, and if it finde any of them, the haleth and tuggeth them clean away as a Pilmiere doth a small grain of Corn: and if the Phalangie offer any refilience, the Ichneumon sparing no labour, pullleth her her contrary way: and by this struggling and thriving, sometimes it so fellath out that the Ichneumon is wearied, and then the breatheth a little, and gathering new strength and courage, lesett again upon the Phalangie with a freth assault, and woundeth her many times, so that at length the curieth her to her own lodging there to be devoured.

If the Tarantula have hurt any one, the best remedy is to firre and exercise the body continually without any intermission, whereas in all hurts that are caused by any other Spiders, rest and quietness are the best means (as Celus affirmeth.) But their Antidote is mutick and singling.

Chiliphas de benevolis counseleth to take forthwith Teares and water without any delay. He also advieth to take Butter tempered with Honey, and the root of Saffron in Wine. He proper Beazor (faith he) or the green berrys or seeds of the Lentisk-tree. Panzetus in his book De remedia, advieth to take ten grains of the Lentisk-tree in Milk, or an ounce and a half of the juice of Mullberry-leaves.

In the increafe of the grieue, he cureth them with Agarick, or the white Vine: and after much sweating, they are to be comforted and refted by strong and heathy walks with cold Medicines, as with the water.
Of the Spider.

water of Poppy, and the like (Merula saphth) they are to be remedied with the stone of Muscall Instruments, dancing, singing and colours: concerning the three former I will not contend, but how they should receive any part of help or health from viewing of any colours I do not well understand, considering that the eye-sight of all those that are bitten of a Tarantula, is quite taken away, or they see but obscurely, as being mightily deceived in their objects.

Andreas Mattiobius in his Commentaries, upon the sixth book of Dioscorides, Chap. 40. reporteth a very strange story of a certain Hermit, his old friend and acquaintance dwelling near unto Rome, who cured all those who were bitten or hurt of any venemous Worms or Serpents, which in this last place I will inter (although some may say that it is needlese, and belongeth not at all to this discourse in hand, or else will not believe it.) For when as any of the inhabitants in those parts were wounded of any poysonous Serpent, by a Meffenger forthwith signified the fame to the old Hermit; who by and by demanded of the Meffenger, whether he could be content to take or drink any Medicine in stead of the sick patient; which if the other assented to, promising to take it, the Hermit commanded him without any further delay, to pull off his right foot thence, and to set his foot on the earth, drawing a line round about the foot with his knife: then he willd him to take away his foot, and within the space of the line so marked, he write or engraved these words following Caro Carus, panem reduce, reputa panem, Emanuel paratis. Then immediately he pared away the earth with the same whittle, so that all the Characters were quite defaced, putting the same earth into a little earthen vessel full of water, letting it there to long remain, until the earth funk to the bottom. Lastly, he drained the water with a piece of the Meffengers thirt; or some other binnens that he wore next to his skin, and being liged with the sign of the Croffe, gave it to drink: But surely (fith Mattiobius) it was marvellous strange, and a wonderfull thing to consider, how that the wounded patient was perfectly healed, even at that very hour and moment of time, that the Meffenger took the aforesaid potion of the Hermit, as it is plainly known unto my self, and to all the people that dwell round about in that Territory or Shire. And thus much of this Hermetical curation by the way.

Now will I come into my path again. A man may finde a great fort both of these, and the like remedies both in Pliny, Dioscorides, and other, concerning the hurts of Spiders, but I think I have been a little too tedious, and you may imagine that I do nothing but Ta arachina hypothis, Araeae, tamet sesera refdinas in hreme tele. That is, ina frivolous matter and of small moment spend infinite and curious labour; so that I had more need to crave pardon for my long discourse about this subject, where-in though many things may want to the satisfaction of an afflicted and searching head, yet I am sure here is enough to warrant the discharge of my good will, and to repel, the cenure of the scrupulous;

"Nunc imus ad illam artificem, mens nostra cui est conformis, Arachnem, Quae medio tenera refidens in harena tene."  
"Qua ferae cursum atroc, repellit volantibus uris."  
"Tangit, utque juno vagos illi byssus ab aspho."  

In English thus;

"Unto Arachne skillfull Miftresse let us come.  
To whom conform'd from the minds of man.  
She fits in middest of web, her tender feet upon:  
Whiter she is tall with East-wind now and then,  
She trembleth at the nope of razing winds,  
At the huming Flee hard wagging finds."

Of the Tame or House SPIDER.

A Rigonde, that diligent searcher and seeker out of Nature and natural causes, termeth this kind of Spider a very gallant and excellent wise creature. King Salomon himself, at whose high wisdom all succeeding ages have and will admire, amongst those four small Creatures, which in wise do out-stript the greatest Philosophers, reckoneth the Spider for one, dwelling (as he faith) in Kings Courts, and there devising and weaving his imitable web. The Poets faign that the Spider called Arachne, was in times past a Mayden of Lydia, who being infracted of Minerva in the cunning skill of Embroidery and spinning, grew therein so excellent, and took such a pride in the same, (for you must remember she was a woman) that she stifly denied, razing it out in braving wife, that Minerva was never her Instructer, and so arrogant presumptuous she was, as that she feared not to challenge her Miftresse Goddesse to work with her, if she durst for her ears enter the lift, in all manner of Embroidery, Tapestry-works, and the like.

At which, Miftresse Minerva being netted, and taking the matter in dudgeon, thus to be provoked, and withall reprehending the mayd very sharply for her fawcinitie, in a pelting chase the brake to pieces the wchens imagery work, that was so curiously woven, and so full of variety, with her fhitte. The Mayd hereat being fore grieved, half in despair, not knowing what to doe, yeelding to passion, would needs hang her self. But Minerva taking compasion upon her, would not have her die forth with, but transformed her into a Spider, hanging by a fine small thred or line.

Arque ita vive quidem, tende ramus, improba, disit,  
Lusae adem pane, ne fis secura jam,  
Dilata duas generis, ferique nepolutus effo.
The History of Serpents.

In English thus;

So live indeed, yet hang thou womanlike,
She said, and let her self same law of punishment
Be unto thee and all thy offspring, while
All kindred lofty; full not futures thee content.

If any be desirous to know more of this fable, let him read the famous Poet Ovid, who hath excellently written thereon in the sixth book of his Metamorphosis, although somewhat differing from this of Piety. The Grecians besides do write, as Callinus Bolognus, in his 7. book Libellum Antiqu. Chap. 16. affirmeth, how that there was in the Country of Aetia a certain man called Phalanx, who had also a Sitter named Arachne, and when Phalanx had perfectly learned of Minerva the Military Science, and all other warlike exercises and offices that belong to a Souldier, and that the lad likewise instructed his Sitter Arachne in weaving, spinning, and needle-work; they concluded a match between themselves, but the Goddess being much displeased with such a shamefull and incestuous marriage, marring their fashion, disfigured them both into the number of creeping Creatures, laying this as a just punishment upon them, to be destroyed of their own young ones.

But it is at every man choice to interpret thefe to be either fables and Canterbury tales, or true historicall narrations: yet most are of this minde, that Arachne first invented spinning of linnen, weaving and working with the needle, which this mayd of Lydia first learned from the Spiders, taking her first Samplers and patterns from them for imitation; which no man ought to think to be strange, fith the craft of playfettering or working things in earth, and the Art of curing the eyes, was first taken from the Swallowes. The Eagles have taught us Architecture, and men firit received the light of Phlebotomie or letting of blood from the Hippopoetanum, which is a beast living in the River of Nilus, having feet like an Oxe, and his back and mane like a Horfe, with a winding tayl, and tusked like a Boar. The bird of Egyp called Ibis, first gave knowledge to Phytitians how to ufe the Glyster; yea, Dogs, Goats, Harts, Storks, Swallowes and Weasels, have taught men many medicines for many diseas.

To begin therefore to make an enumeration of their prays, I will declare unto you, the rich vertues and externall goods of the body, fortune and minde. And first to begin with the good gifts of their bodies. If you will weigh and confider the matter and substance of a Spiders body, you shall finde it to be light, partaking much of fire and ayr, (being two of the most noble and effectuall elements in operation) and having but little earthy diggettife and droffe refuse. If you behold their figure; they have either a Spherical and heavenly, or at leaft wise an Ovall form, which is next to the Spherical, as being the perfectt of all other. Besides, their substance is thin, fine, glittering, and subtile, yea, although they seem not, and then to be fatced up with plenty of meat, that they grow as big in bulk as a Walnut, and if the learned Cardan may be credited, they grow otherwhiles as great as a Sparrow: yet for all that, if you call your eye on them against the light, hanging in their web, the glittereth and shineth on all parts like unto the Chryfoleite, which is a kind of precious stone, shining with a golden colour quite thorow, causing a pleasant reflection to the eyes, and piercing them with singular delight.

The colour of a Spider is somewhat pale, such as Ovid affiribeth to Lovers, and when the hangeth aloft in her web, with her legs wide and large spread abroad, the perfectly and lively expresseth the shape and proportion of a painted Starre: as if nature had intended to give and settow on her, not only the resemblance and counterfeit similitude of heaven, but also the very lustre of the Starres themselves. The skin of a Spider is so soft, smooth, exquisite, pure, clean, and neat, that it farre surpasseth by many degrees, the polished skins of thofe maids that have the Greenfickenfe, or thofe young whores that are so careful in sparing no cofl to preferve their beauties: and it is of such cleerenfe and perspicuity, that it will easilie reprefent the vifage and physiognomy of any beholder of it, much like unto a fine glaffe. Further, it hath fingers, for all the world such as fair Virgins desire to have, that is to say, long, round, and slender, being also endowed with the most exquisite fene of touching that possibly can be imagined, infomuch that it farre furnmounteth any mortall man living, and all other creatures in the world besides, according to that old and common Verfe;

Nor oper auditum praecellit, Araçna tayl,  
Vultur odoratu, Lynx vijus, Simia gulf.

Which may be Englished thus;

To hear, the Boar, to touch, the Spider no exellt,  
The Lynx to see, the Vpe to taste, the Vulture for the smelle.

It hath also feet, but yet not such a multitude as Scorpiondraes have, nor yet none at all, as the meanetl rank and fort of Creatures, nor yet fix only, as the common fort of Insects: but it hath eight, a number which the meanetl Sophists in Cambridge dare not resolve, is next to the perfectt of all numbers, and these feet contriving of a few quartiall proportion, which of all Mathematicians is esteemed to be wonderfull and admirable, so that although the hinder be shorter than the fore-legs, yet notwithstanding they retain a mutuall harmony, equality, and feemblable concordance. Many Philofophers have not dared to affirm that they are blinde, but they themselves in this point are
molt blinde. For if they be deprived of their eyes and eye-sight, I would fain be resolved how they could make choice of such apt and convenient places for their hunting trade, and with what guide, Captain, or Direc\r
or, they do knit, fallen and eye one thread to another, in such admirable order, rank and range, as the excellent work-men in the world fand amazed at. Or else how they can come to the knowledge when their webs are broken by chance, or have the skill to amend them, being either thicken or burft in funder. Befides, we may all obferve by our own experience, that if one take a fly, and hold her at the fide of the web, the familiar, tame, or domelian Spider throttling her, will make all the halfe the can through thick and thin, yea though the be farre off, and will boldly affay and devour her, and will (as a man may fay) take her out of your hands into her own, which thing I have often done. Surely therefore thofe perfonis are half blinde, who neither can conceive nor fee, that Spiders can fee.

Now in that a Spider feemeth to fome to be an ugley and loathfome Creature, and even at the firft fight to be defteed, in regard it is misshapen, I will not impute this to any defect or de\r
fault that is in their form or proportion, but I rather acribe it to their exceeding great Melancholy (for this humour is molt predominant in them) and to their strange lufling or longings, by reafon of naughty humours gathered about the mouth of the flamack, yea, and to their lack of fty and moderation in their lufts and affections. For they are no leffe beholding to Nature for their elegance, handfome and proper feature, then the Butter-fly, or any other Cut-wafle whatsoever. To conclude this poynt, GOD hath given and beloowed upon this ftrange and admirable body, as strange and admirable a disposition, nature, and confluence of the skin. For a Spider changeth her skin, not ony only in a years pace, (as Vipers do) but once in the pace of a moneth the re\r
neweth it, (if the be well fed, and not hunger-harfeved) and putareth on a new hue and skin, and the fame in all poynts more freth, exquifite and neat, then the old skin which the call off.

Amongt the blessings of Fortune, or rather Fate, I egleem this to be the excellent left that is conferred upon them, in that they bear about with them an inexhausted matter or substance in their bellies, to make infinite webs, yea, fuch a manner as can never be confumed, waited or fpent, of which they have fuch foyfon, as they are able to draw out in length and breadth, and to spin and de\r
vide innumerable threads and fuffe to make and finifh their Cob-webs of, fo that if a hundred flies light in them they are of force fufficient fo to entangle and enfinare them all, as they hall never get out again. Furthermore, although they have neither food nor fuffence laid up in Barns or Store-houses, as Pinfires have, nor yet any meat fct or fowed for them as Bees have, but get their commons only by taking of booties casually, by hunting at all adventures, and by chanceable preys, yet do they lattice nature, and expell hunger, by means of that hazardous and fuddain (pooy, and sometimes you shall fee them growne very thick, far, and unwieldy, by reafon of their good difhes, and fat meffes of meat which they can purchase by their own good wary husbandry, or by any means can lay hold on, and catch into their clawes.

Befides, I muft tel you that Spiders have not the leaff benefit of Fortunes favour beftowed upon them, when as being inglutted with Courly Viands, they have been glad to exchange lodgings with an old Courtir called Podegra, or the Gowe, for it skileth not whether of these two names you will chufe. For you have heard before, the wife King Solomon's have given them the molt prife and chiefed places in Princes Courts, that the might be an abolute pattern and prefident of wit, widome, moderate frugality and vertue, and in divers poynts of regiment they might be our directors for imitation. Further, beginning their Cob webs, they have wholly bent and applied themfelves to their molt ingenious weaving trade, they have given themfelves to curious and fuperflitious hunting, to captious taking at advantage, watching and efpying their prey, nothing at all fearing any ambushes, treacheries, traps or treafons and no whit dreading any affaults, much leffe triumphs: and to speak briefly, the wifef creature of the wifeft King, beareth a great stroke, dominated, and hath (I may fay) the fole sovereignty in the molt noble, greatefl, and flatcelf Courts of Princes.

And yet for all thofe vertues, (fince Solomon's time) there have rifen up and followed fome Prin\r
ces and Governours, unadvised, desperatly naught, and unthrifty, and fuch as were not well in their wits, and of thofe it cannot eazily be fpooken how curifully they entertaind her, how they went out their proclamations and warrants, to expell the Spider, to call her down to the earth, tread under foot, undoe and kill, as a night-thief, with bedfoms, brooms, brushes and long poles, fo that by and by in a trice there flocked certain Furies of hell, (for fo I think I may juftily term them) rubbing,bruffhing, lipping, making clean fluts-cores, beating and sweeping together, and whatsoever they found curiously wrought, all that either they swept clean away, or tore all to pieces, fo that hardly they could escape the bufie beofmes of thofe quick-fighted and lewd naughty packs.

Surely, miserable was her condition and estate, which in all that abundance of wealth, the only being indigent and bare, deftelting idleness withall, might not yet be admitted tenant for fome short term of time, in fome small odder corner, in fuch large and spacious buildings, nor yet finde one hole to live at peace. Again, the great men, the rich mifers and penny-fathers, following the example of their Princes and Governours, they in like fort fent packing out of their doors, the School-miulrefle of all labour, diligence and vertue, and will not permit a web, the very pattern, index, and anathema of supernatural widome to remain untouched.

This
This same Spider which now we treat of, in times past, (it was when Dogs and Cats could speak, for now because there are so many languages in the world, they turn all to plain barking,) took a long journey into a strange Country, and by good hap fell into company with my Lady Podagre, although (being none of the belt footers) the could hardly keep way with the Spider, but lagged still behind, and having now spent one whole day in travelling, the night approaching that they should take up their Inne to lodge in, they resolved betwixt them two to betake themselves to sundry houses; so the Spider entering the Town, took up her lodging in the house of a certain wealthy Citizen. (I suppose it was near the sign of the three Tunnies in Tower-bill-street) where when according to her usual manner, hating lewd idlenesse, the began to buckle her self to her wonted task, in weaving her fine Tapestry, and other wrought work, being suddenly espied of a company of corner-creepers, Spider-catchers, fault-finders, and quarell-pickers, they presently begin to expostulate the matter with her, and not staying to hear any reason for her just defence, they made no more ado but gave her Jack-drummes entertainment, thrusting her out of doors by the head and shoulders, to seek her lodging where she could finde it; so that the lay abroad without doors a whole Winters-night in the rain and cold: and all this happened about Saint Nicholas time, when days are at the thorrer.

Now in the mean space Podagre having none of the belt feet, but indeed being somewhat lame, when she could travall no further, she by chance light into a poor Cottage or cabin of turf, builded with Elder-poles at the Towns end, and yet in this poor shed she could hardly be received, but yet at length, through her inefiant solicitation being admitted, the face down to reef her weary bones, so at length, supper being prepared, the tender-hearted Lady found courte spare, and commons farre shorter and more homely, then ever Lipped found in Westphalia: she induced all the miseries in the World, that pity it was to see. There was no infelicity, no diiftreffe, misfortune and adversity to be compared unto hers, for there was not but a little brown barley-bread set on the board to fip withall, which this nice piece so much miliick and abhorred, as that at the very fight thereof she was ready to digorge her queffe stomack, then was there brought some Cock-crown keal, having no good relifh, for they were not fesoned with salt, so that they were in taste very untouchable, and when they should drink, they fetch a little cold water out of a pit or pond, neer adjoyning to the house, in a wooden dish, whereof if Miiftreffe Podagre had fetched but one pound carouse, it would have made her run through an Alphabet of faces: but there was no remedy, hunger breaketh stone-walls, and hard need makes the old wife troth, the mule either quench her thirst with that or fall.

Having thus thinly fupped, she called for her Chamber, where they fwhelled her to clime up a Ladder, (you would have taken it to have been the fles Ladder) and behind a corner there was provided a beduffled with good Wheat-chaffe in head of Down, to harden her hide, and under her head a hard Oken-logge, with the Winnow-cloth, and the one end of an old Hop-bag, call over in head of a Coverlet, (for the poor man and his wife, thought that none but the Lord of the Town, and women in child-bed used Pillowes,) But Podagre not knowing how to mend the matter, groaned, and made a lamentable noyse, and fetching a thousand fighes she couched her self down. But alas what ill the poor heart took that night, and how ill her fofit and tender limbs agreed with such cold cheer and entertainment, I referre my self to your fecret thought. So soon therefore as the day began to break, she startet up, and the Spider and she met together again at the appoint- ed time and place: and firl of all the Spider began much to complain of the inefficiency of the rich Chaffe his boit the Citizen. Podagre contrary-wife found as much or more fault with the short and flarp commons, thin diet, miserable poverty, and indigency of his poor, bare and lean holtt, fwhelled her black and blew marks and printes into whole tender skin the boards and planks had made a deep impreffion. For which cause, being both much discontented, after the matter was throughly debated betwixt them two, they determined and resolved within themselves, that the night following they would change Holtes and Innes, that is, that the Spider should enter into some poor Cottages, or houses of poor men, and Podagre shou'd bend her course unto Noble and great mens houses, to Kings Courts, and Princely Palaces, to fee what good was to be done there. So Podagre not being unmindfull of her word, went with a fine and Smail-like pace to the house of a certain fat, rich, and well mooined man, and quietly laid herself down at the feet of this corfe Sire: which as soon as the gentle Holtt caft an eye upon, it is strange to tell with what mildenes, with what allurement and gentle intreaty, with what promptitude and alacritie she was welcomed; they prepared soft pallatts of Down for her to lye upon, the Bedfides and the Settles whereon she shou'd reft, were covered with Pillowes, soft Cuffions, and Carpets of Perfie, the Kitchen smokes, and all things are in a readinesse to give her a moft friendly welcomme. According to the words of the Poet, where he faith;

Jam dopious menfa onerauit et pocula pamum.
In English thus;
Spread are the tables, and laded with store
Of delicates, the Cups filled, could receive no more.

Briefly, he was in all points for person and provision such a one as Chaucer in his works describeth his Franklin to be:
Nay, hithe they brought fat and crammed Capons, Pheafants, Quails, Turtle-doves, Larks, and Nightingalls. I passe over Turbot or Byrt, Gilt-heads, Sturgeon, Salmons, Soals, and the like, for they were not unburnished of all these, and of other ftre of shell-fifh, as Lobifters, Creffithes, Oyfles, and whatsoever the Sea yeelded that might by love or money be purchased: for I will not speak of a great number of River-fifh and Fous that are to be had about Peterborow, Witlefley-mare, and thofe Fennifh Countreyes, for thither he fent his people to purvay for him all that was rare and furely, very much, and fome Juliana, Falernum, to Phyfick, fome of the Islands of Creta, Chio, Malara, and thofe that are called Baleares, lying neere unto the Coaft of Spain.

To speak nothing of their rear-fuppers, their fine Marchpanes, and curious Confedtions, made with fundry devifes, and exquifite skill of the Apothecary. And to conclude, there was no wanton fare unfought for, no delicate Juncate, no curious trimming and pickedneffe that might gratifie, no fair words, and pleafant enticements fit to draw and allure, nor no delection whatsoever omitted, that might feme to pleafe this great Lady Podagra, (for you muf withander thafe was none of the courfeft for Ladies, whereof there be many now adayes, for all men know the was a Gentlewoman born, both by the fathers and mothers fide, as being the daughter of Barchew and Venu,) and all this, I fay, was done to pleafe both her and her two fweet Sifters, Cziraga and Congra, who take them all three, and fo Twill let them go, and come to the Spider, who likeweife being di- rected by some favourite Planet, boldly and luckily trudged to the poor mans houfe.

--- Atque ibi mira
Dogmate, quidve maren decent, decaetque maritam
Addocet, atque tuo fefe pudore faginate.

Which may be Englifhed thus;
And there by strange inftrutions and documents,
She teacheth male and female how to live,
That is, both man and wife how to increafe their rents,
Whilif she, on her owne fweat and fat diath thrive.

But some man may here object and fay, I fee here no fuch bleftings of Lady Fortune, more then besides a bare commendation, and good hap in this theire xchange of lodging and lodgers. Yes surely, very much, not only because the fpendeth her days more freely and lately from danger, but also because as out of a high watch-tower, the no longer beholdeth in the houfes of poor perfons, lavish and needlefe prodigality, banquets, quaffings, rioting, plays, dancing, dicings, and whoring, and a thoufand vanities and villanies besides, whereof the knew her fel-confious, and a privy witneffe unto, whilft the lived in the Halls and Bowers of the rich and wealtier fort; who when they had thrust clean from houfe and home, and for ever banifhed the Spider, (the true School-mitreffe of indufly and frugality) Straightways the dazv Govt called Podagra, arrested them. Had it not been better for them (thine you) to have granted a dwelling place to a faving, prudent, and harrefle little creature, then to have given entertainment to fuch a bafe, blockifh companion and guelt as the Govt is? Let not therefore, rich, covetous men wonder, if many times they be tormented with this fore grief, fith they will neither admit true Phyfician nor phyfick, I mean, travail, diligence, indufly, moderation, and pains-taking, with the like.

Now to touch the rich and rare gifts and graces of the mind, and other noble qualities and dispositions of Spiders, I know not whether I should first begin with the commendation of their prudence, julice, fortitude, temperance, their Philantropia, Philoquias, Autarquias, their humanity and love towards men, their fludious indufly and love of labour, their contention as having fufficient, and coveting no more then is allotted unto them. Their wittineffe, policy, quickneffe and sharpneffe of fenfe, their cleanly neatneffe, with many other vertues, or else her admirable cunning and skilfulness in their weaving trade. Their prudence, fagacity, and wittineffe to conjecture things future, appeareth in this one thing, that when great abundance of rain, floods, swelling and overflows of Rivers, are like shortly to come to paffe, and thereby to threaten houfe, they then begin to build their Webs higher by a great deal, then their ufive cufome heretofore hath been. And this is another proof of the fame, in that they weare not at all in a clear Sun-thine-day,
day, or when it is fair and calm weather, when Flies are most busy in flying about to and fro, that they may be the better at leisure to give themselves to hunting and watching after them, to take advantage, and if any chance to light into their nets, forthwith to seize upon them for their repast.

Again, when houses are ready to drop down, they with their Cobwebs first of all fall, and get them into packing, alter their climate to some other surer place and dwelling to rest in. If any thing touch her body that is hard or painfully, she immediately draweth up her legs round on a heap, for this end as I think, to feel the leaffe pain, and the better to provide for the health and safety of her head, the director and governor of the whole body: for if any other part be hurt, she can easilie cure it. Who hath manifested and made known this unto them? Hath any Chaldes Star-gazer, or figure-finger, by the sight and position of the stares flewd it unto them? No certainly. But a divine prudence and foreseeming knowledge, originally inbred by Nature, to eschew that which is hurtfull, which is diffus'd into the Spider, and as that famous Poet Virgillus hath excellently described,

\[\text{Spiritus intus alit, totaque infusa per artus}\\text{Mens agitat molem,}\\In English thus;\\text{Mude bred within, infused in all limbs,}\\text{Minde moves the bodies lump, and skins.}\]

Furthermore, so soon as they espy their enemy to be caught in their nets, they do not first of all bite and prick him to death in any hasty manner, but they seem with their feet gently and joftly to brooke him, yet even to intreat and allure him with tickling, and as it were clipping and colling, until they have thoroughly infrared him within their clammy and viscous gins, and being at length wearied, turbulent, and tired with strugling and striving in vain, the fly Fly is made unable either to get away, flir, or reft. So having made sure with one, the hyath her to the center of her Web, observing and preying whether any new prey will come to hand again: so by this policy you shall see sometimes ten, yea otherwhiles twenty Flies hanging aloft by their thredes and fine-spun thredes.

They only feed on the juice of Flies, and the dry Carcasse without any moistur, they cast away as unprofitable fluffe to be used about any businesse. Moreover, because the Female Spider is sometimes greater then the Male, therefore she chufeth her flanding in the lower part of the Web, that the poor Flies may feem carelesse of her, yet is it the very obseruant, taking great heed to them: for they feening her hanging below, thinking themselves safe, do fly up into the upper part of the net, but by this means seeking to shun Charbydes, they fall into Stella, out of the smoke into the fire: for though in regard of her bodies magnitude, she be unwieldy, and very unfit to belitt her self in this hunting office: yet the crafty Male Spider playing Bo-peep, and pretending some other businesse, though minding another, playing the dissembling Hypocrite, hiden himself in the top of the Web, noting all occurrences, and being seen of no body, there he lurketh till some fifh (as we say) come to his net, and having espyed his prey, being more light, quick, and lively, it is a wonder to fee how diligent, vigilant, and earnestly bent he is to bend his course with all expedition toward this new offered booty; for there he will not suffer it very long to remain, but defending in a trice, \textit{Euro veloxis}, as quick as a Bee from the upper to the lower part (as ha have said) of the Cobweb, he maketh a very quick dispatch, and having royally feasted himself, he reverence and layeth up all his other enemies in one place, hanging them all by one of his own thredes till some convenient time to fealt himself again withall. Then again when as by reason of long continuance and length of time, the Webs have loft their binding viscomity, and tenacious substanсе, either the Spider unwaveveth them again, or else confirmeth and new strengtheneth them afresh as it were, with another new glutinosity, or fast-binding clainmines. This their work being finisht, they either contain themselves in the center of it, or keeping fentinell and warding in the upper part, they hold as it were in their hands a thread drawn from the middel or center, by which they have easie acceffe and receffe to and fro to their beguiling nets; and with all this thred ferveth to another profitable use, for if any prey be intang'd, by the light moving and flirring of it, they pretently feel and perceive it. But yet to make sure work, left the should winde down in vain, or take bootleffe labour about nothing, the draweth back the thred a little now and then, and by the motion and poize of it, the putteh all out of doubt, being fully affer-tained of the truth.

Then first, with all celerity possible the bies her to the Center, which thing the fly Flies being \\textit{fi}, and having some Senfe and feeling (as it should feem) that they are taken tardy, and for demeaninge some hurt, are as quiet as a Moufe in a trap, making no noyse at all, left either they might be wary or betray themselves, and so be further enfolden in danger. But alasfe in vain doth he avoid ware, that cannot enjoy peace, and bootleffe doth he thun pain, that hath no means to feel reft: for this avails but little, for they are not able with all these fetches to deceive their sharp inquisitors, for both with eyes and feet, they finely and quickly run unto them, making a clean riddance and quick dispatch of them every one.

But yet it is more to consider what great justice and equity is observ'd to be in Spiders: For there is not one of them so ill bent, so malapercely sawye, and impudently shamelesse, that can be seen to 

Jay
lay claim unto, or to take away another's wife or mate: there is none that intermedieth with another's substance, business, or weaving; every one liveth contented by the sweat of his own browes, by their own proper goods and industrious pains-taking procured by their own bodily labour: so that not one of them dare enter his Neighbours freehold, but it is accounted a hainous matter, and very unlawful, not one dare be so knock-hardy as to break into their friends and fellows fence and enclosure, but it is even defected as a wicked and cursed deed.

Non ipsa mortales, quos (prob dolor) urget habendi
Tactus amor, dominus domus, arvis additur arvam,
Mounticus monti, marius mare, sique potestint
Addiderint mundum mundo, suave omnia dixit.

In English thus;
Then would not mortals men so farre ingag'd in love to have
(As death it is to think,) house to house, and land to land by,
Hillock to hill, sea unto sea, to add they crave,
And if they could, world unto world, and all their own would say.

Again, they spread not their gins and nets to entrap and deceive good Creatures, and such as serve for mans use and benefit, but for Waps, Horse-flies, or Gad-bees, and Brimfees, or Oxe-flies, that in Summer-time vexe Cattle, for Drones Gnats, and other Flies, which to us are like to Theeves, Parafites, Bawds, Pander, and such Merchants that bring whores and knaves together, being Felurix inutile pondus, an unprofitable burthen of the earth, serving to no good use. And besides, being a vermin of singular and incomparable courage, the dare adventure to give the onset upon those Serpents that are called Lizardi, if they offer to contend and strive against her fury, the quickly encompass them round about, and very nimly and eagerly seizeth upon both their lips, biting and holding them together so fast, that the never giveth over till they be dead: and at length having vanquished her enemies, she like another Cacus carricth them into her Cave, or some secret corner.

Now if it happen in this hot bickering, that the nets be either broken, intertangled, or platted together, by and by without further delay the falls to mending what was amisse, to unwind, spread open, and to set them again in due order and frame very ingeniously. What say you to this? That the Spider heareth and mortali hatred to Serpents: for if so be the Serpent at any time lie in the shadow under any tree to cool himself, where Spiders do reforset, some one of them leaveth directly at him, depending down perpendicularly to the Serpents head, and with such a violence flirketh and datheth at his head with her beak or fiont, that her enemy withall making a whizzing noyse, and being driven into a giddinesse, turning round, hisseth, being neither able to break asunder the thread that cometh from above, nor yet hath force enough to escape it. Neither is this strafible or p'geant ended, until this our champion with her battering, hath sent her life to Pluto, the God of Hell for a present. Let men therefore be silent, and cease wondering at the amphitheatrical fights of the Roman, which were made with feasts and scaffoldes to behold Plays and fights, and where were presented to the Spectators the bloody fights of Elephants, Bears, and Lions, therefore a small Spider dare challenge to the field, and fight hand to hand with a black and blew Serpent, and not only to come down to him in daring wife, but also victoriously to triumph over him, entirely possessing all the fioy. Who would not marvel that in so small, or in a manner no body at all, which hath neither bones, nor finnewes, nor flesh, nor scarce any skin, there should be so great force, such incredible audacity and courage, such sharp and hard bittings, and inivincible fury? Surely we must conclude necessarily, that this cannot proceed altogether from their valiant Romacks, but rather from God himself: In like fort, they dare buckie with Toads of all sorts, both of the land and water, and in a singular combate overthrew and destroy' them, which thing not only Pindus and Albertus do recite and set down for a certain truth, but Erasorus also in his Dialogue entituled De Animis, maketh mention of, reporting how a certain Monk lying fast asleep, on whose mouth a foul Toad fate, and yet by the Spiders means was freed from all hurt. Yea, they dare enter the combat with winged and flinged Hornets, having not foit but fillie bodies, and almost as hard as horn, who although the many times breaketh through their Cobweb with main strength (as rich men undoe and make away through Lawes with Gold, and by that means many times scape foot-free) yet for all that, at length being over muddered, hand to hand in fingle combate, and intangled and infarled with the binding pallinefe, and tenacious gleeath substance of the Web, the payeth a dear price for her breaking into another house and possession, yielding at length to the Spiders mercy.

I will not omit their temperance, a vertue in former ages proper only to men, but now it should seem peccular to Spiders. For who almost is there found (if age and strength permit) that contenenth himself with the love of one as he ought, but rather applyeth his minde, body, and wandering affections to strange loves? But yet Spiders so soon as they grow to ripening age, do choose them mates, never parting till death it self make the separation. And as they cannot abide Corrivals, if any Wedlock-breakers, and Cuckold-makers dare be so fnappish to enter, or so infolently proud as to preffe into another house or Cottage, they reward him july
with condigne punishment for his temerarious enterprise, and flagitious fact: First by their cruel bittings, then with banishment or exile, and oftentimes with death it self. So that there is not any one of them, that dare offer villany or violence to another Mate, or seek by any means unlawfully to abuse her. There is such restraint, such strict orders, such faithfull dealing, uprightneffe of confidence, and Turtle love amongst them. Further, if you look into their house-keeping, you shall finde there is nothing more frugall then a Spider, more laborious, cleanly, and fine. For the cannot abide that even the least end or piece of her thred to be lost, or to be placed and let to no use or profit, and they exale and relieve themselves by substitutes, that supply their rooms and take pains for them: for whileth the Female weaveth, the Male applyeth himself to hunting, if either of them fall sick and be weak, then one of them doth the work of both, that their merits and defects may be alike. So sometimes the Female hunteeth whileth the Male is butte about Net-making, if the one stand in need of the others help and furtherance.

But yet commonly the Female-Spider being instructed of her Parents when she was young and docile, the art of spinning and weaving (which cloth was amongst us also in times past) beginneth the Cobweb, and her belly is sufficient to minister matter enough for such a piece of work, whether it be that the nature or substancc of the belly growth to corruption at fun-set and appointed time (as Democritus thought) or whether there be within them a certain languerous fertility naturally as in Silk-worms. Aristotle is of opinion, that the matter is outward as it were a certain Shell or pill, and that it is unwound, loosed, and drawn out by their fine weaving and spinning. But howsoever it be, certain it is, they will not by their good wills lose the least jot of a threads end, but very providently fee to all though never so little. The love they bear to their young breed is singular, both in the care they have for their fashioning and framing to good orders, and for their education otherwise, for the avoidance of idlenesse. For the Male and Female do by turns sit upon their Egges, and by this way interchangably taking courses, they do fibre up, quicken, move and encrease natural and lively heat in them, and although it hath been sundry times observed, that they have brought forth three hundred young ones at once, yet do they train them up all alike without exception, to labour, parfimony, and pains-taking, and inure them in good order, to fashion and frame all things for the weaving craft. I have often wondered at their cleanliness, when to keep all things from nastiness or finking, I have beheld with mine eyes those that were lean, ill-favoured, and sickly, to come glyding down from the upper to the lower part of their buildings, and there to exonerate nature at some hole in the Web, left either their shop, work-house, or frame might be detained or annoyed. And this is sufficient to have spoken of their political, civil, and domesticall vertues: Now will I proceed to discourse of their skill in weaving wherewith Pallas was so much offended: for the Scholar excelled her Miftres, and in fine, cunning and curious workmanship, did farre surpass her. First then let us consider the matter of the Web, whose substancc is tough, binding, and glutinous, plant, and will flick to ones fingers, like Bird-lime, and of such a matter it is compounded, as it neither lofeeth his clammienne and fault-holding quality, either by ficity or mothure.

The matter whereof it is made, is such as can never be consumed, wafted, or spent, whileth they live, and being so endleffe, we must needs here admire and honour the never ending and infinite power of the great God: for to seek out some natural reason, for it, or to ascribe it to natural causes, were in my minde meer madness and folly. The Autumnall Spiders, called Lapi or Halei, Wolves or Hunters, are thought to be the most artificial and ingenious: For these draw out a thread finer and thinner then any Silk, and of such a subtility, that their whole Web being folded together, will scarce be so heavy as one fine thred of Linnen being weighed together. Edwardus Monimus hath very finely and eloquently described both the Males and Females, Heptam. lib. 7. in these words following:

---

Ille d. mens usum paeft, ut se
Maxonia gracies ordinatur tegmine tela.
Stamnuras venter, somnis lauter, ipsi
Pallcadam cumulatque column, calatasque ministrat.
Ipsum est fium pondus, quot fila trabiendo
Netnit et interquart parit sub tegmine dicta.
Ilia suam a medias ordinat Dea
dela telam,
Et gracie tenues intentat fiamine trebna.
Tela juge junctas, stamn cenitis arundo,

Inferitur medium radia subtignem acuio,
Aque oram a centro panum fhi flaminat illam,
Periv thela patet gemina de parte, seroci
Ne concuera cura franguntur fiamina, quoque
Musca volax tenus fretre suaminne cajias,
Reticuli priramin vic muscula contigit oram.
Mors abit in telo centum, ut dieirmine parvo
Vinciat ipsi suo peregrinam cace vulnerem.

Which may be Englishe thus:

The Spider-male by hunting gane the bowre change doth feed,
The female with Maxonian art begins to spin fine thread,
Out of Web-breeding belly, breast wooley, upscawle twine,
Wherein the diiffe he applies by art of Pallas fine:
To her belongs the prepaid weight, which does the teall out-draws,
Both matter, art, and substance, she doth shields by nature Law.
Like Dea daela out of her meddle, her web she doth begin,
And stretching out her tender workes, by pressing it fall thin.
The which is joined as in yoke, yet parted by a cane,
And planted is the middle roof in a sharp beamy frame.
And from the center draweth a thread like wool to the upper
While double work on every part doth fasten her skin:
Wherewith the blades of Eastern windes unbroken web resists,
And tender fly surprized, is fallen into those lifes.
While scarce upon the edge or brink this little Fly doth fall,
But by and by death seizes her within webs center thrift:
And so the stranger winged Flye with little or no ado,
She overcometh speedily when it the nets comes to.

Of these Cobwebs there is great diversity, variety and difference: for some of them are loose, weak, slack, and not well bound: other contrary-wise well compacted, and close couched together, some triangular, othersome quadrangular; and some are made with all sides equall, but yet not right angled or cornered like a quarry of Glaifle; others are made of such a form as will beth fit the place where they hunt, you shall perceive some of them to be orbicular, if they weave between two trees, and you shall finde this fashon also among weeds, and oftentimes in Windows hanging together with many lines and different croffe pieces: so that herein no man can deny but that they shew forth great reason, wisdom, admirable judgement, and much gallant beauty worth to be seen.

Surely Exclesior that famous Geometrician, who was Scholar to Socrates, and lived in the time of Iotomys the first, need not be ashamed to learn from Spiders the drawing of divers of his figures and Geometricall proportions. And Fifer-men also from them have been glad to learn the trade of Net-making. For from whom else could they borrow and fetch such lively representations, and such expressive patterns, than from such a skilfull and industrious School-master. But the strength of the web seemeth to be very strange, which although it seemeth to be the most weak of all other things, yet we see it is able to hold Hornets, and to endure the furious blasts of raging windes, and if one throw or cast daff upon it, the same will rather be diffended and stretched, then either undone, broken, or felled down.

And yet this is the strangest of all, which many a man would think impossible but that it cannot be called in question, in regard we may daily see and observe the proof thereof of both to passe, that a Spider shoulde begin to place the one end of her thred on the one side of a little River or Brook, and how the should fasten the other end on the other side of the water, considering that Nature never taught them the art either of flying or swimming. I would fain be resolv'd of this scruple, by what means they sayl and passe over. Or do you imagine that they jump over, or convey themselves over in a leap? Surely I dare not say so, I much doubt thereof, I will not hand to it.

The next that best deverveth to be marshalled in the second rank and place, for cunning work in weaving and spinne, be those kinde of Spiders who build and labour about the rafters of Houses, in Ceilars, Floors, and about boards, planks, and such like, and of these some are wilders, which do fashion and dresse a broad, thick, and plain web in the grasse and fields all about, stretching out the same like a sayl, or some fine spread Sheet or Curtain.

If you would duly look into their work and thoughtfully consider the strange trydles of their Looms, the Shittles they use, their Combes to make all clean, the hay of their Looms wherewith they dreader their Webs, their Croffe-lines, the frame, Wouf, their fine spinneing-fluffe, and so to their whole Cobwebs, you shall therein very plainly behold the finger of God working in his poor and weak Creatures. And quetionless in this excellent mystery they are able to put down, and farre surmount the Egyptian, the Lydians, Penelope, Tanagua (who was Wife to Tarquinius Prisco) Amestris that famous Queen of Persia, Claudiana, Sabina, and Julia, Noble Roman Ladies, and all the Queens of Macedonia, who were esteemed and renowned throughout the whole world, to be the most curious and exquisite in this kinde of work. And who in needle-work, Tapestry, and all Embroidery, were thought to be Peerlesse. For these Spiders (even contrary to all reason and Art, as we think) makes a firm, strong, and well compacted Web with no lines or threads drawn croffe-wise or overthwart, but only made out and continued still in length. When their work is perfected and brought to an end, they lay it over and cover it round about with a certain glutinous kinde of jelly, or flimed juice, by touching of which their prey being entangled, pay full dearly for their ignorant rachnefe, undispered heed-taking, and lack of fore-sight. Their Web is of the colour of the air, or rather none at all, which easily deceiveth the foolish unwary Flies, and such as be quick-fighted, circumpect, and can elpy things very quickly. For if it did represent any notorious and manifest colour, they would provide in time against such dangerous devilies, and take heed of such traps beforehand.

The bafe and wilder sort of Spiders, and such as be least reputed of, are those that live in holes, Caves, and corners of Houses, and these in respect of the former are flow, flothfull, and lazy, fat, croffe, and big-bellyed corner-creepers, and these spin a very homely, rough, and course thred, which they spread abroad, and set before the hollow places and chinks of Walls. These kinde of Spiders have a more heavy and ponderous body, shorter feet, and more unhandsome
to work or finish any Webbes in their Looms, and as for separating, dividing, picking, carding, or futing their fluffe, they are very Bunglers to the first mentioned.

They apprehend and take their preyes rather casually, then take any great pains to seek farre for it, because their hole being great outwardly, seemeth to be a good and convenient lurking-corner, and a safe corner for Flies to hide themselves in; being entangled and arrested in the very entry, they are snatch'ed up suddenly by the watchfull Spider, and carried away into the more inward places of their dens, there to be flaugthered. For they watch and ward aboute in high walls and buildings, as well to deceive such Birds as lye in wait to intrap and take them at unawares, as Sparrowes, Robin-red-breasts, Wrens, Nightingales, and Hedge-Sparrowes, which are all sworn enemies to Spiders: and besides, the more easilie to beguile the silly flies suspecting nothing at all.

There be certain other forts of Spiders, which as yet I have not describ'd: as for example; there is one (the greatest of all that ever I saw) which spredeth her artificiall nets in the Harvest-time amongst the leaves and branches of Roses, and entangleth either any other little Spider that is running away, or else Gnat-flies, and such like, being caught at unawares, and hanged by a kinde of thred, whom the first pursueth and layeth hold on with a wonderfull dexterity and quicknesse: and being fast hanged, and so made sure, the there leaveth them, for the satisfying of her hungry appetite till another time. The body of this Spider is in colour somewhat whitish, refembling scumme or frothy sorne, and almoft of an Oval-figure, the head very little, placed under her belly, being withall crooked or bending like hooks, as is to be seen in the Crab-fish, and her back garnish'd with many white spots.

This is one kinde of Autunnall Lapi, or Wolf-Spider, which in a very short space of time do grow from the bigneffe of a little Peale, to a very great bulk and thickneffe. There are also found in all places of this Country, long-legged Spiders, who make a very homely and disorderly Web. This kinde of Spider liveth altogether in the fields, her body is almoft of a round figure, and somewhat brownish in colour, living in the graffe, and delighting in the company of Sheep: and for this caufe I take it, that we English men do call her a Shepheard, either for that she keepeth and loveth to be among their flockes, or because that Shepheardes have thought those grounds and feedings to be very wholesome wherein they are most found, and that no venemous or hurtfull creature abideth in those fields where they be: And herein their judgement is to be liked, for they are indeed altogether unhurtfull, whether inwardly taken, or otherwise outwardly applied: and therefore because I am tyed within a Teacher, and thereby restrained from all affectionate discourting or dilating unlesse of poysonous and hurtfull Creatures, I will come into my path again, and tell you of another certain black Spider, that hath very short feet, carrying about with her an Egge as white as Snow under her belly, and running very swiftly: the Egge being broken, many Spiders creep forth, which go forth with their dam to seek their living al together, and climbing upon her back when night approacheth, there they rell, and so they lodge.

In rotten and hallow trees there are also to be found exceeding black Spiders, having great bodies, short feet, and keeping together with Cheeselips or those creeping vermine with many feet, called of some Somet. We have seen also (faith the learned Gejner) Spiders that were white all over, of a round compact and well knit body, somewhat broad, living in the flowers of Mountain Parsley, amongst Glos, and in the green graffe: their Egges were little, slender, and very long, their mouth speckled, and both their sides were marked with a red line running all along. He took them to be very venemus, because he saw a Marmot or Muskey to eat of them, and by eating thereof easily to escape with life, yet at length it did well again, and was freed from further danger, only by cowring down a great deal of Oyl into his throat. I myselfe have also seene some Spiders with very long bodies and sharp tayls, of a blackish or dark red colour, and I have noted other-fore again to bell all over the body green-coloured. I will not deny but that there are many other forts of Spiders, and of many more different colours, but I never read, or yet ever saw them: Neque enim nostra fert omnia tellus, The ages ensuifg peradventure will finde more.

I will only put you in remembrance of this one thing worthy to be observed, that all weavings and Net-making Spiders, according as they grow in years, so do they acquire more knowledge, and attain to greater cunning and experience in their spinning trade: but carrying a resolute and ready will to keep both time and measure with that Mufick which bell contents most ears, I will now passe to speak of the propagation and use of Spiders, and fo I will close up this discourse.

The propagation of Spiders for the most part is by coupling together, the desire and action whereof continueth almoft the whole Spring-time, for at that time by a muntall and often drawing, and cavie pulling of their Web, they do as it were wooe one another, then approach they neere together, and lastly are joyned with their hips one against another backwards as Camels do, for that is the moe ft for them, in regard of the round proportion and figure of their bodies. In like sort do the Pholulanges joyn together, and are generated by those of the fame kinde, (as Aristotle faith:) But the Pholulanges couple not in the Spring-leaon, as the other Spiders doe, but towards Winter, at what time they are very swift, quick, nimble, and of moe certain hurt, more dangerous, and more venemous in their bitings. Some of them after their coupling together, do lay one Egge only, carrying it under their belly, it is in colour as white as Snow, and both Male and Female fit upon it by turns.

Some
Some Spiders do exclude many little Eggess very like unto the seeds of Poppy, out of which it hath been observed, that sometimes there have been hatched three hundred Spiders at one time, which after their vain and idle plying and sporting together in their web, at length come forth with their Dam, and towards evening they all trudge home, until each one hath learned, and perfectly attained to the skill to spin his own web, that therein he may spend the residue of his days in mope pleasure, ease and security. They make exclusion of their young breed in hopping or skipping-wit, they sit on their Eggess for three days space together, and in a moneths space their young ones come to perfection. The dometelic or House-spider, layeth her egges in a thin web, and the sale-spider, a thicker and stronger, because they are more exposed to the injuries of winds, and lie more open to the rage and fury of storms and showers.

The place and Countrie where they are, helpeth much, and is very available to their generation. There is no Countrie almost, but there are many Spiders in it. For in the Countrie about Ariba, which is in Arabia Felix, there is an infinite number of them to be found, and all the Island of Candie swarmeth with Phaenoges, Strabo saith, that in Ethiopia there is a great number of Phaenoges found, of an exceeding bigness: although as Pliny saith in his eight Book and 58 chapters, there are neither Wolves, Foxes, Bears, nor any hurtful creature in it: and yet we all know that in the Isle of Wight (a member of England,) the contrary is to be found, for although there were never dwelling in it Foxes, Bears, nor Wolves, yet there be Spiders enough.

The Kingdom of Ireland never saw Spiders, and in England no Phaenoges will live long, nor yet in the Isle of Man, and none unto the City of Grenoble, in that part of France which lyeth next Italy. Gaulium Merula faith, there is an old Tower or Castle standing, wherein as yet never any Spider hath been seen, nor yet any other venomous creeping creature, but rather if any be brought thither from some other place, they forthwith die. Our Spiders in England, are not fo venomous as in other parts of the world, and I have seen a mad man eat many of them, without either death or deaths harm, or any other manifi accident or alteration to enue. And although I will not deny, but that many of our Spiders be swallowed down, may do much hurt, yet notwithstanding we cannot chuse but confesse, that their biting is poysonifie, as being without venom, procuring not the least touch of hurt at all to any one whatsoever; and on the contrary, the biting of a Phaenog is deadly.

We see the harmless Spiders almost in every place; they climb up into the Courts of mighty Kings, to be as it were myrrors and glaftes of vertue, and to teach them honest provencie and valian-
ty. They go into the lodgings, shops and Ware-houses of poor men, to commend unto them contentment, patience, labour, tolerance, industry, poverty and frugality. They are also to be found in rich mens chambers, to admonish them of their duties. If you enter into your Orchard, they are but in cloathing every Tree; if into the Garden, you shall finde them amongst Roses; if you travel in the field, you shall have them, their work in hedges, both at home and abroad, whithersoever you bend your course, you cannot chuse but meet with them, left perhaps you might imagine, or else complain and finde some faults, that the Schoolmistrisfe and perfect president of all vertue and diligence were in any place absent.

Who would not therefore be touched, yea and possified with an extreme wonder at these vertues and faculties, which we daily see and behold with our eyes. Poile hath briefly and copiously described their nature, properties, inclinations, wit and invention in his Greek verses, which being turned into Latin, found to this effect.

Indulhiens natura Spiders have, Exceeding Virginus bands of skil. Superflum hamures of tellers save, And into webs they weave them still. And they without all Weavers comb. Their folding orbs invaded are. And underneath their webs as tombs, Are thread the worthy work to bear, And hang their threads in air above, Bypleuses unfer to the eye of man, Without foundation you may prove. All their buildings firmly stand:

Which may be Englished thus:

Not yet clear light to the eyes most bright. Can fee the coupling of their thread. The thinness of the web in flight. On pint of air are jars spread. On Gnats and sally winged Flies. Which guilefully in nets they take. They feed their full when they epy. And yet their life much rest doth make. They labour too, and do provide. Gainst winds and things that break their swell. That bands from tackling may not flie. When greater strength doth them affair.
Their use.

The Spider put into a linnen cloath, and hung upon the left arm, is an excellent medicine to expel a Quotidian Ague, as Trallium faith: and yet it will be more effectual if many Spiders be boiled with Oyl of Bay to the confinennent of a liniment, to anoint the wriithes and the temples a little before the fit; for by this means the Fever will be absolutely cured, or will seldom return again: 

A Spider tempered and wrought up with Milt-wooll or Ceteroeb, and so fpred upon a cloth to be applied to the temples, cureth the fits of a Tertian Fever. 

Dioforides. The Spider that is called a Wolf, being put into a quill, and fped about the neck perfonment the fame effect, as Pliny reporteth. The domestic Spider, which fpinneth and weatheth a thin, a white, or a thick web, being inclofed in a piece of leather, or a Nut-fhell, and fo fped about the neck, or worn about the arm, drujeth away the fits of a Quarantin Fever, as both Dioforides and Fermelum have thought. For in the paine in the ears, take three live Spiders, boil them with Oyl upon the fire, then difflic or drop a little of this Oyl into the pained ear, for it is very excellent, as witnesmeth Mureullis Empirical. Pliny keepeth them in Vinegar and Oyl of Rofes, and fo to be fpammed together; and a little thereof to be dropt into the pained ear with a little Saffron, and without doubt, faith he, the paine will be mitigated, and the fame affirmeth Dioforides. Or else strain out the juice of Spiders, mixing it with the juice of Rofes, and with some wooke dipped in the fame liquor, apply it to the ear.

Sorauus in his book peri Daglon writeth, how that the Spider which is called Cranocatus, being flud or choked in Oyl, is a very preuent help against any poifon taken inwardly into the body, as the Scholaft of Nicander reporteth. There be some that catch a Spider in the left hand, and feast and fpread it with the Oyl of Rofes, putting some of it into the ear, or the fame fide the tooth sketh, and as Pliny tellith us, it doth exceeding much good. Spiders applied and laid upon their own bittings, or taken inwardly into the body, do heal and help those hurtz themselves procured.

What should I take of the white spots of the eyes, a most dangerous grief? and yet are they clean to be taken away with very small labour, if to be once take the legs, especially of tho' Spiders which are of the whitier fide, and flamming them together with Oyl, do make an Ointment for the eyes. Pliny.

The moiff juice that is squeezed out of a houte Spider, being tempered with Oyl of Rofes, or one dram of Saffron, and a drop or two thereof dropt into the eyes, cureth the drooping or watering of them, by means of a hume effuing out thereth, or else the moisture of a Spider or his urine being taken by themselves, laying a little wolle on the top of the part affected, worketh the fame effect; whereby you may well understand, that there is nothing in a Spider fo vile, homely, or fordidous, that doth not some good, and serveth to some end.

Against the fuffocation of the belly, Actius doth counfel to apply a Cerote to the navel made of Spiders, and faith that he hath found it to prevail much in this kinde of paffion. Pliny faith, but he yeeledeth no reafon for it, that Spiders help the paine and dwelling of the Spleen. He writeth alfo further, that if a man catch a Spider, as theis is gliding and defending downwards by her thread, and fo being cruified in the hand, and then applied to the navel, that the belly will be provoked to the fLOG, but being taken as the is afcending, and applied after the fame former manner, that any loofeneffe or flux is layed, and refrained thereby. The fame Pliny alfo writeth, that if a man take a Spider, and lay it upon a Fellon, (provided that the fick patient may not know fo much,) that within the space only of three days, that terrible and painful grief will be clean taken away. And besides he affirmeth that if the head and feet of a Spider be caft away, and the reft of the body rubbed and bruised, that it will throughly remedy the dwelling in the fundament, proceeding of inflammation.

If any be vexed with fcore of Lice, and do ufe a suffumigation made only with Spiders, it will caufe them all to fall and come away, neither will there afterwards any moe breed in that place. The fat of a Goode tempered and mixed with a Spider and Oyl of Rofes together, being used as an Ointment upon the breasts, preferveth them safely, as that no milk will coagulate or curdle in them after any birth. Anonymus. Yea, that fame knotty fource of rich men, and the scorn of Phyliitans, I mean the Gowe, which as some learned men hold can by no means be remedied, yet feeleth mitigati- on and diminution of pain, and curation alfo, only by the presence of a Spider, if it be taken alive, and her hinder legs cut off, and afterward inclofed in a purfe made of the hide of a Stag. Moreover, we fee, (while all other medicines can never do) that all they are freed from the moft part, both from the Gowe in the legs and hands, where the Spiders are moft found, and where they are moft buife in working, and framing their ingenious deviled webs. Doubtlesse, this is a rare miracle of nature, and a wonderful vertue, that is in this contemptible little creature, or rather esteemed to be fo vile, ab- ject, and of no estimation. Rich men were happy indeed, if they knew how to make ufe of their own good.

Antinomirus Pius was wont to fay, that the sharp words, witty fayings, quicks and subtiles of Sophi- fters, were like unto Spiders webs, that contain in them much cunning Art, and artificial conceit, but
Of the Spider.

but had little other good besides. If any one be newly and dangerously wounded, and that the miserable party feareth a bleeding to death, what is a more noble medicine, or more ready at hand then a thick Spiders web, to binde hard upon the wound, to stay the inordinate effusion of blood? Questionable, if we were as diligent and greedy to search out the true properties and virtues of our own domestic remedies, which we would buy of others for dearly, we would not enforce our selves with such eager pursuit after those of forain Countries; as though things fetched far off, were better then our own neer at hand; or as though nothing were good and wholesome, unless it came from Egypt, Arabia, or India. Surely, unless there were some wide worm in our brains, or that we were bewitched and posseted with some fury, we would not so far be in love with foreign wares, or be so much befotted, as to seek for greedy new phyrick and Physical means, considering that one poor Spiders web will do more good, for the blanching of blood, the cureation of ulcers, the hindering of flains, flame, or flough to grow in any fore, to shave and quench any inflammations, to conglutinate and consolidate wounds, more then a Cart-load of Bole fetcht out of Armenia, Saracotta, Sardaracha, or that earth which is so much nobilitated by the imprafe of a seal, and therefore called Terra Sigillata, the clay of Samori, the dirt of Germany, or the loam of Lemnos. For a cobweb adstringeth, refirgerateth, folderedeth, joyenth, and closeth up wounds, not suffering any rotten or filthy matter to remain long in them.

And in regard of these excellent vertues and qualities, it quickly cureth bleeding at the nofe, the Harnormboids, and other Bloody-fluxes, whether of the opening of the mouthes of the veins, their operations, breakings, or any other bloody evacuation that too much aboundeth, being either given in itself alone in some Wine, either inwardly or outwardly, or commixed with the Blood-flone, Stelion Maria, and other the like remedies fit for the fame intentions.

The cobweb is also an ingredient into an unguent which is made by Phyfitians, against the disease called Serpes, and being bound to the dwellings of the fundament, if there be inflammation joyned with them, it consumeth them without any pain, as Marcellus Empericow writeth. It likewise cureth the watering or dropping of the eyes, as Pliny reporteth, and being bound about the wounds of the joints: and some for the same intent, use the cobwebs, with flour and white Wine mixed together.

Some Chirurges there be that cure Warts in this manner; They take a Spiders web, rolling the same up on a round heap like a ball, and laying it upon the Wart they then set fire on it, and do burn it to ashes, and by this way and order the Warts are eradicated, that they never after grow again. Marcellus Empericow taketh Spiders webs that are found in the Cypresse tree, mixing them with other convenient remedies, to give them to a podagral person for the aflwaging of his pain. Against the pain of a hollow tooth, Galen in his book De Compoñ. medicam. secundum loco, much commendeth, (by testimony of Arbigenes) the Egges of Spiders, being tempered and mixed with Orum Nar- dinum, and so a little of it being put into the tooth. In like fort Kiranides giveth Spiders egges for the cureation of a Tertian Ague. Whereupon we conclude with Galen, in his Book to Pifs, that Naure as yet never brought forth any thing so vile, mean, and contemptible in outward fiew, that it hath manifald and most excellent and necessary ues, if we would show a greater diligence, and not be so qveamish as to refuse those wholesome medicines which are ealle to be had, and yet great charges and water acquired.

I will add therefore this one note before I end this discourse, that Apes, Marmofets or Monkeys, the Serpents called Lizards, the Stellion, which is likewise a venomous Beast like Grizzle, having spots in his neck like unto fars. Waps, and the little beast called Ichneumon, Swallows, Sparrows, the little Tittoue, and Hedge-Sparrows, do often feed full favourly upon Spiders. Besides, if the Nightingales, the Prince of all singing Birds do eat any Spiders, the is clean fceed and healed of all diseases whatsoever.

In the days of Alexander the Great, there dwelled in the City of Alexandria a certain young maid, which from her youth up, was fed and nourished only with eating of Spiders; and for the same cause the King was premmost not to come neer her, lest peradventure he might be infected by her poyfonous breath, or by the venom evaporated by her sweating. Akeriaus lef the bath recorded, in his writings, that there was a certain noble young Virgin dwelling at Colen in Germany, who from her tender years was fed only with Spiders. And thus much we English men have known, that there was one Henry Lilgrave, living not many years since, being Clerk of the Kitchen to the right Noble Ambrose Dudley Earl of Warwick, who would search every corner for Spiders, and if a man had brought him thirty or forty at one time, he would have eaten them all up very greedily, such was his detrurous lengthing after them.

of the Stellion.

They are much deceived that confound the green Lizard, or any other vulgar Lizar for because the Stellion hath a ruffie colour: and yet (as Mathiolas writeth) seeing Arisfaile hath left recorded, that there are venomous Steallions in Italy, he thinketh that the little white Beast with fars on the back, found about the City of Rome, in the walls and ruins of old houses, and is there called Tarantula, is the Stellion of which he speaketh, and there it liveth upon Spiders. Yet that there is another and more noble Kinde of Stellion, anciently so called of the learned, shall afterward appear in the succeeding discourse.
This Beast or Serpent is called by the Grecians, Colotes, Acolabotes, and Galotes, and such a one was that which Arisphantes signifieth from the side of a houfe eafed her belly into the mouth of Socrates as he gaped, when in a Moon-shine night he observed the courfe of the flars, and motion of the Moon. The reafon of this Greek name Acolabotes, is taken from Akolos, a circle, becaufe it appeareth on the back full of fulc circles like flars, as writeth Ptolemy. Howbeit, that feemeth to be a signifieth Etymo-

Monte

Gulf of Guademabras

ble general back cleaneffe among that about for writeth. in fame

fame imitation

Amfing the houfe. 

Lizards, angry, and in graves and Sepulchres, becaufe it climbeth up the walls even as Rats and Mice; or as Kinamides will have it, from Culis, signifieth a piece of wood, becaufe it climbeth upon wood and trees. And for the same reafon it is called Galotes, becaufe it climbeth like a Weafil, but at this day it is vulgarly called among the Grecians, Ligops; although fome are alfo of opinion, that it is alfo known among them by the words Teniamitis, and Ταμιαμάιθε. 

Among the vulgar Hebrews, it is alfo sometimes called Leviath, and fometimes Sememitis, as Manfier writeth. The Arabian call it Sarabamus, and Senabrot, a Stellion of the Gardens. And peradventure Gueffil, Gualfambras, Alrett, and Gnafer. And Sybarites alfo, ueth Epibates, for a Stellion. And the general Arabian word for fuch creeping biting things, is Vaffa, which is alfo rendered a Dragon of the houfe. In read of Colotes, Albertus hath Arcaulis. The Greeks, English, and French, have no words for this Serpent, except the Latin word, and therefore I was justly constrained to call it a Stellion, in imitation of the Latin word.

As I have flewed fome difference about the name, fo it now enfeth that I fhould do the like about the nature and place of their abode. First of all therefore I muft put a difference betwixt the Italian Stellion or Tarantula, and the Thracian or Grecian, for the Reletion of the Ancients is proper to Greece. For they lay this Stellion is full of Lentile spots, or speckles, making a sharp or shrill shrieking noife, and is good to be eaten, but the other in Italy are not fo. Alfo they fay in Sicilia, that their Stellions inflict a deadly biting, but thofe in Italy caufe no great harm by their teeth. They are covered with a skin like a shell or thick bark, and about their backs there are many little finifhing spots like eyes, (from whence they have their names) streaming like flars, or drops of bright and clear water, according to this verfe of Ovid;

Aptomque coloris

Nomen babef unius Stellatus corpora guttis.

Which may be Englifhed thus;

And like his {potted} brea, fo is his name,

The body flarr'd over like {drops} of {rain}.

It moveth but slowly, the back and tail being much broader then is the back and tail of a Lizard, but the Italian Tarantulas are white, and in quantity like the smallest Lizards: and the other Grecian Lizards, (called at this day among them Hocmi) is of bright finifh colour, and are very harmful and angry, whereas the other are not fo, but fo meek and gentle, as a man may put his fingers into the mouth of it without danger. One reafon of their white bright finifhing colour, is becaufe they want blood, and therefore it was an error in Sybarites to fay that they had blood.

The teeth of this Serpent are very small and crooked, and whensoever they bite, they fllick faft in the wound, and are not pulled forth again except with violence. The tail is not very long, and yet when by any chance it is broken, bitten, or cut off, then it groweth again. They live in houfes, and neer unto the dores and windows thereof make their lodgings, and fometimes in dead-mens graves and Sepulchres, but moft commonly they climb and creep aloft, fo as they fall down again; fometimes into the meat as it is in dressing; and fometimes into other things, (as we have already faid) into Socrates mouth, and when they deffend of their own accord, they creep fide-long, They eat Honey, and for that caufe creep into the Hives of Bees, except they be very carefully flopped, as Virgil writeth;

Nam {sepe} favos, ignotum {adedit} Stello.
Of the Stellion.

Many times the Stellion at unawares meeteth with the Honey-combs. They also of Italy many times eat Spiders. They all lie hid four months of the year, in which time they eat nothing, and twice in the year, that is to say, both in the Spring time and Autumn, they cast their skin, which they greedily eat so soon as they have dripped it off. Which Theophrastus and other Authors write, is an envious part in this Serpent or creeping creature, because they understand that it is a noble remedy against the Falling-Jacknife: wherefore to keep men from the benefit and good which might come thereby, they speedily devour it.

And from this envious and subtle part of the Stellion, cometh the crime in Ulysses called Crime men Stellianus, that is, when one man fraudulently preventeth another of his money, or wares, or bargain, even as the Stellion doth man kinde of the remedy which cometh unto them by and from his skin.

The crime is also called Extortion, and among the Romans, when the Tribunes did withdraw from the Souldiers their provision of victual and corn, it is said, Tribunos qui per Stellatum Militibus aliquid absolvissent, capitati pena affecti. And therefore Budesius relateth a History of two Tribunes, who for this fellacie were worthily stoned to death by the commandment of the Emperor. And all frauds whatsoever, are likewise taxed by this name, which were not punishable but by the doom of the Supream or highest Judge, and thereupon Alciatus made this Emblem following.

Parva lacrata, arris Stellato corpore gutia Stellato, qui lateris & cana buita colit, Invota pravitate doli fert symbita, illius : Hen minimum nutibus cognitus Zelotypis.

Nam turpi obtinent faciem lenitigne, quisquis
Sit quibus inmererus Stellius, via bibat.
Hinc vindicta frequens, decepta pellece vinis,
Quam formae amisso fero relinquit amans,

Which may be Englanded this;

The little Lizard, or Stellion starred in body grain
In secret holes, and graver of dead which debt remain,
When painted you it set, or drawn before the eye,
A symbole then you view of deep deceit and cursed entry:
Alias, this is a thing to jealous wits known too well,
For whofsover of that Wine doth drink his fill
Wherein a Stellion hath been drencht to death,
His face with filthy Lentile spots all ugly it appeareth,
Herein a Lover oft requires the fraud of concubile,
Defring her of beauties bled by draught of this same Wine.

The Poet Ovid hath a pretty fiction of the Original of this cursed envy in Stelliones, for he writeth of one Abas the son of Metaneira, that received Ceres kindly into her house, and gave her hospitality, whereby the said Abas being displeased, derided the sacrifice which his mother made to Ceres; the Goddesse seeing the wretched nature of the young man, and his extreme impiety against the sacrifice of his Mother, took the Wine left in the goblet after the sacrifice, and poured the same upon his head, whereupon he was immediately turned into a Stellion, as it is thus related by Ov. Metam. 5.

Combibit os maculae, & que modo brachis gisfit
Crua gerit, cauda eft mutatis addita membris :
Inque brevem formam, ne fit vis magna nocturni,
Contradixit, parvaque minor mensura laoceta est.

In English thus;

His mouth lacks in those spots: and now where arms did stand,
His legs appear, and to his changed parts was put a tail,
And left it should have power to harm, small was the bodies band,
And of the Lizards poysonous this least in shape did tail.

Their bodies are very brittle, so as if at any time they chance to fall, they break their nails. They lay very small egges, out of which they are generated: and Piny writeth, that the juice or liquor of these egges lay upon a mans body, caufeth the hair to fall off, and also never more permitteth it to grow again. But whereas we have said, it devoureth the skin, to the damage of hurt of men, you must remember, that in ancient time the people did not want their policies and devises to take away this skin from them before they could eat it. And therefore in the Summer time they watched the lodging place and hole of the Lizard, and then in the end of the Winter toward the Spring, they took Reeds and did cleave them in funder, thefe they composeth into little Cabinets, and let them upon the hole of the Serpent: Now when it awaked and would come forth, it being grieved with the thicknife and straithnife of his skin, prefeth out of his hole through those Reeds or Cabinets, and finding the fame somewhat straith, is the more glad to take it for a remedy; so by little and little it lilith through, and being through, it leaveth the skin behinde in the Cabinet, into the which it cannot re-enter to devour. Thus is this wily Serpent by the policy of man jutly beguiled, losing that which it so greatly Desired to possesse, and changing nature, to line his gue with his coat, is prevented from that glutony, it being sufficient to have had it for a cover
The History of Serpents.

The History of Serpents.

in the Winter, and therefore unsuufferable that it should make food thereof, and eat the same in the Summer.

Thee Stellions (like as other Serpents) have also their enemies in nature, as first of all they are hated by the Asles, for they love to be about the Mangers and racks on which the Asse feedeth, and from thence many times they creep into the Asles open Nostrils, and by that means hinder his eating. But above all other, there is greatest antipathy in nature betwixt this Serpent and the Scorpion, for if a Scorpion do but fee one of thefe, it falleth into a deep fear, and a cold sweat, out of which it is delivered again very freely: and for this caufe a Stellion putrified in Oyl, is a notable remedy against the biting of a Scorpion; and the like war and diffenfion, is affirmed to be betwixt the Stellion and the Spider.

We have fhewed already, the difference of Stellions of Italy from them of Greece, how these are of a deadly poynous nature, and the other innocent and harmleffe, and therefore now it is also conveiient, that we should fhew the nature and cure of this poyson, which is in this manner:

Whensoever any man is bitten by a Stellion, he hath ach and pain thereof continually, and the wound received looketh very pale in colour, the cure whereof, according to the saying of Actius, is to make a plaiter of Garlic and Leeks mixed together, or elfe to eat the said Garlic and Leeks, drinking after them a good draught of sweet Wine, unmixed and very pure, or elfe apply Nigella Romana, Saffronnes and sweet Water unto it. Some (as Arnolus writeth) prescribe for this cure the dung of a Faulcon, or a Scorpion to be bruized all to pieces, and laid to the wound. But sometimes it happeneth, that a mans meat or drink is corrupted with Stellions that fall into the fame from some high place where they defire to be climbing, and then if the fame Meat or Wine fo corrupted be eaten or drunk, it caufeth unto the party a continual vomiting and pain in the stomac. Then mult the cure be made elfe by vomits to avoid the poyson, and by Glyders to open the lower paflage, so there may be no flop or flay, to keep the imprifoned meat or drink in the body. And principally those things are prescribed in this cafe, which are before expressed in the Cantharides, when a man hath by any accident been poiyned by eating of them.

The remedies which are observed out of this Serpent are these: Being eaten by Hawks, they make them quickly to call their old coats or feathers. Others give it in meat after it is bowelled, to them that have the Falling-fickneffe. Also when the head, feet, and bowels are taken away, it is profitable for those perfons which cannot hold in their urine: and being fodder, is given against the Bloudy-flux. Also fod in Wine with black Poppy-fed, cureth the pain of the loins, if the Wine be drunk up by the fick patient.

The Oyl of Stellions being anointed upon the arm-holes or pits of children, or young perfons, it restrainevth all hair for ever growing in those places. Also the Oyl of Stelleions, which are sod in Oyl-olive with Lizards, do cure all boils and wens, confusing them without lancing or breaking. And the afhes of the Stellion are most principally commended against the Falling-fickneffe, like as also is the skin or trunck, as we have faid before. The head burned and dried, and afterward mixed with Honey-attick, is very good againft the continual dropping or running of the eyes; and in the days of Piny, he writeth that they mixed Sibiuon herewithal. The heart is of fo great force, that it being eaten, bringeth a moft deep and dangerous sleep, as may appear by these verfes:

Mandev cor, et tans profernt corpore formus,
Ut jundis postum abique dolore manus.

Which may be Englished thus;

Eat you the heart, and when it should sleep, the body will possesse,
That hands may from the same be cut away painlesse.

To conclude, the Phyftitians have carefully observed sundry medicines out of the egges, gall, and dung of Stellions, but because I write for the benefit of the English Reader, I will spare their relation, feeing we fhall not need to fear the bitings of Stellions in England, or expect any drugs among our Apothecaries out of them, and therefore I will here end the History of the Stellion.

Of the Tyre.

Tbere be fome which have confounded this Serpent with the Viper, and taken them both to be but one kinde, or at leaft the Tyre to be a kinde of Viper, because the Arabians call a Viper Thiron, of the Greek word Therion, which signifies a wide heafe, and whatsoever the Grecians write of their Echides, that is their Viper, the fame things the Arabians write of the Tyre, and Leonti-nes compiled a whole Book in the defence of that matter: and from hence cometh that noble name or composition antoditory, called Therion, that is, Triacle. But Asien in the mention of the Triacle of Andromachus, distinguifteth the Triacle of the Viper, from that of the Tyre, and calleth one of them Trebios Tyre, and the other Trebios Viper. So Gentilius and Florninius do likewise put a manifeft difference betwixt the Tyre and the Viper, although in many they are alike, and agree together.

This Tyre is called in Latine Tyros and Tyria, and also among the Arabians, as Sylvaticus writeth, Esfani, and Alphabes. Rabbi Moses in his Aphorisms writeth, that when the Hunters go to seek the
Of the Tortoise.

The Serpents, they carry with them bread, which they call unto them, and while the Tyre doth eat it, he closeth his mouth so fast, that his teeth cannot suddenly open again to do his hunting adversly any harm, and this thing (as he writeth) is very admirable at the first, to them that are ignorant of the secret in nature. Galien also writeth so much to Piso of Vipers, and he faith that the Circulators, Juglers or Quackalvers, did cast certain mazes or small cakes to them, when which they had tasted, they had no power to harm any body.

This Tyrus is said to be a Serpent about the coasts of Jericho in the Wilderneffe, where it hunteth Birds, and liveth by devouring of them and their eggs. And a concoction of the flesh of this Serpent, with the admixture of some few other things, taketh away all intoxicate poyson, which concoction is called Triaile. It is also reported, that whereas the Dragons have no poyson of themselves, they take it away from this Serpent, and so poyson with a borrowed venom. For this poyson is very deadly: and there is a tale (which I will not tell for truth:) that before the coming and death of our Saviour Jesus Christ, the same was unremediable, and they dyed thereof. Whereover they were that had been poysoned by a Tyre; but on the day of Christ his passion, one of them was found by chance in Jerusalem, which was taken alive, and brought to the side of our Saviour hanging upon the Cross, where it also fastened the teeth, and from that time ever since, all the kinde have receaved a qualified and remediable poyson, and all their flesh made apt to cure it self, or other venons. It is reported that when the Tyrus is old, he calleth, or rather wretgeth off his coat in this manner following; first it getteth off the skin which groweth betwixt the eyes, by which it looketh as if it were blinde: and if it be strange to a man, (I mean the first time that ever he saw it:) he will verily take it to be blinde: afterward, it also flayeth off the head, and so at last by little and little, the whole body, at which first it appeareth as though it were an Embryon, or skinleffe Serpent. They keep their eggs in their belly, and in them breed their young ones, as the Vipers do, for before they come out of the dam's belly, they are in all parts (according to their kinde) perfect creatures, and so every one generateth his like, as do four-footed Beasts.

It taketh by the relation of Cenon, that the Diphas in Italy is called Tyrus. Alfo Cardan writeth, that there is a suppos'd and false conceit, that with the flesh of this Tyre, mixed with Hellebore and water, is made a concoction to restore youth: but the truth is, it rather weakeneth and destroyeth bodiies, then helpeth them, and maketh a counterfeit or varnished false youth, but no true youth at all. Thus far Cardan, and thus much of this Serpent, the other things written of it, are the same that are written of the Viper.

Of the Tortoise.

He left four-footed Egge-breeding Bealt, cometh now to be handled in due order and place; namely, the Tortoise, which I have thought good to insert also in this place, although I cannot finde by reading or experience, that it is venomous, yet seeing other before me have ravelled the fame in the number and catalogue of these Serpents and creasing creatures, I will also follow them; and therefore I will first expresse that of the Tortoise, which is general and common to both kindes, and then that which is special, and proper to the Land and Sea Tortoises.

The name of this Bealt is not certain, among the Hebrews some call it Sebabul, some Kopul, and some Homer; whereas every one of these do also signifie another thing, as Sebabul, a Snail; Kopul, a Hedge-hog; and Homer, a Lizard. The Chaldeans call this Bealt Thribila; the Arabians term it Sijme, alfo Kasen fulhabafe, and Halccatale: the Italians call this Tisulfus, tradinus, vetustiger, tartus, essifarruce, turtoco, et confiscina. And in Ferraris, Gallinae, tartua, bica festinella, the Inhabitants of Laurinum, Cupparia; the Portugals, Gagada, the Spaniards, Galpago, and Tartusae; the French, Tortue, and Tartue; and in Savoy, Bog conte; the Germans, Schillkat, and Tallerkat; the Flemings, Schilt-padle, which answereth our English word Shell-crab; the Grecians call it Chelone, and the Latines, Te-fuda: which words in their several languages, have other significationes, as are to be found in every vocabular Dictionarie, and therefor I omit them, as not pertinent to this businesse or Historie.

There be of Tortoises three kinde, one that liveth on the land, the second in the sweet waters, and the third in the Sea, or salt waters. There are found great store of these in India, especially of the Water-tortoises, and therefore the people of that part of the Countrey are called Chelonephagi; that is, Eaters of Tortoises, for they live upon them: and these people are said to be in the E击-part of India. And in Carmania the people are likewise so called. And they do not only eat the flesh of them, but also cover their houses with their shells, and of their abundance, do make them all manner of vessels. Pliny and Salinas write, that the Sea-tortoises of India are so big, that with one of them they cover a dwelling Cottage. And Strabo faith, they also row in them on the waters, as in a Boat.

The Island of Serapis in the Red-sea, and the farthest Ocean Islands, toward, the East of the Red-sea, hath also very great Tortoises in it: and every where in the Red-sea they do abound, that the people there do take them and carry them to their greatest Mars and Fairs to sell them, as to Raphitis, to Polemaris, and the Island of Dioscorides, whereof some have white and small shells. In Libya also they are found, and in the night time they come out of their lodgings to feed, but very febrly, so as one can scarcely perceive their motion.
And of one of these Scaliger telleth this story. One night (faith he) as I was travelling, being overtaken with darkness and want of light, I cast about mine eyes to seek some place for my lodging, safe and secure from wild Beasts; and as I looked about, I saw (as I thought) a little hill or heap of earth, but in truth it was a Tortoise, covered all over with moss: upon that I ascended and sat down to rest, whereupon after a little watching I fell asleep, and so ended that night's rest upon the back of the Tortoise. In the morning, when light approached, I perceived that I was removed far from the place, whereon I first chose to lodge all night; and therefore rising up, I beheld with great admiration the face and countenance of this Beast, in the knowledge whereof, (as in a new nature) I went forward, much comforted in my wearisome journey.

The description of the Tortoise and several parts thereof now followeth to be handled. Those creatures (faith Pliny) which bring forth or lay eggs, either have feathers as Fowls, or have scales as Serpents; or thick hides as the Scorpion, or else a shell like the Tortoise. It is not without great cause that this shell is called Scutum, and the Beasts Lutaria, for there is no buckler and shield so hard and strong as this is. And Palladum was not deceived when he wrote thereof, that upon the same might safely passe over a Cart-wheel, the Cart being loaded. And therefore in this the Tortoise is more happy than the Crocodile, or any other such Beast.

Arthurus writeth that it hath two shells, one upon the back, the other on the belly, which are conjoined together in four places, and by reason of this so firm a cover and shell, the shell thereof is dry and firm, also long lasting, and not very easie or apt to putrefaction. This shell or cover is smooth, except sometimes when it is grown old, it hath moss upon it, and it never calleth his coat in old age, as other creeping things do. In the head and neck it resembleth a Serpent, and the great Tortoises have also shells upon their heads like a shield, yet is the head but short; and the aspect of it very fearful, until a man be well acquainted therewith. And by reason of the hardneffe of their eyes, they move none but the sincerest lid, and that without often winking. The liver of it is great, yet without any blynd. It hath but one belly without division, and the liver is always foul, by reason of the vitious temperature of the body. The milt is exceeding small, coming far short of the bodies proportion.

Besides, the common nature of other thick-hided creatures. It hath also reins, except that kinds of Tortoise called Lutaria, for that wanteth both reins and bladder; for by reason of the softneffe of the cover thereof the humor is over-fluent; but the Tortoise that bringeth forth eggs hath all inward parts like a perfect creature: and the females have a singular passage for their excrements, which is not in the males. The eggs are in the body of the belly, which are of a party-colour like the eggs of Birds.

Their flones cleave to their loins, and the tail is short, but like the tail of a Serpent. They have four legs, in proportion like the legs of Lizards, every foot having five fingers or divisions upon them, with nails upon every one. And thus much for the several parts.
They are not unjustly called Amphibias, because they live both in the water and on the land, and in this thing they are by Pliny referred to Beavers: but this must be understood of the general, otherwise the Tortoises of the land do never dare come into the water: and those of the water can breath in the water, but want respiration, and likewise they lay their Eggs and sleep upon the dry land. They have a very slow and easy pace; and thereupon Pertunius calleth it Tardi-gradus, and also there is a Proverb, Testudinem inco sits a low and soft pace, when such a motion is to be express'd. The Tortoise never calleth his coat, no not in his old age. The voyage is an abrupt and broken halting; not like to the Serpents, but much more loud and diffused. The male is very facetious and given to carnal copulation, but the female is not so; for when she is attempted by the male, they fight it out by the teeth, and at last the male overcometh, whereat he rejoiceth as much as one that in a hard conflict, fight, or battle; hath won a fair Woman; the reason of this unwillingness is, because it is exceeding painful to the female. They engender by riding or covering one another. When they have laid their Eggs, they do not set them to hatch them, but lay them in the Earth, covered, and there by the heat of the Sun the young one is formed, and cometh forth at due time without any further help from his Parents.

They are accounted crafty and subtle in their kind, for subterfus is not only ascribed to things that have a thin bloud, but also to those that have thick skins, hides, and covers, such as the Tortoise and Crocodile have. The Tortoise is an enemy to the Partridge, as Philer and Alcmane write: Alfo the Ape is as fraid thereof, as it is of the Snail: and to conclude, whatsoever enemy it hath, it is safe enough as long as it is covered with his shell, and clingeth fast to the earth beneath; and therefore came the proverb, Oikos philos, oikos aristos: That house which is ones friend, is the best house.

The Poets give a fabulous reason, why the Tortoise doth ever carry his house upon his back, which is this: They say, that on a time Jupiter bad all living creatures to a banquet or Marriage feast, and thither they all came at the time appointed, except the Tortoise: and the at laft appeared at the end of the feast when the meat was all spent: whereas Jupiter wondered, and asked her why she came no sooner: Then it answered him, Oikos philos, oikos aristos: at which answer Jupiter being angry, adjudget her perpetually to carry her house upon her back, and for this cause they fable, that the Tortoise is never separated from her house.

Flaminius the Roman diffuating the Acheans from attempting the Island of Zoeinthus, used this argument, and fo afterward T. Livius. Caternum sicut Testudinem, ubi collleta in sua tegumen est, tutam ad omnes illias vitæ esse: ubi exeritis partes alienas, quodunque nudavit, obviavitque infrimmium babere: Haud dissimiliter vobis Achai, clausus undique marius, quod intra Peloponesum est, termino, ea & jungere vobis, & juncta tuerti facile: si semel avideitate plus amplectendns, vinc excedat, nuda obiit omnia que extra sint & expetita ad omnes illias esse. Thus far Pliny. That is to say. Even as when the Tortoise is gathered within the compass of her shell, then is it safe and free from all troubles and feelth no violence, but whensoever the putteeth forth a limb or part, then is it naked, inoffenfible, and easy to be harmed: fo is it with you Acheans, for by reason of the inclosed feast of Peloponesus within the Straights of the Sea, you may well winde all that together, and being conjoynd, as well defend it: But if once your audacious and covetous minds to get more, appear and stretch it self beyond those limits, you shall lay open your naked infirmity and weakness, to all force, blows, and violence whatsoever. Wherefore the Tortoise careth not for flies, and men with good armour care not much for light and easy adversaries.

Alictus hath a witty Emblem of a Tortoise to express a good Huswife, and that the fame of her virtues, spreadeth much further then either beauty or riches.

Anna Venus, quem sem bac facies? quid dema at illa
Tetudo, moles quam pede diva premis?
Me sse effe miti Phidas, sexuque referri
Which may be Englished thus;

Quae holy God, what means that ugly face?
What doth that Tortoise signify indeed,
Which thou & God alike under soft foot pace?
Declare what means the same to me with speed:

These is the shape that Phidas did me frame,
And bade me go resembling Womanlike,
To teach them silence, and in houle remain,
Such pictures underneath my feet you finde.

There is a manifold use of Tortoises, especially of their cover or shell, and likewise of their fleth, which cometh now to be handled. And firft of all, the ancient ornaments of Beds, Chambers, Tables, and Banqueting houses, was a kind of artificial work, called Carutilis, and this was framed in gold and silver, brasse and wood, Ivory and Tortoise-shells; but, Modo luxuriae non fuerit contenta ligas, jam ligam emi testudinem facta: That is to say, Ryot not contented, bought precious frames of wood; and again, the use of wood cau'd Tortoise-tshells to be dearly bought, and thereof alfo complained the Poet Iuvenal, where he faith;

---Nemo curabit
Rivalis in Oceani flatus testudinis notaret
Claram Titus genitrix & nobilis fulcrum.

YYYY
The History of Serpents.

In English thus:

Then none did care for Tortoife in the Ocean flood,
To make the noble beds for Trojans blood.

We have shewed already that there are certain people of the East called Chelopagi, which live by eating of Tortoises, and with their shells they cover their houses, make all their vessels, row in them upon the water, as men use to row in boats, and make them likewise serve for many other uses.

But as concerning the eating of the flesh of Tortoises, the first that ever we read that used this ill diet, were the Amazonis, according to Callius *Eadus*; and other Authors writeth. Besides, Aloisius Cassanarius affirmeth, that he himself did taste of the flesh of a Tortoise, and that it was white in colour, much like unto Veal, and not unpleasant. But Ruffis is of a clear contrary opinion, condemning it for very unfitness, and unwholesome, because the taste and temperament thereof is betwixt the Land and the Water, it being a Beast that liveth in both Elements. And in eating hereof the Grecians have a proverb, *Ccelones kreat be phagein, be me phagein*: That is, either eat Tortoises flesh, or eat it not. Meaning that when we eat it, we must eat nothing else, and therefore must be filled sufficiently only with that kind of meat. For to eat little, bredeth fretting in the belly, and to eat much is as good as a purgation, according to the observance of many actions, which being done *frigida ir ignorantia*, that is, coldly and slothfully to halfe, do no good, but being done *actus* et *explicature*, earnestly and thoroughly bring much content and happiness.

But I marvel why they use in this age, or defined by Meat-mongers, seeing *Apicus* in all his Book of Variety of Meats, doth not mention them; and I therefore will conclude the eating of Tortoises to be dangerous, and hateful to Nature it self, for unless it be taken like a Medicine, it doth little good, and then also the Sawees and decoctions or compositions that are confected with it, are such as do not only qualify, but utterly alter all the nature of them, (as Stephanus Aquae hath well declared in his *Frensis* discourse of Frogs and Tortoises.) And therefore to conclude this History of the Tortoise, I will but recite one riddle of the strangeness of this Beast which *Tertullian* out of *Pavonius* maketh mention of, and also in *Greek* by *Methophius*, which is thus translated.

*Animal prægnat nativit, fine fluitat spiro, geminis oculi virtutis cerebrum, quibus dicibus aurorum progression. Super ventre carnulo perge, sub quo ventre latent albus, aperitus & clausus. Oculi non operimur, nem progression, donec venter intitus albus vatus eff. Hoc staturum, oculi non apparent insignis, & pergo ad ster; Et quiesquant mutans variis edo voces: That is to say, I am a living creature, of a strange nature, I breathe without streams, with two eye behinde, near my brains do I go forward, I go upon a blew belly, under which is also another white, open and short, my eyes never open, I go forward until my belly be empty, when it is full, then they appear plain and I go on my journey, and although I am mute or dumb, yet do I make many voices. The explication of this riddle, will shew the whole nature of the Beast, and of the Harp called *Chelys*. For some things are related herein of the living creature, and some things again of an Instrument of Musick made upon his shell and cover. And thus much for the Tortoise in general, the Medicines I will reserve unto the end of this History.*

**Of the Tortoise of the Earth, whose shell is only figured.**

The Tortoises which never come in water, either sweet or Salt, clear or muddy, are called by the Grecians, *Chelone Chefiate*; by the Latines, *Cerastes*, and *Tesselates*, *Tortes*, *Psevletes*, and *Montane*; and by Nescander, *Orine*; and the French peculiarly *Tortue des Bous*, a Tortoise of the wood.

These are found in the Desarts of Africa, as in Libya and Mauritania, in the open fields, and likewise in Libya in the Corn-fields, for when the Plough-men come to plough their land, their thares turn them out of the earth upon the furrows as big as great Gribes of land. And the thieves of these the Husbandmen burn on the land, and dig them out with Spades and Mattocks, even as they do Worms among places full of such venom.

The Hill Persians, and Savans, *Asenidia*, do yeeld many of these land Tortoises. The shell of this living Creature is very pleasantly distinguished with divers colours, as earthy, black, blewith, and almost like a Salamanders. The liver of it is small, yet apt to be blown or swell with with winde, and in all other parts they differ not from the common and vulgar general prefixed description.

These live in Corn-fields, upon such fruits as they can finde; and therefore also they may be kept in Chefs or Gardens, and fed with Apples, Meall, or Bread without Leaven. They eat also Cockles, and Worms of the earth, and Three-leaved-grasse. They will also eat Vipers, but presently after
Of the Tortoise.

After they eat Origan, for that herb is an antidote against Vipereine poyon for them, and unless they can instantly finde it, they die of the poyon. The like use it is said to have of Rue, but the Tortoises of the sandy Sea in Afric live upon the fat, dew, and moistneffe of those Sands. They are ingenere like other of their kinde, and the males are more veneration then the females, because the female must needs be turned upon her back, and the cannot rise again without help: wherefore many times the male after his luft is satisfied, seek away, and leaveth the poor female to be destroyed of Kites, or other adversaries: their natural wisdom therefore hath taught them to prefer life and safety before luft and pleasure. Yet Thurtium writeth of a certain herb, that the male Tortoise getteth into his mouth, and at the time of luft turneth the fame to his female, who presentely upon the smell thereof, is more enraged for copulation then is the male, and so giveth up her self to his pleasure without all fear of evil, or providence against future danger: but this herb neither he nor any other can name.

They lay Eggs in the earth, and do not hatch them, except they breath on them with their mouth, out of which at due time come their young ones. All the Winter time they dig themselves into the earth, and there live without eating any thing, insomuch as a man would think they could never live again, but in the Summer and warm weather they dig themselves out again without danger.

The Tortoises of India in their old and full age change their shells and covers, but all other in the World never change or call them. This Tortoise of the earth is an enemy to Vipers, and other Serpents, and the Eagles again are enemies to this, not so much for hatred as defirous thereof for Physick, against their lickneffes and diseases of nature; and therefore they are called in Greek Che-

To the end, in a fair Sun-thine clear day he fate in the fields, and suddenly an Eagle let a Tortoise fall down upon his head which brake his skull, and crushed out his brains, whereupon the Greelans wrote:

Aeschylo graphomi, epipsoke Chelone.

Which may be Englisht thus;

Aeschylos writing upon a rock,

A Tortoise falling, his brain out knock.

The use of this land Tortoises, are first for Gardens, because they clear the Gardens from Snails and Worms: out of the Aegadian Tortoises they make Harps, for their shells are very great, and this kinde of Harp is called in Latine Taphado, the inuenfer whereof is said to be Mercury, for finding a Tortoise after the falling in of the River Nilus, whose flesh was dried up, because it was left upon the Rocks, he struck the finewes thereof, which by the force of his hand made a musical sound, and thereupon he framed it into a Harp, which caused other to imitate his action, and continue that unto this day. These Tortoises are better meat then the Sea or Water Tortoises: and therefore they are preferred for the belly; especially they are given to Horfes, for by them they are raised in flesh, and made much fatter. And thus much shall suffice for the Tortoises of the earth.

Of the Tortoise of the Sweet-water.

Pliny maketh four kinde of Tortoises, one of the Earth, a second of the Sea, a third called Lataria, and the fourth called Smyda, living in Sweet-waters, and this is called by the Portugalls, Can-

gado; and Gazado; the Spaniards, Giglap; and the Italianis, Gaiandre de aqua. There are of this kinde found in Helvetia, near to Zurich, at a Town called Andelfingen: but the greatest are found in the River Ganges in India, where their shells are as great as tus, and Damosen writeth, that he saw certain Embassadors of India, present unto Augustus Caesar at Antiochia,a Sweet-water Tortoise, which was three cubits broad. They breed their young ones in Nilus. They have but a small Milt, and it wanteth both a bladder and reins. They breed their young ones and lay their Eggs on the dry land, for in the water they die without repirarion: therefore they dig a hole in the earth wherein they lay their Eggs, as it were in a great ditch, of the quantity of a Barrel, and having covered them with earth, depart away from them for thirty days; afterwards they come again and uncover their Eggs, which they finde formed into young ones, thofe they take away with them into the water: and these Tortoises at the inundation of Nilus follow the Crocodiles, and remove their nestes and eggs from the violence of the floods.

There was a magical and superstitious use of these Sweet-water Tortoises against Hail, for if a man take one of these in his right hand, and carry it with the belly upward round about his Vineyard, and so returning in the same manner with it, and afterward lay it upon the back, so as it cannot turn on the belly, but remain with the face upward, all manner of Clouds should passe over that place and never empty themselves upon that Vineyard. But such Diabolical and foolish observations were not so much as to be remembered in this place, were it not for their silliness, that by knowing them,
The History of Serpents.

Of the TURTLEDOE of the SEA.

I

T were unproper and exorbitant to handle the Sea-tortoise in this place, were it not because it liveth in both elements, that is, both the water and the land, wherefore seeing the Earth is the place of his generation, as the Sea is of his food and nourishment, it shall not be amiss nor improper (I trust) to handle this also among the Serpents and creeping things of the earth.

Pony calleth this Sea-tortoise Mus Marinus, a Mouse of the Sea, and after him Albertus doth so likewise. The Arabians call it Asfulnasb; and the Portuguese Tartarugas; and in Germany, Meefchlickoet, which the common Fisher-men call the Souldier, because his back seemeth to be armed and covered with a shield and helmet, especially on the fore-part: which shield is very thick, strong, and triangular, there being great veins and finews which go out of his neck, shoulders, and hips, that tie on and fasten the same to his body.

His fore-feet being like hands, are forked and twilled very strong, and with which it fighteth and taketh his prey, and nothing can preffe it to death except the frequent strokes of Hammers. And in all their members except their quantity, and their feet, they are much like the Tortoises of the earth, for otherwise they are greater, and are also black in colour. They pull in their heads as occasion is ministered to them, either to fight, feed, or be defended, and their whole shell or cover seemeth to be compounded of fine Plates. They have no teeth, but in the brims of their beaks or snouts are certain eminent divided things like teeth, very sharp, and that upon the under lip like the cover of a Box, and in the confidence of the sharp prickles, and the strength of their hands and backs, they are not afraid to fight with men.

Their eyes are most clear and splendent, calling their beams far and near, and also they are of white colour, so that for their brightness and rare whitenesse, the Apples are taken out and included in Rings, Chains, and Bracelets. They have reins which cleave to their backs, as the Reins of a Bugle or Ox. Their feet are not apt to be used in going, for they are like to the feet of Seals or Sea-calves, serving in stead of Oars to swim withal. Their legs are very long and stronger in their feet and nails, then are the claws of the Lion.

They live in Rocks and the Sea-finds, and yet they cannot live altogether in the water, or on the land, because they want breathing and sleep, both which they perform out of the Water: yet Pony writeth, that many times they sleep on the top of the water, and his reason is, because they lie still unmoveable, (except with the Water) and snort like any other Creature that sleepeth, but the contrary appeareth, seeing they are found to sleep on the land, and the snorting noife they make is but an endeavour to breath, which they cannot well do on the top of the water, and yet better there then in the bottom.

Castovii.

Arjalea.

Oppianus.

Flusarch.
Of the Viper.

of the body, it dieth not presently, nor clofeth the eyes, for if a man shake his hand at it, then will it wink, but if he put it neer, it will also bite if it can reach it. If by the heat of the Sun their backs grow dry, they also grow weak and inflexible, and therefore they halien to the water to remollifie them, or else they die within short time: and for this cause this is the best way to take them. In the hottest day they are drawn into the deep, where they swim willingly with their backs or shells above the water, where they take breath, and in continuance, the Sun so hardeneth them, that they are not able to help themselves in the water, but they grow very faint and weak, and are taken at the pleasure of the Fisherman.

They are also taken on the tops of the water after they return weary from their feeding in the night-time, for then two men may easily turn them on their back, and in the mean while another calleth a Snare upon them and draweth them safely to the land. In the Phoenician Sea they are taken safely without danger, and generally where they may be turned on their back, there they can make no resistance, but where they cannot, many times they wound and kill the Fisher-men, breaking the nets asunder, and let out all the other Fish included with them.

Bellarius writeth, that there be of these Sea-tortoifes two kindes, one long, the other round, and both of them breath at their Nozes, because they want gills, and the long ones are most frequent about the Port Tripolis in the Red-sea, whole cover is variable, for the males shell is plain and smooth underneath, and the females is hollow. The Turky have a kinde of Tortoise, whose shell is bright like the Chryfolite, of which they make hafts for Knives of the greatest price, which they adorn with plates of gold. In Amboslea, an Iland of the South, there are also found certain Monstres or living creatures, which are not very great, yet are they admirable in Nature, and in the vertue of their blood.

Their bodies are round and like the Tortoise, having two croffe lines over their backs, in the ends of which is an eye and an ear at either side, so as they seem to have four ears, the belly is but one, into which the meat paffeth out of the mouth. They have feet round about, and with them they go both backward and forward. The vertue of their blood is affirmed to be admirable: for whatsoever body is cut asunder and put together, if it be sprinkled with this blood during the time that it breatheth, it counteth as before.

The ancient Troglydites had a kinde of Sea-tortoife, which they call Celitium, which had horns unto which they fasten'd the fringes of their harps; these also they worthipped and accounted very holy. Yet some think that they might better be called Celium than Celitium: but I think Hermolaus doth better call them Celitium apostes Chelius, which signifies both a Tortoise and their broad breasts; and with their horns they help themselves in swimming. Albertus also maketh mention of a Tortoise called Barubara, but it is thought to be a corrupt word from Ophi a Cadeburnus. These Sea-Tortoifes are found sometimes to be eight cubits broad, and in India with their shells they cover houses, and such use they also put them unto in Taprobane, for they have them fifteen cubits broad. And thus much for all kinde kinde of Tortoises.

Of the VIPE.

Notwithstanding the affer- vation of Sutus, who will needs exclude the Viper from the Serpents, because a Serpent is called Ophis, and the Viper Echis, yet I trueth there shall be no reaonable man that can make exception to the placing of this living creature among Serpents; for that great learned man was deceived in that argument, seeing by the fame reason he might as well exclude any other, as the Snake, Dragon, Scorpion, and such like, who have their peculiar names, besides the generall word Ophis; and yet must he also have been better advis'd, then to affirm a Viper not to be called a Serpente: for even in Aristate whom he expoundeth and approveth, he might have found in his fifth Book of Gen. animal, and the last Chapter, that the Viper is recorded. Later genera ophiem: that is, Amongst the general kindes of Serpentes, although as we shall shew afterward, it differeth from most kindes of Serpentes, because it beareth the young one in his belly, and in the Winter time lieth in the Rocks, and among Stones, and not in the earth.

The Hebrews as it appeareth, Esa. 59. and Job 6. call it Ahabynthesis, and according to Manier Aphi- gnath, or Aphiagnath, for Vipers, because of the variety of colours, whereby they are set all over. The Arabians
The History of Serpents.

Arabians from the Greek word θερός, signifying all kinds of wide Beasts, do also call it θερός, and that kind of Viper whereof is made the Triangle, they call a Μάκσαρα, and Αθύριον, they also call it Στίθον, (as Leonicus writeth.) Beside it is called Στίθον, whose teeth are to be derived of the Hebrews, and Απίς, which may likewise be conjectured to arise from the Greek word Επίς. The Greeks call the Male peculiarly and properly Επίς, and the Female Επίδανα, and it is a question whether the vulgar word among the Grecians at this day Εχεδάνα, do not also signify this kind of Serpent. Bellerus thinketh, that it is corrupted of Επίδανα the female Viper. The Germans have many words for a Viper, as Brand Schlangen, Natter, Ech, Hiek nater, and Viper-nater. The French, use Vipere; the Spaniards, Vipera, and Ech; the Italians, Vipera, Mara Rae, Scurnio, and sometimes Scurzon, although Scarzo, and Serzone, be general words in Italy for all creeping Serpents without feet, and that strike with their teeth.

There is also about the word Macha some question, although Leonicus decideth the matter, and maketh it out of all Controversie, and Robigimus thinketh it a very significant word derived from the people Μαχάς, because they carried away about Vipers. The Mountebanks do also call Sauffis, from Si-bila, the hissing voyce which it maketh. Some will have Nepa to be also a Viper, yet we have thowed that already to signify a Scorpion.

The Grecians say, that the Viper is called Εχεδάνα, para to σεισμον, in aetate ten genet, accigenie: because to her own death she beareth her young one in her belly; and therefore the Latines do also call it Vipera, quae Βιπερα is, because it dyeth by violence of her birth or young: and they attribute unto it venom and pelilience, and generally there are few Epithets which are ascribed to the Serpent, but they also belong unto this. There is a precious stone Eactices, (greenish in colour) which feemeth to be like a Viper, and therefore taketh name from it. Also an herb Eebits, like Semmymy, and Echidain or Vipers, in Coryne there are Mice, which from the fimitude of Vipers are called Eebes; ecb on was the name of a man, and Eebitides and Ecboit, of people; and Echidain a City bevide the Sea Αγεμον: Also the Eagle which by the Poets is laign to eat the heart of Prometheus, is likewise by them said to be begotten betwixt Lyphon and Epidaus, and the same Echidna to be also the Mother of Coimera: which from the Navel upward was like a Virgin, and downward like a Viper, of which also Docnored Scelus, and Herodotus telleth this story:

When Hercules was driving away the Osten of Geryon, he came into Sythia, and there fell asleep, leaving his Mares feeding on his right hand in his Chariot, and so it happened by divine accident, that whiles he slept they were removed out of his sight and estrayed away from him. Afterwards he awaked, and missing them, he went all about the Countrey, and came unto a certain place, where in a Cave he found a Virgin of a double natured proportion, in one part resembling a Maid, and in the other a Serpent, whereat he wondered much: but the told him, that if he would lie with her in carnal copulation, he would shew him where his Mares and Chariot were: whereunto he confessed, and begat upon her three Sons, famous among Poetical Writers: Namely, Agythyrus, Gelonos, and Syphus: but I will not prosecute either the names, or these fables any further. And so I will proceed to the description of Vipers. The colour of Vipers is somewhat yellowish, having upon their skin many round spots, their length about a cubit, or at the most three palms. The tail curled, at the end very small and sharp, but not falling into that proportion equally by even attenuation, growing by little and little, but unequally sharped on the sudden from thickneffe to thinneffe. It is also without feth, confiling of skin and bone, and very tharp. The head is very broad, compared with the body, and the neck much narrower then the head: the eyes very red and flaming, the belly winding, upon which it goeth all in length, even to the tail, and it goeth quickly and nimblly; some affirm that it hath two canine teeth, and some four. And there is some difference betwixt the male and female; the female hath a broader head, the neck is not so eminent, a shorter and thicker body, a more extended tail, and a softer pace, and four canine teeth. Again, the male hath a narrower head, a neck swelling or standing up, a longer and thinner body, and a swifter pace or motion, so that in the Pictures propounded in this discourse: the first of them are for the male, and the last for the female: & this is the peculiar outward difference betwixt the male and the female Vipers. Besides that, the tails of Vipers make a noise when they go or move Thoese are taken to be the most generous and lively, that have the broadest and hollowest head like a Turbot, quick and lively eyes, two canine teeth, and a griffle or claw in the nose or tail; a short body or tail, a pale colour, a twift motion, and bearing the head upward. For the further description of their several parts. Their teeth are very long upon the upper chap, and in number upon either fide four, and those which are upon the neither gum are so fmall, as they can scarce be discerned, until they be rubbed and preffed; but alfo it is to be noted, that while they live, or when they be dead, the length of their teeth cannot appear, except you take from them a little badder, in which they lie concealed. In that badder they carry poyson, which they infuue into the wound they make with their teeth: they have no ears, yet all other living creatures that generate their like, and bring forth out of their bellies have ears, except this, the Sea-calf, and the Dolphin, yet in fhe thereof, they have a certain griffly cave or holloweness in the same place where ears should stand. The womb and place of conception (faith Pliny) is double, but the meaning is, that it is cloven as it is in all females, (especially Women and Cows.) They conceive Egges, and thes Egges are contained neer their rens or loins. Their skin is soft, yeelding alfo to any stroke: and when it is eyed ed off from the body, it strecheth twice fo big as it appeared while it covered the living Serpent: To conclude, Phylis, writeth, that their face is somewhat like the face of a man, and from the
Navel it refembled a Crocodile, by reason of the small passage it hath for his ejection which exceeded not the eye of a Needle. It conceiveth at the mouth. And thus much for the description in general.

There is some difference among this kind also, according to the distinction of place wherein they live, for the Vipers in Æthiopia are all over black like the men, and in other Countries they differ in colour, as in England, France, Italy, Greece, Asia, and Egypt, as writeth Bellonius. There is scarce any Nation in the World wherein there are not found some Vipers. The people of Amynta which were of the Grecian blood, drove away all kind of Serpents from among them; yet they had Vipers which did bite mortally; and therefore could never be cured, being shorter then all other kinds of Vipers in the World.

Likewise in Arabia, in Sygroi, the sweet Promontory of Frankincense, the Europeen Mountains, Sciron, Parnassus, Aethiopia, Crete, and Rhipheus: the Mountains of Asia, Egyptus, Bucertenor, and Cercophas, abound with Vipers. Likewise Egypt, and in all Africa they are found also, and the Africans affirm, (in detection hereof;) that it is not so much Animal, as Malum nature: that is, A living Creature; as evil of Nature: To conclude, they are found in all Europe. Some have taken exceptions to Crete, because Aristotle writeth, that they are not found there, but Bellonius affirmeth, that in Crete also he saw Vipers which the Inhabitants call by the name of Chevutra, which seemeth to be derived from the Greek Echidna. At this day it is doubted whether they live in Italy, Germany, or England, for if they doe, they are not knowne by that name: yet I verily think that we have in England a kind of yellow Adder which is the Viper that Bellonius saw here, for I my selfe have killed of them, not knowing at that time the difference or similitude of Serpents, but since I have perceived to my best remembrance that the proportion and voyage of it did shew that it was a Viper. The most different kinds of Vipers are found in Egypt and Asia.

Concerning the quantity, that is the length and greatness of this Serpent, there is some difference, for some affirm it to be of a cubit in length, and some more, some leFFE. The Vipers in Europe are very small, in comparison of them in Africa, for among the Traguloses (as writeth Elianus) they are fifteen cubits long, and Neurobus affirmeth as much of the Indian Vipers; Arifabolus also writeth of a Viper that he saw one, which was nine cubits long, and one hand breadth; & some again (as Strabo) affirm, that they have seen Vipers of sixteen Cubits long, and Nicander writeth thus of the Vipers of Asia:

Fort Asia ultra tres longis qui tradibus ultus
Se tendant rigidum quales Bucertonor, atque
Arduus Aegagus, & celtus Cercopus intra
Se multis refuuet.
In English thus:

Such as Asia yields in length, as are three elites,
In Bucertonor: these rough, these Vipers flourish,
Hard Egygsus and high Cercopus cells,
Within their compass many such do nourish.

Others there be in Asia sixteen foot long, and some there be again twenty, as in the Golden Cystiga, where their heads are like the heads of Kids. There be some that make difference between Echois and Echidna, because one of them when it biteth causeth a convulsion, and so doth not the other, and one of them maketh the wound look white, the other pale, and when the Echo biteth you shall see but the impertion of two teeth, and when the Echidna biteth you shall see the impertion of more teeth. But these differences are very idle, for the variety of the pain may arise from the constitution of the body, or the quantity of the poyson, and so likewise of the colour of the wound, and it is already set down, that the Echo or Male Viper hath but two canine teeth, but the other, namely, the Echidna hath four: thus faith Nicander;

Musculo eminit, petitus color, ipsa canino
Binos perpetuo monstrat, sed femina plures.
Which may be englished thus;

The Male two canine teeth, whose colour well is known,
But in the Female more continually are flown.

But yet the Male hath besides his Canine teeth, as many as hath the Female: and besides the Male is known from the Female, as the name Nicander writeth, because the Female when the goeth, draweth her tail as though she were lame, but the Male more manlike and nimble, holdeth up his head, stretheth out his tail, restrainteth the breath of his belly, seteth not up his Scales (as doth the Female;) and besides draweth out his body at length.

The Meate of these Vipers are green Hearbes, and also sometimes living Creatures: and namely, Galen. Hore-flies, Cantharides, Fidincombers, and such other things as they can come by, for these are fit and convenient meat for them. Aristotele writeth, that sometimes also they eat Scorpions, and in Arabia they not onely delight in the sweet juice of Baljam, but also in the shadow of the same. But above all kinds of drink, they are most infatiable of wine. Sometime they make but little folds, and sometime greater;
greater, but in their wrath their eies flame, they turn their tailes and put forth their double tongue.

In the winter-time as we have said already, they live in the hollow Rocks, yet Pliny affirmeth, that then also they enter into the earth, and become tractable and tangible by the hands of man, for in the cold weather they are nothing so fierce as they are in the hot, and in the Sommer also they are not at all times like furious, but like to all other Serpents. They are most outrageous in the Canicular daies, for then they never rett, but with continual disquiet move up and down till they are dead or expired of their poiyon, or feel an abatement of their heat. Twice in the year they cast their skins, that is to say, in the Spring, and in the Autumn: and in the spring time when they come out of their hole or winter lodging, they help the dimmefle of their eye-fight by rubbing their eyes upon fennel. But concerning their copulation and generation, I find much difference among wri- ters: wherefore in a matter so necessary to be known, I will first of all fet down the opinion of other men, aswell Historians as Poets, and then in the end and conclusion, I will be bold to interpose my own judgment for the better information of the Reader.

Heredatus in his Thalia writeth, that when the Vipers begin to rage in luft, and desire to couple one with another, the Male cometh and putteth his head into the mouth of the female, who is so infatiable in the desire of that copulation, that when the male hath filled her with all his seed-genital, and so would draw forth his head again, the bitch it off, and destroiyeth her husband, whereby he dieth and never liveth more; but the female departeth and conceiveth her young in her belly, who every day according to natures inclination, grow to perfection and ripeneffe, and at last in revenge of their fathers death, do likewise destroy their mother, for they eate out her belly, and by an unnatural issue come forth into the light of this world: and thus this thing is also thus witnessed by Nicander:

Cum durum fugiens mosua ignecestis coliditae
Freund ecis, vel uti jevante libidinis estu
Saeve ducte sui refeact copul illaruit:
Aft ubi pust vegetam orperrum pignora visum,

In English thus;

When the male Viper gazeth, avoiding females bite,
Whose fiery rage is all on ardent luft,
Tell when he burns for copulation right,
Her cruel tooth doth Husband head off cruft.

Vpto this agreeeth Galen, Iffidre, Plutarch, Athanasius: and Lucan who writeth;

Viperem sequunt abrupto corpora natu
That is to say:
The geniture of Vipers blood
Engender, breaking bodies good.

Pliny agreeith with the residue for the death of the Male in carnal copulation, but he differeth in this, about the Female, affirming that when the young Vipers grow ripe and perfect in their Mothers belly, the caltie forth every day one for three daies together, (for her number is sometimes twenty) at last the other, impatient of delay, gnaw out her guts and belly, and so come forth, destroying their mother: And here is no great difference, for in the sum and destruction of Father and Mother they all agree, and Saint Jerome, Saint Basilis, and Horace do agree and subscribe to the truth of these opinions. Thus we have thewed the opinions of the Ancient and first Writers: now it followeth that we should likewise thew the opinions of the latter Writers, which I will performe with as great brevity and perspicuity as I can. Pierius therefore writeth, that in his time there were Learned men defirous to know the truth, who got Vipers, and kept them alive, both Males and Females, by fluttering them up safe where they could neither escape out, nor do harme, and they found that they engendered, brought forth, and conceived like other Creatures, without death or ruine of Male and Female.

Amatus Lusitanus also writeth thus. The Male and Female Viper engender by their tailes together, even to the one half of their body, and the other half standeth upright, mutually kiffin one another. In the Male there is a genital member in that part beneath the Navel, where they embrace, which is very secret and hidden, and against the fame is the Females place of conception, as may appear manifestly to him that will look after the fame; and therefore all the Philosophers and Physitians have been deceived, that have wrote they have conceived at their mouth, or that the Male perfified at the time of engendering, or the Female at the time of her delivery. Thus faith Amatus.

This Plutarch he likewise writeth in this manner; The young Vipers do not eate out their way, or open with their teeth their Mothers belly, nor (if I may speak merrily) do make open their own passage by breaking up of the doors of their Mothers womb, but the womb being narrow, cannot contain them; and therefore breaketh of it own accord: and this I have proved by experience, even as the same falleth out with the fift called Asmodeus and therefore I must crave pardon of Heredatus, if I affirm his relation of the generation of Vipers to be meerly fabulous. Thus far Theophrastus.

Apollonius
Apollodorus also writeth, that many have seen the old Vipers licking their young ones like other Serpents.

Thus have I expressed the different judgements of sundry Authors both new and old touching Celius, the generation of Vipers, out of which can be collected nothing but evident contradictions, and unreconcilable judgements, one mutually crossing another. So as it is unpossible that they should be both true, and therefore it must be our labour to search out the truth, both in their words, and in the conference of other Authors. Wherefore to begin, thus writeth Aristotle. The Viper amongst other Serpents, almost alone bringeth forth a living creature, but first of all she conceiveth a several egg of one colour, above the eggs lieth the young ones folded up in a thin skin, and some-times it falleth out, that they gnaw in vnder that thin skin, and so come out of their mothers belly all in one day, for the bringeth forth more than twenty at a time.

Out of the words of Aristotle, evilly understood by Pliny and other ancient Writers, came that errore of the young Vipers eating way out of their mothers belly, for in stead of the little thin skin which Aristotle faith they eat thorough, other Authors have turned it to the belly, which was clean from Aristotle meaning. And another error like unto this, is that wherein they affirm, that the Viper doth every day bring forth one young one, so that if the hath twenty young ones in her belly, then also the must be twenty days in bringing of them forth.

The words of Aristotle from whence this error is gathered, are these, Titel de en miximera katof, Titel de ptos bo eikofs, which are thus translated by Ganea, Parit enim singulas δειδος σιγιλας, plures quam vigintinumeros: That is to say, the bringeth forth every day one, more then twenty in number. But this is an absurd translation, and agreeth neither with the words of Aristotle, nor yet with his mind, for his words are these: Parit autem una die singulas, parit autem plur quam viginti numero. That is to say in English, the bringeth forth every one in one day, and the bringeth forth more than twenty: so that the sense of these words shall be, that the Viper bringeth forth her young ones severally, one at a time, but yet all in a day.

But concerning her number, neither the Philosopher, nor yet any man living, is able to define and let it down certain, for they vary, being sometimes more, and sometimes fewer, according to the nature of other living creatures. And although the Viper do conceive eggs within her, yet doth the lay them after the manner of other Serpents, but in her body they are turned into living Vipers, and so the eggs never see the sun, neither doth any mortal eye behold them, except by accident in the dissection of a female Viper when she is with young. I cannot also approve them that do write, that one, namely the Vipers, among all Serpents, bringeth forth her young ones alive, and perfect into the world, for Nicander and Crevins, do truly affirm, with the constant consent of all other Authors, that the horned Serpent called Cerastes, of which we have spoken already, doth likewise bring forth her young ones alive. And beides, Herodotus writeth of certain winged-Serpents in Arabis, which do bring forth young ones as well as Vipers, and therefore it must not be concluded with apparent fallibhood, that only the Viper bringeth her young ones perfect into the world.

The like fable unto this, is that general conceit of the copulation together, betwixt the Viper and the Lamprey; for it is reported that when the Lamprey burneth in luft for copulation, she forsaketh the waters, and cometh to the Land, seeking out the lodging of the male Viper, and doth yoneth herselfe unto him for copulation. He againe on the other side, is so tickled with desire hereof, that forfaking his owne dwelling and his own kind, doth likewise betake himselfe unto the Waters and Rivers sides, where in an amorous manner, he highteth for the Lamprey, like as when a young man goeth to meet and call his Love; so that these two creatures, living in contrary elements: the earth and the water, yet meet together for the fulfilling of their lufts in one bed of fornication. Upon which Saint Bayle writeth in this manner: Viper insecutisse humanum animal rurum, quae fornunt cum mutere congruitur, &c. that is to say, the Viper a most pernicious enemy to all living creeping things, yet admittedh copulation with the Lamprey, for he forsaketh the Land, and goeth to the water-side, and there with his huffing voyce, giveth notice to the other of his presence, which the hearing, instantly forsaketh the deep waters, and coming to the Land, suffereth hirselfe to be imbraced by that venemous beast. Also Nicander writeth thus thereof in his verses.

Fama est, si modu vera, quod hae sua pascua linquant,
Atque est in fuscum cognitum linitum,
Et cum Viperos coeunt serpentes gravatur,
Which may be englisht thus:

Fame saith (if it be true,)that the her feed forfakes,
I mean the store, and goes upon dry land,
Where for her luft the Viper male he takes,
In fleshly couitise to be he husband.

But this opinion is vaine and fantastical, as Pliny and divers others have very learnedly proved, for the Lamprey cannot live on the Land, nor the Viper in wet places, besides the waters: and therefore, besides the impossibility in nature, it is not reasonable that these will hazard their own lives, by forsaking their own elements for the satiastion of their lufts, there being plenty of either kinds to work upon, that is to say, both of female Vipers in the Land, to couple with the male, and male Lampreys in the water, to couple with the female. Although
Although I have else-where confuted this error, yet I must here again remember that which is said already. The occasion of this fable is this; the male Lamprēy is exceeding like a Viper, for they wait, eat, and have long bodies, which some one by chance seeing in copulation with his female, did rashly judge it to be a Serpent because of his likeness, as afore-land; and therefore they deviled a name for it, calling it Myris, which some have made a kind of Viper, and others a Snake: but Androclus hath notably proved against Archeclus, that this Myris neither is nor can be any other then the male Lamprēy: and so I will conclude, that neither Vipers ingender with Lamprēys, nor yet the female Vipers kill the male in copulation, or that the young ones come into the world by the deftruction of their dams.

In the next place we are to consider, the antipathy and contrariety that it observeth with other creatures, and the amity also betwixt it and others. First of all therefore it is certain and well known, what great enmity is betwixt man-kind and Vipers, for the one alwaies hateth and feareth the other: wherefore, if a man take a Viper by the neck, and spit in his mouth, if the sportive glide down into his belly, it dieth thereof, and rottest as it were in a consummation. Vipers also are enemies to Oxen, as Virgil writeth, *Pisces acerra buman petorique aegera viris*: that is, a sharp plague of Oxen, calling his poiyon upon all other Cattel. They are also enemies to Hens and Geese, as Columella writeth, wherefore in ancient time they were wont to make fence walls for the custody of their pullen against Vipers. They are likewise enemies to the Dormouse, and they hunt very greedily after their young ones, whereof *Hyphorius* in a discourse against Origen writeth thus: When the Viper cometh to the nest of a Dormouse, and findeth there one of his eggs, he putteth out all their eies, and afterwards feedeth them very fat, yet killeth every day one, as occasion of hunger serveth; but if in the mean time a man, or any other creature do chance to eat of those Dormice, whose eies are to put out by the Viper, they are not poisoned thereby. And this is a wonderfull work in nature, that neither the little Dormice receive harme by the poiyon, but grow fat thereby, nor yet the Viper be poisoned herewith, while the eate them, and yet a man or beast which is a stranger unto it, dieth thereof.

All kind of Mice are as much afraid of Vipers, as they be of Cats, and therefore whensoever they bear the huffing of a Viper, infinitely they look to themselves and their young ones. There is a kind of harmeloffe Serpents called Parce, whereof I have spoken before in his proper place, which is an enemy unto Vipers, and that same which is harmeloffe unto men, killeth them. *Aelianus* also telleth a story of a Viper that climbed up into a tree, to the net of a Magpie, whereupon the old one was sitting, this poore Pye did fight with the Viper, untill the Viper took her bale by the thigh, so as she could fight no more, yet she ceased not to chatter and cry out to her fellowes to come and help her, whereupon the male Pye came, and seeing his female so grieved by the Viper, he ceased not to peck upon his head until the braines came out, and so the Viper fell down dead. This story is also alluded by *Carden*.

The Scorpions and the Vipers are enemies one to another, for at Padua a Viper and a Scorpion (for the trial of this matter) were both included in a vial, where they continued fighting a little while, but at lat they both died by one anothres poiyon. The Torroyle of the earth is also an enemy to the Viper, and the Viper to it, wherefore if it can Origan, or wild-Savory, or Rue, it eateh thereof, and then is nothing afraid to fight with the Viper, but if the Torroyle can find none of thefe, then they die inconveniently by the poiyon of the Viper, and of this there hath been triall, as both *Aristotle* and other Authors affirm.

And as there is this contrariety betwixt Vipers and other living creatures, so there is betwixt them and Plants of the earth, and this biebling God in nature hath bestowed upon many beastis, that when they feel themselves to be hurt by one herb, they know another to cure them: as for example, Garlick is poiyon to the Viper, and therefore having tafted thereof the dieth, except the eate some Rue. A Viper being brook with a Reede once, it amazeth her, and maketh her faintpeare, but being flook the second time, the recovereth and runneth away: and the like is reported of the Beech-tree, saying that it layeth the viper, and she is not able to go from it. But most marvaulous is the antipathy betwixt the Viper and the Yew-tree, for it is reported by *Mercurialis*, that if you lay fire on the one site, and a piece of Yew on the other side, and then place a viper in the middle betwixt them both, the will rather chufe to runne thorow the fire, then to go over the branches of Yew.

The Viper is also afraid of Mustard-leaf, for it being laid in her path, she fleeth from it, and if the tale of it, the dieth. There is an herbe called *Arris*, if the hands or body of a man be anointed with the juice of the root thereof, the viper will never bite him; the like is reported of the juice of Dragons, expressed out of the leaves, fruit or root. It is also said, that if a viper do behold a good Smaradge, her eyes will melt and fall out of her head. But above all other plants in the world, the Viper is most delighted with Vetches, and the Savyne tree, for in Italy (as Carden writeth) there was once seen a great number of Vipers about a Savyne Tree, and many of them did climb up and down upon that Tree.

There is no love betwixt this Serpent and other creatures, fave onely to his own kind, and therefore are two things memorable in the nature of this뉴 Savage Serpent, the one is the love of the male to the female, and the other of the female to her young ones. It is reported by Saint Ambrose and Saint بطس, that when the male miffeth the female, he seeketh her out very diligently, and with a pleasing and flattering noyce, calleth for her, and when he perceiveth the approcheth, he calleth up
Of the Viper.

up all his venom, as it were in reverence of matrimonial dignity. The female on the other side, maketh much of her young ones, licking and adorning their skins, fighting for them unto death, both against men and beasts. For this occasion and some medicinal uses, the Arabians counted Vipers holy Serpents, for by reason (as we have said already) that the Vipers do harbour the Balm-trees, whereof there be plenty in that country, they hold them for holy keepers of that precious fruit: wherefore they never kill them, but at the time of year when the Balm is ripe, they come unto the trees bearing in their hands two wooden rules, which they smite one against another, by the noise whereof the Vipers are terrified and driven away, and so the Trees are freed for the Inhabitants to take the fruit thereof at their pleasure.

Now forasmuch as we read that Paus King of India sent many great Vipers for a gift unto Augustus, it is profitable to express the means whereby Vipers are safely taken without doing any harm. Wherefore Aristotle writeth, that they are very much desirous of Wine, and for that cause the Country-people set little vellels of wine in the hedges and haunts of Vipers, whereunto the Vipers coming, easily drink themselves tame, and so the Hunters come and kill them, or else so take them, as they are without danger of harm. Plini reporteth, that in ancient time, the Marfians in Libya did hunt Vipers, and never received harm of them, for by a secret and innate vertue, all Vipers and serpents are afraid of their bodies, as we have already shewed in other places. Yet Galen in his discourse to Pijus, writeth that the Marfians in his time had no such vertue in them, as he had often tried, fave onely that they used a deceit or sleight to beguile the people, which was in this manner following.

Long after the usual time of hunting Vipers, they use to goe abroad to take them, when there is no courage nor faint any venom left in them, for the Vipers are then easily taken if they can be found: and them they take, they accultome to their own bodies, by given them such meats as doth evacuate all their poison, or at the least drive doth stop up their teeth, as it maketh the harm very small; and so the simple people being ignorant of this fraud, and feening them apparently carrying Vipers about them, did ignorantly attribute a vertue to their natures, which in truth did not belong unto them. In like manner there were (as hath already in another place been saide) certain jugglers in Italy, which did boast themselves to be of the image of Saint Paul, who did do deceitfully carry themselves, that in the presence and sight of many people, they suffered Vipers to bite them without any manner of harm.

Others again when they had taken a Viper, did drown her head in mans sippit, by vettue whereof of the Viper began to grow tame and meek. Besides this, they made a certain oyntment which they set forth to sale, affirming it to have a vertue against the biting of Vipers, and all other Serpents, which oyntment was made in this manner. Out of the oil of the seed of wild-raddish, of the roots of Dragons, the juice of Daffadul, the brain of a Hare, leaves of Sage, Sprigs of Bay, and a few such other things, whereby they deceived the people, and got much money: and therefore to conclude, I cannot find any more excellent way for the taking and destroying of Vipers then that which is already expressed in the general discourse of Serpents.

We do read that in Egypt they eat Vipers and divers other Serpents, with no more difficulty then they would do Eels, so do many people both in the Eastern and western parts of the New-found-Lands. And the very selfsame thing is reported of the Inhabitants of the Mountain Atlas, the which meat they prepare and dress on this manner. First they cut off their heads and also their tails, then they boyle them and salt them, after which they feeth them or bake them, as a man would see the or bake Eles, but sometimes they hang them up and dry them, and then when they take them down again, they eat them with Oyl, Salt, Anyfeedes, Leeks and water, with some such other observations. Whole diet of eating Vipers I do much pity, if the want of other food constrain them thereof; but if it arise from the intastible and greedy intertemperance of their own appetites, I judge them eager of dainties, which adventure for it at such a market of poyson.

Now it followeth that we proceed to the handling of that part of the Vipers story, which concerneth the venom or poison that is in it, which must begin at the consideration of temperament of this Serpent. It is some question among the learned, whether a Viper be hot or cold; and for answer hereof it is said, that it is of cold constitution, because it lieth hid, and almost dead in the Winter-time, wherein a man may carry them in his hands without all hurt or danger: and unto this opinion for this selfsame reaason, agreeeth Galen. Mercuriusia maketh a treble diversity of constitution among Serpents, whereof the first are those that with their wound do influe a mortal poyson that killeth instantly, and without delay: a second fort are those that kill but more leisurely, without any such speed: and the third are those whose poyson is more flow in operation then the second, among which he assigns the Viper. But although by this knownes of operation he would enforce the coldnes of the poyson, yet it is alwayes to be considered, that the difference of Vipers, and of their venom, ariseth from the place and region in which they are bred, and also from the time of the yeer wherein they bite and wound, so that except they fortune to hurt any one during the time of the Cunicularia, (in which feason their poyson is hottest, and themselves most full of spirit) the same is but weak, and full of deadnes. And again it is to be considered, whether the Viper harm in her mood and fury, for anger doth thrust it forth more fully, and causeth the same to work more deadly.
Likewise the Region wherein they live, begoteth a more lively working spirit in the Serpent, and therefore before all other, the Vipers of Numidia are preferred, because of the heat of that Country. Also their meat causeth in them a difference of poifon, for those that live in the woods and eat Toades, are not so vigorous or venemous, but those that live in the mountains, and eat the roots of certain herbs, are more poiyonful and deadly. And therefore Cardan relateth a story, which he faith was told him by a Phcenician, that a Mountain-Viper chafed a man so hardly, that he was forced to take a tree, unto the which when the Viper was come, and could not climbbe up to utter her malice upon the man, she emptied the fame upon the Tree, and by and by after, the man in the tree dyed, by the faavour and secret operation of the fame.

But of the Arabian Vipers which haunt the Bafom-trees, I have read, that if at any time they bite, they only make a wound like the pricks of yron, void of poifon, because while they fuck in the juice of that tree, the acerbity and strength of the venom is abated. About the Mountain Helicon in Greece, the poifon alfo of Vipers is inifirme and not strong, fo that the cure thereof is alfo ready and easie. But yet for the nature of Vipers poifon, I can say no more then Wolfwine hath faid, that it is ofit felt and in it felt considered, hot: and his reafon is, because he fa\w as a combat in a glaffe betwixt a Viper and a Scorpion, and they both perifhed one by the others poifon. Now he faith that it is granted, the Scorpion to be of a cold nature, and his poifon to be cold; therefore by reafon of the antipathy whereby one died by the malice of another, it muft needs follow that the Viper is hot, and her poifon likewise of the fame nature. For a Serpent of a cold nature, killeth not another of the fame nature, nor a hot Serpent, one of his own kind, but rather it fall eth out clean contrary, that the hot kill tho\w that are cold, and the cold Serpents the hotter.

All the Vipers that live near the waters, are of more mild and meek poifon then others. If there be any fuch, but I rather believe there be none, but that the fame Author which wrote of the Vipers of the water, did intend Serpents of the water. But concerning the poifon of Vipers, there is nothing reported more strange then that of Vincentius Bellonensis, who writeth, that if a man chance to tread upon the region of a Viper unawares, it paineth him more then any venom, for it spreadeth it selfe over all the body incruably. Alfo it is written, that if a woman with child chance to passe over a Viper, it caufeth her to suffer abortion, and the Mushrooms or Toade floothes which grow neere the dennes and lodgings of Vipers, are alfo found to be venemous.

The Scythians alfo do draw an incurable and unreffistible poifon out of Vipers, wherewithall they anoint the sharp ends of their darts and arrows when they goe to warre, to the end that if it chance to light upon their adversary, he may never any more do them harm. They make this poifon in this manner. They observed the littering places and time of the Vipers, and then with strengthe and Art, did take the old and young ones together, which they precently killed, and afterward suffered them to lie and rot, or foake in some moist thing for a fea\w on: then they took them and put them into an earthen pot filled with the blood of some one man; this pot of mans blood and Vipers they stoppd very cloe, so as nothing might issue out at the mouth, and then buried or covered it all over in a dunghil, where it rotted and confumed a few daies, after which they uncovered it again, and opening it, found at the top a kind of watery fubftance swimming, that they take off, and mixe it with the rotten matter of the Viper, and hereof make this deadly poifon.
